## FORTHCOMING EVENTS.

*Monday, January* 10.

Liverpool Architectural Society: Paper on "Town Planning and Architecture," by Professor S. D. Adshead, F.R.I.B.A.

Surveyors' Institution: Paper on "The Housing and Town Planning Act, 1909," by Mr. John Willmot. The discussion will include that on the paper by Mr. Davidge read on November 22.

*Tuesday, January* 11.

Illuminating Engineering Society: Discussion on "Glare, its Causes and Effects," to be opened by Dr. J. Herbert Parsons, F.R.C.S.

*Wednesday, January* 12.

Architectural Association: Opening lecture of a course on "European Mediæval Architecture," by Mr. Edward S. Prior.

Manchester Society of Architects: Paper on "Concrete and Concrete Tests," by Mr. A. E. Corbett, A.R.I.B.A.

*Thursday, January* 13.

Royal Academy: Course of Four Lectures on Painting, by Sir W. B. Richmond, R.A., K.C.B.; (1) "Design and Drawing."

Royal Society of Arts: Paper on "Art Administration in India" (Indian Section), by Mr. E. B. Havell.

*Friday, January* 14.

Architectural Association: Paper on "A Comparison between English and Continental Ironwork," by Mr. J. Starkie Gardner.

---

## A FOREWORD.

By The Editor.

At the beginning of a New Year it is natural to all of us to offer good wishes and to form good resolutions. We therefore present to all our readers our good wishes for a prosperous and happy New Year, and record our resolution to do what lies in our power to assist in the realisation of those wishes. We do not, however, pretend to pose as philanthropists or wish to obscure the fact that The Architect, in common with all other technical journals, is conducted as a business and primarily for the benefit of the proprietors.

But we are fortunate in being able to feel that our business is closely bound up with the prosperity and the happiness of our readers, our contributors, and our advertisers, and that we may therefore so direct our energies that for all profit and pleasure may be the result.

For our readers we purpose to include articles on the art of architecture, the profession and the business of architects, that may afford interest and instruction to the many varied activities and enthusiasms of all. We crave the indulgence of those to whom some of the subjects on which we treat may not appeal on the ground that there are others to whom they are attractive. We are resuming in this issue illustrations of our Cathedrals, and shall continue those of the Colleges of Oxford. We commence a series of articles on Cold Storage and Refrigeration, a subject that has become of considerable importance to all architects who have to design buildings in which people live, not only hotels but private residences, besides the more obvious class of manufactories. We have other subjects in view, both practical and artistic, with which we propose to deal at length in the future. For our junior readers we have started a Students' Sketching and Measuring Club, in the hope of adding one more inducement to a branch of study of the highest value and importance, and this we trust will be well supported.

For our contributors we propose to afford the opportunity of publicity to those who have not yet reached the heights of fame, but who deserve to do so, while we hope still to be allowed to illustrate the work of masters in the art. In common with our contemporaries, we do not wish to include, save on exceptional occasions, drawings or photographs that have appeared elsewhere. There is too much good work being done now in British architecture to allow room for duplication. It is quite a common thing in an open competition to find numerous designs that, though not fortunate enough to receive a premium, well merit publicity before they are rolled up and put away on the top shelf.

For our advertisers we ask the consideration and attention of all practising architects, for it is only the support of advertisers that makes possible the existence of technical journals. If there were no advertisers there would be no illustrations in our own or any other architectural paper, and the architects who are doing good work would scarcely be known to their brother artists beyond a very small circle of intimate acquaintances. Therefore we ask our readers not to throw away the advertisement pages without a glance, and we do so the more readily because we know that these pages often help the busy practising architect to keep himself up to date in facilities for improved work and prevent him from keeping to his own little groove, which, ever deepening, shuts him off from what is going on around him.

Frederic R. Farrow.

## ARCHITECTURE IN 1909.

THE year 1909 has been one of those whose end has been welcomed in the world of architecture, accompanied by a forlorn hope that its successor may have better things in store. Activity in building is admittedly subject to wave action, now rising to the height of a boom, now falling to the depths of a slump. We in this country have now experienced the deepest slump within the memory of practising architects and active builders, and as yet there appears little sign of the swing of the pendulum to a period of prosperity.

Added to the normal operations of bad trade and commercial depression,

The Budget

of the past year has exerted a most paralysing influence on all building. Confidence in any assured set of conditions under which not only speculation but investment in any form of building might be undertaken with a reasonable sense of security has been utterly abolished. Not only have the financial proposals of the Government promised burdens on building of a crushing character, but there has been inspired the worse feeling that no one can foresee what further impositions may follow.

The rich man hesitates to buy an estate and build a mansion suitable to his means when he is confronted with the probability that these may subject him to an impost greater even than his wealth can sustain. The business man will not stoop to the folly of investing his capital in bricks and mortar when he cannot possibly estimate the extent to which his outgoings may be increased by an indefinite increment of taxation. The comparatively poor man, who, out of his hard-earned savings, puts his twenty or thirty pounds into a bit of freehold at a land sale is hit hardest of all. He knows that if the land taxes of the Finance Bill of 1909 are carried into effect he cannot possibly make a profit, and may sustain an actual loss.

A period of deep depression is not that in which we may expect to find the inception of great works of architecture, and thus it comes about that the event of the year has been the completion of the

Victoria and Albert Museum,

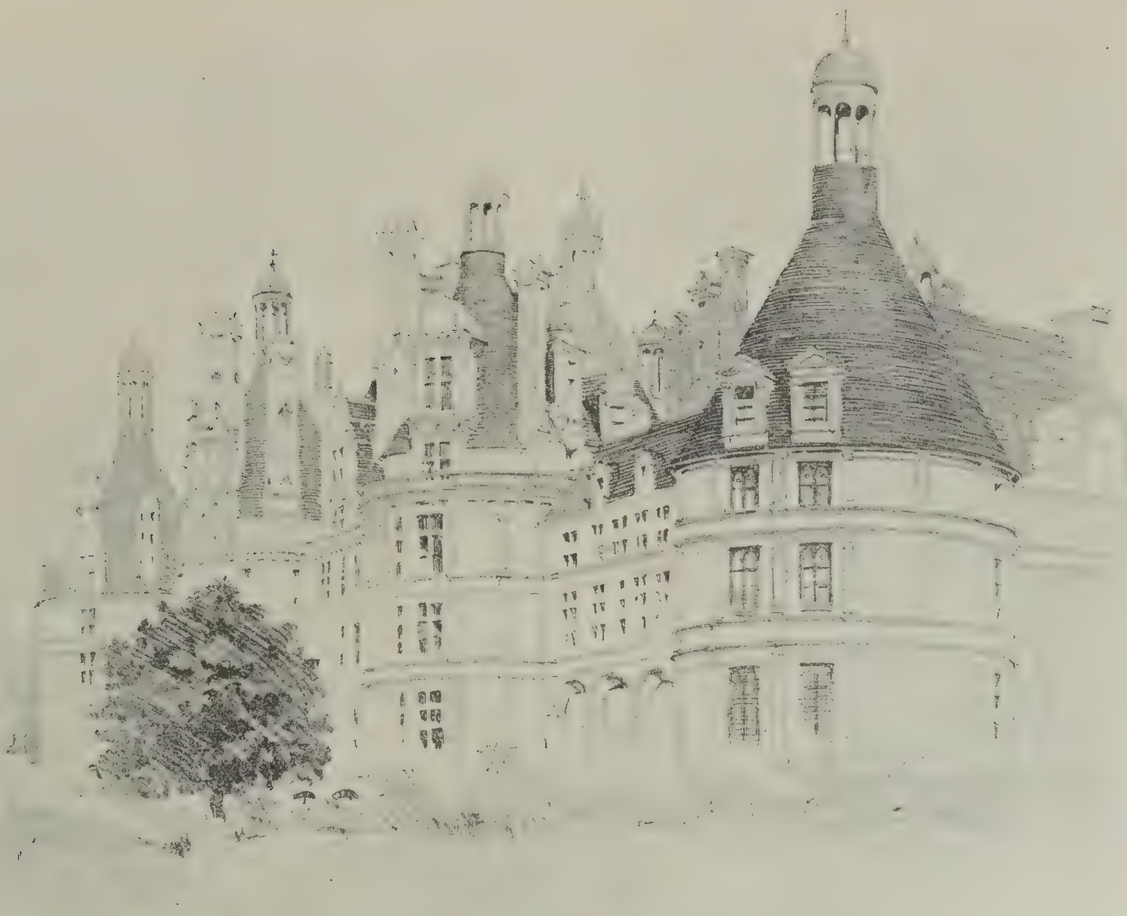
from the designs of Sir Aston Webb, R.A., notable not only as the consummation of a great building, but as the provision of an invaluable aid to the study of architecture and accessory art, in which the many treasures that have been gathered together at South Kensington can be properly seen and appreciated. In connection with the museum, the passing of the collections of the late Mr. George Salting from the condition of a loan to that of a possession of the nation is a memorable event of the year.

Of great importance in the modern history of architecture has been the passing into law of the

Housing, Town Planning, &c., Act,

and the recognition thereby enforced on the public mind of the fact that town planning should be raised from the haphazard method of muddle that has hitherto been the vogue in this country to an organised system of well directed effort in which the peculiarly architectural quality of prevision is essential. The preservation of the amenities is now by way of being recognised as of importance, not only to the comfort but to the health and social well-being of the community. It is a distinct gain to the position of architecture that beauty has come to be estimated as a vital element in our towns. Various congresses and conferences, lectures and discussions have assisted in drawing attention to the many questions that are connected with town planning, even if, as yet, they have not determined the principles far less the details of the science of laying out and building a city or a suburb as an organised entity.

The appointment of Mr. Stanley D. Adshead, F.R.I.B.A., as Associate Professor of Civic Design in the



CHATEAU D'AMBOISE.—Drawn by A. N. PRENTICE, F.R.I.B.A.

University of Liverpool is an earnest that the subject of town planning is to be dealt with seriously as a branch of architecture requiring careful study and research as well as imaginative conception to raise it to its proper sphere.

Last year has been for the

ROYAL INSTITUTE OF BRITISH ARCHITECTS

a memorable one, for it has seen the reception of the new Charter that is intended to pave the way for the attempt to make the Royal Institute more truly representative and more completely comprehensive of the body of architects in Great Britain. The new Charter has rendered necessary the modification of the by-laws of the Society, and this has occupied much time during the past session, largely by reason of the endeavour on the one hand to increase the power and autocracy of the Council, and on the other to restrict that body's independence of the general membership. At the last business meeting of the year the general body of members were surprised by the announcement that the Council is actually engaged on the drafting of a Bill for the Parliamentary sanction of—something. What that something may be remains to be seen, and whether it will satisfy the advocates of

REGISTRATION

is doubtful. Perhaps the members of the Council, the majority of whom are anti-registrationists, have recognised that there is an overwhelming preponderance of opinion among architects throughout the kingdom in favour of registration, and that it is better for those who fear evil results from its enforcement to assist in framing a Bill by which those dreaded evils may be minimised rather than to offer an uncompromising opposition to the desires of the majority.

The Royal Institute has been able during the past year to effect a solution of the problem of obtaining more roomy quarters by the acquisition of premises adjoining its previous home at 9 Conduit Street, which, if not so heroic a scheme as a fine new building might have proved, will apparently serve its purpose for many years to come.

Steel frame construction and reinforced concrete have now so far become actualities in English architecture that an

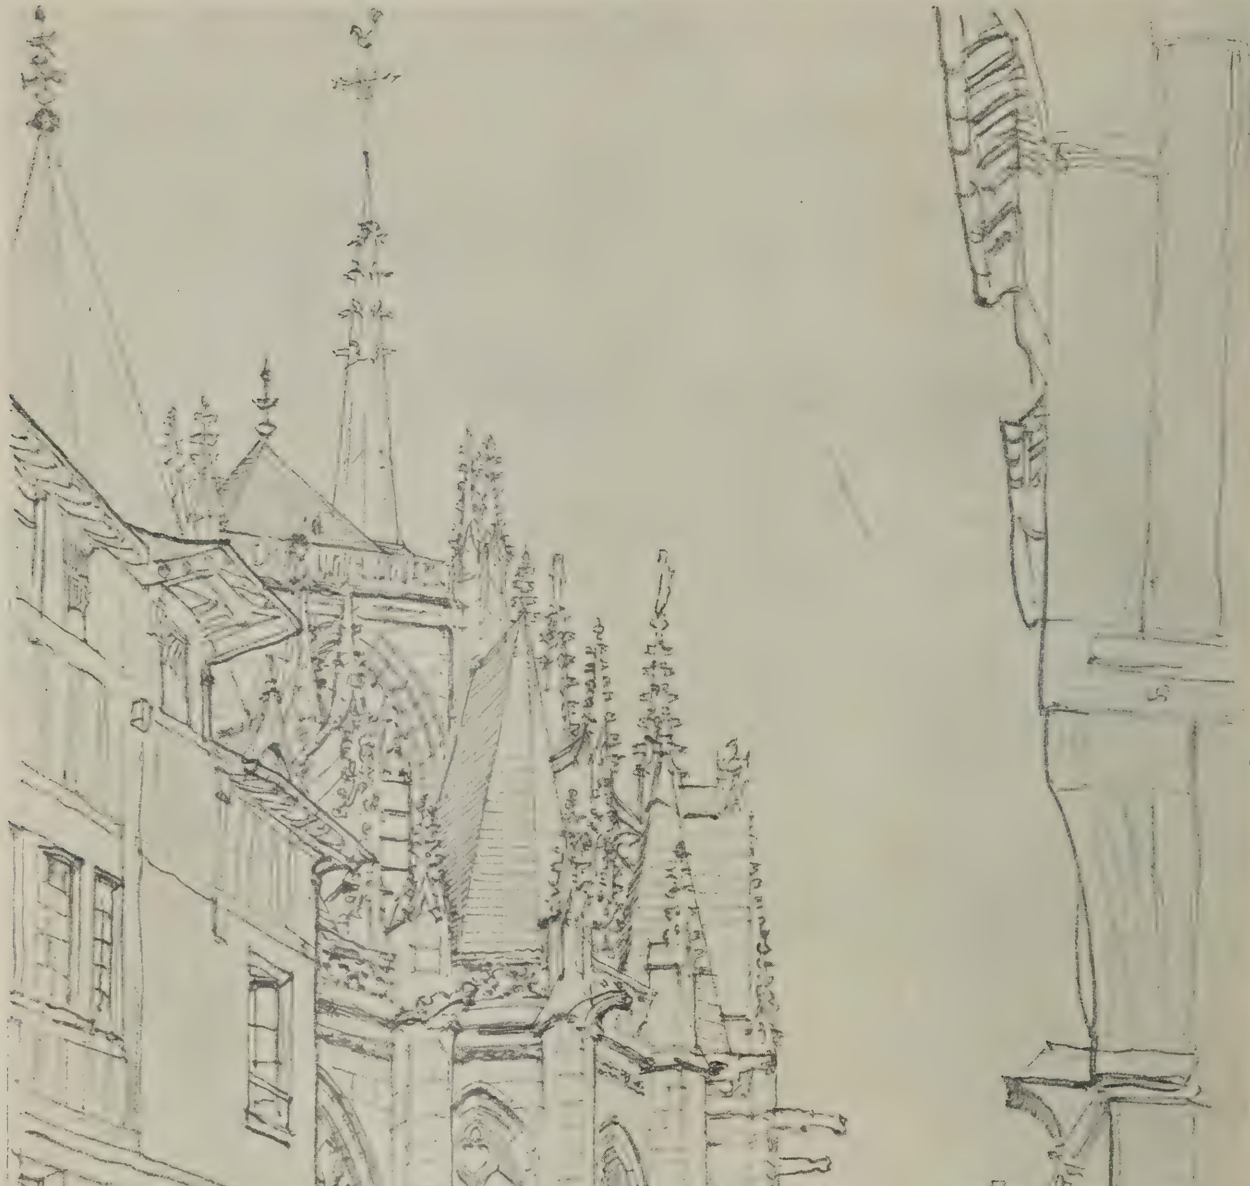
AMENDMENT OF THE LONDON BUILDING ACTS

was an urgent necessity, and has been incorporated in our statute law during the past year, thus establishing a code of regulations recognising and determining the conditions under which these methods of construction may be employed in the Metropolis. The opposition of the Royal Institute to some of the regulations proposed by the London County Council, particularly those dealing with the internal construction of steel frame buildings, was unsuccessful.

Early in the year we directed public attention to the imminent danger from fire of

ST. PAUL'S CATHEDRAL

and other national and monumental works of architecture, and we are pleased to be able to record that, under the direction of Mr. MERVYN MACARTNEY, the surveyor to the fabric, a high-pressure system of water supply has been installed at St. Paul's, which should go far to reduce the danger that formerly existed.



CAUDEBEC.—Drawn by LESLIE WILKINSON, A.R.I.B.A.

HOTOT FARM.—Drawn by A. N. Prentice, F.R.I.B.A.

### Liverpool's New Cathedral

has made satisfactory progress during the year, and the Lady chapel is now within measurable distance of completion, the building being roofed in and the stained glass windows inserted. The choir is also well advanced.

The Corporation of the City of London has determined on the construction of the new

### St. Paul's Bridge,

which we trust will become an ornament to the river, as well as a practical improvement to the traffic facilities of the Metropolis. The cost of this important work, as well as of the improvement of Southwark Bridge, will be defrayed from the funds of the Bridge House Estates, which trust has already done so much in the past for the benefit of the citizens of London.

### Important Buildings Completed

have not been so numerous or of such magnitude as we have been able to record during previous years, and the paucity of their number reflects the depression which has now existed for a considerable period. Among those with which the past year may be credited are the first portion of the buildings of Birmingham University, from the designs of Sir Aston Webb, R.A., and Mr. E. Ingress Bell; the extension of the Bradford Town Hall, at a cost of 86,000*l*., the work of Mr. F. E. P. Edwards, formerly the City Architect of Bradford, in consultation with Mr. R. Norman Shaw, R.A.; the premises of the British Medical Association, Agar Street, Strand, London, of which Mr. H. Percy Adams was the architect; the Northern Assurance Company's building in Moorgate Street, London, by the late Mr. E. A. Gruning and the late Mr. E. W. Mountford; the new Post Office at Hull, erected at a cost of 53,000*l*., from the designs of Mr. W. Pott, of His Majesty's Office of Works; new offices for the Grand Trunk Railway of Canada, in Cockspur Street, London, from the designs of Sir Aston Webb, R.A.; the City of London Workhouse and Infirmary at Homerton, which Mr. Albert E. Pridmore has carried out at a cost of between 50,000*l*. and 55,000*l*.; the Court of Sessions Buildings at Edinburgh, designed by Mr. W. T. Oldrieve, His Majesty's principal architect for Scotland. There have been also a large number of school buildings completed all over the country, and what activity there has been displayed in building during the past year may be said to have been largely centred in this class of edifice, both as regards buildings completed and buildings commenced.

A certain amount of work has been carried out in ecclesiastical buildings, and among the

### Churches Completed

we may note St. Andrew's, Handsworth, built from the designs of Mr. W. H. Bidlake at a cost of 11,000*l*.; the first part of St. Margaret's Church, Leeds, from the designs of Mr. Temple Moore; St. Alban's Church, Bournemouth, of which Mr. G. H. Fellowes Prynne is the architect; St. Luke's, Wimbledon Park, designed by Mr. T. G. Jackson, R.A.

### Important Works Commenced

during the year include Arbroath Railway Station, at a cost of 50,000*l*., for the Caledonian and North British Railway Companies; Wandsworth Union Infirmary, to cost 66,550*l*., for which Mr. J. S. Gibson is the architect; the extension of Aberdeen Royal Infirmary, under the direction of Mr. William Kelly, amounting to 25,000*l*.; new baths, Derby Road, Weaste, for which Messrs. Mangnall & Littlewood are the architects, and which are to cost 24,000*l*.; the Albert Mission Hall and Astor Institute, Manchester, designed by Messrs. Morley & Sons, and amounting to 55,000*l*.; the offices of the Palatine Bank, at Manchester, costing 30,000*l*., for which Messrs. Briggs, Wolstenholme & Thornely are the architects; the Liverpool Royal Infirmary Building from the designs of Mr. J. Francis Doyle, which is estimated to cost between 25,000*l*. and 30,000*l*.; the Post Office extension at Bristol, designed by Mr. John Rutherford, of His Majesty's Office of Works, the anticipated expenditure on which is 40,000*l*.; the extension of Belfast Asylum at a cost of 70,000*l*., for which Messrs. Graeme, Watt & Tulloch are the architects; the central building of the Y.M.C.A., Tottenham Court Road, London, for which Mr. Rowland Plumbe is the architect, and which is estimated to cost 90,000*l*.; the new building of the General Accident Assurance Corporation, Aldwych, London, designed by Mr. J. J. Burnet; new offices for the Anglo-American Oil Company, Queen Anne's Gate, London, for which Mr. Ernest Runtz is the architect;

CHATEAU FUMICHON.—Drawn by A. N. Prentice, F.R.I.B.A

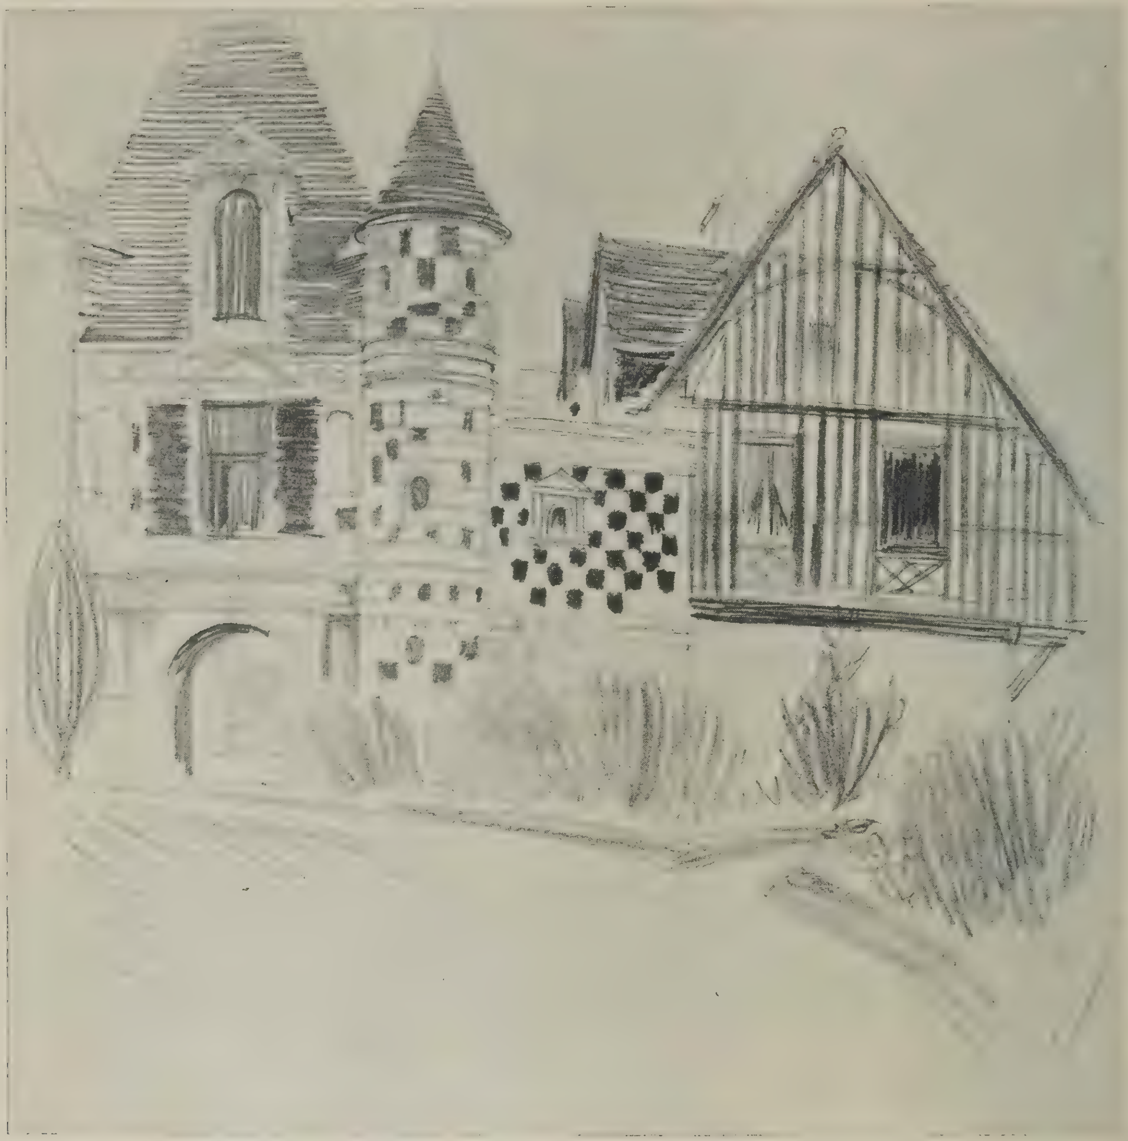
new Royal Infirmary buildings for Perth City and County, the cost of which, from Mr. James Miller's designs, is estimated at 36,800*l.*; Town Hall and Municipal Buildings, Torquay, to cost 30,000*l.*, Mr. Thomas Davison having secured the appointment as architect in open competition; Glasgow Infirmary extension, amounting to 80,000*l.*; New Grand Hotel, Sheffield, by Messrs. Connon & Chorley; new offices for the Woods and Forest Commission, designed by Mr. John Murray; Cardiff Infirmary, at a cost of 32,851*l.*, by Mr. E. M. Bruce Vaughan; Napsbury Asylum, Middlesex, 56,948*l.*, by Mr. Rowland Plumbe; additional offices for the Royal London Mutual Insurance Company, designed by Mr. John Belcher, R.A., to cost about 24,000*l.*; lunatic asylum, Mile End, for the county of Essex, for which Messrs. King & Son's tender at 189,691*l.* has been accepted, Messrs. F. Whitmore & W. H. Toun being the architects; and the raft foundation and retaining walls for the London County Hall, for which Messrs. F. & H. F. Higgs's tender at 46,900*l.* has been accepted.

### New Churches Commenced

include St. Ambrose, Bristol, designed by Messrs. W. V. & A. R. Gough; St. Michael and All Angels, Summertown, of which Mr. A. Mardon Mowbray is the architect; Methodist church at Dunstable, for which Messrs. Withers & Meredith are the architects; memorial church of St. Philip, Litherland, Liverpool, by Mr. J. Francis Doyle; St. Michael, Newquay, from designs by Mr. J. N. Comper; St. Martin's, Worcester, and St. Mark's, Woodcote, Purley, for both of which Mr. G. H. Fellowes Prynne is the architect; St. Saviour's, Westcliff, by Messrs. Hoare & Wheeler.

### Competitions

decided during the year have largely been limited in number of participants either by geographical or other basis of selection. Amongst those to be noted are that for the Bristol Royal Infirmary, Mr. Edwin T. Hall being the assessor, and the places of honour being awarded to Mr. H. Percy Adams, Messrs. Henman & Cooper, and Messrs. Worthington & Son; for the Cornwall County Council offices, in whch Mr. G. H. Fellowes Prynne placed Messrs. Silcock & Reay first, Messrs. Pearson & Milburn second, and Messrs. Warwick & Hall third; for Blackpool Library, in which Messrs. Cullen, Lochhead & Brown were placed first by the assessor, Mr. G. H. Willoughby, and there were bracketed equal for second place Messrs. Cooper & Slater, Mr. H. R. Gardner, Mr. C. H. Potter, Messrs. Russell & Cooper, Messrs. Thomson & Bristow; for additions to Whittingham Asylum, Lancashire, the premiated designs being by Messrs. Sykes & Evans, Mr. Percy D. Lodge, and Messrs. Appleyard & Quiggin; for branch offices at Leeds for the Pearl Life Assurance Company, for which Mr. Percy Monckton, the assessor, selected the design of Mr. William Bakewell; for Middlesbrough Library, in which Mr. J. S. Gibson, the assessor, placed the design of Messrs. Russell & Cooper first, that of Messrs. G. H. Wenyon & Chas. H. Potter second, and that of Messrs. Cooper & Slater third; for the National Library of Wales, in which Mr. Sydney K. Greenslade's design, estimated to cost 85,000*l.*, was selected by the assessor, Mr. Reginald Blomfield, A.R.A.; for the extension of the Victoria Buildings, Liverpool University, in which the assessor, Mr. Guy Dawber, placed first the design of Messrs. Briggs, Wolstenholme & Thornely; for Town Hall and Law Courts, Burslem, in which Mr. H. T. Hare, the assessor, awarded the first premium to Messrs. Russell & Cooper, the second to Mr. E. Montague Thomas, and the third to Messrs. Warwick & Hall; for extension of Town Hall, Stoke-on-Trent, in which Messrs. Garratt & Simister were placed first, Messrs. Warwick & Hall second, and Mr. William Heywood third by the assessor, Mr. Leonard Stokes; for Berkshire County Council offices, in which the premiums went to Messrs. Warwick & Hall, Mr. E. J. Shrewsbury, and Messrs. Wills & Anderson, Mr. Mervyn Macartney being the assessor; for extension of Grimsby Town Hall, in which Sir W. Alfred Gelder, the assessor, placed Messrs. Eade, Johns & Browne first, Messrs. Withers & Meredith second, and Messrs. Rigby, Oliver & Phipps third; for Girls' School, Harrogate, to cost 46,000*l.*, a limited competition, in which Mr. H. W. Chatters, the assessor, selected the design of Mr. W. Gilbee Scott; for Training College, Hull, in which the premiated designs were those of Messrs. Crouch, Butler & Savage first, Mr. W. H. Thorp second, Mr. G. H. B. Gould third, Mr. John W. Simpson being the assessor; for Isolation Hospital, Aberdare, in which Sir William Emerson and Dr. W. Williams,



CHATEAU ST. GERMAIN DE LIVET.—Drawn by A. N. Prentice, F.R.I.B.A

the assessors, placed Mr. **Edward C. H. Maidman** first, Messrs. **Stockdale, Harrison & Sons** and Mr. **Howard H. Thomson** second, and Mr. **E. Montague Thomas** third.

### Honours and Appointments

during the past year include the gift of the Royal Gold Medal to Dr. **Arthur John Evans**, the bestowal of a C.B. on Sir **Aston Webb**, R.A., the elevation of Mr. **John Belcher** to the full rank of Royal Academician, the appointment of Mr. **John Slater** as a member of the Tribunal of Appeal under the London Building Act.

### Obituary.

The past year has removed from among us Mr. J. H. **Richardson**, Mr. **James Neale**, Mr. J. L. **Murray**, Mr. R. H. **Boyce**, Mr. E. A. L. **Ould**, Mr. **Cole A. Adams**, Mr. W. W. **Bethell**, Mr. A. H. **Paget**, Mr. C. J. H. **Cooper**, Mr. T. M. **Reade**, Mr. J. M. **Taylor**, Mr. H. D. **Bryan**, Mr. N. S. **Joseph**, Mr. H. **Stock**, Mr. J. W. **Penfold**, Mr. J. A. **Campbell**, Mr. W. **Owen**, Mr. H. **Hall**, Mr. F. H. **Pownall**, Mr. F. H. **Williams**, Mr. T. **Worthington**, Mr. M. A. **Hennessy**, Mr. H. B. **Garling**, Mr. G. C. **Sherrin**, Mr. T. W. **Cutler**, Mr. A. B. **Rowe**.

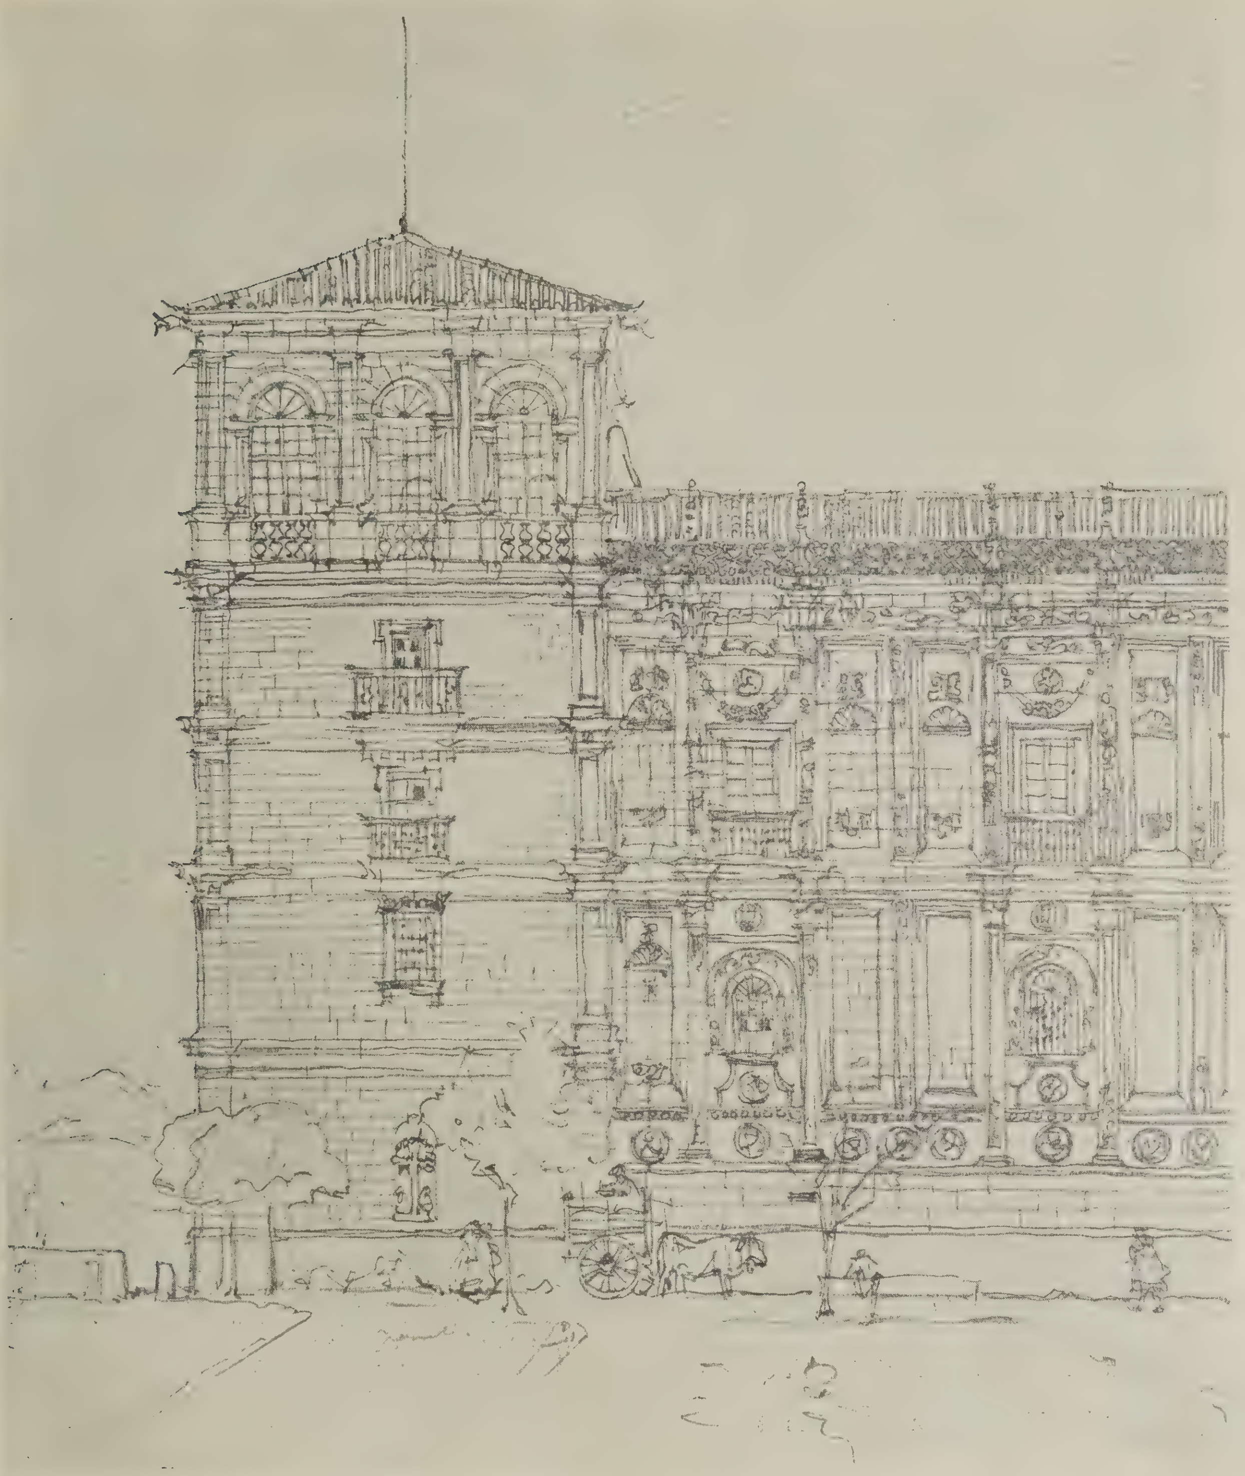
## NOTES AND COMMENTS.

Several members of the Royal Institute journeyed to Conduit Street on Monday last, some from long distances, to discuss the amended Regulations for Architectural Competitions which have been placed in the hands of members, but this part of the agenda was not reached, as practically the whole evening was occupied with the consideration of quite private and personal matters of little general interest. These concerned largely the doings of some members of the Practice Standing Committee, and at least showed what we have before urged, the necessity for a code of professional ethics or etiquette which should define what is and what is not proper professional conduct in an architect.

At present members of the Council and other architects of high standing do things that some ordinary members consider are derogatory to their professional standing, and, on the other hand, the men on the front bench deem practices adopted by some of the rank and file unworthy of professional men. In the present chaotic state of opinion each is inclined to "atone for sins he is inclined to by damning those he has no mind to."

The Practice Standing Committee would seem to be the proper body to draft such a code for the discussion and acceptance of members generally, and until they do so members of that Committee ought in their own practice to be especially careful to do nothing that can be considered by the most captious as in the least degree questionable or indiscreet. This Committee is at present, to some extent, the *censor morum* of the profession, and the conduct of its members should be, like that of **Cæsar**'s wife, above suspicion.

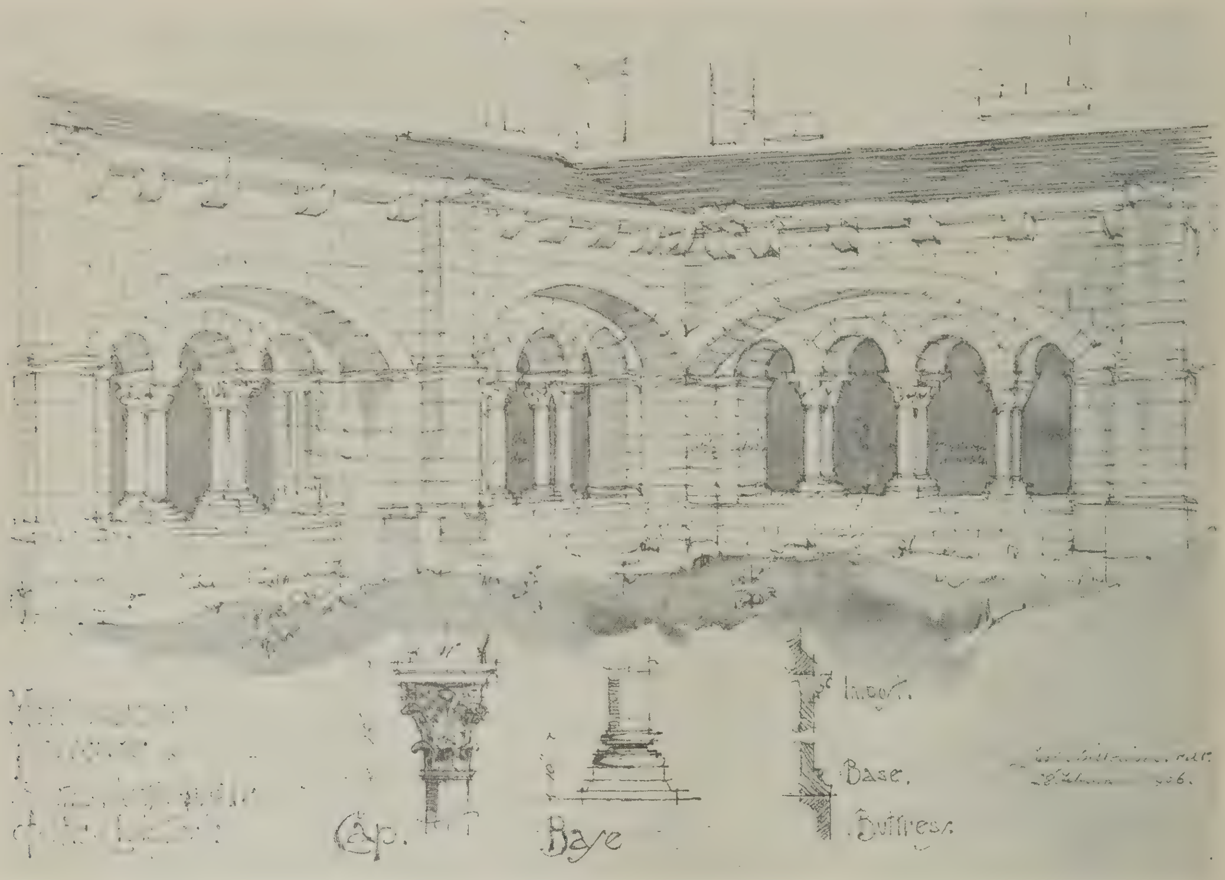
In our advertisement pages will be found the regulations and particulars of subjects for our Students' Sketching and Measuring Club, which we trust will receive warm



THE CONVENT OF SAN MARCOS, LEON.—Drawn by LESLIE WILKINSON, A.R.I.B.A.

support from a large number of the younger members of the architectural profession, for whose benefit it is intended. The measurement of old work is now scarcely so popular as it was in the days of Gothic enthusiasm, but it is still, in our opinion, an essential part of a young architect's training, for it is only by careful measurement that the niceties and refinements of design in architecture can be observed and appreciated. Sketching gives the student a knowledge of the effects produced, but measurement is necessary that he may learn how those effects are produced. This holds good of Renaissance designs as well as of Mediæval or Classic. The difference that we feel between the work of INIGO JONES and WREN, between that of GIBBS and HAWKESMOOR, is scarcely definable in words or in sketches; its nature must be examined by actual measurement.

THE Master of the Charterhouse, the Rev. GERALD S. DAVIES, M.A., in a letter to the *Times*, makes a suggestion with regard to the annual exhibitions of the Royal Academy, with which we cannot but agree. He proposes that the summer exhibition should be devoted entirely to paintings in oil, and that sculpture, water-colour, black-and-white and architecture should be allotted the winter exhibition. It is obvious to all that at present the Royal Academy apparently recognises but one art, that of painting in oil, and that all other forms of art are grudgingly given a corner on sufferance. There would, we fancy, be no unwillingness on the part of painters in oil to find more space available for their pictures in the summer exhibition, whilst the practitioners of the other art crafts, including architecture, would rejoice in a better opportunity of displaying their work if only at a winter exhibition. The



Drawn by Leslie Wilkinson, A.R.I.B.A.

success of the Grafton Gallery exhibition of old masters relieves the Royal Academy of its dutiful but unprofitable necessity for an exhibition on the old lines.

Signor Nathan, the Syndic of Rome, is hardly going the right way to pave the path of success for the great exhibition that is to be held in the Eternal City next year. Most Englishmen, in common with the citizens of other nations, like and admire Italy, and would do what they could to further the success of Rome's exhibition. But Signor Nathan, with the Council of which he is the head, is not content with opposing those of his own countrymen who value the remains of Italy's artistic and historic past, but flouts all art-lovers who have the impertinence to support the views of the cultured artists and archæologists of Italy, and tells them to mind their own business and stay at home. Hence the present newspaper campaign against the foreigner in Italy, but we need not get excited over the ebullitions of the present representatives of the S.P.Q.R.

The municipality of Paris takes a large view of the amenities of the city when it asks Parliamentary sanction for a loan of 36,000,000*l.* for improvements to the town planning, the removal of insanitary areas, the repaving of streets, the provision of new promenades and squares, the repair or rebuilding of public edifices. Included amongst the improvements is that of school buildings, the completion of the public markets, and the provision of sanatoria to aid in the fight against tuberculosis. We wish the City of Paris success in its enlightened enterprise.

Holme Lacy, near Hereford, is one of the treasure houses of English domestic art, and the sale of its contents on the last day of this month and three following days will afford a grand opportunity for the collector of seventeenth and eighteenth century furniture, of tapestry, of pictures, and of a magnificent series of carvings by Grinling Gibbons.

## LLANDAFF CATHEDRAL.*

By S. Bowen Williams, M.S.A.

The subject of Llandaff Cathedral is one that, if properly treated, is capable of inducing a great deal of pleasure and interest; for a cathedral is, as it were, a materialised epitome of the various changes and vicissitudes through which the people in the vicinity have passed during the ages that the cathedral has been in existence. We see in its early beginnings the budding of a religious feeling, then its development onwards to fruition; we see the story of the trials and tribulations which troublous times have brought upon the people in the picture of the desolation which has overtaken the fabric at certain times; and again later the revival of a religious fervour portrayed in the restoration of the beloved walls. This is more or less true of all mediæval cathedrals, but it is especially the case with Llandaff Cathedral.

To anyone with the least spark of imagination in his veins, or the least love for the history of his country and his Church, it is a source of the most profound pleasure to linger in the vicinity of such a building or to loiter through its aisles, conning and reading, in signs known and easily recognised by the professional eye, the ancient history of the building, and seeing here and there indications, more eloquent than words, of the great labour and love which have been expended in its erection. A roughly hewn capital here, a queer hieroglyphic there, a rediscovered fresco in one place, or a mutilated reredos elsewhere, all have a meaning to the trained eye, indications of the various changes which time has brought about. The time spent in deciphering old inscriptions or examining old monuments, delineating some moulding, &c., is not lost, but opens up a new vista of ancient lore, and at the same time creates a love for the underlying professional work which is of immense value to the architectural student.

But to proceed from the general to the particular. First of all we will give a skeleton history of the cathedral we have in mind, and then touch upon the various features of architectural interest which strike an inquiring visitor.

Llandaff is a Welsh word meaning "the church (llan) on the Taff." The see is one of the oldest in the kingdom, being second only to that of Sodor and Man. We have no authentic records of the foundation, and this is one very unfortunate circumstance connected with the church. Few records were ever kept, and most of these even have been destroyed. There is a tradition that King LUCIUS built a church at Llandaff about the year 170, but this rests on very shallow foundations. It is certain, however, that a Welsh bishop, either of Caerleon or Llandaff, was present at the Council of Arles in France in the year 314, and it is also believed that a Bishop of Llandaff was present at a Council held near Bristol in the year 603 by St. AUGUSTINE. The founders of this early church, so far as evidence and not tradition goes, were Saints DUBRICIUS (or DYFRIG) and TEILO, and their remains are said to be buried in the present cathedral. They were the real authentic pioneers of the church, and to them is due the credit of establishing the Christian faith on a firm basis in the district.

What kind of a church was that of Saints DUBRICIUS and TEILO we have no means of knowing, for there are absolutely no remains whatever. The history of the present cathedral dates from the twelfth century, and the church of Saints DUBRICIUS and TEILO was swept away to make room for the new one.

Bishop URBAN was appointed in 1107 by the Normans, and he at once began to erect a new church on the site of the old one. This cathedral of URBAN's was a small one, and during the succeeding generations underwent many alterations and additions.

During the Early English period it was extended westward as far as the present west front, and the gable portion of this front presents unchanged its appearance in the beginning and middle of the twelfth century. A tower was raised on both sides of this front, that on the north side being slightly the higher of the two.

A short time afterwards the chapter-house was added, in the Early English style, and somewhere between the years 1270 and 1290 the Lady chapel was built by Bishop DE BRAOSE, who lies buried there. The Lady chapel exhibits traces of the transition to Decorated work. The large and notable Norman archway between the presbytery and the Lady chapel is a retained portion of URBAN's church.

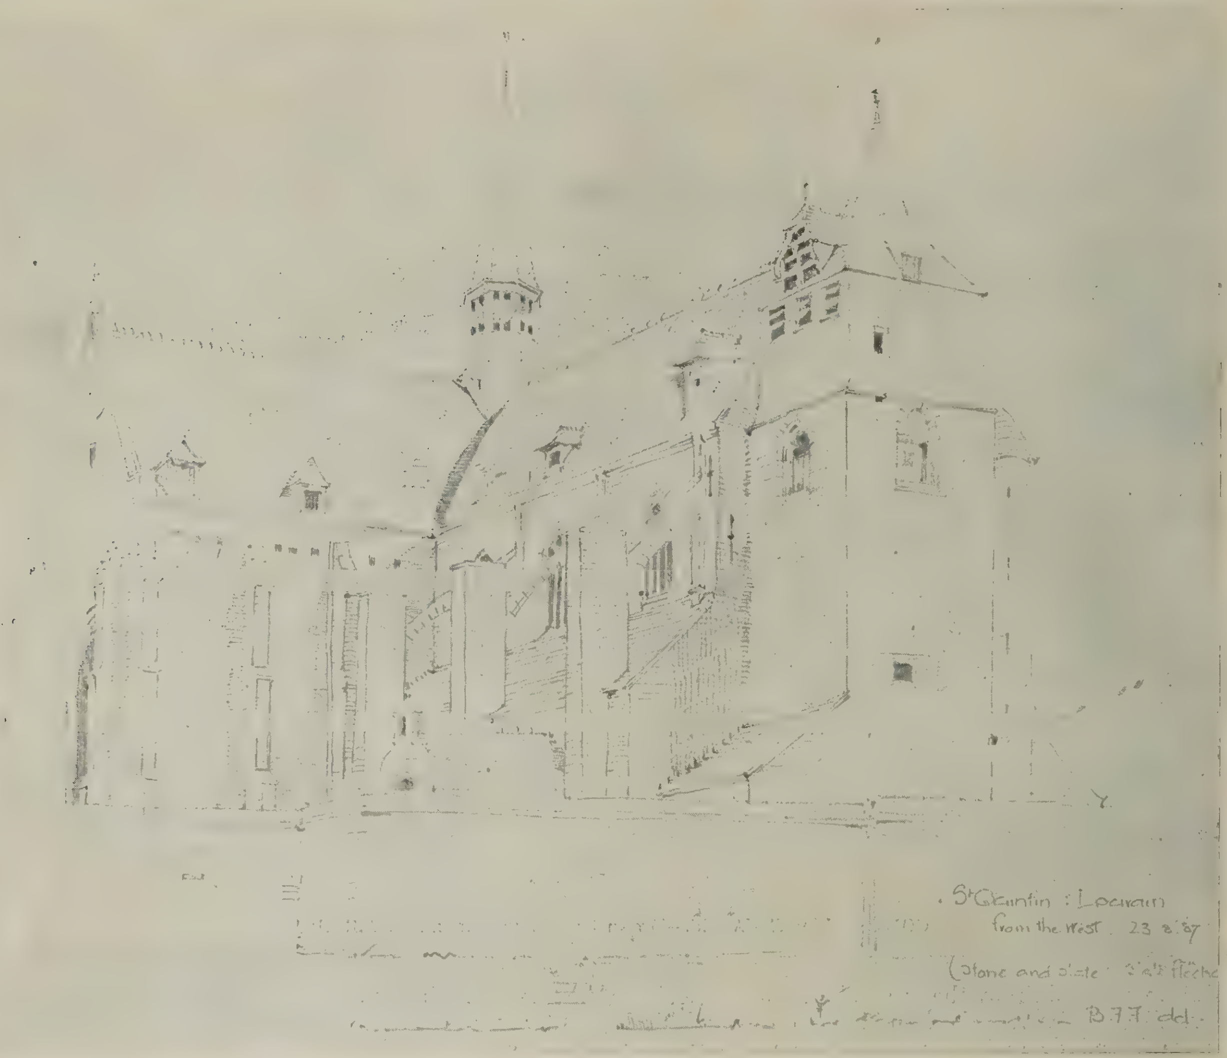
Later on it became necessary to rebuild the walls of the presbytery, and at the same time the aisle walls of nave and choir were pulled down and rebuilt. In the latter case two Norman portals were retained, though it is probable their position has been altered.

Some time afterwards the tower on the north-west angle was rebuilt in the Perpendicular style by JASPER TUDOR, uncle of King HENRY VII.

This was the last structural alteration the cathedral underwent, and so after two or three hundred years the cathedral was a completed one, having passed through the same changes which most of the Norman churches suffered.

It may be as well to pause here a moment and try and fix in our mind's eye the appearance it presented. It was small in size, with a long, unbroken length of roof over nave and choir. This, with the lack of transepts, must have given it the appearance of a large parochial church rather than a cathedral. There was no spire at the west end, but two towers, the tower which the present spire has replaced being lower and plainer than that on the north side. The chapter-house roof was of low pitch, and generally the whole could not have been particularly attractive. Inside it was doubtless more pleasing, the long, unbroken roof and main arcade giving it a certain dignity and grace.

This then was the state of the cathedral for some 150 years; but about the middle of the sixteenth century, during the time of the Reformation, it began to suffer



St Quentin : Lorrain

sadly from neglect and decay, even more so than any other cathedral in the country.

There had never been a resident bishop and no episcopal residence. The various bishops had alienated the land of the see, and it was in a very poverty-stricken state. In 1575 the cathedral was in absolute ruin, and the number of persons on the chapter was reduced in order to obtain funds. The remains of various residences attached to the cathedral were used as pig-sties and stables, and the church was described by a contemporary writer as "dug in pits and more like a desolate and profane place than a house of prayer." Later on, during the civil war between Charles I. and the Parliament, the cathedral suffered still more, and there is a tradition that Oliver Cromwell stabled the horses of his troops within the walls of this desolated and desecrated church. Be that as it may, the revenues of the see were confiscated in 1649, the year of King Charles's execution, and the library was dispersed and destroyed. The Royalists of the county were summoned to Cardiff Castle on a cold winter's day and were shown a fire at which to thaw themselves. To their intense indignation they found that the fire was fed with the prayer-books and part of the library of the cathedral.

## ILLUSTRATIONS.

### LIVING ARCHITECTS.—NO. 28, MR. EDWIN L. LUTYENS, F.R.I.B.A.

MR. LUTYENS has made his mark in English architecture chiefly by his domestic work, which is ever characterised by originality and infinite variety. No one can speak of a "Lutyens style," for he is continually trying new ideas in plan, in composition and in texture, and usually with success. Although he has but recently joined the R.I.B.A., his reputation speedily led to his election on the Council.

### NO. 29. SIR ALFRED BRUMWELL THOMAS, F.R.I.B.A.

SIR BRUMWELL THOMAS is one of the younger generation of our prominent architects, and has attained his position by success in open competitions, principally in designs for municipal buildings. His most notable works have been those at Belfast, Stockport, and Woolwich.

### HEATHCOTE, ILKLEY.—THE ENTRANCE—THE HALL.

THIS is one of Mr. Lutyens's latest works and a good example of the originality of treatment with which he uses the vernacular language of architecture.

### CATHEDRAL SERIES, LLANDAFF.—EAST END OF LADY CHAPEL.

WITH this view from the eastward we resume our series of the Cathedrals of England and Wales, and shall continue with several other illustrations. An account of the cathedral will be found on page 10.

### GNS FOR CHURCH FITTINGS.

THIS drawing was exhibited in the Royal Academy, 1909, and is interesting as an example of modern English church architecture. The architects are Messrs. J. Gibbons & Son.

### MOSQUE OF OSMAN III., CONSTANTINOPLE.
### MOSQUE OF SULEIMAN I., CONSTANTINOPLE.—VIEW FROM SOUTH-WEST.

THESE drawings by Mr. Jas. B. Fulton, A.R.I.B.A., illustrate good examples of the characteristic architecture of Constantinople under Mohammedan rule.

## BEAUTY IN ARCHITECTURE,

By B. R. GRIBBON.

BEFORE we can proceed to define what is meant by "beauty" in architecture, we must decide as to what we wish to convey when we speak of "beauty" in any connection; that is, what constitutes beauty. It is perhaps the most difficult of all abstract principles to define, for we are so readily sensible of its presence, from the effect it produces on the emotions, that it rarely occurs to us to attempt an analysis of the qualities which combine to produce the result as a whole.

Beauty then, in the abstract, appears to be that combination of qualities which attracts and sustains the interest, and which by approximating, however remotely, to perfection of expression, incites the imagination to conceive a closer approach to the ideal. It thus acts as a living principle animating a quiescent medium, rendering it capable of expressing all its essential qualities; and the more perfectly it effects this result, the more powerfully it affects the emotions, and, by the very directness of its appeal, affords the highest form of mental pleasure. It may be said that beauty is the language of truth; but while all perfect beauty *is* the expression of truth, it does not follow that all truths must be beautiful when translated into sensible form. There are a vast number of truths, material, scientific, spiritual, which are inherently repellent, and the most faithful and perfect expression of their meaning could only succeed in increasing the instinctive aversion they produce, exactly the reverse of the effect of beauty. Beauty is therefore the perfect expression of an attractive truth.

Now, accepting this general definition of beauty, what is the fundamental truth of architecture? What is the reason for its being? It is essentially a means to an end; it is the provision in artistic form of the fulfilment of material requirements, and it is the adaptation of these requirements in the manner best calculated to express them pleasingly in the form of the completed building which constitutes that distinction which marks the difference between mere building and architecture. It would be difficult to improve upon Inigo Jones's definition of the ideal in this art, that it must be "solid, proportional according to rules, masculine and unaffected." Exception might be taken to the proportion being necessarily "according to rules," but if for these rules we take the recorded experience and the results of experiments of bygone masters of the art, not the mere text-book figures of any one architect, there is surely little to urge against it.

So we have as the essentials by which the truth—the purpose and meaning of each building—is to be expressed: solidity, proportion, vitality and strength, the most masculine characteristics, and freedom from all affectation, and each of these implies rather a group of qualities than one complete in itself.

First take solidity. This implies that the building must be solid in appearance as well as in fact. It must possess repose and breadth, giving it an appearance of assured purpose, and every detail must be carefully subordinated to the whole. It must convey the impression that the designer has thoroughly grasped the requirements he had to fulfil; and having done so, has grouped them together as a single whole to be incorporated in one complete design, an impression which can only be communicated by perfect unity in the design, and unity is essentially solidity. Stability must appear to be assured, and every opening must be supported by a surrounding mass of solids sufficient to prevent the impression that it weakens the structure. The lines of the design must suggest that it is firmly placed upon the ground, and this effect is greatly helped if the main lines gradually converge inwards as they rise, and it is also assisted by massing the heaviest, plainest, and strongest materials at the base. Note in the Parthenon how the fluted columns lead the eye upward from the plain stylobate to the comparative richness of the carved metopes and the long lines of exquisite mouldings which relieve the massive entablature. Notice how these mouldings emphasise and give prominence to the sculptures of the pediments, passing above and below them, and, with their delicately shaded outlines, insisting on the contrast between these sculptures and the bold lines of the triglyphs below.

## MODERN COLD STORAGE AND REFRIGERATION.

By W. S. Douglas, B.Sc.

I.

THE real development of the science of refrigeration is practically all concentrated within the last thirty years. Even in the late 'seventies its application on a practical scale was still regarded as merely the day-dream of a few irresponsible geniuses, and it was not until the introduction of the Bell-Coleman machine in 1879 that refrigeration was taken seriously by the commercial world at large. But the enterprise of the promoters of this system, in fitting their machine to the s.s. *Circassia*, of the Anchor Line, and carrying successfully the first cargo of dead meat from America, at once opened the eyes of the public. The s.s. *Strathleven* followed from Australia in 1880, and from that time forward the success of refrigeration was assured.

Previous to 'seventy-nine, beginning with Perkins in 1834, there had been many attempts to introduce a commercial form of the refrigerating machine, but, although some of these machines appear to have done fairly good work, their owners evidently lacked the courage of their convictions, or, what is more likely, the capital and influence necessary to place their inventions on the market. Notable among them were the machines of Windhausen (Austrian), one of which produced 30 cwt. of ice per hour at the Vienna Exhibition in 1870, and those of two celebrated Frenchmen, MM. Carré and Pictet, the first of these being on the absorption principle, and the second, sulphurous anhydride compression.

But although, previous to the success of the Bell-Coleman machine, the attitude of the practical world towards refrigerating engineers had been distinctly sceptical, from the date on which the *Circassia* discharged her cargo onwards progress has been rapid, and the day-dream of the 'seventies is now the basis of a prosperous and fast developing industry. Not only is the present market steadily expanding, but new applications, as the result of scientific research and experiment, are continually being discovered, and the sphere of usefulness of refrigeration is, at the present time, very wide indeed. All public cold stores and ice factories naturally depend for their existence on the freezing machine, but it is also an indispensable adjunct in breweries, public abattoirs, bacon factories, large dairies and creameries, and is very extensively used by butchers, provision merchants, fishmongers, and poultry dealers. Up-to-date hotels and country mansions are incomplete without either mechanical or ice refrigeration, and other important applications are

Drawn by Banister F. Fletcher, F.R.I.B.A

to be found in the cooling of theatres and public buildings; the storage of furs, rubber, hops, butter, fruit, and all sorts of perishable goods; the quick cooling of lard, and refining of whale oil; the chilling of chocolate, and the manufacture of optical lenses, essences, scents, margarine, sulphuric acid, &c. Even the corpses in the Morgue at Paris are now artificially refrigerated.

This list, though incomplete, is sufficient to show for what a number of different purposes refrigeration is used, and as most installations of any size involve either a totally new building, or structural alterations to one already in existence, the importance of the subject to the architect is manifest. He is frequently called upon not only to design buildings or extensions for cold storage and other purposes involving the use of refrigeration, but, in many cases, to specify the whole of the plant, including the refrigerating machine, motive power (gas, oil, steam, electric, or water, as the case may be), methods of cooling and form of insulation. A knowledge of refrigeration is therefore essential, in order that he may be able to arrange the plant and buildings to the best advantage, and, with this end in view, it is proposed in the present series of articles to deal with all branches of the subject which interest the architect, and show, as far as possible, the methods of design principally in vogue at the present day.

The principle of the refrigerating machine itself will be detailed at a later stage. At present, it will be sufficient to say that most modern machines work by the alternate condensing and vaporisation of a volatile vapour, such as ammonia, within a closed circuit. The evaporation of this vapour takes place usually in a system of piping from 50 feet to a few miles in length, which may be arranged in the form of flat or circular coils, or in single grids, the exact form varying with the purpose to which the plant is applied. In accordance with a well-known physical principle which may be exhibited by allowing some ether to evaporate in the palm of the hand, the act of vaporisation is accompanied by a large absorption of heat into the gas. This heat must be extracted from the metal of the coil itself and from its surroundings, with the result that anything in its neighbourhood, whether air or unfreezable brine, becomes intensely cold. The coil thus acts much in the same way as a block of ice, the difference being that the coils extract heat from everywhere near to change the substance within them from a liquid to a vapour, while the change in the case of ice is from the solid form to the liquid. The effect in both cases is the same, consisting in a considerable reduction in the temperature of surrounding objects, which, by the use of the evaporating coils, may, if necessary, be brought down to zero Fahrenheit or even lower. With ice alone they can never be reduced below the freezing point of water.

The arrangements of two small cold chambers, one cooled by ice and the other by "direct expansion" from a refrigerating machine to a temperature of about 38° Fahr., are contrasted in figures 1 and 2. Cooling by ice, it will be noticed, wastes a certain amount of space, which necessitates, for a given net capacity within the chamber, an increase in the radiating surface and the cost of insulation.

It is obvious that if either of these two chambers were constructed in the same way as an ordinary room, the difference in temperature between the inside of the walls and the outside would cause considerable leakage of heat, resulting in waste of ice in the one case, and loss of refrigerating effect in the other. To avoid this there are superimposed on the ordinary walls, floors, and ceilings, inner layers constructed of various non-conducting materials. Usually one kind of insulator only is used, but in some cases there are several thicknesses, each composed of a different material, with, very often, air spaces in between. The exact method employed depends on the purpose for which the cold store is to be used, and the opinions of the designer, but in all cases the end in view is to reduce both heat leakage and cost of construction to a minimum.

In making a selection several points are to be considered. The material (or materials if more than one are used) should, as far as possible, combine efficiency with economy. It should also be fireproof, or at the least not easily combustible. Vermin should fight shy of it, it should have no tendency to absorb moisture, and it should not be liable to decompose or crumble to dust. No material complies exactly with all these conditions, but there are several which have been proved to fulfil the majority of them, and it will be as well, before proceeding to the actual design of cold stores, to become acquainted with the nature and properties of each individually.

### *Insulating Materials.*

*Silicate Cotton.*—Slag wool, or silicate cotton, is made by melting blast furnace slag at a temperature of about 3,000° Fahr., and driving through it a jet of superheated steam (in some cases compressed air). This treatment distends the slag to about twelve times its volume, and transforms it into a white fibrous substance, similar in some respects to spun glass. Its fibres, crossing and interlacing, entangle among themselves a vast number of tiny air cells, which, being individually non-conductors, give the material a high resistance to the passage of heat. The best wool is made from slag which is rich in silica and alumina, and poor in free lime. A certain amount of lime is beneficial and whitens the wool, but an excess causes it to become dusty and crumble after it is packed. Very white wool should therefore be looked upon with suspicion. The small globules of glass, which will be found suspended in the wool, also afford a good criterion of its efficiency. They are formed by the combination of the silica and lime in the slag, and although they must always be present in small quantities, the wool should be, as far as possible, free from them, as they reduce its insulating efficiency, and at the same time, by increasing the weight, lessen the covering power.

There is a very large demand for slag wool, as it is not only cheap, but efficient. It is also the only insulating material known which is absolutely fireproof. By reason of this property it has on many occasions been of the greatest service to the owners of cold stores, and some years ago a notable instance was furnished by a fire which took place at an Irish butter factory. The buildings were completely gutted, but the slag wool in the walls of the cold stores, which remained standing intact, although blackened by the heat, preserved the goods inside so well that the butter, it is rumoured, was sold in London at 55*s.* per cwt.

The one disadvantage it possesses is a slight tendency to absorb moisture by capillary attraction. The effect of this absorption, if it were allowed to proceed to the saturation point, would be very harmful, as it would reduce the insulating efficiency of the material by about 40 per cent., and probably

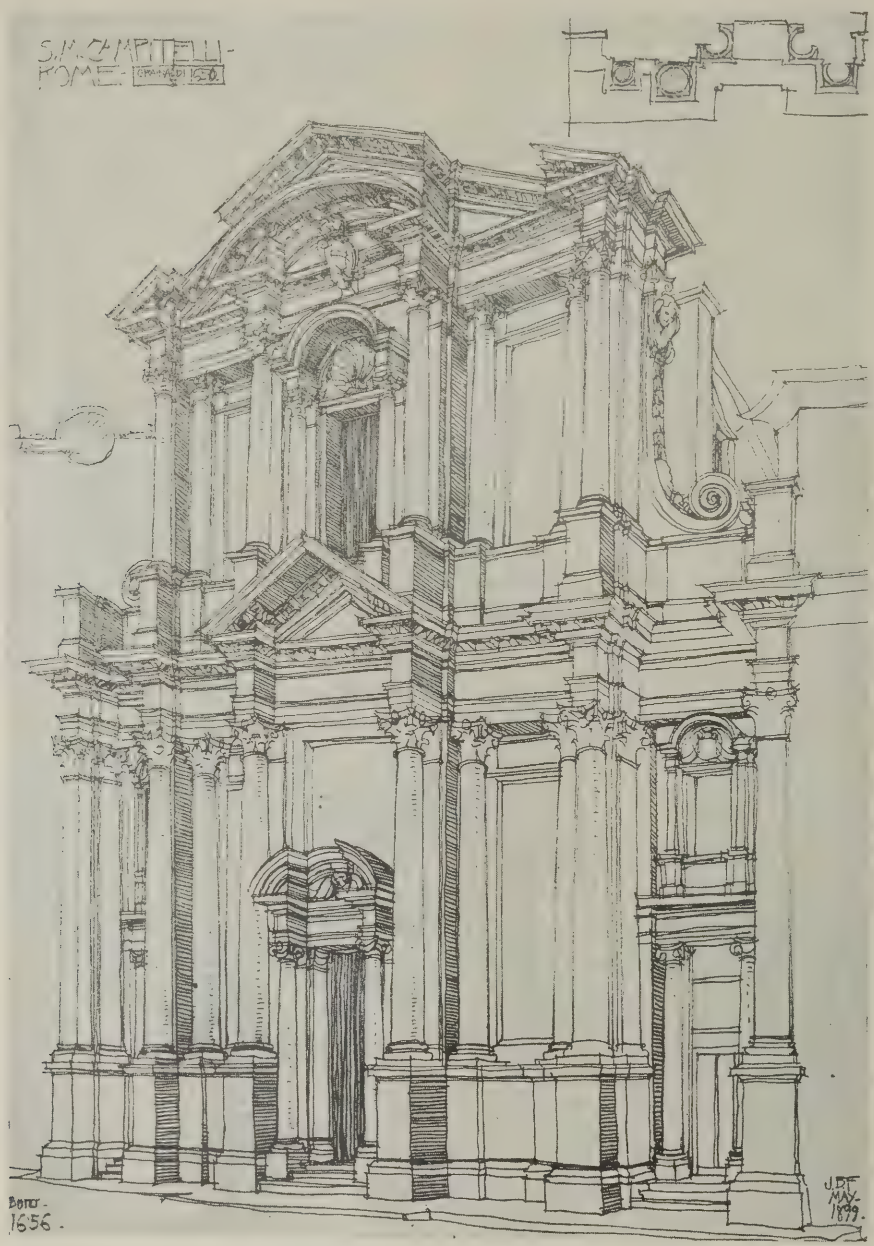
do serious injury to the timber by setting up decomposition. But by taking reasonable precautions and, in extreme cases, employing a lining of galvanised sheets, the possibility of dampness penetrating as far as the silicate can be effectually avoided.

In addition to the ordinary loose silicate, strips about 4 inches by 1 inch and ropes from 1 inch by 2 inches diameter may be obtained for the purpose of lagging brine pipes. It is also supplied in slabs, which may be backed with hair-felt or metal lathing, or bound on both sides with galvanised wire-netting. Its weight, when packed in the ordinary way, is 14 lb. per cubic foot, giving a covering capacity at 6 inches thickness of 320 feet super per ton, and the cost about 3*l.* per ton on rail.

*Cork.*—Cork is well known in various forms as the bark of a tree belonging to the oak family (*Quercus robur*), which flourishes in Spain and Portugal. It is claimed by those who manufacture it that it must naturally be the best of all insulators, because the tree which produces it grows in a country where it is very hot and where burning winds prevail. It follows, they say, that if the tree were not well insulated the sap would be dried up and absorbed and the tree would not live. Whatever modicum of truth may be in this, cork admittedly forms a very good insulating material owing to the myriads of tiny air-cells which are imprisoned throughout its structure, and which, as in the case of silicate, act individually as non-conductors. Although not absolutely fireproof, it is not easily combustible, and merely smoulders when exposed to great heat. It is also non-absorbent, and in this respect is superior to silicate. There is no capillary attraction caused by its honey-combed mass, hence if water leaks to the bottom of a cork wall it does not rise, and this makes it for some purposes very useful indeed.

For insulating purposes cork may be obtained either granulated or compressed into slabs. The granulated form is made from the waste cuttings produced in the manufacture of bottle corks, lifebelts, &c., which are ground up in an ordinary mill to separate the fibre from the bark and sifted to get rid of the dust. The larger grains are then packed and sold as granulated cork. Compressed cork slabs are formed from these grains by pressing them into iron moulds of the required thickness and baking at about 500° Fahr. At this temperature the cork gum liquefies and forms a natural binding, which keeps the blocks together when they are extracted from the moulds. The process is so regulated as to leave small spaces, which break the continuity of the material, and, assisted by the microscopic air-cells within the grains themselves, preserve its non-conducting properties. The same air spaces, of course, are formed by insulating with granulated cork in the ordinary way, but the grains, not being cemented together, are liable to settle, if subject to vibration, and cause a serious loss in insulating efficiency. The advantage of the slabs is that they



Drawn by Jas. B. Fulton, A.R.I.B.A

are easy to handle and effect a certain saving in labour, as they simply require to be nailed in position. To facilitate this they are sometimes inset with wood. On the other hand, their density is about twice that of the loose granules, and this, combined with the extra cost of manufacture, makes the slabs rather expensive.

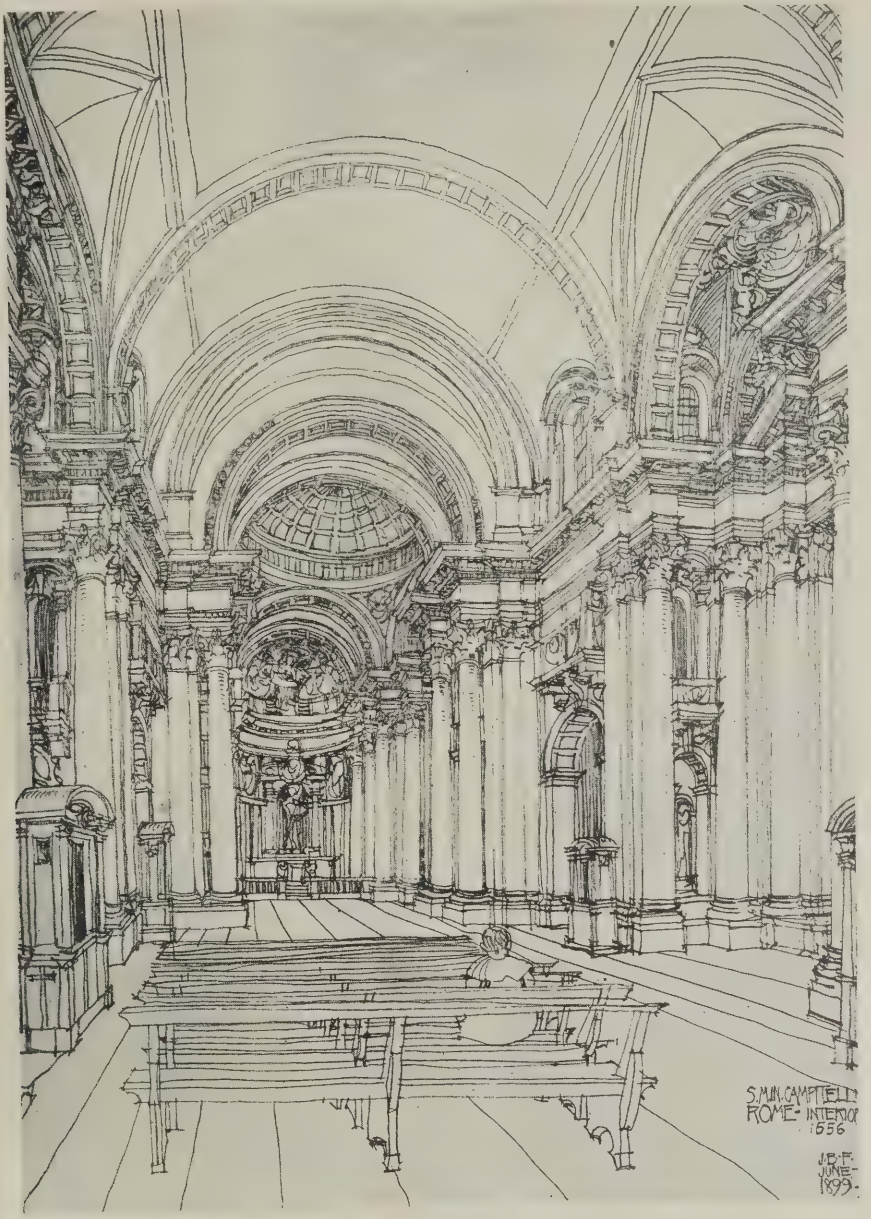
Granulated cork packs at 5 or 6 lb. to the cubic foot, and the slabs at 12 lb., giving a covering capacity in feet super per ton of 746 in the first case and 373 in the second, at a thickness of 6 inches. The cost of granulated cork is approximately 7*l.* 5*s.* per ton, and of cork slabs 3 inches thick 11¼*d.* per foot super, 1*s.* if inset with wood.

*Charcoal.*—Charcoal is more or less impure carbon. It is produced from bones, animals, and most vegetables, but the only kind which is useful for insulating purposes is that made from wood. The process of manufacture consists of burning the wood in closed retorts, oxygen being excluded and the temperature carefully regulated. Burnt in air, of course wood reduces to a white ash, but when taken from the retort about 65 per cent. is found to remain as carbon mixed with a certain amount of oxygen and hydrogen. The percentage of carbon depends on the temperature in the retorts. It is larger when the carbonisation is carried out at a great heat (*i.e.*, the charcoal is purer), but the quantity of charcoal obtained from a given quantity of wood is less.

To make good insulating charcoal only the lighter woods must be employed. One of the best of these is willow, and, in the form of turnings from the thread mills of Paisley, it is extensively used at the principal factory in this kingdom. It gives a light porous charcoal, which by reason of the air-cells entangled offers a high resistance to the passage of heat. That made from the heavier woods, such as box, is, on the contrary, more compressed and conducts both heat and electricity. It is therefore useless as far as insulation work is concerned.

The finished product may be obtained either in the flake form or as compressed slabs, somewhat similar to those made from granulated cork. The latter have been developed quite recently, and will probably be more expensive per foot super than the ordinary variety, as an extra process of manufacture is added, but, although no exact figures are available, comparative tests prove that they are superior in insulating efficiency. Their convenience has already been explained when dealing with compressed cork.

As an insulator charcoal has several advantages. Most chemical agencies have no effect on it, and it does not therefore tend to decay. It is also, owing to its powerful propensity for absorbing gases, very useful as a deodoriser. Further, when properly packed it is not liable to settle, but, if it should happen to do so, settles uniformly, leaving an open space at the top which can be easily refilled. This is important, as, when a material settles unevenly, blank patches are formed, which are difficult to locate and repair. Its one



Drawn by **Jas. B. Fulton, A.R.I.B.A**

drawback is that, being readily combustible in air, it is dangerous in the event of fire. There was even at one time a theory that it produced combustion in itself by spontaneous action, but this has been fairly well disproved and may safely be regarded as untenable.

Packed in the ordinary way charcoal weighs 12 lb. per cubic foot, and a ton at 6 inches thickness covers 373 square feet. The cost, which varies greatly, may be taken at 45*s.* to 70*s.* per ton.

Besides being employed for insulation, charcoal is also useful to the refrigerating engineer as a purifying and deodorising filter for distilled water in ice factories. A variety very suitable for this purpose is that made from sugar maple wood. *(To be continued.)*

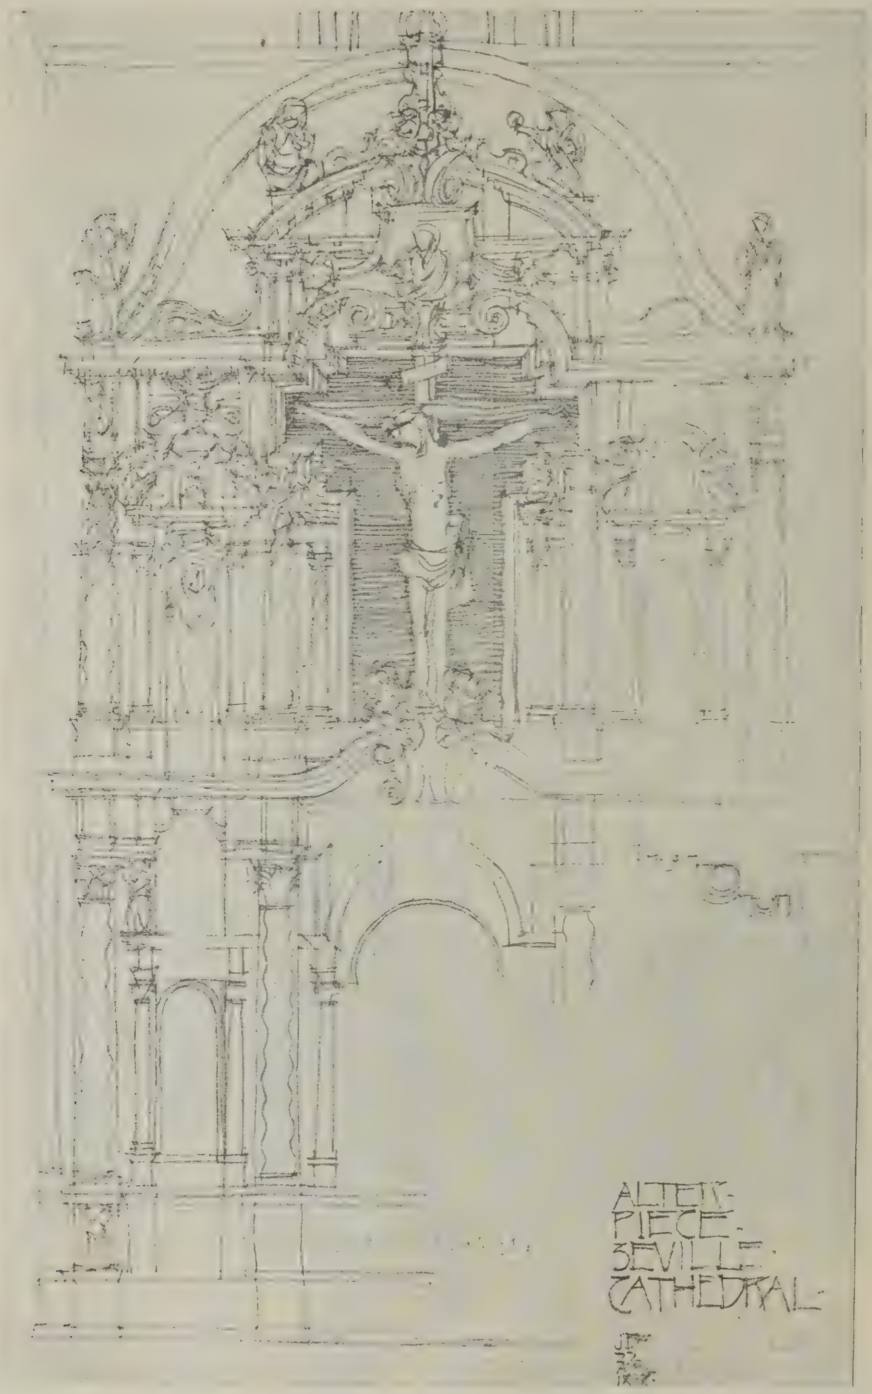
## RENAISSANCE ARCHITECTURE OF THE SEVENTEENTH AND EIGHTEENTH CENTURIES IN ITALY AND SPAIN.

### ROME AND SEVILLE—A COMPARISON.

By J. B. Fulton, A.R.I.B.A.

THE glory of the Renaissance in Rome was full of the spirit of beauty, the proportion and refinement in detail of the Greeks, and the masterly conceptions and grandeur of the Romans. Rome was the centre of the highest civilisation in the world, and here the culture of the Renaissance discovered and studied the lost arts, the beauty of which inspired the genius of Bramante, Baldassare Peruzzi, Antonio da Sangallo, Michel Angelo, and many others. The personality of Michel Angelo so dazzled Rome by the splendour of his works that it is generally accepted by architects as the beginning of the decadent tendency in the Renaissance. Michel Angelo's influence is considered by many to be disastrous, but later historians will be able to write more clearly and be able to consider and compare more correctly.

Mr. W. J. Anderson, in his excellent book on the Renaissance in Italy, states:—"The loss of conformity to constructive principle was the decisive cause of the decay of Renaissance architecture, and if the responsibility can be attached to one man, that man was Michel Angelo, the greatest genius of all." And again he writes:—"The qualities in Michel Angelo's work which appear to have led architecture into the dark and devious ways of the Baroco corruption were: first and chiefly, its insincerity, in which may be included not only an absence of truthful construction or logical articulation, but the tendency to employ architectural features as mere scenery, and to introduce false or unnecessary windows, niches, panels, consoles, and balustrades,



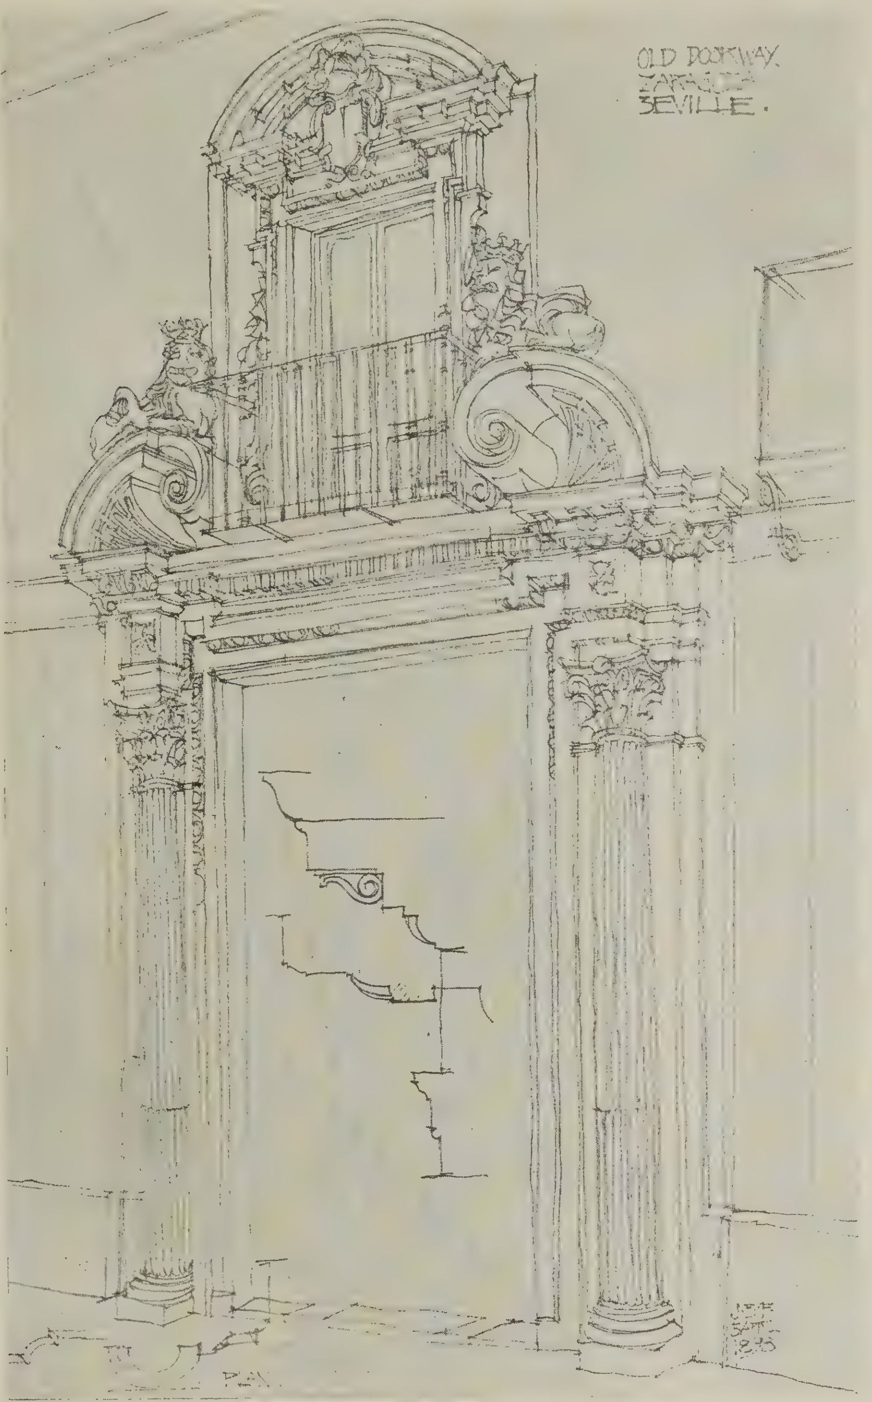
Drawn by Jas. B. Fulton, A.R.I.B.A.

arising out of an unwholesome dread of unbroken wall surface; second, a quality which from its nature had less disastrous consequences, that of exaggerated scale." As a student in architecture I have learned that the above statements are wrong, and to learn this we have only to look at such noble examples as the Parthenon, the Banqueting House, Whitehall, &c. Michel Angelo had studied the ancient Roman buildings and had mastered the principles of construction and design. This knowledge, combined with that of sculpture and painting, gave birth to many wonderful examples in architecture which have inspired architects through centuries to the present day with imaginative suggestions in design. The object of this short paper is to trace this influence in later centuries in Rome and Seville.

The originators (some have stated) of the degenerated Renaissance known as Baroque were said to be Vignola, Carlo Maderno, Borromini, Carlo Fontana, &c. They are said to have robbed architecture of its fitting repose, and by the introduction of figures posed in startling attitudes, startled and convulsed by unseen agency, of curves instead of straight lines, of order above order, substituted a turbulent unrest. Not that the style was without striking, imaginative, and artistic effect.

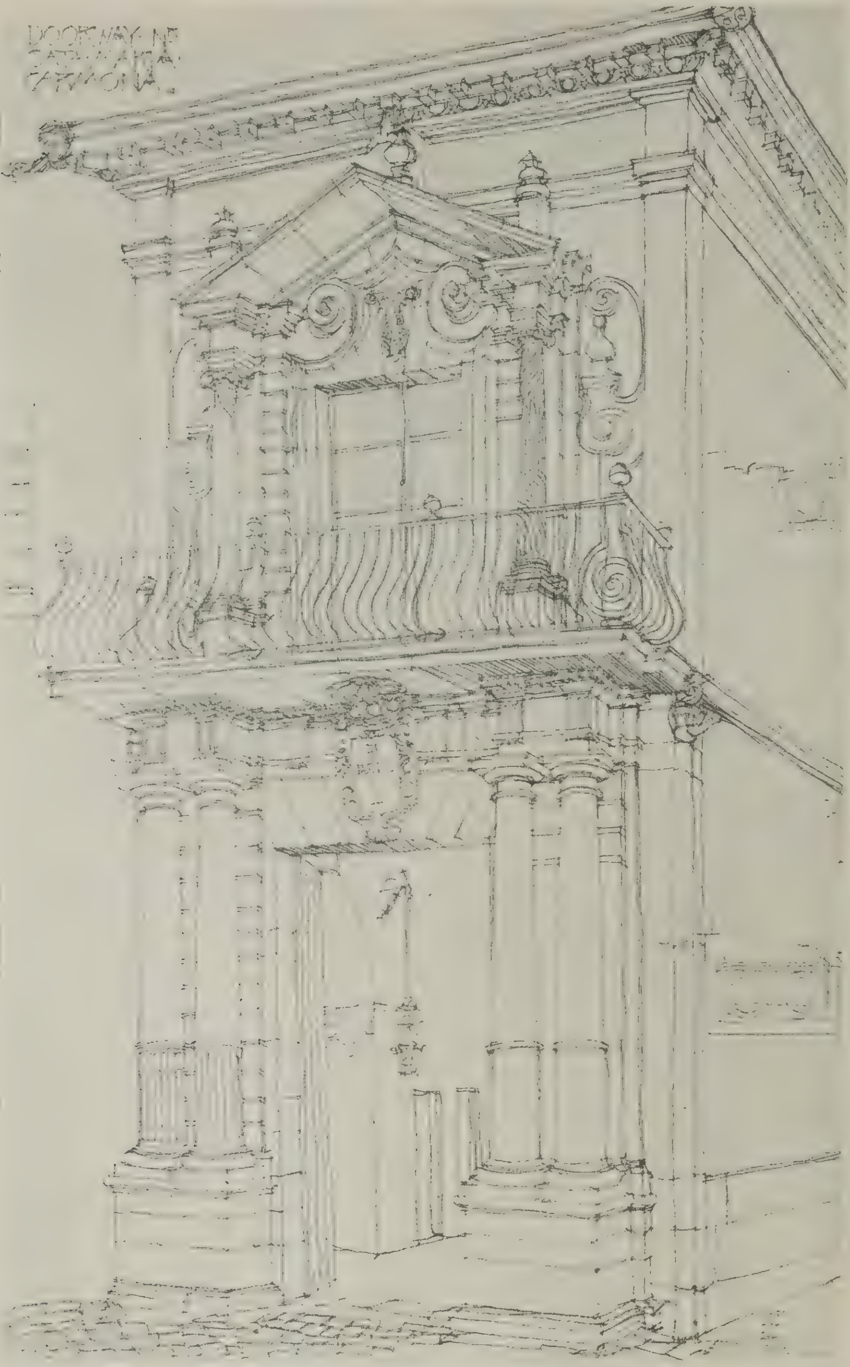
An undoubted vigour in the disposition of detail, a feeling for vastness and pomp, together with an internal decoration which spared neither colour nor costly material to attain an effect of dazzling splendour, such are the distinguishing features of the later Renaissance. In Rome and Seville examples are seen on every hand—in the churches of St. Ignazio, Gesu, St. Andrea della Valle, the Bernini Palace, &c., in Rome; and in Seville, the Cathedral, Archbishop's Palace, &c.

The first example I choose is the church of St. Maria Maggiore at Rome, designed by Fuga in 1743. The view on p. 16 shows the east portico, which opens in five



Drawn by Jas. B. Fulton, A.R.I.B.A.

portals with a loggia over in three arches. The façade as a whole is masterly, with the portico in the centre, suggesting the approach to a great building, spacious, magnificent, and picturesque in treatment. The openings forming the portals are all square, the entablature of the Ionic order being carried through, with the central and side openings specially emphasised with pediments suggesting the Trinity; and not only do the pediments protect sculpture but they also support sculpture, the central opening being more elaborate. A loggia being required over to protect some ancient mosaics, three arches were formed in a Corinthian order, the central arch being carried higher under a pediment, in contrast to the semi-circular pediment immediately below, over the square portal. The end piers are crowned with statues on the lower order; an enriched cavetto buttress carries the composition back on the upper order to the second pier on either side. The junction with the main building at this point is worthy of note, as on plan the wall forms a large cavetto. One of the most interesting and important points to note is that every feature is perfect in itself, and yet the composition as a whole is consistent and logical, and clearly shows the result of a cultured mind carrying forward the traditions of the Renaissance in a most interesting manner. My next example is the church and square of St. Maria della Pace (p. 17). A short street leads on an axial line to the circular portico forming the principal entrance to the church. The square is quite small, and one is only a few yards from the building when the originality and beauty of conception awakens the imaginative spirit of architecture. The perspective is slightly exaggerated to show more clearly this marvellous example. A Doric order forms the lower storey; the entablature is unbroken except on plan; a semi-circular porch suggests the principal entrance, and is a pleasing contrast to the reversed curves of the upper storey forming an architectural background, and to the angle pediment crowning the central feature. The upper storey is the Composite order, treated in plan in a most original manner, and yet

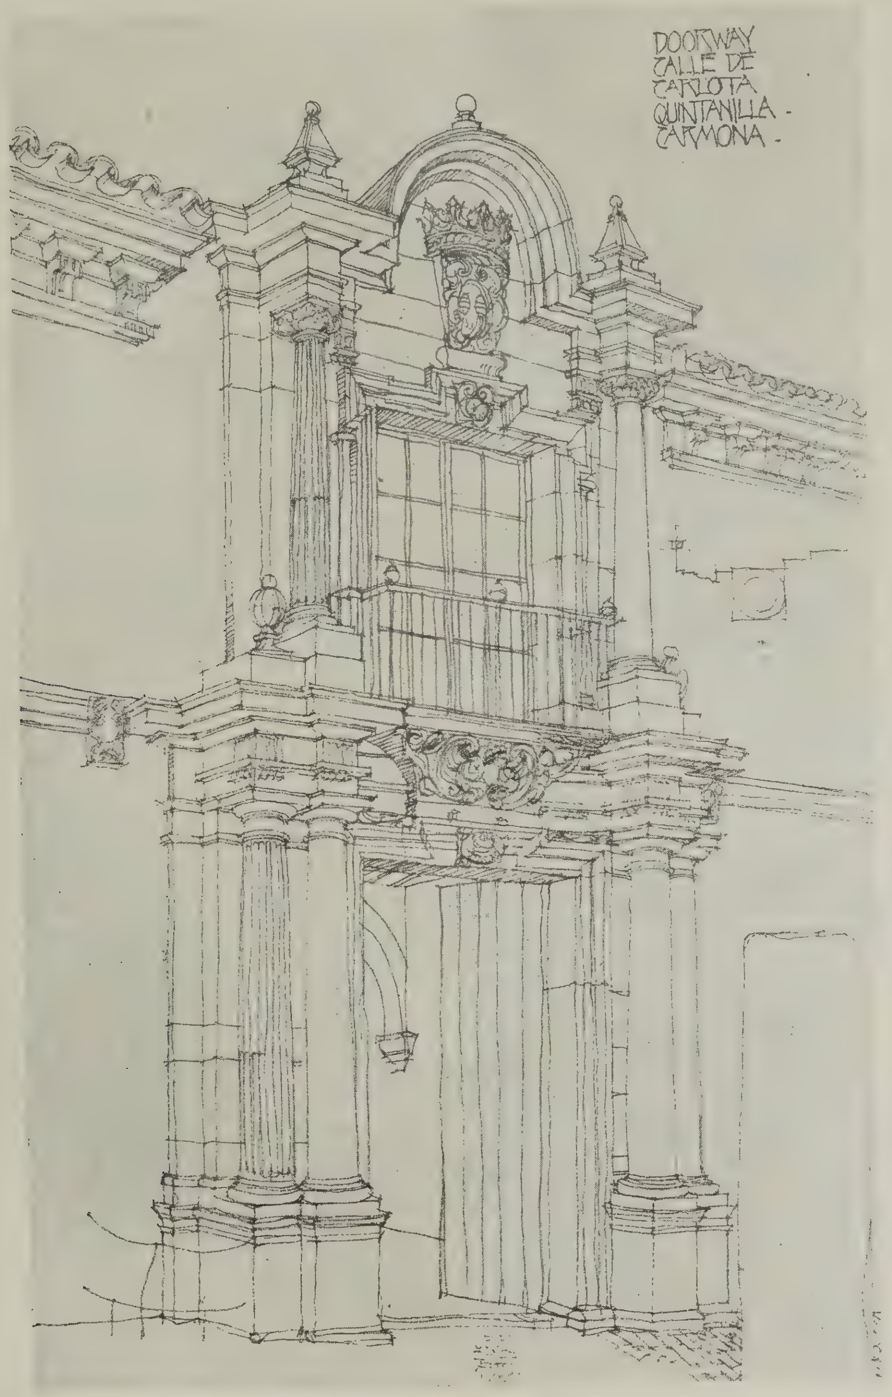


Drawn by **Jas. B. Fulton**, A.R.I.B.A.

with all the curves and recesses the spirit of the Renaissance is clearly shown. Your interest is held at every part, and finally rests with pleasure on the central panel, with coat of arms, emphasised and protected by a semi-circular pediment.

The church of St. Maria in Campitelli, erected by C. Rainaldi under Alexander VII., is the next example. The lower storey is Corinthian, with a pedestal base. The central doorway is emphasised with a broken semi-circular pediment, which is again framed with the true central columns of the order and crowned with an angle pediment. It is interesting to note that the order of the doorways is Ionic and rises from the base of the pedestal. The upper storey is Composite, and is contracted to the three central bays of the lower order by voluted, carved buttress features. The window, with its smaller order and semi-circular pediment, groups with the larger pediment over; and both are contrasted with the broken pediment crowning the composition. This is a work of extraordinary power, showing a masterly grasp of the principles of architecture, and revealing a charm and freedom in design that the Greeks and Romans suggested but never attained. The interior of this church is remarkably fine, and forms the subject of the next example. The interior is designed in a masterly style in the Corinthian order. The nave, with its barrel vaulted ceiling and side chapels, leads in the usual manner to the transepts, where the crossing is crowned with a dome with enriched pendentives, and further is the semi-circular apse for the high altar. The general effect of the Corinthian order without a pedestal base is exceedingly charming, and breathes the life and spirit of the highest aspirations of Classic genius.

The Renaissance in Spain is in many ways a contrast to the Renaissance in Italy, especially the architecture during the sixteenth century; for example, the Town Hall in Seville by Diego de Riano, 1530, &c. Nowhere in Spain are found examples showing the refinement, knowledge, and beauty of those in Italy; but there are to be found everywhere in Spain works of architecture

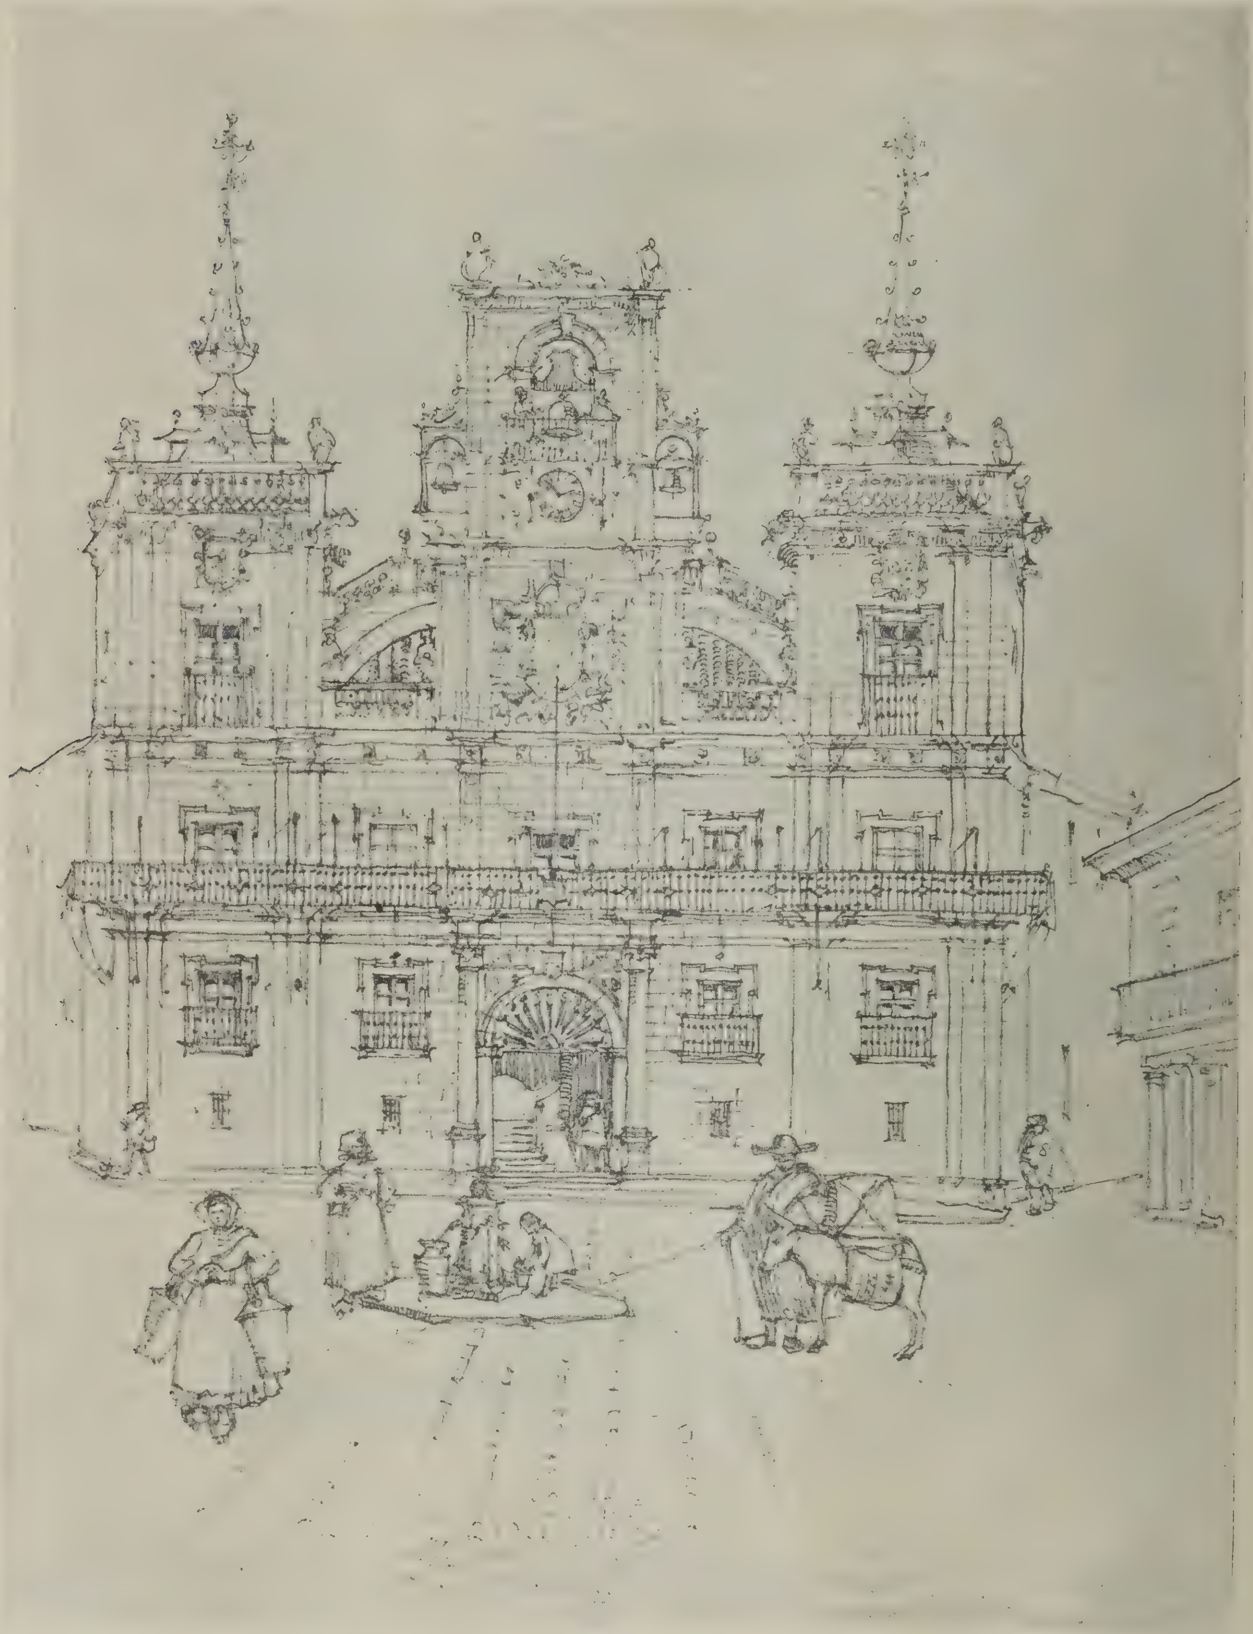


Drawn by JAS. B. FULTON, A.R.I.B.A.

which are full of suggestive forms and ideas, more picturesque perhaps although not so refined. Many buildings of the Plateresque or Early Renaissance are familiar to the student, but later examples have not yet been studied; and I propose here to describe several in contrast to the Roman examples.

My first sketch is an altar piece in the Capella de la Concepçion Grande in Seville Cathedral. The treatment is most original and effective. The general build-up of the composition is good, with ordinary niches on either side and voluted cornices with angels on pediments, whilst the interest of the design is undoubtedly centred on the Cross, with its masterly recess, crowned with voluted and semi-circular pediments. The treatment and effect is grand and mysterious, especially in the dimly lighted interior of the great church.

Many of the houses in Seville have interesting doorways, and I choose one for my next example—a fine Corinthian order with half columns in plan, with door architrave and small projecting pilasters on either side. The architrave of the doorway runs up to the under side of cornice, and has no connection with the architrave of the entablature. The pediment is broken and voluted supporting lions, with a small window between crowned with a semi-circular pediment protecting a shield. The simple recessed surface at either side is effective, and with the balcony and other features forms a composition at once original and pleasing, because the design is based on the traditions of the Renaissance. This doorway clearly shows the influence of MICHEL ANGELO in Spain, although lacking in his masterly knowledge of sculpture in detail. For the next two examples we go to Carmona, near Seville—the façade of a house or hostel near the church of Santa Maria. The lower order is Doric, on a pedestal with columns fluted one-third up. It is interesting to the student to note the treatment of simple channelling on an unbroken surface behind the columns, and the simple treatment of doorway. The upper mem-



THE TOWN HALL, ASTORGA.—Drawn by LESLIE WILKINSON, A.R.I.B.A.

bers of the cornice support and form the balcony over. The upper storey is Ionic with angle pediment over. The voluted ornament is curious, but not in good taste. The manner in which the crowning cornice of the building is kept strong and unbroken binds the composition and gives the whole a masterly touch.

My last example, the doorway in the Calle de Carlotta Quintanilla, is somewhat similar at the first glance, but in detail it differs very considerably; note the treatment of balcony with the semi-circular pediment over crowning the whole composition. The method of building up from the two columns forming the lower storey to the one column over is suggestive and picturesque.

In all the towns of Spain the student will find many more examples; enough has been shown, I hope, to prove that the Renaissance lived and flourished in the seventeenth and eighteenth centuries. In Italy the Renaissance may be studied for its perfection in composition of design and beauty of detail, while the Renaissance in Spain may be studied for its suggestiveness and imaginativeness, assisting to a higher and nobler architecture.

## FORTHCOMING EVENTS.

*Friday, January* 14.

Architectural Association: Paper on "A Comparison between English and Continental Ironwork," by Mr. J. Starkie Gardner.

*Monday, January* 17.

Royal Institute of British Architects: Paper on "Carr of York," by S. D. Kitson, F.R.I.B.A., M.A. Award of Prizes and Studentships.

Royal Academy: Course of Four Lectures on Painting, by Sir W. B. Richmond, R.A., K.C.B.; (2) "Design and Drawing."

Royal Society of Arts: Cantor Lecture (1) "Textile Ornamentation," by Mr. Alan S. Cole, C.B.

*Tuesday, January* 18.

Royal Institute of British Architects: Annual Exhibition of Designs and Drawings submitted for the Institute Prizes and Studentships 1909-10 opens in the Gallery of the Alpine Club: closes January 29.

*Wednesday, January* 19.

Edinburgh Architectural Association: Paper on "Architectural Form Uninfluenced by Material: A Popular Notion to the Contrary Reviewed," by Mr. Alex. M'Gibbon, A.R.I.B.A.

*Thursday, January* 20.

Royal Institution of Great Britain: Paper on "Assyriology" (1), by the Rev. C. H. W. Johns, M.A.

Concrete Institute: Paper on "Reinforced Concrete Chimney Construction," by Mr. E. R. Mathews.

## COMPETITION DESIGNS FOR THE CITY OF LEEDS TRAINING COLLEGE.

THE competition for the proposed City of Leeds Training College for Teachers, to be erected at Kirkstall Grange, Far Headingley, is notable in several ways. First, it was limited to architects practising in Leeds, and though limitation by geographical considerations is not now peculiar or unusual, there are circumstances connected with this Leeds competition that we think must be unique.

In the city of Leeds the Education Department, like others, has an official and permanent architect and staff, and as the upshot of the competition proves, a competent architect, specially skilled in the planning of school buildings. Now the architects practising in Leeds necessarily, as ratepayers, assist in the payment of the official architect's salary, and might naturally and justifiably feel aggrieved that one or some of them should not be employed when the city of Leeds erects an important and costly building.

The Leeds Education Committee promoted a competition, limited, as we have said, to their fellow-townsmen, but with some remarkable peculiarities. They determined that the competition should not result in the success of one architect only, but that four or five should share the work of designing and carrying out the college. This is rendered feasible by the fact that the training college is to consist of several blocks of buildings—an educational block, seven hostels, and other separate buildings. Instead of premiums, therefore, the prizes consist of jobs, the author of the best design getting the biggest one and four others getting smaller ones. We are a little puzzled to know how the four smaller ones are to be divided, as, according to the award of Sir Aston Webb, the assessor, which has been adopted in its entirety by the Leeds City Council, there are seven hostels to be built from the designs and under the supervision of five different architects. The architect of the big job is to have a "general control over the design" of the hostels he does not himself design, so that it looks as if the college were to be the work of a syndicate with a chairman entrusted with exceptional and disciplinary powers. We hope there is enough tact and *camaraderie* amongst the selected architects to ensure the work being carried to a satisfactory conclusion, but it is evident that the experiment is a bold one and contains the ingredients of a very pretty kettle of fish.

The next point to notice about this remarkable competition is that the competitors were supplied with "plans, showing a detailed arrangement of the educational block and of the hostel blocks which have met with the approval of the Board of Education," prepared by the official architect, Mr. Fred Broadbent. Competitors were at liberty to depart from or vary these as they pleased, but it is a tribute to their excellence that very few ventured to make more than trifling alterations, and of these only one was amongst the five selected by Sir Aston Webb, and that, we imagine, rather in spite of than in consequence of the departure from the approved plans.

Competitors were not required to show plans of the hostels nor any indication of their elevations other than could be expressed in a small-scale bird's-eye view, so that the competition virtually resolved itself into one for the elevations of the educational block and the general lay-out of the estate of forty acres with the various buildings. Thus the ratepaying architects of Leeds who competed may consider that they had a good deal of their work done for them by their employé, the official architect.

The site of the college is an excellent one, ample in extent, well sheltered on the north and south-west by woods and open to the south, whilst Kirkstall Grange, the former residence of Lord Grimthorpe, is an old house of considerable dignity and architectural interest, and is to be retained as a hostel in addition to the seven new ones.

The arrangement of the blocks which best seemed to solve the problem was that of a quadrangle open to the south with the educational block on the north, the men's hostels on the west, and the women's hostels in double file on the east. Mr. Kirk's disposition was a charming variant with three of the women's hostels forming a separate group on the west of the great open quadrangle. Mr. Schofield had another plan with three of the women's hostels *en échelon* behind and northward of the educational block, thus gaining symmetry.

As regards the design of the elevations, Mr. Atkinson, Mr. Kirk, and Mr. Kitson all gave refined and scholarly versions of English Renaissance based closely on eighteenth century work and thus harmonising with the design of the old mansion. Mr. Schofield's treatment was rather more of the modern twentieth century version of Renaissance to which we are now accustomed in competitions for municipal buildings, and Messrs. Percy Robinson and W. Alban Jones also gave a modern design, piquant and pleasing, if less dignified and restful than that of the other selected architects.

There were amongst the unfortunates several good designs both in elevational treatment and grouping. Of these we liked best that of Mr. Wm. Whitehead, a good scheme shown in a most excellent coloured picture.

Drawn by Banister F. Fletcher, F.R.I.B.A.

The architect placed first by Sir Aston Webb is Mr. G. W. Atkinson; the author of design No. 4 is Mr. Albert E. Kirk, A.R.I.B.A.; of No. 13, Mr. Sydney D. Kitson, M.A., F.R.I.B.A.; of No. 14, Mr. W. Peel Schofield, A.R.I.B.A.; of No. 26, Messrs. Percy Robinson, F.R.I.B.A., and W. Alban Jones.

The following is Sir Aston Webb's report on the competition:—

"I have made a careful examination of the twenty-seven designs sent in in competition for this building, and must congratulate the committee on the excellent response made to their invitation. The designs show much care and thought, together with a due regard for practical requirements and the conditions laid down.

"I have no hesitation in reporting that, in my opinion, taking plan and elevation together and the general requirements of the scheme, that the design numbered 9 is decidedly the best, and I therefore recommend that the author of this design be appointed architect for the college, subject to his being able to obtain a satisfactory tender for the erection of this design within the usual margin of 10 per cent. of his estimate. Of the remaining designs I consider the authors of Nos. 4, 13, 14, and 26 would be the most suitable for selection as architects for the hostels, but I should recommend that the author of No. 9 be entrusted with the erection of the southernmost block of hostels and that he be given a general control over the design of the remaining hostels, so as to ensure a general unity to the whole scheme."

## NOTES AND COMMENTS.

The exhibition of the Arts and Crafts Society that has just been opened at the New Gallery, Regent Street, is the last that will be found in its old home, for that gallery will shortly change its function as the scene of art exhibitions for the more mundane purpose of prandial delights. Space does not allow us at present to give a critical review of this the ninth exhibition of the Arts and Crafts Society, but the furniture, metal work, pottery, and bookbinding now to be seen are, as before, admirable and well worthy of a visit from all who believe, as we do, that Art is not confined to picture painting in oils, or even to the works of the great trio, Architecture, Sculpture, and Painting.

We are pleased to learn from the remarks of Mr. R. H. Dawson, A.R.C.A., Headmaster of the Belfast School of Art, at a recent meeting of the Irish District of the Society of Art Masters, that the teaching and appreciation of art in Ireland has made satisfactory progress during the last fifteen years, and that it is recognised that art teaching is not only valuable as a specialised form of instruction, but is also useful as an important element in general education.

An interesting discussion took place at the last meeting of the Tipperary County Council as to the preference to be given as between ferro-concrete and steel for a proposed new bridge to be erected over the River Suir at Waterford. In the estimates before the Council there appeared to be a difference of 200*l.* only in favour of ferro-concrete in an amount of 67,000*l.*, but it was not quite clear as to whether the depth of the foundations below the river mud was sufficient in the case of the ferro-concrete estimate. The general opinion of the Council was rather in favour of a steel bridge, although it seemed that the Privy Council was inclined to give preference to ferro-concrete.

Although the French Chamber and Senate have passed a vote to permit the purchase of the Farnese Palace as a permanent home for the French Embassy in

Rome, it seems that this purchase is conditional on the consent of the Italian Government to the alienation, which in 1861 was forbidden by PIUS IX. in favour of the Apostolic Chamber or the Pontifical Treasury. The prohibition has passed to the Italian State as the Papal heirs. We trust that the natural desire of Italy to retain its artistic treasures may not operate to send the Palazzo Farnese to a worse fate than that of becoming the abode of the French Embassy.

OF the results of archæological discovery during the past year few have been more valuable or more interesting than those in Nubia, where it has been shown that in the Pre-Dynastic period of Egyptian history, from about 4000 to 3500 B.C., Nubia was inhabited by the Egyptian race having the same culture as in Egypt. Copper was little used and appeared only as ornaments. On the other hand, tools and weapons were of stone, and the working of stone vases and bowls as well as the preparation of flint knives and lanceheads had reached a high state of perfection. The Early Dynastic period (3500-3000 B.C.) which followed showed copper weapons coming into use, and hand-made pottery was abundant. Culture at this time in Nubia was falling behind that of Egypt, as the centre of gravity of Egyptian power moved northwards into Middle Egypt and negro influences entered Nubia from the south. The next period (2800-1800 B.C.), corresponding to the Old Kingdom of Egypt, saw a marked change in Nubia. Culture was advancing slowly and was crude in type, and anatomical evidence fully established the development of a hybrid type derived from a strong intermingling of the negro from the south with the original Egyptian. This crude Egypto-Negro mixture became a more homogeneous blend in the succeeding period, Middle Kingdom of Egypt 2000-1500 B.C., and a Nubian physical type was produced which had remained dominant in this portion of the Nile Valley from that time down to the present day.

NOT only has the origin of the Nubian race been worked out, but great additions had been made to the history of disease from records extending over sixty centuries. In the fourth and fifth centuries bodies packed in salt and laid in the dry soil had preserved not only skin and hair, but every internal organ, muscle, nerve and vessel; gout, and even appendicitis, were recognised among the ailments that had afflicted dwellers in Nubia. Tuberculous disease was located rarely, but rheumatic gout was remarkably common in the early Pre-Dynastic cemeteries.

THE work of the National Trust for Places of Historic Interest or Natural Beauty deserves to be better known, and at a recent meeting of the Sheffield Society of Architects and Surveyors, Mr. NIGEL BOND, M.A., Secretary of the Trust, pointed out the principles and methods of the Corporation.

MR. BOND explained that the Trust stood for the preservation of the beautiful and the historic. This country possessed a great mass of beautiful landscapes and beautiful architecture, but in diminishing quantity, and it was felt that in the interests of the nation and of national interests that as much as possible should be done, without interfering unduly with other interests, to preserve the beauty of that architecture. The Trust also stood for other interests besides the æsthetic and the architectural. There were existing many good examples of that continuity which is one of its main features, showing how one event glided, so to speak, into another, and went forward without any great breaks.

To preserve the evidences of that continuity could not fail to be of great educational value, as it enabled us better to judge the most important political issues which arose from time to time. It was important that historical buildings should be preserved to help us to remember and appreciate what had gone before, and understand it better. Hence the Trust was preserving not natural beauty alone, but also historical associations, and anything which tended to the development of historical knowledge. For instance, they recently acquired one of the long barrows in Wiltshire, which had been in danger of destruction, and such objects would probably be extremely helpful in the future in developing theories about anthropology in the event of the study of that science being taken up. It would be seen that the Trust covered very wide ground. In fact, there was no æsthetic or intellectual interest which did not find sympathy in it. The speaker mentioned that the famous view of Windsor Castle from the river was recently threatened with destruction by the piece of land separating the building from the river being built upon, but the Trust had stepped in, and was now endeavouring to raise 3,000*l.* for the purchase of the site. Towards this fund the KING had contributed 500*l.* and the PRINCE OF WALES 250*l.*

SOME details were given of the constitution of the Trust. In its earlier days a limited company, it was incorporated two years ago, and had been recognised by Parliament as a suitable body for holding objects and places in trust for all time. Their present status constituted a guarantee that properties acquired by them requiring special management would be governed by a body capable of providing the best possible expert advice.

## MODERN COLD STORAGE AND REFRIGERATION.

By W. S. DOUGLAS, B.Sc.

### II.—INSULATING MATERIALS—(*continued*).

*Sawdust.*

THIS material is so familiar that it is scarcely necessary to give an account of its manufacture. As an insulator its only merit is its cheapness. It has a fair resistance to heat (especially if it has been first spread and kiln-dried), but affords no protection whatsoever against fire, and owing to its spongy nature has a fatal tendency to absorb moisture. It is also rather subject to the malignant fungoid growth known to timber merchants as "dry rot." The packing weight is about 14 lb. per cubic foot, giving a covering capacity at 6 inches thickness of 320 feet super per ton, and the cost in most places is about 1*s.* per cwt. sack. As an insulator for large cold stores it has very little vogue, and is only used in the cheaper forms of ice rooms.

*Cowhair.*—Cowhair is cleaned with acid, thoroughly washed and dried in centrifugal machines by the merchants, and is then prepared for cold-storage purposes by teasing in what is known as a "teaser" or carding machine, which is very similar to a large comb. By this means it is torn into shreds and cleared of all matted lumps without the natural strength of its fibre being destroyed. The effect is to increase the covering capacity by diminishing the weight per cubic foot, and at the same time to render it more efficient as an insulator by avoiding solid masses and providing a large number of air cells. The advantage of cowhair is that it is light and fairly inexpensive, and it has no tendency to absorb moisture. For this reason it is frequently used in lagging evaporators and small ice-making tanks, especially when they are for export purposes, where lightness is very important. Its disadvantage is that in course of time it is liable to become a little musty owing to slight decomposition being set up.

The weight per cubic foot averages 6 lb., giving a covering capacity of 746 feet super per ton at a thickness of 6 inches, and the cost is usually about 19*s.* per cwt.

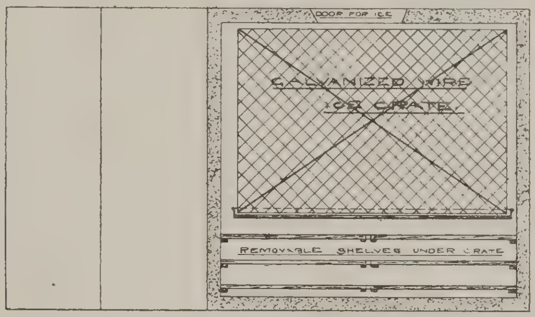
*Peat Moss Litter.*—Although not quite so well known in this country, peat moss litter is used to a certain extent by cold-storage engineers in Germany. Unfortunately, no exact figures are available of the actual heat leakage it permits, but the results obtained in practice indicate that it is fairly efficient. The raw peat from which it is produced is found in large quantities in most moorland districts, such as Yorkshire, Cumberland, Derbyshire, and the greater part of Scotland, and is converted to a litter by the simple process of drying thoroughly in air and then disintegrating. It is afterwards pressed into bales for transit, at a pressure of some 200 lb. per square inch, in which state a cubic foot weighs about 16 lb. When packed for cold-storage purposes, however, it is considerably lighter, and its weight then averages 11 lb. per foot cube, giving, at the standard thickness of 6 inches, a covering capacity of 409 feet super per ton.

Owing to the plentiful nature of the supply and the simple process of manufacture, the cost is not excessive, and in most places it may be obtained at about 35*s.* per ton.

Peat is largely used in Scotland and elsewhere as fuel, and therefore, although not readily inflammable, it cannot be regarded as fire-proof. On the other hand, it does not attract moisture, and the tannin included in its composition not only prevents decay of the moss itself, but exerts a preservative effect on the timber which cases it in. The same cause renders it immune from the attacks of vermin. As an instance of its powers of preservation may be mentioned the body of a Roman lady, which was unearthed some time ago from the celebrated Chat Moss. Although it must have lain there for centuries, its condition was practically perfect.

The materials described above are those which are chiefly used for the actual insulation. Many others have been tried, such as hair felt, rice husks, and pumice; but none of these, in this country at any rate, has attained to any measure of success. Pumice to a certain extent is used in the United States, and felt is largely employed for insulating cold brine pipes, but the husks, owing to their tendency to vegetable decay and their attraction for vermin, have now very little vogue at all. Fossil meal, of course, is an insulator, but is usually found only on steam surfaces, where it can be applied in a hot state.

Other materials sometimes specified for floors in cold stores and curing cellars are bitumen, asphalte, concrete, engine ashes and cement. White tiles are also employed for facing purposes, and zinc and galvanised sheets for lining ice chambers and covering damp walls. These are all too well known to need description, but attention may be drawn, in passing, to the walls, made from hollow concrete blocks, which have recently developed. These are highly recommended for buildings to contain cold stores, as the dead air space formed inside each block is one of the best insulators known. Further, it will probably be news to some that buildings of any size made from these blocks are actually cheaper than those constructed from corrugated iron.



SECTIONAL ELEVATION.

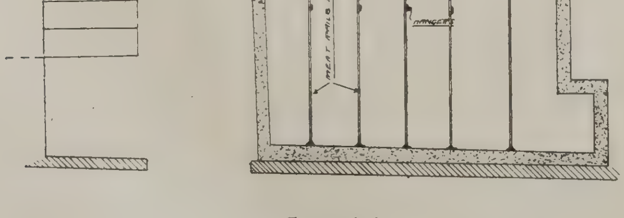


FIG. 3.—PLAN.

Timber is a very important factor in cold-storage construction, and too much attention cannot be paid to its selection. It should be free from sapwood, knots or shakes, and any with the least sign of rot should be rejected. Timber rot is of two kinds: the wet form, which is due to a species of fermentation, and the dry variety, due to fungoid growth. Either has most pernicious effects on the insulation, and must be carefully avoided. This can be done by selection in the first instance, and afterwards by taking proper precautions. No dampness should ever be allowed to approach the insulation, and the filling used should, as far as possible, tend to prevent decay. Preservatives are occasionally employed, especially in marine work, and there are many of these on the market to choose from. Most of them are simply applied with a brush or by soaking, but there is also the well-known process of "burnettizing." This consists in exhausting the air and moisture from the wood in an air-tight cylinder by means of a vacuum and then forcing in preservative under pressure. Different woods, it should be noted, absorb different amounts of preservative, and the pressure varies in each case.

Both for sheeting and studding ordinary white deal does very well. Yellow deal, on the contrary, should be avoided, as it gives off a very noticeable smell, which is taken up by the goods in storage; but spruce, although rather expensive, may be used with advantage in small work. In any case, the timber, if painted, should be finished off inside with enamel, in order that it may be cleaned down at intervals with a damp cloth.

Appended below is a table culled from many experiments and from working results, which summarises the data already given under the various insulators, and in addition states the heat resistance of each:—

| | Heat Leakage B.T.U.'s per Square Foot per Hour.* | Weight per Cubic Foot. | Covering Capacity Foot Super per Ton at 6 Inches. | Cost per Ton. | | | Cost per Foot Super 6 Inches Thick. |

* This column is calculated on the basis of a difference of temperature of 50 degrees Fahr.

*Ice Chambers.*—Ice, either alone or mixed with salt, is now, unless under special conditions, used for cooling storage rooms only when they are not large enough to make the installation of a refrigerating machine advisable. But before the experiments with machines had led to practical results it was the only method available, and as such was universally employed where cold storage was necessary. The ice trade in those days was therefore of considerable importance, and as natural ice had at that time no competitors, Norway and North America, which were then, and are still, the chief sources of supply, did a very large export business in this commodity. The Americans were first in the field, and the Lake Wenham Ice Company began to tap the British market as early as 1840. But it was not long before the Norwegians followed up, which they did with such energy that ultimately, owing to their superior transport facilities, they captured the whole of our trade from the Americans, and at the present day they still, as far as natural ice is concerned, maintain their supremacy. They have now, however, other rivals to fear in the shape of the large ice factories which have followed the advent of mechanical refrigeration, and artificial ice, except in the eastern and northern counties, which are fed by the big seaports, is steadily regaining all the ground once lost by the Americans. Already the number of factories in existence is very large, but principally owing to the reduced costs of production obtained with up-to-date methods it is increasing steadily year by year. In America, although ice factories are far more plentiful even than they are here, a great quantity of natural ice is still harvested every winter, and elaborate methods have been invented for handling it with the minimum of expense. The cutting and trimming machines, the elevators, and the huge ice houses employed are of great interest, but as they do not concern us here it is not intended to do more than mention their existence. Suffice it to say that in this country there is a plentiful supply of ice, both natural and artificial, which enables the user of small ice chambers to store his provisions at a not unreasonable cost.

By far the greatest number of ice rooms at the present date are used by butchers, whose trade renders the use of some form of cold storage a necessity. The larger establishments are mostly fitted by their owners with refrigerating machinery, but those whose business does not warrant the capital outlay which is necessary to put down a complete plant prefer to use the ordinary ice chamber. In this way, although the running costs are considerably higher, they save in initial expenditure.

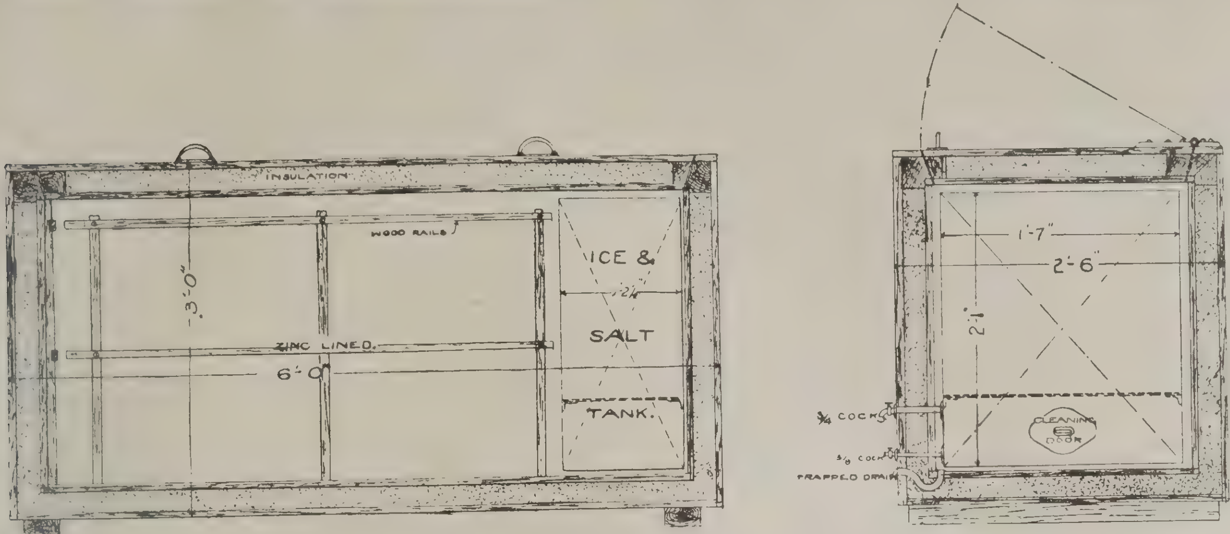

Fig. 4.—Arrangement of small box cooled by ice and salt.

But while some prefer ice cooling to mechanical refrigeration for the reason mentioned, or from personal taste, there are very few butchers indeed who have no form of cold storage at all on their premises. It will therefore be seen that to satisfy this demand alone the number of ice chambers supplied yearly must be very large.

Next to the meat trade the most important application of large and small ice rooms is in hotels, restaurants, and country residences. In the two first-named they are used for storing all sorts of provisions, and as a more efficient and less troublesome method of icing wines, champagnes, &c., than the ordinary pail. Their use in country houses is obvious; so many of these mansions are at such a distance from centres where suitable provisions may be obtained that it becomes almost imperative to have some means of preservation in order to save unnecessary journeys and expense. For this purpose and for storing game small ice chambers have been specially designed, and are now widely employed. Other important users are provision dealers, fishmongers, poulterers, and dairymen, and ice cooling is also resorted to by the smaller bacon-curers.

It is scarcely possible to draw a definite dividing line and to say at what storing capacity ice cooling should cease and mechanical refrigeration begin. Much depends on circumstances and the purpose for which the cold store in question is being used. A very important factor too is the personal opinion of the purchaser, many of whom are unduly prejudiced on one side or the other. In one case, perhaps, a butcher who has a rising trade may not have accumulated sufficient capital to think of a machine. He is bound, however, to have a cold store of some sort, and he therefore, going along the line of least resistance, buys a large ice chamber. By doing so, although his ultimate running costs are quadrupled, he spends at the time perhaps only one-fourth of what he would pay for the complete mechanical equipment. On the other hand, for hotels or country houses, where capital is usually available and will be gladly expended if convenience is thereby gained, the refrigerating machine should be advised wherever practicable, especially as it very soon saves its extra cost by its small attendance and upkeep expenses. These instances may be multiplied *ad infinitum*, and it is easily seen by considering a few of them that the line of demarcation is very vague. An approximate figure, however, will be useful as a practical guide, and although it will vary a great deal in different circumstances, the limiting value for ice-cooled rooms under ordinary circumstances may be set at 200 cubic feet of inside capacity. There are, of course, many rooms smaller than this which are cooled mechanically, and many larger which are cooled by ice. In fact, only last summer there was built in London an ice chamber having a capacity inside the walls of 700 cubic feet, which is shown in fig. 3. On the other hand, it is believed that machines will shortly be placed on the market suitable for dealing with capacities as low as 120 cubic feet. But these cases are more the exception than the rule, and the above figure, although purely arbitrary, may be taken as giving a very fair idea of modern practice.

Ice rooms divide themselves naturally into two classes—those cooled by ice blocks and those using broken ice mixed with salt. The latter are used for obtaining lower temperatures than are possible with ice alone, which they are able to do owing to the fact that the melting-point of the salt solution is well below that of ordinary water.

Working with the block ice the thermometer inside a well-constructed room will register from 40° to 44° F., which is a temperature very suitable for the storage of most provisions during short periods. Lower temperatures may be obtained without the use of salt, calcium chloride, or other solid, but such a proceeding is not advised, as cooling below 40° is a very slow process if ice alone is employed. The reason for this is found in a physical axiom well known in Newton's law, which states "that the rate of cooling varies exactly as the difference in temperature." In other words,

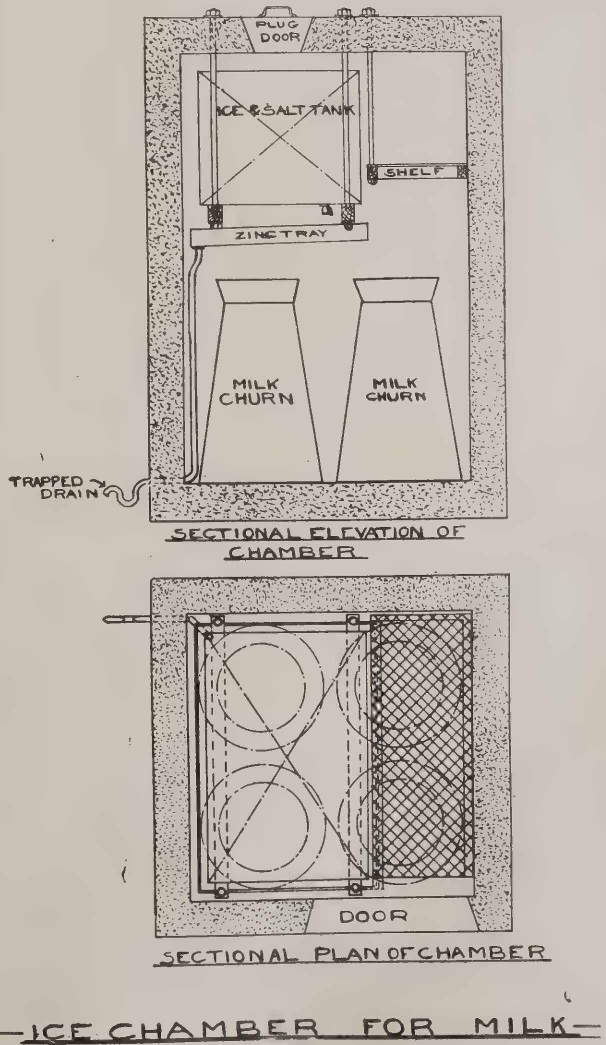

Fig. 5.

the nearer the temperature of its surroundings is to 32° F., the longer 1 lb. of ice takes to melt and dissipate its heat of fusion (*i.e.* heat it gives up in turning to water). Hence at temperatures below 40° cooling takes place very slowly.

Low temperatures should be avoided wherever possible, as the effect is always to increase the consumption of ice, firstly, because more B.T.U.'s must be extracted from the produce stored, and secondly, by reason of the greater radiation losses, which by Newton's law are proportional to the temperature difference between the inside of the chamber and the atmosphere. Such temperatures are unnecessary in ordinary circumstances, but if the produce is to be stored for any length of time they are essential, and in that case ice and salt tanks instead of plain ice crates should be employed.

The ice and salt tank, like all other cold-storage fittings, must be galvanised to prevent rusting from moisture condensation, and must be fitted with a perforated plate, from 3 to 6 inches off the bottom, according to size, in order to obviate damage through the falling of extra large pieces of ice. It should also have a liquid outlet, controlled in small tanks by a pit cock, and in the larger sizes by a wheel valve. In fact, it is advantageous to have two of these outlets, as shown in the small horizontal box illustrated in fig. 4. The larger of the two is situated just under the perforated plate, and prevents the liquid salt solution from penetrating to the ice above, thereby causing it to melt with undue rapidity. At the same time it does not waste the intensely cold liquid at the bottom, which is still capable of doing very good cooling work. The smaller cock is in order to drain the tank completely when not in use, and a hand hole in one side is provided for cleaning purposes. The box shown in the illustration is lined with zinc, and it is therefore unnecessary to have a drip tray under the tank to catch the condensed moisture. The drips simply drop on to the zinc-covered bottom, which is arranged to fall towards one corner, whence a trapped waste pipe conducts the water to the outside of the box. By means of this trap an effectual water seal is formed, which, while allowing water to escape, prevents air from flowing in. The insulation in this case is composed of 2 inches silicate cotton between T 98 B matching, and wooden rails are fixed round the inside for the purpose of hanging small goods to be stored.

Another form of the ice and salt chamber much used by dairymen is shown in fig. 5. Churns, it will be seen, are stored on the floor, and a shelf is provided for carrying butter, cheese, &c.

(*To be continued.*)

## BEAUTY IN ARCHITECTURE,

By B. R. Gribbon.

(*Continued from last week.*)

So, too, in the Colosseum, how the endless rows of arches carry the eye onward to cover the whole building. One can scarcely conceive of a "part" of the Colosseum; it forces itself upon the mind as a whole. It is here too that the value of mass and repetition is very strikingly shown. The orders of the building are ill-proportioned and roughly worked, the outlines of the mouldings are coarse and poorly designed—compare them with those of the Parthenon—yet, thanks to its size and its constantly recurring arcades, the Colosseum is the very embodiment of strength and will always rank as one of the most impressive buildings of the world.

We have said that repose is essential to the appearance of solidity and strength, but repose must not be confounded with lifelessness. Repose may be either inert or alert. One of the finest examples of the former is found in the Pyramids: they are the very ideal of inert repose; while the Theseion is another good example. None of these buildings convey the faintest impression of expectant life, but the case is very different when the arch is confessedly used. Turning again to the Colosseum, does not the constant repetition of the bold semi-arches lead the eye on and on, suggesting at least orderly preparation, a readiness in each to bear its part in supporting any weight thrust upon them? And this rather seems to accentuate than to diminish the repose of the building as a whole.

After solidity, or more correctly speaking, with it, comes proportion. The essence of this factor is fitness. It is obvious on the most casual examination that there are some proportions which are always pleasing to the eye, and it will be found that this is the case according to the apparent fitness of the different portions of the design to fulfil their respective requirements. Considering proportion in design as a whole, it may be said that it is the proper adaptation of parts to an end, it is the relative size of the parts to each other and to the whole, and it is one of the most important factors in producing unity in a design, thus helping to give the expression of strength and solidity which, as we have already said, is the first necessity to obtain beauty in architecture. How great its importance was in Classic times may be seen in the existing remains of the temples of ancient Greece. From the natural size of the various component parts, steps, columns, the lintels of the entablature, the cornice and its mouldings, in such early buildings as the Hieron and the Temple of Corinth, to the perfected details of the Parthenon and the monumental ones of the Temple of Jupiter at Agrigentum; in these and in all the varying examples lying between them in the evolution of the perfect Greek style, the factor of proportion is practically the key-note of the design. Could a clearer illustration of this be found than in the inner portion of the Propylæa and in the Epinaos of the Parthenon at Athens? The order externally and the general design in each case is Doric, yet when it became necessary to insert columns internally, where great bulk would be undesirable, rather than weaken the robust proportions of the Doric column, it is rejected altogether and the designer deliberately turns to the Ionic, and so obtains a column of the necessary height without inconveniently encumbering his building and without any sacrifice of the all-important factor of proportion.

So also in Roman work. The accepted height for the Corinthian column was ten diameters, but in the case of the Temple of Vesta at Tivoli, where, from its site close by the crest of a lofty cliff, the usual height would tend to give the column an appearance of weakness and attenuation, it is reduced from ten to under nine and a half (9.47) diameters, and not only this, but the proportions of the entablature, the contours of the mouldings, and the intercolumniation itself are all altered in sympathy. True, in some cases, as in the Theatre of Marcellus and the Colosseum, the proportion of the several orders and their details is not so carefully observed, but in these cases the effect of the design would have been even finer had the proportion been more closely attended to.

The special qualities which proportion has the power to produce, or to assist in producing, are refinement and grace. Refinement is the best possible adaptation of means to an end; it is usually understood to mean slight variation of detail to emphasise the functions and purpose of the parts affected, or to correct apparent defects as opposed to real ones: thus it is in reality a variation of proportion. Grace is more difficult to define; it seems to be produced partly by extreme refinement of detail and ornament, and partly by beauty of line and form, and thus, according to our definition of "beauty," of the fullest expression of purpose in form. Careful finish and definition of outline are also essential to full expression of grace, as is perfectly illustrated in the marble mouldings of the Athenian temples.

The third of Inigo Jones's requirements is that architecture shall be masculine. This implies strength, vitality and restraint.

Strength, as we have said when discussing solidity, to the appearance of which it greatly conduces, is obtained by the careful disposition of voids and solids, by refraining from placing a heavy mass over a void, by placing the hardest and strongest materials and the largest details at the base of the building, and by the careful subordination and proportion of parts. Ornament should be sparingly used in the lower storeys; it may be introduced more liberally on each successive storey as the building rises, and will then help to give the appearance of lightness to the upper portions essential to the appearance of strength in the whole. The design should not be cut up into more divisions than is necessary, unless they are uniform and symmetrical; few parts conduce to unity, and a building possessing breadth and unity always *appears* to be stronger than one actually equally strong but cut up into a multiplicity of varying parts.

(*To be concluded.*)

Messrs. Gotch & Saunders, architects, Kettering, have been appointed by the Northamptonshire education committee architects for the Kettering Grammar School.

The following names of candidates for the appointment of city engineer at Newcastle-on-Tyne are to be considered by the Corporation:—Mr. J. Rush Dixon, of Woolwich; Mr. A. D. Greatorex, of West Bromwich; Mr. E. B. B. Newton, of Paddington, and Mr. W. J. Steele, of Bristol.

## WELLS AND GLASTONBURY.*

WELLS probably owes its immunity from desecration to the secular character of its church, in consequence of which it escaped the upheaval that overthrew other religious houses at the time of the Reformation. The city possesses a peculiar charm being situated at the foot of the Mendip Hills, and having been handed down to us from the Medieval times practically unaltered, still retains its old world characteristics and ecclesiastical atmosphere which is unique. The central feature of the city, the cathedral church of St. Andrew, is of old foundation, and was from the first served by secular canons. The usual monastic buildings do not appear, but instead we have the Vicars' Close, one of the most interesting features. It should be noted that the cloisters were merely a walk for the clergy and not the busy working place of an active monastery. King INA was the founder of the first secular church, upon the foundations of which Bishop JOCELINE raised (1220-42) the fine nave and the west façade, so well known to all interested in architecture that it is superfluous to comment on this work here. The Vicars' Close, with its chain gate and gallery, however, are the chief subjects of these notes.

Bishop JOCELINE DE WELLES, or TROTMAN, returned from his five years' exile in 1213, and then started rebuilding and improving his cathedral church of Wells, which he dedicated in October 1239. Two years previously he had ordained chantry priests, but there is no reference to any common residence for these vicars choral. They do not seem to have had any regular establishment until WALTER DE HULLE in 1334 gave some land in Wells, so that the thirteen chantry priests might live in common together. It was RADULPHUS DE SALOPIA, or RALPH OF SHREWSBURY, who in 1348 began to erect a new college on the west side of the cloisters for their residence: "hall, kitchen, bakehouse, and other houses in the same place built and to be built."

Time must have made sad havoc of the buildings erected by this prelate, as only a few traces now remain of the original design.

The great benefactor, Bishop RALPH ERGHUM, in his will requested his executors to build a college in the street then called La Mountery, but afterwards College Lane, for fourteen priests and chaplains, that they might live in common together. This has by some been confounded with the Vicars' Close, and the foundation of a neat little college for vicars and singing men on the north side of the cathedral is attributed to this prelate. T. L. WALKER, in "Examples of Gothic Architecture," says that Mountery College, or Mounterox College, was destroyed and its revenues confiscated at the time of the suppression of the monasteries. There are references to Letters of Patent in the time of RICHARD II. and HENRY V. which are grants to this college. NICOLAS BUBWITH's arms occur on the door of the chapel at the north end of the Close, and also on the painted glass in the windows. It may therefore safely be supposed that the grant in HENRY V.'s time was bestowed by him, but several signs, viz. the character of the carving and the mouldings to some of the windows signify an earlier date. Various small alterations have taken place, but the next principal addition was made by Bishop THOMAS BECKINGTON (1385-1464), who built the Close Hall Gate, or Chain Gate, which connects the hall of the Vicars' Close with the staircase of the chapter-house, and forms a private passage whereby the singers may pass from the church to their quarters.

This gateway forms an entrance into the cathedral close from the west, and consists of a vaulted carriageway and a passage on each side for pedestrians; over these is a gallery of communication for the vicars choral when going to and fro to perform service in the choir. This building is excellent in design, with mouldings beautifully executed in fretstone.

Over the central arch are two compartments, or bays, divided by enriched shafts terminating in crocketted pinnacles above a panelled parapet. Each bay contains a window of two lights divided by a transome with a canopied niche and a statue in the centre; these windows form distinct lights inside.

Over each passage is a window with two lights and similar tracery, and the same design of fenestration continued up to the north wall of the chapter-house staircase. Bishop BECKINGTON's arms and rebus occur three times on the gateway, viz. on the central boss of the vaulting and under each of the two windows of the small anteroom communicating from the hall to the gallery. Two corbels over the central archway displaying angels bearing a mitre with labels attached complete his armorial bearings. These and the statues in the niches are much decayed, but the one on the west elevation is supposed to be that of St. ANDREW.

Among others of Bishop BECKINGTON's buildings still existing and worthy of note are the Palace Eye and the Penniless Porch.

This eminent person is characterised by GODWIN as "a good statesman, a good churchman, a good townsman, a good subject, a good kinsman, a good master, and a good man." Surely he ought to have added "a good builder," if one is to believe that BECKINGTON was his own architect. He is supposed to have acquired his knowledge of building from WILLIAM DE WICKHAM, or WYKEHAM, which is not improbable, having been patronised by that distinguished prelate.

The executors of BECKINGTON, RICHARD SWAN, HUGH SUGAR, and JOHN POPE, *alias* TALBOT, may be safely attributed to have completed the Vicars' Close by adding—and probably rebuilding most of it—and thus rendering it the most beautiful of its kind in England. Their rebuses are introduced in the chimney shafts of the houses.

In spite of the great vandalism having ruined and laid waste such an immense amount of our Medieval architecture, Wells still possesses an infinite charm, and ranges among the best and the most delightful of cathedral towns, and it owes a great deal to those who are at present responsible for the upkeep and repair. It seems that they have been fortunate in striking the happy medium between repairing and restoration—preservation being their motto.

### GLASTONBURY.

Though the town of Glastonbury bears no prosperous or progressive air, it has its former venerable history, which is not without flavour of stirring times, lying in a valley green with orchards, with a little river, the Brue, almost surrounding it.

The two principal streets form a cross, and on either hand rises the Tor, crowned by its solitary tower—a remnant of a thirteenth century church—seeming to keep watch over the town.

The principal entrance to the abbey church used to be on the west, on a site now occupied by the "Red Lion Hotel," and led into the church by way of St. Joseph's Chapel. Of the latter, the most beautiful feature still in existence is the Norman doorway (*see* sketch) on the northern side, consisting of four elaborately-carved arches ornamented with emblematic figures. It was begun in the reign of HENRY II. and finished in that of RICHARD I., and its architecture shows the transition in styles from Norman to Early English. At each of the corners was a turret, one of which still exists, arcaded and surmounted by a spire. Underneath the chapel are the remains of a twelfth century crypt, which was discovered in 1825. In the same year a well on the south side of the crypt was discovered.

Of the rest of the great church, once the most magnificent in the kingdom, there now remain only three bays of the south nave aisle, an eastern bay of each transept, the massive eastern piers of the central tower, and one of the eastern chapels of the northern transept; the south wall of the choir with its five windows is also complete. But this only gives some idea of the beauty of the perfect whole.

Of the monastic buildings, one of the most perfect ruins is that of the Abbot's kitchen, which was erected at the end of the fourteenth century, built entirely of stone and having a pyramidal roof in the shape of an octagon crowned by a double lantern.

---

* See Illustration.

At each corner of this kitchen was a large fireplace, having a chimney over it. The roof is supported on the inside by eight curved ribs, and has eight louvres for letting out the steam. Inside the outer lantern was a smaller one wherein was hung the bell that used to call the poor to the almonry.

Another of the monastic buildings still almost intact is the abbey barn, which stands at the corner of Bere Lane, on the Pennard Road, and is 93 feet long by 63 feet broad and 36 feet high. This was used for storing the grain supplied by tenants in lieu of rent. The windows still show some rich detail, and at the extremity of each gable is a carved figure, one representing the Virgin Mary, and the other the abbot who built the barn.

## LLANDAFF CATHEDRAL.*

By S. Bowen Williams, M.S.A.

(*Continued from last week.*)

In spite of a few repairs made after the Restoration the building went from bad to worse. The south tower was roofless, the battlements of the north tower fell through the nave roof, and about 50 feet of the nave itself fell. In this state it was nothing but a picturesque ruin. The Lady chapel was best preserved, and the services were held in this portion of the cathedral. The choral services were, however, discontinued after 1691, and the choir disbanded. About this time it was suggested that the see should be moved to Cardiff, but fortunately this was not done. But in 1732 it was decided to call in a Mr. Wood, of Bath, to advise and estimate the cost of restoration or repairs. His report was a remarkable one, and as a result there arose one of the most extraordinary perversions ever seen in an English church. Deeming the existing building hopeless, he proceeded to erect within the roofless walls another church, and what a church! His building was of Classic or Italian design with pedimented front, and produced the most incongruous effect it is possible to imagine. The hideous anomaly of a badly designed Classic temple rising amidst the ruins of a Gothic cathedral can better be imagined than described. A sketch of its appearance is to be found in Freeman's History of the Cathedral, and is well worth seeing, as exhibiting to what a low ebb the national taste had descended, and also the pitiable state of the original church.

This church of Mr. Wood's occupied the presbytery, choir, and nearly half the nave of the cathedral. The Gothic details were covered with plaster and generally misused.

The south tower had become dangerous and was taken down for the greater part.

This then is the state to which the splendid fabric of the fourteenth and fifteenth century had descended: the original church in a miserable state of decay and neglect, and Mr. Wood's monstrosity rising inside it. And so it remained until nearly the middle of the nineteenth century. In 1835 the Precentor had the east window of the Lady chapel restored. Mr. Wood had cut away the stone tracery and inserted a wood window in its place. Later on the Rev. Bruce Knight, the first dean since the twelfth century, began to move in earnest; money was collected, and as a first step the Lady chapel was restored. The Italian defamation was next taken down, and the choir, presbytery, and eastern portion of the nave, restored to some of its pristine splendour, was reopened on April 16, 1857. The choir of Gloucester Cathedral attended and gave the first choral service since 1691. Efforts to complete the restoration were not relaxed, and after a most excellent sermon by Bishop Wilberforce, a sum of nearly 3,000*l.* was at once subscribed. The repairs of the west end began, a new tower and spire on the south-west angle were commenced, and work went on continually until final completion in 1869.

The old cathedral had risen, phœnix-like, from its ashes, more splendid than before, a material example of the devotion of the people to their religion. Prominent in the movement were Deans Bruce Knight and his successors, Conybeare and Williams, and Bishop Ollivant, who laboured incessantly to this end. We must not forget, too, Mr. Pritchard, the architect, a native of Llandaff, to whom the restoration is a tribute and a record of the time and love he spent on it. He lies buried in the cathedral, and of him as of Wren it may truly be said, "*Si monumentum requiris, circumspice.*"

The restoration is one of the few which were not undertaken by the late Sir Gilbert Scott. It is the most complete and certainly one of the most successful. It was carried out in the most conservative manner, and all the original work has been preserved wherever possible. The only really new portion is the tower and spire at the south-west angle. The original tower had been completely destroyed, and this new tower and spire which replaces it is a particularly happy conception and one of the finest pieces of work of modern times. Taken as a whole the restoration reflects the greatest credit on all concerned. Other cathedrals may be, and are, far finer and more perfect, but none have ever risen so excellently after such hopeless ruin. The only comparison is the restoration of Lichfield, which was destroyed by the Cromwellians.

This then is briefly the history of the cathedral, and by no means an uninteresting history. I will now proceed to touch upon a few of the more important architectural features and such other circumstances as impress the mind or are deserving of recognition.

First of all its position. Lying as it does snugly ensconced under the side of a hill, and hidden from view if approached from the south or south-west sides, it occupies a most unique position; rarely do you find a cathedral so placed. Compare it with Durham Cathedral, towering majestically on an eminence overlooking the Wear, a landmark for miles around; or Salisbury, lying in the middle of a wide plain. Yet it always seems to me such an appropriate position for Llandaff Cathedral. Here we have not got a bold towering mass or a variety of steepled soaring towers which, as it were, compel the attention of the eye, but we have a church which seems conscious of its own modest pretensions, and so half reveals and half hides itself beneath a convenient ridge, leaving its beautiful spire to just indicate its whereabouts.

In my opinion few cathedrals are better placed. It seems to have grown in its present position like some organic part of the country around, and fits in its place just as much as the trees and hills.

Now to proceed to its plan. This is simple, very like an enlarged parish church. In fact, many parish churches could be mentioned which exceed it in size. It is long and narrow, with single aisles to nave and choir, but no transepts. Its length, exclusive of Lady chapel, is 200 feet, and its width between aisle walls is 70 feet. You see therefore that it is very small compared with some of the better-known cathedrals. The chapter-house is on the south side and opens off the aisle of the choir.

(*To be continued.*)

## ILLUSTRATIONS.

### CATHEDRAL SERIES, LLANDAFF.—WEST FRONT.

The description of Llandaff Cathedral is continued, and this view forms one of the series of illustrations.

### SKETCHES IN SOMERSET.

These sketches are part of a series by Mr. John Th. Westbye, which we shall continue in following issues, and of which the article on Wells and Glastonbury, also by Mr. Westbye, is explanatory.

### COMPETITION DESIGN FOR BERKSHIRE COUNTY COUNCIL OFFICES READING.

This design, by Mr. T. Lawrence Dale and Mr. A. G. Horsnell, is one of the many submitted in this competition, which, though containing good work, were not fortunate enough to gain a premium.

---

* See Illustration.

## HOUSING AND TOWN PLANNING.*

THE author, in commenting upon sections 1 to 9 of the Housing Acts, which deal with the facilities for acquisition of lands for the laying-out of roads and the housing of the working classes, expressed the hope that district councils would not embark in any building schemes which involved speculation with the ratepayers' money unless they were thoroughly satisfied that the schemes could be carried out without a charge upon the rates. Otherwise, he suggested, it would be very unfair to ratepayers who were erecting houses in competition, or who had already made proper provision for the housing of labourers working on their estates. The stipulation that the arbitrator was to act on his own knowledge and experience must appeal, said Mr. Willmot, to all members of the Surveyors' Institution, and would lead them to hope that practical valuers might be appointed to those posts, although that was contrary to what was stated by the President of the Local Government Board in the House of Commons. The arbitrator might not, except with the permission of the Board, hear counsel or expert witnesses, which made it all the more necessary that a practical valuer should be appointed. In any event it was to be desired that permission for seeking the advice of those who were qualified to express an opinion as to value would not be withheld from the arbitrator. In the case of closing and demolition under Part II. of the principal Act, they had a simplified process, as, instead of an order being made by a court of summary jurisdiction with an appeal to Quarter Sessions, an order could now be made by the local authority with an appeal to the Board. The author of the paper could not find that any procedure was set out for the issue of a closing order by a local authority. Section 17 (3) provided for service of notice on an owner; he should, however, have proper notice that a closing order was being considered, and should be given an opportunity of conferring with the authorities, and time should be allowed him to carry out any works which he might be prepared to do to meet the necessities of the case. The prohibition of back-to-back houses was one, he said, which must commend itself to all surveyors. There was no doubt that the erection of that class of house, except in cases where side ventilation was provided, had been a great factor in the creation of slum property. The stipulation that such houses might be erected if the medical officer of health certified that the rooms in the houses could be properly ventilated, would provide a safeguard for those cases in which circumstances might make it permissible to erect that class of house. Section 44, which empowered the Local Government Board to revoke by-laws as to new streets and buildings which in their opinion impeded the erection of houses for the working classes, would, Mr. Willmot suggested, be of great value in cases where the by-laws of a local authority provided for the construction of streets of so costly a nature as to impose a heavy charge on the land which had to be recouped out of the rents of any houses erected upon it. In many instances the by-laws as to the construction of new streets might be relaxed without putting the local authority into any worse position as regarded the maintenance of the roads. In some, indeed, he thought it would be desirable to relax the building by-laws, but he had not found that they pressed so hardly on the provision of cheap houses as did the by-laws relating to the construction of roads. The effect of the new definition of "cottage" was to increase the size of a garden from half an acre to one acre, and the limitation as to annual value was removed. Mr. Willmot, in commenting on Sections 54 to 67 of the Act, said it would be useful to consider what was meant by "town planning." The Act, he said, sets out that the general object of "town planning" was to secure proper sanitary conditions, amenity and convenience in connection with the laying-out and use of land likely to be used for building purposes, and of any neighbouring land. To secure that object, he considered, it will be necessary in preparing schemes to provide for the laying-out of land for housing purposes so as to secure the best results to the persons who will live in the houses, without having regard to the interest of any particular landowner, care being taken that in every scheme wide through main thoroughfares be provided with recreation grounds, open spaces, and small playgrounds for children, and intermediate roads so graded as to be only of sufficient width and strength to serve the purpose of affording means of communication to a limited number of houses per acre. The laying-out of the main thoroughfares should be arranged so as to allow of quick and cheap means of transit from the populous districts to the locality dealt with by the scheme. The next point to be considered was in respect to what land a scheme might be made. The words of the Act, as set out in Section 54, were wide, and most land round towns might reasonably be considered to "appear likely to be used for building purposes" at some time or other; and the fact that where land, although not likely to be built upon, was so situate with respect to any land likely to be built upon as to be essential for the carrying out of a scheme—it might be included in the scheme—should remove difficulties in dealing with large areas. The question of whether land was likely to be used for building purposes or not was left to the Board, whose decision was final. It was to be hoped that no narrow interpretation would be imposed which might prevent the laying-out of schemes to provide for through means of communication, a matter which was of the utmost importance. If this could be provided for, the development of intervening land might reasonably be left to individual effort under the general supervision of the local authority and the Board. In this country few opportunities could occur for laying out an entirely new district; most schemes would deal with land round a town, in which case all the circumstances would have to be taken into consideration and regard paid to existing highways. The proviso in Section 54 that a local authority might adopt a scheme prepared by one or more landowners was a most useful provision, of which full advantage should be taken. In the case of a large estate, a scheme, if approved by the local authority and the Board, would permit of the development of the estate on town planning lines, whereby the disadvantages that landowners now have to contend with in complying with local by-laws as to the construction of roads would be mitigated, the by-laws being relaxed to meet each individual case. In the same way a scheme by a number of landowners for the development of intermixed estates would provide for the development of the particular properties on the same lines. He hoped that in practice it would be found that schemes would be largely initiated by landowners, who by combination and agreement could more expeditiously and conveniently secure the ends in view than it was possible for a local authority to do by the use of compulsory powers. The provision of an appeal to the Local Government Board, in the event of a local authority not approving a landowner's scheme, was of great value. Section 55 gave the Board power to prescribe a set of general provisions for carrying out the general objects of schemes, but it did not appear to be obligatory upon them to do so. Regulations would, however, be urgently required, and it was to be hoped would be issued at the earliest possible moment. The regulations would act in much the same way for the Act as the Lands Clauses Act did in matters of compensation and the taking of land compulsorily, and would define and regulate the matters set out in the section and in the Fourth Schedule. The Board had to prescribe special provisions for each scheme, defining among other matters its area, and the authority who were to be responsible for carrying it out and (subject to either House of Parliament not objecting) suspending statutory enactments and by-laws.

That was a most important provision, as to his mind the success of town planning was largely dependent upon the relaxation of by-laws relating to street construction. Unless the cost of road-making can be reduced there appeared to be little prospect for the successful laying-out of estates on town planning lines; in many cases the expenditure that might reasonably be saved on road-making would be sufficient to cover the value of land given up for open spaces and to meet any depreciation in value of the building sites which might arise from a restriction being placed on the number of houses to be put up per acre. The Board might also make regulations for regulating the procedure applicable to the preparation and adoption and carrying out and enforcing a scheme. It would be convenient to have these regulations at once, as little could be done towards preparing a scheme until they were issued. One of the most important matters to be dealt with in each scheme by regulation would be the details to be specified in the plans, including, where necessary, the restrictions on the number of buildings which might be erected on each acre and the height and character of those buildings. The restriction on the number of buildings to be put up on a particular property might in some cases inflict hardship on a landowner and involve him in considerable loss, but in the majority of cases any depreciation in value caused by this restriction would, he thought, be fairly met by the power that was given to relax by-laws permitting of the construction of cheaper roads. The capital outlay would in consequence be much less, so that although the land would realise a lower rate per acre, the return to the landowner should be much the same. In the case of large estates any difference in value would be further met by the better demand there would be for land lying at a greater distance from populous places than the land to be dealt with in the scheme. Under the old conditions this outlying land would probably not be utilised for building purposes for many years. Under new conditions with successful town planning a much larger area should be brought into the market. The question of the restriction on the height and character of the buildings was an important matter. In cases where a scheme provides for the erection of small houses it was probable that the numbers would vary from twelve to possibly eighteen per acre, and when the land was used for that purpose he did not think any hardship would be inflicted by regulating the height of the buildings. On the contrary, it seemed a very useful provision, as it would prevent the erection of high tenement houses, a practice which had been carried out in Germany without giving satisfactory results. The question of prescribing the character of the buildings raised a much wider issue. It was intended, he concluded, that a scheme might prescribe whether houses, shops, public buildings, warehouses, or factories, or which of them, were to be allowed, and the area and position of the land included in the scheme which was to be devoted to each class of buildings. If this could be done the power should be exercised with great care, as undoubtedly hardships to an individual might be caused by obliging him to use his land for a purpose for which it was not well fitted. The Act precluded such an owner from obtaining compensation under this head. It was, of course, necessary for the amenities of a town planning scheme that houses and commercial buildings should not be erected indiscriminately. A scheme should be so devised as not to inflict a hardship on an owner in respect of which the Act precluded him from compensation. The proviso that the Board might make regulations for securing conferences with the landowners, and for hearing objections before the approval of a scheme, would give all owners full opportunity of laying their views as to the restriction on buildings and other matters before the authority, and they would also have a further opportunity to lodge objections to the approval of the scheme by the Board. The power of the responsible authority to enforce a scheme seemed to be limited to the removal, pulling down, or alteration of any building or other work which was in contravention of the scheme, and to executing any work which it was the duty of any person to execute under the scheme. The authority did not appear to have any power under this part of the Act to make roads and put up houses as they could under Part I. of the Act. It might happen, however, that they might have to construct roads which it was the duty of some person to execute under the scheme, and which he had neglected to do. No directions were given in the Act as to when a building or work which contravened a scheme was to be pulled down; the carrying out of a scheme would take time, and in many cases it might not be necessary to remove a building until its completion; provision to provide for this should accordingly be made in schemes where necessary. By Section 58 any person whose property was injuriously affected by the making of a town planning scheme was (with certain limitations) entitled to compensation from the responsible authority. The words of the section appeared to have a somewhat wider application than Section 63 of the Lands Clauses Act, and did not appear to limit the payment of compensation to property situate within the area of the scheme; no one could, however, obtain compensation for anything done on land included in the scheme after the time at which application for authority to prepare the scheme was made, or such other time as the Board might fix. The preparation and completion of the scheme would probably take some time, during which an owner must either postpone the development of his land or carry out the works at his own risk. The Act provided for payment of "betterment" to the responsible authority in respect of any property that was increased in value by the making of a scheme. The amount the authority could recover in respect of such property was one-half the amount of the increase. Many questions as to whether lands were injuriously affected or increased in value by the operation of a scheme were certain to arise. All such matters were to be determined by the arbitration of a single arbitrator appointed by the Board, unless the parties agreed on some other method. The proviso that where a scheme was revoked any person, who had incurred expenditure for the purpose of complying with the scheme, should be compensated so far as the expenditure was rendered abortive by the revocation of the scheme, did not appear to the author to go far enough. An owner should also be entitled to compensation on revocation of a scheme for any loss of income he might have sustained by reason of having been precluded from dealing with the land in any manner he thought fit during the time the scheme was in force. He could conceive it possible that restrictions might be imposed by a scheme which would make it impossible for an owner to deal with his land, and if the scheme was ultimately revoked, an owner should in such case be entitled to receive from the authority compensation in respect of the loss that he had incurred by having been forced to hold up his land. Local authorities could purchase by agreement or compulsorily any land comprised in a scheme. The procedure for compulsory purchase was the same as in Part I. of the Act. It was not quite clear in what way the authority could deal with the land. The general provisions prescribed by the Board include "dealing with or disposal of land acquired by the responsible authority or by a local authority"; these might possibly authorise the authority to lay out streets and deal with the land for building purposes. In all cases where the Board were authorised to determine matters they could act as arbitrators or otherwise. If they determined the matter as arbitrators the provisions of the Regulation of Railways Act, 1868, and its amendments were to be applicable. It appeared to be open to the Board under this part of the Act to appoint an arbitrator to act on their behalf.

---

* A summary of a paper on the "Housing and Town Planning Act," read by Mr. John Willmot before the Surveyors' Institution on Monday evening last, Mr. A. R. Stenning, president, in the chair.

In conclusion, he said the terms of the town planning part of the Act were so very general that it would be difficult to predict how it would work, but he had no doubt that it would form the basis of a good working arrangement between landowners and local authorities, and it was with that hope that he commended it to the members of the Institution, feeling sure that they were in agreement with anything which would conduce to the better laying out and development of land, as being to the advantage of those for whom they act and of the community at large.

Mr. H. Chatfeild Clarke, who proposed a formal vote of thanks to the author of the paper, said they were extremely indebted to Mr. Willmot, one of their busiest members practising in the Midlands, for presenting the Act to them in such a simplified form. The Act seemed to be well framed, and proper provision appeared to be made for compensation and for appeal on the various points which might arise.

Mr. Richard Fowler (Birmingham) seconded the motion.

The President said the Council had arranged that the discussion of that evening's paper and the one contributed by Mr. Davidge should take place on January 24. Mr. William Woodward had promised to open the discussion on that occasion, and Mr. Speaight and Mr. H. V. Lanchester, who would also take part in it, had offered to illustrate their remarks with lantern diagrams and views.

Messrs. Raymond Unwin, H. Griffin, and W. F. Craies supported the vote of thanks, which was passed by acclamation, and the meeting then terminated.

## THE ACADEMY WINTER EXHIBITION.

The fierce and rather undignified controversy that was raised last year when the Royal Academy Winter Exhibition was given up to the modern works purchased for the collection of Mr. George McCulloch made it inevitable that the exhibition for 1910 should follow conventional lines. There is no reason for supposing that the Council ever intended to make last year's departure from tradition the first of a successive series of similar exhibitions. The conditions were peculiar and justified an unusual course of action. Many bitter and justifiable complaints are constantly raised as to the glorification of dead painters at the expense of living ones. Consequently, the example of a wealthy collector, who showed his love of art not by the purchase of a few world-famous Old Masters, but by the encouragement of his contemporaries alone, called for some recognition. The exhibition also served to show the purchasing public that their patronage of living artists could be something in the nature of a profitable investment. Mr. McCulloch was not, of course, an adventurous patron, for his taste was strictly orthodox and he was probably helped by the advice of artists who had little sympathy with experiments. But in its own way his collection admirably reflected the work of an all-important section of modern painting.

The latest exhibition at Burlington House must serve as a reassurance to any who feared that the winter shows would degenerate from their usual high standard. In the first five galleries and in the Water-Colour Room there ıré nearly two hundred works by old masters and leceased masters of the British school; while in the Black-and-White Room there hangs a small collection of ɔictures by the late Mr. E. J. Gregory, R.A.

Giovanni di Paolo, the painter of the first picture on he walls, has been called a master of the "marvellous mongrel style," which overspread the School of Sienna when in the fifteenth century realism began to assimilate with the qualities which had made the school famous. In his *Annunciation* the artist was at some pains to introluce into the foreground rabbits playing in foliage, in the eft of three horizontal divisions, and in the right St. Joseph warming his feet and hands at a fire. The centre shows an open Gothic loggia with the Virgin and the ngel both with arms humbly crossed on their breasts. Presumably the *Madonna de' Talenti*, which hangs next, s an earlier production of the school, although in many haracteristics it might be a comparatively modern nasterpiece. It lacks altogether that crowded composition which marks most of the early works. The panel is exclusively occupied by the Virgin and Child seated on great throne. Round her golden nimbus is embossed ' Ave Maria Gratia Plena," and in her cloak is a jewel. The dignity of the whole seems to be heightened by the Child in her lap, who is, it should be observed, not nude, out lightly clad. This picture offers an interesting conrast with the circular *Virgin and Child* by Botticini near oy. Here as much, or more, space is given to the andscape setting as to the figures. The former was erhaps the contribution of an assistant, who sought to btain dignity by representing the country as sown with niniature castles. Sandro Botticelli, like del Sarto, s represented by only one picture—the Virgin seated nder a marble Renaissance canopy, with the Child tanding in her lap. There is an irresistible loveliness n Andrea del Sarto's *Virgin and Child and St. John*, n which all the artist's genius was lavished on the three mall figures. There is no landscape background to disract attention, as in some of his works, for the beautiful oung Madonna stands out against a gilded setting. nother industrious artist whose skill can be gauged by nly a single work, and in this instance it is a mediocre ne, is Leonardo da Vinci.

In Gallery II. are the three works ascribed to Titian. The first is a *Portrait of Sansovino*. This sculptor-archiect first went to Venice after the sack of Rome in 1527. Titian, who was ten years his senior, had for a long ime been accepted as the greatest painter in Venice. Sansovino, according to Vasari, "in his age had an xceedingly venerable appearance; with his beautiful hite beard he still retained the carriage of his youth; e was strong and healthy even to his ninety-third year, nd could see the smallest object at whatever distance, ithout glasses, even then." His recorded affection for andsome clothes is not emphasised in the portrait, for e wears a suit of solemn black. Titian may have elieved that his subject's facial expression was of greater nportance than his white beard; the general effect is at of a shrewd, busy, and business-like architect whose houlders have become rounded by unremitting toil at the rawing-board. Although he is leaning with his right and on a table, the painter did not take advantage of ne opportunity to introduce any roll of plans or statuette s indication of his dual calling. It is a long stride from itian to Murillo. By the Spanish master there are vo large canvasses; the first is *St. Augustine of Hippo*, kneeling figure of the bishop, and the other is *The aralytic*. We believe that the latter was one of the ght large pictures painted by Murillo for the Hospital St. George in Seville about 1670, and the majority of hich are now dispersed. The handling is strong and mple; one half of the foreground is occupied by the upght figures of Christ and three disciples with the paratic at their feet; to the right is seen the architectural irroundings of the Pool at Bethesda. Murillo was inebted to Velasquez for much help in his days of ruggle, but the three examples of the latter artist sugest that the younger man became the better painter. In *ur Lady of the Immaculate Conception* Velasquez had a great theme. Pope Paul VI. in 1617 publicly affirmed the doctrine which was one of the most discussed by theologians. The artist may have felt little enthusiasm in the matter; a homely Virgin clad in purple and blue drapery stands sadly on a crescent moon, with a diadem of twelve stars, in accordance with the well-known passage in the Apocalypse of St. John (chap. xii. 6). Another of the pictures shows St. John writing the Apocalypse in a wood. The third—*The Steward*—might have been painted to suit the whim of some wealthy patron, for the subject could have offered little attraction to such an artist.

The Water-Colour Room contains a curious assortment of pictures, chiefly of the Dutch and Flemish Schools. There are four single portraits by Franz Hals; the first was a sitter after his own heart, *Hille-Bobbe of Haarlem*, a half-length of a coarse old fishwife hugging a drinking vessel with both hands. The remaining three are of more respectable types. Among other artists represented in this room are Gerard Dow, Albert Cuyp (3), Nicholas Maes (3), Teniers (3), and Holbein (2).

Gallery No. III. is chiefly occupied with the more modern works of the Winter Exhibition. They include four characteristic portraits by Gainsborough and one of his landscapes; prominent among the former is the full-length of Sir Charles Morgan, Bart., in the grand manner. Neither in *Sheerness* nor the *Harbour of Dieppe* is Turner seen at his best; but his Venetian scene is a more creditable specimen. The full-length of *William II. of Orange* as a boy is as remarkable for the fact that it was painted by Albert Cuyp when he was no more than eighteen years old as for its vivid presentment of the youthful royal sportsman. The *Portrait Group* by Jordaens is accepted as one of the greatest works by that unequal master, and as even bearing favourable comparison with any picture by Rubens, his fellow pupil and life-long friend. The composition with its two figures contains many features seen in his other portraits. Of a very different character, though no less typical, is his *The King of Twelfth Night*, which is marred by the exultant grossness of all the thirteen figures. There are six portraits by Vandyke, none of which are of particular importance. His large equestrian portrait of *Duke d'Aremberg* bears the closest possible resemblance to the same artist's equestrian portrait of Charles I. in our National Gallery. Three out of the twelve portraits by Sir Joshua Reynolds are in Gallery III. The claim that "his children have all the artless graces of childhood, his women are lovely," is fully borne out by the first two, and that "his men are endowed with dignity" is also seen by the bust portrait of himself. Some of the nine, however, appear lacking in vigour, if it is not heresy to say so. There are two anonymous portraits by Rubens, together with an extraordinary *Landscape with Boar Hunt*, which must surely be one of the many works to which the artist's name is erroneously attached.

Of Sir Henry Raeburn, R.A., a critic wrote many years ago, "His portraits were distinguished by great breadth, and marked by great individuality of character and truthful expression, but they were simply portraits and do not possess any high interest as works of art." With the latter opinion there will probably be few visitors in agreement; the six portraits contributed are certainly splendid portraits above everything else, but they are much besides, and it is difficult to know which to admire most. The three Romneys include a large canvas, *The Beaumont Family*, containing five full-length life-sized portraits in an uncompromising direct fashion.

It is curious to step out of the Water-Colour Room, filled with Flemish and Dutch masters, into the Black-and-White Room, which is given up to oil-paintings and water-colour drawings by the late Mr. E. J. Gregory. The abrupt transition is not fair to the deceased Academician, whose modernity is made to look "cheap." The pictures are in themselves of the pleasantest, with their wholesome frankly English spirit and joyousness. Yet they are overpowered by the weight of the remainder of the pictures in this Winter Exhibition. It has been said that Mr. Gregory lacked artistic personality and was seriously handicapped by his facile dexterity in adopting the moods and manners of his contemporaries. The present small collection seems certainly too much in the nature of a charming picture-book designed to while away an hour of idleness and painted under the spell of happy thoughts.

## NORWEGIAN v. BRITISH GRANITE.

THE following correspondence is interesting and instructive:—

GRANITE.

Sir,—After reading your letters to a working man on the political situation, just published in book form, I am writing you as a worker interested in the British granite industry with regard to one point contained in your letter No. VI. on page 47.

You state that "the contractors could not obtain Cornish granite of proper quality and in sufficient quantity to complete work in time. Contractors submitted samples of Norwegian granite, which was substituted for Cornish. The value of the British granite was 760*l*., of foreign 76,500*l*."

I submit to you, sir, that the delay was caused chiefly by the officials at first taking too literal an interpretation of the specification with regard to workmanship on the Cornish stone, and considerable time was lost until the matter was finally adjusted to enable the granite merchants to proceed with the supply.

Now, with regard to the 760*l*. worth of British granite.

The quantity of granite supplied from the home quarries was close on 100,000 feet cube. If the Admiralty got it for the amount mentioned I am sure the taxpayers can congratulate themselves; but no, sir, I fear there must be some mistake, because the foreign granite did not cost 76,500*l*., nor anything like it.

As I feel quite sure this is a clerical error, I point it out to you so that you may have an opportunity of correcting it publicly, seeing the amount of publicity which has been accorded your letter.

I trust you will give this your prompt attention.—I am, sir, your obedient servant,

(Signed) JAMES CLAYTON.

To Dr. Macnamara, M.P., House of Commons, Westminster, S.W.

---

Dear Sir,—In reply to your letter of the 22nd ult., with reference to the granite used in the construction of Chatham Dock, I write to say that the statement which I made in my pamphlet, though necessarily compressed, was based on information obtained from official sources. Permission to use Norwegian granite in place of Cornish was granted because the contractors satisfied the Admiralty that, in consequence of the exceptional activity in the Cornish granite trade at that time, it was not possible to obtain from the Cornish quarries a supply adequate in quality and quantity to complete the work within the specified time. I would remind you that at this time large orders were on hand for Admiralty works at Gibraltar, Keyham, and Dover, and also for the Great Western Railway Company and other big companies.

The impossibility of obtaining the necessary supply in time was confirmed by one of the principal Scotch quarry-owners, who was consulted on the subject.

The decision to allow the use of foreign granite was not dependent on the officials taking, as you suggest, too literal an interpretation of the specification with regard to workmanship.

I do not know what authority you have for the statement that 100,000 cubic feet of British granite were supplied to Chatham.—Very faithfully yours,

(Signed) T. J. MACNAMARA.

To James Clayton, Esq.

---

Sir,—I thank you very much for your courteous letter of the 10th inst. *re* granite supply at Chatham Dock.

You ask me what authority I have for the statement that nearly 100,000 cubic feet of British granite were supplied to Chatham.

In reply to this I have to say that my figures are obtained direct from the Cornish granite merchants who undertook the supply.

They show that they supplied 89,990 cubic feet from British sources. This quantity was obtained principally from their Cornish quarries, a small portion only being sent from Aberdeen.

The total quantity required in the new dock was 262,440 cubic feet, so that the balance left to be obtained from Norway was 172,450 cubic feet.

Putting your relative values against the granite merchants' quantities, the result appears as under:—

British granite, 89,990 cube feet supplied, value 760*l*.; Scandinavian granite, 172,450 cube feet supplied, value 76,500*l*.

Seeing that it is an accepted fact that British granite is quite unable to compete in price with Norwegian, then you will understand why I am writing you to point out this discrepancy.

The publication of your letter and booklet containing this statement is most damaging to the British granite merchants, and I feel sure that with the actual facts before you, you will not hesitate to admit the injustice done to an industry which is suffering intensely from foreign competition.

Thanking you in anticipation for the favour of your further attention to this matter.—I am, sir, your obedient servant,

(Signed) JAMES CLAYTON.

To Dr. Macnamara, M.P.

---

Sir,—In reference to my letter to you dated December 15 last, *re* granite supply at Chatham Dock, I shall esteem it a favour if you will let me know whether you are yet able t substantiate your figures giving the relative values of British and Norwegian granite used in the Chatham Dock.

I may say that a very considerable amount of political capital is being made out of your statement, particularly i the West of England, to show that the home quarries entirel failed in the supply for the granite, and I hesitate to mak any correction until you have had ample opportunity o justifying or amending your figures in face of my last letter.

Thanking you in anticipation for a prompt reply, an wishing you the compliments of the season.—I am, sir, you obedient servant,

(Signed) JAMES CLAYTON.

To Dr. Macnamara, M.P.

---

Dear Sir,—In reply to your letter of the 15th ult., I hop I need not say that nothing was further from my intentio when I wrote my little book than to make any statement calcu lated to damage the British granite or any other Britis industry, and I could wish that Tariff Reformers were alway as careful.

As I have already told you, the contractors for Chatha Dock represented that it would be impossible at that tim to supply the granite required from British sources withi the specified time. This was confirmed both by Cornish an Scotch granite merchants, and the contractor was allowed t substitute foreign granite for British granite, provided tha it complied with the Admiralty specification. As foreig granite was at that time cheaper than British—although th difference in price was not as considerable as it has sin become—no further inquiries were made as to the source fro which the granite was obtained after the contractor had bee given leave to supplement his British supplies from foreig sources, and the Admiralty merely took the necessary ste to insure that all the granite used in the construction of th dock came up to the required standard as regards durabilit and finish.

I have, however, had further inquiry made, and I no find that though the contractor was given this option, he w eventually able to obtain, roughly, a third of the grani required from British sources.—Very faithfully yours,

(Signed) T. J. MACNAMARA.

To James Clayton, Esq.

## THE PROGRESS OF DESIGN IN PAPERHANGINGS.*

ALTHOUGH paperstaining is found to be a recognis trade in France in 1586, yet it was not until 1692 th we find any record of English paperhangings, and that was consequence of the granting of a patent to William Bayl of that date in the time of William and Mary. To quo from the "Encyclopædia Britannica":—"Wallpapers d not come into common use in Europe till the eighteenth ce tury, though they appear to have been used much earlier the Chinese. A few rare examples exist in England whi may be as early as the sixteenth century; there are imitatio generally in flock of the fine old Florentine and Genoese c velvets, and hence the style of the design in no way sho the date of the wallpaper, the same traditional patterns being reproduced for many years with little or no change."

---

* Abstract of a paper read on Monday, the 9th inst., by Metford Warner (of Jeffreys & Co.) before the Incorpora Institute of British Decorators.

The designs used for the earliest English paperhangings were largely influenced by the velvets and damasks of an earlier period and also by the importation of the Chinese paperhangings during the reign of Queen Anne, 1702-1714. At that time the manufacture of paperhangings was so well established that they had to contribute to the revenue by the imposed duty of 1¾*d.* per square yard.

It was with a view of introducing paperhangings of a different type to this that a Mr. Jackson, of Battersea, who was printing wallpapers at that period, urged the reproduction of the most celebrated classic subjects, statues and landscapes, in preference to imitations of Chinese papers. Instead of flowing patterns covering the wall, his designs were pictures, landscapes, architectural scenes or statues treated on panels with plain paper or painting between. They were all in the worst possible taste, and yet were offered as a great improvement on the Chinese papers. Mr. Jackson says that by the use of his paperhangings, "The person who cannot purchase the statues themselves may have these prints in their places, and thus effectually show his taste. 'Tis the choice and not the price which discovers the true taste of the possessor and thus, the Apollo Belvedere, the Medicean Venus, or the Dying Gladiator, may be disposed of in niches or surrounded with a mosaic work in imitation of frames, or with festoons and garlands of flowers, with great taste and elegance, or, if preferred, landscapes after the most famous masters may be introduced into the paper." Notwithstanding all Mr. Jackson's efforts to counteract the tendency to Chinese design, it continued to have a great influence.

A Mr. Taylor, who at that time was an eminent manufacturer of paperhangings and who visited France, reported on his return that he found the French paperhangings very inferior to our own both as to execution and beauty of design. We had at that time an extensive export trade in paperhangings with America and other foreign parts.

The influence of Chinese ornament was very marked, both in France and England, and the practice of sending out costly presents to China from both nations and receiving valuable gifts in return fostered the fashion. Among such was the Gobelin tapestry which Louis XV. sent out with a deputation to the Emperor of China, and was retaken by the French in the looting of the "Summer Palace" in 1860. In London there is at the present time one of the finest examples of Chinese paperhangings. It was brought over to England by Lord Macartney, the first British Ambassador to China, who returned in 1792 and presented this set of painted papers to Mr. Coutts, the banker. They remained as the decoration of the drawing-room at Coutts' Bank, in the Strand, until 1905, when they were taken down and placed in their new buildings opposite Charing Cross station. The space covered by the decoration is about 20 feet by 30 feet and 12 feet high.

In 1786 George F. Echardts established a manufactory at Chelsea, where he produced works of great excellence. Only part of the design was given by printing, the rest put in by artists specially retained assisted by more than fifty young girls.

Simultaneously with the establishment of the Chelsea works, Mr. Sherringham commenced the business which he so long carried on with remarkable taste, skill and energy in Great Marlborough Street. He is described by Mr. Contan as the Wedgwood of paper-stainers. He secured the talent of some admirable foreign artists (La Briere, Boileau, Louis and Rosetti) and infused the highest beauty and grace into the artistic department of his trade. He was the first to produce what are known as Arabesque papers with any degree of excellence.

Mr. Digby Wyatt also says, "We are induced to believe that the establishment of Mr. Harwood, an equally eminent promoter of this manufacture, might be dated even earlier than the two to which we have just referred," and speaks of him as a man who possessed a large capital, and purchased a business which had for some time been established at Chelsea.

The excavations of Pompeii, commencing in 1755, had a great influence on the designs of the latter part of the eighteenth century, influencing the later designs of Louis XV. and more or less the whole of Louis XVI. period in France, and finding expression in England in the architecture of Robert Adam and the furniture of Chippendale.

Towards the end of the eighteenth century the French began to excel in this particular branch of art, which with us had fallen on barren ground. Their manufacture was encouraged by the French Government, and Mr. Zuber of Reinheim (the celebrated French paperstainer) said, in a lecture which he delivered in Mulhausen, in 1851, "Towards the end of the last century, about 1780, the manufacture passed from England into France." At this time the importation of paperhangings into England was entirely prohibited. (It was not permitted until 1825.) And our paperhangings were also subjected to a tax so onerously applied that before the adoption of continuous paper each piece composed of twenty-four sheets received on its back twenty-four stamps with two more to mark the two ends, the duty on each piece being 1*s.* 4*d.* in addition to the tax on the paper itself, and an annual payment of 20*l.* for a licence.

Although English manufacturers were thus reaping the pecuniary benefit by the prohibition of foreign wallpapers, yet they were in a great measure unaware of the progress which which was being made in France, and they continued to strike after the effect of silks and other materials rather than strike out in a new direction. That paperhangings were in vogue and that they were used in the highest class of decoration, is evident from notices of them which have come down to us from that period. Shelley in a letter dated 1811, speaks of his "quiet back sitting room, its walls papered with trellis, vine leaves and clustering grapes: an abode of enchantment."

In the year 1825 the prohibition of foreign wallpapers was removed and a duty of 1*s.* per square yard equal to seven francs per French piece was established. Mr. Zuber (the French paperstainer) who paid a visit to England says:—"My curiosity nevertheless led me to make an excursion to England for the purpose of seeing if it were possible to import at this rate of duty, and to my astonishment I found I was able to enter into considerable transactions. 'You beat us completely' was what I continually heard from the English dealers on showing our products. This state of things continued till 1834. Our importations at last pushed the English manufacturers into the improvement of their work, and at this latter date the English Government reduced the customs duty to one-half and took off at the same time the stamp duty on English-made paperhangings. Our business was not in any way augmented, but the English manufacture made such progress that in 1846 Sir Robert Peel made a new reduction of the import duty by two-thirds, *i.e.*, reduced it to 2*d.* a yard or about one franc per piece. A violent shock to the English manufacture followed, but a salutary effect was quickly produced on it. During the first year of the new regulations our importations doubled themselves; they however soon fell off again, but not before this heavy competition had impelled the English manufacturers to such exertions that now, with a duty of one-sixth of that of 1825, we find a difficulty in introducing merchandise to the same amount as then."

In 1837 commenced the printing of paperhangings by machinery, which was eventually to revolutionise the trade. It was introduced by Evans & Fisher, of Alder Mills, Tamworth, who, as paper-makers, commenced to make the paper in endless coils of some 2,000 yards in length, and then use it for their own printing, the designs used being formed almost entirely of simple lines. A marked change, however, came in design in 1843 and following years, when Augustus Welby Pugin designed the celebrated wallpapers for the Houses of Parliament, for Mr. Crace, the blocks of which are still in use and are now in the possession of Messrs. Cowtan. The Great Exhibition took place in 1851, and among the valuable records of it are the illustrated volumes of Sir M. Digby Wyatt, and in looking at these illustrations one cannot but be struck with the extent to which French design had been adopted by English manufacturers. It was also between 1851 and 1861 that Messrs. Scott Cuthbertson (who had acquired Hingcliffe's business) introduced the "raised flocks." As the effect obtained by flock entirely depends on flat treatment, the designs of Augustus Welby Pugin were peculiarly suited for the purpose. In 1854 Owen Jones brought out his grammar of "Ornament," and although he did not design for paperhangings until some years later, yet its publication had a marked influence on designers. In 1861 the duty on paper itself was finally abolished and the customs entirely removed, English and French manufacturers being placed (in England) on the same footing. A tremendous impetus was given to the machine-printed papers, which were already largely in demand, and with it came the call for designs especially adapted for machine printing.

The year 1862 is noticeable as the date when William Morris commenced to design his wallpapers, and his firm of Morris, Marshall, Faukner & Co. exhibited these with furniture and tapestries in one class, and stained-glass windows in another, in the 1862 Exhibition. A medal was bestowed on the firm for their work in either class. The "Trellis" was the first wallpaper he designed, and the "Daisy" the first published. The first series of Morris wallpapers, the design-

ing of which went on rapidly for several years (he designed between seventy and eighty wallpapers) "culminated in the favourite and beautiful pattern known as the 'Pomegranate.'" It was the blue colouring of this paper which Messrs Morris used as a background to their exhibit of furniture at the Franco-British Exhibition of 1908. Owen Jones' services as a designer and art adviser were now retained by Messrs. Jackson & Graham, and it was under his control that shortly before 1865, they completed the decoration of the Viceroy's palace at Cairo. For this work he designed a most elaborate series of paperhangings for walls, ceilings, friezes, dados and borders, based on Persian ornament, the colouring employed being blue, red, yellow, gold and white; the white and gold being used either for the grounds or for the lines falling between the colours. The character of design was such an entirely new departure in paperhangings that Jeffrey & Co. decided to show the French that English paperstainers were no longer under their influence, and in the Paris Exhibition of 1867 their chief exhibit was the Pilaster decoration by Owen Jones. The Owen Jones wallpapers appealed to a limited circle, but they were too severe in character to meet the public taste, and it was left to Dr. Dresser, who immediately followed in the wake of Owen Jones or worked on his lines, to give a greater popularity to the flat treatment of ornamenting. He not only went to Persia and the near East for his inspiration, but largely drew on Japan, whose wares were being more largely imported. He was in a great measure responsible for that unfortunate style of design in which, instead of a flower being treated in all the beauty of its growth, is ruthlessly dissected and has its parts laid bare and worked up into a pattern.

In Charles L. Eastlake's book "Hints on Household Taste in Furniture, Upholstery and other Details," the first edition of which was published in 1868, he acknowledged the valuable designs which had been prepared since Pugin by architects and artists, and produced by such houses as Woollams and Crace, yet he adds "The British public are, as a body, utterly incapable of distinguishing good from bad design and have not time to inquire into principles. But let customers once become accustomed to the sight of good forms and judicious combinations of colours and we may one day aspire to the formation of a national taste. To attain this end, however, the manufacturers (if any are to be found so disinterested) must first inform themselves of the best sources from which good designs may be originally obtained, because at present they seem to be derived from the very worst." It had its effect, and when Eastlake brought out the fourth edition, 1878, he was glad to find that his hope ten years previous had

[From *Der Profanbau.*

A PORTAL, LANDONVILLERS CASTLE.—Professor BODO EBHARDT, Architect.

been in a good measure realised, and among the illustrations was that of his own "Solanum" wallpaper which created quite a demand for that character of design. Also, in 1868, B. J. Talbot published his book on Gothic forms applied to furniture, decorations, &c., and eight years after he brought but another edition with illustrations of furniture, silk hangngs, and wallpaper decorations. His designs for wallpapers were numerous and the copies still greater. Many of Talbot's designs were influenced by Japanese art—and in fact Anglo-Japanese became at that time quite the fashion, finding expression in the furniture and wallpapers designed by E. W. Godwin, and the celebrated Peacock Room which J. McNeill Whistler decorated for Leyland. The influence of Japanese ornament was as marked at this period, both on French and English design, as the Chinese had been in the time of Queen Anne.

The Philadelphia Exhibition of 1876 was the occasion of further demonstration that English designers were holding their own against the world, and the award of the juries which accompanied the medal given to Jeffreys & Co. for the decoration specially designed by Walter Crane, stated it was given for "great excellence and chastity of design, connected with xceedingly harmonious colouring; altogether a most artistic xhibit of the large decorative effect which is possible with his material in the hands of a clever designer." English aperstainers made a good show at the Paris International Exhibition of 1878, both Messrs. Woollams, and Jeffreys & Co. exhibiting; and a gold medal was awarded to the latter for their exhibit, the chief feature of which was the embossed leather paper known as "Peacocks Amorini" by W. Crane, and the "Sunflower," in flocks, by B. J. Talbot. Both of these had a marked influence on the wallpapers of that day and since, the various versions of the Sunflower being used for all classes of materials.

It was not left to manufacturers to be alone the pioneers in improvement in wallpaper designs, but early in the 'eighties Messrs. Simpson brought out a special book from designs by Lewis F. Day, which obtained much favour with many leading architects and decorators, not merely from the originality of the designs, but from the success which attended their use as decorations. Previous to the "Simpson" patterns L. F. Day, in 1879, had brought out his "Instances of Accessory Art." It was at the same time that Mr. L. A. Shuffrey brought out his private patterns, which, again, not merely were a success in themselves, but had their effect on the designer.

In 1888 the Arts and Crafts Exhibition Society held their first exhibition. It was composed of artists, designers and craftsmen, who felt that up to that time the decorative artist and handicraftsman had little opportunity of displaying their work in the same sense as the pictorial artist, and they asked manufacturers who were striving after more artistic work to unite with them in forming an exhibition of designs and manufactured goods. The result was that many artists whose work would not otherwise have become known got into touch both with the public and the manufacturer, and both France and Germany recognised its service in stimulating originality (not whim or eccentricity) in design.

It was at the Arts and Crafts Exhibition of 1889 that C. F. A. Voysey made a large exhibit of designs for all classes of work, and there can be no question that his designs have had a great influence, not merely on wallpapers, but on carpets and fabrics of all kinds. At the Paris Exhibition in the same year a further satisfactory display was made of English wallpapers, including W. Crane's "Peacock Garden," and again the jurors recognised the progress made by awarding a gold medal. Anyone who recalls the pictures displayed at that exhibition will recall how satisfactory they looked against the rich flock paper designed by L. F. Day and coloured under the direction of Sir Frederick Leighton compared with the foreign galleries where the walls were blank and uninteresting.

These International Exhibitions held in London and Paris, and the Arts and Crafts Exhibitions led the French designer to feel that the time had come when he too must make a move forward. Up to this period he had been content to design in the classic French styles. The desire for something new brought about the "Art Nouveau" which was rampant in the Continental courts in the Paris Exhibition of 1900. The foreigner looked to the English exhibits for something emphatically new, and found it in the exhibit of Messrs. Essex, whose wallpapers were principally, if not entirely from Mr. Voysey's designs, and in Messrs. Jeffreys & Co.'s exhibit of "The Rose Bush," by Walter Crane, whose treatment of the subject sprang from his starting from nature but treating it as an ornamentist. The French designer took the motif from the English but so infused it with his own expression that he entirely lost any sense of nature from which the English design sprang, and in consequence produced in many cases a meaningless squirm. One of the results of this Paris exhibition has been a demand for less pattern and more plain surface. A little squirm goes a long way, and to some no squirm at all is more satisfactory still, and hence came the demand for little or no pattern. What could be better than a mere spot and a little scratch? So what need for the skilled designer and the enterprising manufacturer?

In Mr. Morris's lecture on the Lesser Arts of Life, he says, "Whatever you have in your rooms think first of the walls, for they are that which makes your house and home, and if you don't make some sacrifice in their favour you will find your chambers have a kind of makeshift, lodging-house look about them however rich and handsome your movables may be." It is just this lodging-house, uninteresting effect which is brought about where walls are treated with simple plain tints; it may be that they are pleasing in the first instance, but when the unavoidable finger-marks and rubs come and the pictures or prints get a little awry, the eye seeks in vain for the compensation which comes from a surface broken by pattern and colour such as can be found in a well-considered wallpaper.

Mr. LEWIS F. DAY said he had listened to the paper with very great interest as coming from one who not only was interested in his work but who knew all about it. To a great many people more than half the information given would be new. Although Mr. Warner had talked about the history of wallpaper, he had been rather quiet as to what he had done himself. Yet there was no one who had done so much for wallpaper manufacture as Mr. Warner; if it had not been for him English wallpapers would have never reached their present high position. The ultimate effect of the artist's design was partly dependent on the man into whose hands it fell. Many artists, who did the very best they could, had the mortification of seeing their work murdered in reproduction. But no one had ever grumbled at their treatment by Mr. Warner, and Mr. Day added that the most successful reproductions of his own designs had been those made by that firm. Mr. Warner might indeed be called the Wedgwood of the wallpaper world. No doubt everybody would like to have their walls painted by artists, but 999 people out of 1,000 had to accept wallpaper as a substitute; it was certainly the cheapest way of getting a comfortable effect. With regard to pattern, it should be noted that it is easiest to get beautiful tones in broken colour. Mr. Day, reverting to the lecturer, added Mr. Warner was the first to induce artists who had not previously done anything of the sort to design wallpapers for him. Among the instances given were Godwin, Burges and Walter Crane.

Mr. SHUFFREY expressed the opinion that a wallpaper is most suitably designed and is most satisfactory in a room when it takes the form of a background. That principle had of late been lost sight of; the designers had attempted too much and only produced a restless feeling which killed whatever was placed near it. Architects had notably lost all interest in wallpapers. It was to be hoped there would soon be a return to the two or three most suitable colours.

Mr. J. D. CRACE, the chairman, in concluding the brief discussion, said that no one possessed a more thorough knowledge of paper hangings than Mr. Warner, who had followed his occupation far beyond its mere hand to mouth demands. The earliest paper stainers were chiefly employed in producing papers with small patterns for the lining of books. An advertisement in the *Postman* 1702, showed that the sale of hangings had then become a business in London. In 1770 some 13,242*l*. was paid to the Government as duty on 255,731 pieces. Sixty years later the number of pieces had increased to 1,222,783; while in 1874 one single firm produced 12,000,000 pieces.

A vote of thanks was then passed.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* has issued a special number on "Apartment Houses," or residential flats as we should call them here, which, with an extensive collection of plans and views, gives a thorough insight into what is being done to-day in the United States in this class of dwelling, in which American architects have had far more experience than is obtainable in England.

*La Construction Moderne* has given us illustrations of the premiated façades in Paris for the year 1907. Nos. 44 and 46 Rue Bassano, by MM. Le Nevé et d'Hont; No. 124 Avenue Victor Hugo, by M. P. Humbert; No. 110 Boulevard Raspail, by M. Eugène Chifflot; No. 13 Rue de la Paix, by M. Auburtin. In its review of Old Paris, our contemporary now deals with the Gobelins quarter.

*Berliner Architekturwelt* gives, with an explanatory article, many illustrations of the work of the education department of the Applied Art Museum in Berlin. Other illustrations are principally of designs for public buildings by Berlin architects.

*Der Architekt* has an interesting article on garden-craft and landscape-gardening. The principal designs illustrated this month are for a museum in Innsbruck, by Heinrich Ried, and a pilgrims' church and cloister at Maria Wald. There are also several examples of old work principally from Graz.

*Arquitectura y Construccion* devotes its illustrations and much of its text to the exhibition of the Province of Valencia, its chosen example of modern Spanish architecture. A review of the history of Spanish Christian architecture in the Middle Ages, by Don Vicente Lamperez y Romea, gives a list of the buildings referred to by the author.

*Stone* illustrates the Chautuqua County Court House, Mayville, N.Y., of which Mr. Wm. J. Beardsley is the architect, and the accepted design for New York's new municipa office building by Messrs. McKim, Mead & White, which is a fine example of the skyscraper or tower type of modern American building.

*Construction* gives us a capital series of illustrations of the modern architecture of Winnipeg, "the gateway to the granary of the British Empire"; of Regina, the "model city of the West"; of Saskatoon; of Edmonton the "gateway to the North"; of Calgary, which, taken altogether, enable us to form a clear conception of what architects are doing in the dominion of Canada.

The *Engineering Record* describes the method of driving what are called "pedestal" piles, a novel and useful device for soft ground, in which the bottom of the pile, which is o concrete, is expanded into a bulb.

## Correspondence

*[The Editor will not be responsible for the opinions expressed by Correspondents.]*

**Llandaff.**

SIR,—The following anecdote may perhaps prove of interest in connection with the See of Llandaff:—

When Protector Somerset, in the middle of the sixteent century, thought to build himself a Palace in Westminster he laid sacrilegious hands on churches and seized also episcopal residences, one of which was the palace of the Bishop o Llandaff, situated on part of the coveted site.

The witty Bishop remarked that as the Protector had taken the land, he (the Prelate) was only Bishop of hal ('aff).

He had the consolation of his wit; a consolation denied to the other mulcted bishops, whose titles did not lend themselves perhaps to the perpetration of puns.—Faithfully yours

## FORTHCOMING EVENTS.

*Monday, January* 24.

Liverpool Architectural Society : Paper on "The City Beautiful; or, Liverpool Compared with Cities Old and Modern," by Mr. Edmund Rathbone.

Royal Society of Arts : Cantor Lecture (2), "Textile Ornamentation," by Mr. Alan S. Cole, C.B.

Surveyors' Institution : The adjourned discussion on Mr. Davidge's paper, "Town Planning Systems," and Mr. John Willmot's paper on "The Housing, Town Planning, &c., Act, 1909," will be continued. Mr. William Woodward will open the discussion.

*Tuesday, January* 25.

Guild of Architects' Assistants : Annual general meeting at the Bedford Head Hotel, W. Mr. R. Weir Schultz, chairman.

*Wednesday, January* 26.

Carpenters' Company : Paper on "The Carpenter's Craft," by Mr. Banister F. Fletcher, F.R.I.B.A.

Manchester Society of Architects : Paper on "Truro," by Professor S. H. Capper, M.A., A.R.I.B.A., R.C.A.

*Thursday, January* 27.

Leeds and Yorkshire Architectural Society : Paper on "The Elizabethan House as Illustrated by Contemporary Architectural Drawings," by Mr. J. A. Gotch, F.S.A., F.R.I.B.A.

---

## STUDENTS' DRAWINGS AT THE ROYAL INSTITUTE.

THE annual display of students' work for the year may be said in a sentence to be excellent in studies, but poor in design. The measured drawings, the PUGIN and the OWEN JONES are well contested with high-class work, whilst the SOANE, the TITE and the GRISSELL show a generally low standard of achievement.

For the Institute silver medal and ten guineas offered for measured drawings of ancient buildings in the United Kingdom a very fine set of drawings of the Wellington Monument in St. Paul's Cathedral by Mr. JAMES WHITELAW takes the first position justly, by reason of its thoroughness and excellence of draughtsmanship. Scarcely less excellent, if by reason of the greater magnitude of the subjects less complete, are the drawings to which the second and third positions have been awarded, illustrating respectively the Hôtel Carnavalet, Paris, by Mr. CYRIL DE FAREY, and the Palazzo della Gran Guardia Vecchia, Verona, by Mr. HERBERT J. ROWSE. The drawings of the west portico of St. Paul's Cathedral, submitted under motto "Ad Metam Contendo," are good, and so are those of FROMAND's Chantry and Cloisters at Winchester College, which are particularly interesting from the aberration of the cloister width, which looks as if it must have been intentional and worthy of the attention of Mr. GOODYEAR as an example of "refinement." But really there are no bad drawings amongst the dozen sets, though some are better than others, and some are evidence rather of painstaking labour than of artistic appreciation.

A design for a Shakespeare Memorial Theatre has proved an attractive subject for the Soane Medallion, and at a first glance the seventeen sets of drawings submitted make a brave show, but on a closer inspection one finds many weaknesses, chiefly of plan. It would seem that several of the competitors assumed that the requirements of a theatre were of quite secondary importance in a Shakespeare Memorial, and that the audience would not go to hear or to see or even to be comfortable, but that the memorial would be quite effective if it never opened its doors. Another fallacy that seems to have caught competitors is that to win the blue ribbon of British architectural students in design it is necessary to come as near being a Frenchman as possible, and if one has not had the advantage of instruction in the Ecole des Beaux-Arts to make believe to have had it. We hope that the fact that Mr. ADRIAN BERRINGTON, who for the third year in succession takes second place, was a student of the Liverpool University School of Architecture, where they study drawing, as in Paris, will not lead more Britishers to imitate, at a distance, what they have not truly learnt. The Parisian style of drawing has its charms, but it is not the only style, and it is not necessarily architecture.

Mr. ALICK G. D. HORSNELL, the winner, has had a fairly easy victory. His design expresses all parts of the house. The stage, with the great height necessary for modern scene-shifting, soars above everything and forms a background for the auditorium, which with a low-pitched dome itself rises clear of the approaches and accessories. In planning, Mr. HORSNELL divides his house into parterre and one tier, an arrangement we do not think any English manager would approve unless he were sufficiently subsidised to be independent of his box office. Around the auditorium is a wide promenade, with two lounges on each floor, which from a practical point of view is the best feature of his plan. His detail is of the modern French type with which the competition work of one or two exponents has made us familiar.

Mr. BERRINGTON's design is not so happily expressive, as an immense false roof over the auditorium, though it makes for unity of the building, destroys the relation of the parts. Here we have stalls, boxes, balcony and gallery which would please better the financial views of a manager. The detail is a version of modern French treatment of the Doric order, and in feeling is rather too monumental in the necropolitan sense to be suitable for a theatre.

"Caliban" has a design that rightly expresses the parts of the house, and in planning provides stalls, boxes one tier, a big foyer and two salons, but his exterior lacks dignity in the entrance front, which is too much cut up and has doors too small for architectural effect. His detail is based on that of a well-known English theatrical architect of the day before yesterday.

"Mafie" does not trouble about planning, and produces a rather wild design based upon modern French detail.

"Horseshoe" (device), No. 6, has a dignified exterior, though cold and not enthusing. The planning of the auditorium with a broken curve to the corridor is bad, and the balcony level is impossible.

"Touchstone" has a dome of overpowering dimensions that dwarfs the stage, and his conception is a *tour de force* rather than a rational and expressive design. The tinted perspective is a good piece of drawing.

"Star and Crescent on Shield" (device), No. 3, has an almost rectangular auditorium, with boxes on the sides that are apparently designed for the occupants to see the people in the house rather than the stage. The author attempts to be French, but indifferent figure drawing spoils the effect.

"Forward" has a strange idea of a balcony, and apparently thinks that a theatre should consist mainly of a grand vestibule, salons and salle de (*sic*) fêtes.

"Sunshine and Air" bases his design soundly on modern French work and shows it in good drawing, but in planning the auditorium seems to think that the chief desire of the audience is to look into the wings. He also has an exaggerated idea of the importance of lounges, whilst his notion of a balcony is quite impossible.

"Puck" has had a bad attack of angles in arranging his plan, and his detail and drawing are both very poor attempts at being French.

"Red Seal" has adopted a concert-hall gallery plan for his upper tier, and not having provided much lounge space inside, makes up with immense covered promenade halls outside open to the air. As these are about 64 feet by 42 feet without internal supports, he must have great faith in the possibilities of steel girders, or perhaps reinforced concrete. He is not content with a dome, but, wishing to be truly monumental, tops it with a huge spire, a rival of the Mausoleum of Halicarnassus.

"L'Espoir" has a very original idea of theatre planning, with a shallow auditorium less than a semicircle, a quite horizontal stage, and a hidden orchestra. He seems to imagine that a Shakespearean theatre would be given up to Wagnerian trilogies, and has given each box a private sitting-room with a fireplace. Drawing and detail are worthy of a plan more reasonably like a theatre.

"Nunquam Dormio" shows a more intimate knowledge of practical theatre planning than anyone else, but does not know so much of architectural design and has not had time to finish his drawings.

"Yellow Disk" (device), No. 14, would be French if he could, but does not understand the planning of seats in a theatre.

The Owen Jones Studentship has attracted only three competitors, but their quality is high. Mr. W. O. Miller sends a very fine set of beautiful drawings that are also careful studies of Italian work from Rome, Assisi, Florence, Siena, and the Victoria and Albert Museum, from which latter he has had the good sense and courage to study modern work as exemplified in the green dining-room.

Mr. H. R. Wilkinson supplements excellent studies from the Palazzo Vecchio, Florence, and a Parisian room of the latter half of the eighteenth century by Rousseau de la Rottiere, Langrenee dit le Jeune, Clodion and Couthiere, with a study of decoration for a church as designed by himself for the sanctuary of Santa Chiara in the Victoria and Albert Museum, which in its colour scheme is not quite a success. Mr. Wilkinson shows that he can copy pictures, and his detail drawing of mosaic from the west front of Orvieto Cathedral is marvellous in its realism.

Mr. J. Harold Gibbons bases his claim on the studentship chiefly on careful study of the colour-work of Westminster Abbey and an internal perspective showing how he thinks the church was decorated, with which we cannot quite agree, as the colour tone he adopts is not that we should expect to find in English work till very late in the fifteenth century. Mr. Gibbons sends also some nice sketches of fragments of English colour decoration, but his Continental work is limited to water-colour sketches of architecture in Normandy, and nowadays to win the Owen Jones Italian study is imperative.

The Pugin Studentship is excellently well contested, and Mr. H. Hubert Fraser wins, we fancy, by the impression his work creates that it is a study of architecture, and not a carefully prepared series of drawings made *ad hoc* for the prize. His measured work includes studies of colour, without which a proper comprehension of English mediæval architecture is impossible.

Mr. D. J. Chisholm has sent in much excellent measured work, but his perspective drawings are rather hard and mechanical in character, and he has not devoted attention to colour.

Mr. J. B. F. Cowper shows good drawings, including a big perspective study of St. Patrick's Church, Patrington, Yorks, which is a frankly diagrammatic architectural drawing, but his work is just the opposite of Mr. Fraser's, and conveys the idea that it has been done for the sake of the Pugin Studentship, and not for the sake of architectural study.

Mr. J. L. Berry has done good work, but this year it does not happen to be the best, although he has studied good examples, having measured the Bell Harry tower at Canterbury and Warmington Church, and made a fine study of the west front of Wells.

Mr. W. T. Benslyn also sends good drawings, his principal contribution being the measurement of the rood-screen of Kenton Church, South Devon. Dore Abbey is good, but Top Farm, Willersey, is hardly the kind of work that pays in competition for the Pugin. Mr. Benslyn's perspective drawing in pencil is rather woolly and confused, neither effective nor informative.

Mr. Frank Hearne has shown commendable industry in measuring, but fails in his freehand drawing.

The competitors for the Tite Prize have, we think, been rather hardly treated in being set a very difficult subject and then snubbed by the withholding of the prize, because none of them reached an ideal but indeterminate standard known only to the caprice of the judges. We admit that the designs are not a super-excellent set, but it seems to us to be very questionable policy for the Institute to withhold prizes that are supposed to be given to encourage the younger members of the profession, and it is absurd to expect a genius to appear every year at the age to which the competition is limited. Our view is that each prize offered should be given to the best man that competes, however low the standard attained. We wonder how many of the judges would like to make such a set of drawings as is required for the Tite Prize for the paltry sum of 30*l*. Oh! we must not forget that there is a certificate as well.

Mr. Wm. A. Robb gets ten guineas and a certificate for a design that is quite decent, even if it is a little claptrap and the drawing a bit queer in perspective; whilst Mr. Wm. Friskin and Mr. A. R. Barker, who receive certificates—without cash—and the authors of "Apex," "Woman's Head" (device), No. 3, and "Palladio" ought in our opinion to have been each rewarded with the 30*l*., failing a stronger competitor, if it were only that they might be induced to do something better in future after spending the money in travel and study in Italy.

The Arthur Cates Prize appears to be losing the character the founder intended, that of encouraging a higher standard in the "testimonies" submitted by candidates for the final examination, as it is evidently to be won not by the "testimonies" but by the additional work accompanying them. This, no doubt, is excellent, Mr. C. D. Carus-Wilson, the winner, showing some very effective and clever drawings of Trinity College Library, and each of his four competitors putting in also capital work.

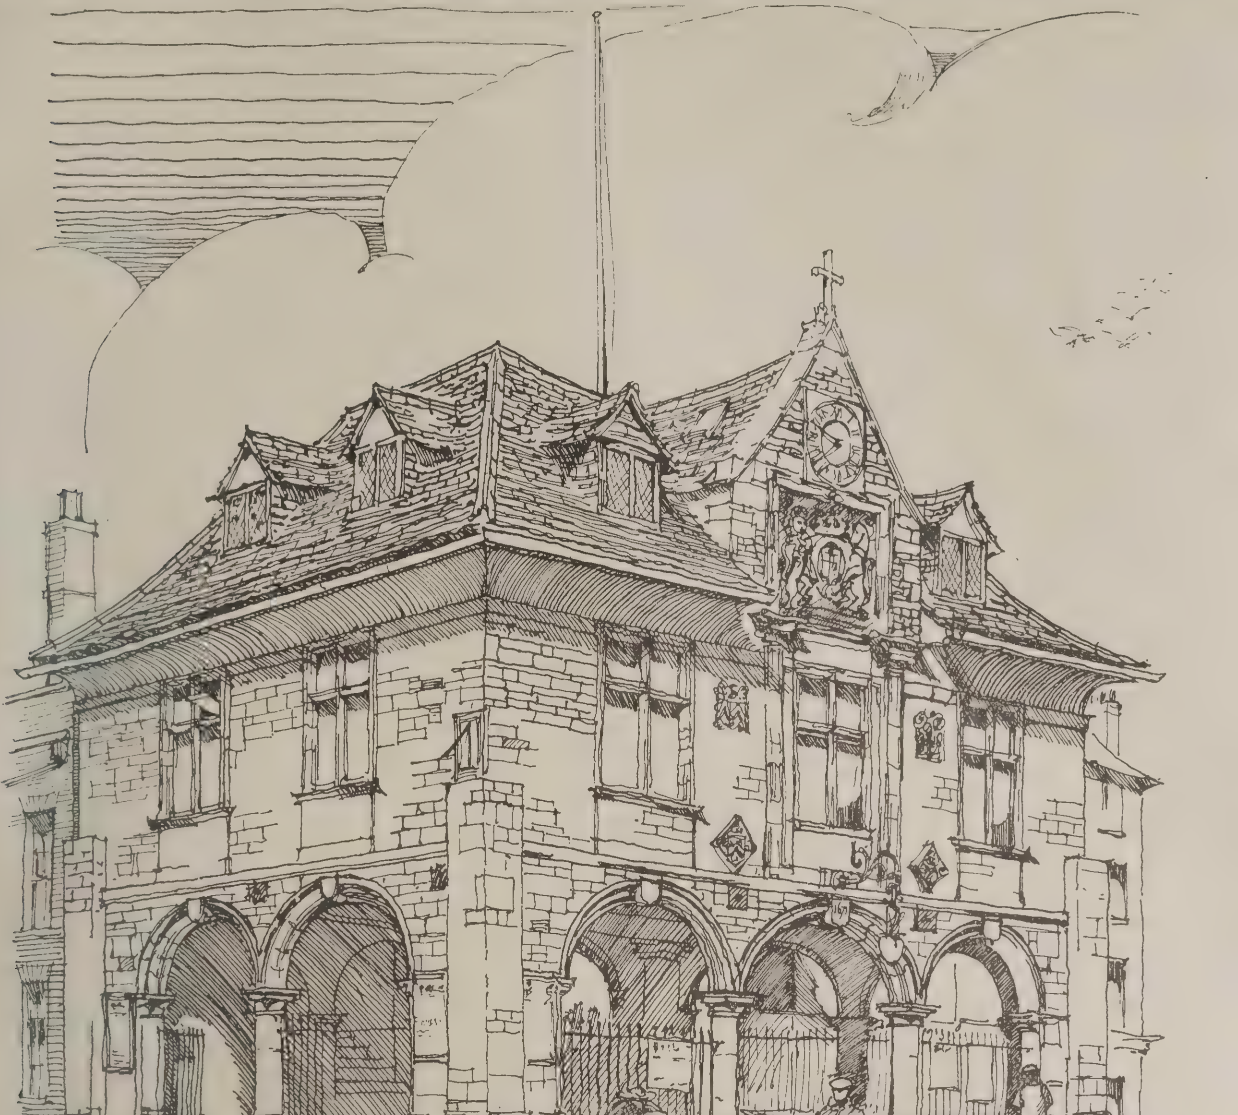
The Grissell Gold Medal has found but two competitors, but both good, and the unsuccessful one showing the most originality both in his construction and his architectural treatment of the reinforced concrete church with vault.

## NOTES AND COMMENTS.

The Royal Academy of Arts has discovered that there is an architect named Ernest George, and has done itself the honour of electing him as an Associate, by the tardiness of which action it has incontestably proved its incompetence to recognise in the slightest degree what is comprehended in the Art of Architecture.

---

Burslem Municipal Buildings have at last got a fair start. A ratepayers' meeting has been held and approved the scheme and the expenditure, and the Town Council has resolved, "That the plans for the new public buildings proposed to be erected in Wedgwood Place, prepared by Messrs. Russell & Cooper, be approved, and that the



Drawn by LESLIE WILKINSON, A.R.I.B.A.

tender of Messrs. ARNOLD & SON, of Doncaster, amounting to 24,918*l.*, for the erection of such buildings, be accepted, and that all the necessary contracts be entered into." Of course, the opposition was active to the last, but was in a minority, though by a very small margin.

STOKE-ON-TRENT is also to have carried out the proposed extension of its town hall, the Town Council having resolved to accept the tender of Messrs. WILCOCK & Co., of Wolverhampton, to carry out the amended plans of Messrs. WALLIS & BOWDEN for the sum of 25,791*l.*

The Duke of Fife has presented to the Burgh of Banff the large collection of Highland targes of leather, suits of plate-mail and chain armour, and arms of various dates that was formerly at Duff House, before it, with the adjoining grounds, was presented to the Burghs of Banff and Macduff.

Whereas the standard quality in which steel joists are rolled in certain foreign countries is only 23½ to 27 tons tensile strain, as compared with the British standard quality of 28 to 32 tons, it is of great importance that British architects should be wary of steel joists that come on to a building without a brand, or with only a letter or two. Our principal British steel-rolling firms brand their standard joists as under:—Messrs. Dorman, Long & Co., Ltd., "Dorman, Long & Co., Ltd., Middlesbrough"; The Cargo Fleet Steel and Iron Works, Middlesbrough, "Cargo Fleet, England"; The Earl of Dudley's Round Oak Works, Ltd., Brierley Hill, "Earl of Dudley—Steel"; Frodingham Iron & Steel Co., Ltd., Frodingham, "Frodingham Iron & Steel Co., Ltd., England"; Glengarnock Iron & Steel Co., Ltd., Glengarnock, N.B., "Glengarnock Steel"; Lanarkshire Steel Co., Ltd., Motherwell, N.B., "Lanarkshire Steel Co., Ltd., Scotland—Siemens Martin Acid Process"; Walter Scott, Ltd. (Leeds Steel Works), Leeds, "Leeds Steel Works"; Shelton Iron, Steel & Coal Co., Ltd., Stoke-on-Trent, "Shelton Steel."

## COMPETITION DESIGNS FOR BATHS, WOOD GREEN, MIDDLESEX.

In this limited competition several well-known experts in the planning of baths were invited, but they seem to have been rather thrown out of their stride by the unusual nature of the conditions and failed to appreciate the key of the situation.

There can be no doubt that as a general rule baths do not pay unless bathing can be supplemented by entertainments, and the problem at Wood Green was to facilitate this as much as possible, with which idea it was stipulated that the dressing-boxes were to be in a separate room outside the swimming bath. Of course, this does not make for economy in the original cost of the building, and cost was supposed to be a vital element in the competition. We had not time to cube out all the designs, and the authors' reports were not attached to the drawings, but it was clear that if some of the designs could be carried out for the sum limited—8,000*l.*—others could not. We do not think the winning design by Mr. Harold Burgess would much, if at all, exceed the limit.

Mr. Burgess's design is far and away superior to all the others in providing a hall for entertainments which could be used on occasion for a swimming bath. This may look like putting the cart before the horse, but if baths are to be maintained at the expense of the ratepayers we are sure that the revenue from lettings is a very important item and one that must be carefully considered.

The site for the baths is at the corner of Western Road—which is to the east of the baths—and a new road on the north, and the conditions provided that the principal front should face the new road. Competitors for the most part seemed to think that the main entrances should be on the principal front, but the author of the second premiated design, Mr. E. Harding Payne, so far departed from this reading as to place all his entrances on the side, which, by the way, was the longer dimension, and to make his principal front mostly blank wall with meaningless columns and pilasters merely for decoration.

Another condition of the instructions which seems to have been a stumbling-block to competitors was that the swimming bath which is to be first built was to be at present chiefly for men, but occasionally for women, for whom hereafter a second bath is to be built. A few slipper and ablutionary baths for each sex had to be provided, more for the look of the thing, we imagine, than as a paying part of the establishment, as Wood Green is one of those quite modern neighbourhoods where nearly every house has a bath of its own, even if it is only in the scullery.

Mr. Burgess has placed his entrances for men and women in the new road, with the usual one-ticket office, and has located his private baths at this end of the site. His men's entrance leads to a good hall, 22 feet square, which forms a crush-room to the hall swimming bath. This is 55 feet by 121 feet with a pond 30 feet by 100 feet, and has a gala entrance in the middle of the side from the Western Road, and another exit adjoining the club-room and w.c.'s, &c., at the far end. The dressing-boxes are on the right or west side of the men's swimming bath and between it and the future women's bath. Thus they are available for either sex, whilst, as we have already said, the arrangement for entertainments is admirable. Mr. Burgess's elevation is simple and effective, with an open loggia divided by Ionic columns, and his detail is about the best in the competition. The one fault in the plan is the small size of the areas into which look w.c.'s, &c., but there is a good feature of compactness.

The author of the second premiated design, Mr. E. Harding Payne, puts all his entrances, as we have said, on the east side, on which are his dressing-boxes and his private baths, but he cannot get away altogether from tradition, and has provided some collapsible dressing-boxes at the side of his swimming bath. He has provided an emergency exit or club entrance next the club room at one end of his bath, and in the size of his internal areas does better than Mr. Burgess.

Messrs. F. J. & F. D. Smith, the authors of the third premiated design, place their main entrances on the principal front and give an emergency exit from the back. One point about their plan that we do not like is that when the women use the swimming bath they have to go through it to the dressing-boxes, thus neutralising one advantage that is to the credit of the method of placing these in an annexe instead of round the sides of the bath itself.

Mr. R. S. Ayling has a curious arrangement of entrances, that for the men from the Western Road, and that for the women from the new road, the ticket office being at the corner.

Mr. Stuart Hill's plan is too expensive, with much corridor and wasteful space in the dressing-room. He has the merit of two emergency exits from the swimming bath.

Mr. H. T. Bonner has a plan that economises attendance, one attendant being so placed as to command the swimming bath and its entrance as well as the men's private baths, whereas most of the competitors, including Mr. Burgess, require two attendants for this duty. Mr. Bonner has an almost too good plan for the private baths, but, as in the third premiated design, the women have to pass through the swimming bath to reach the dressing-boxes.

Mr. Arnold S. Taylor sends a plan which is compact and avoids corridors, but the club room is entered from the bath, and there are no emergency exits. Hence he fails from the entertainment point of view.

Mr. Maurice B. Adams's plan is good, with main entrances from the Western Road and exits from the bath to the new road. His elevation would not rank with his best work.

Mr. A. Saxon Snell has his entrances on the new road, but by putting his dressing-boxes between them and the swimming bath becomes involved in an unnecessary and wasteful extent of corridor. His bath is lacking in emergency exits for entertainments.

Messrs. T. Dinwiddy & Sons also indulge in too much corridor, and though they place their swimming bath next to the Western Road, have not taken full advantage of this disposition to make it excellent for entertainments, but give only one emergency exit.

Messrs. WEIR, BURROWS & WEIR have a good plan, of which the chief fault is expense, though they oblige the women to go through the swimming bath to reach the dressing-boxes.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held on Monday evening last at Conduit Street, W., Mr. Ernest George, President, in the chair.

Mr. JOHN BELCHER, R.A., rose to ask that before the business of the meeting was proceeded with he might be permitted to act on behalf of the Institute in venturing to offer congratulations to their President on his election to the Royal Academy. The election had been a source of great pleasure to all the members, and in addition it had given satisfaction to the public who had long recognised in Mr. Ernest George an artist of distinction who had become known to the world at large. There was reason for congratulation that it had happened during Mr. George's term of office, even though they would have been still more pleased if it had come sooner. However such were the vagaries of election to the Academy it sometimes happened that the best man was left out. Fortunately they could now congratulate him and wish him a long life in which to further the interests of his art.

Mr. ERNEST GEORGE, A.R.A., in saying a few words of thanks expressed the hope that his brother architects would think that his election to the Academy was a suitable one. The compliment was primarily conferred on him, no doubt, as occupying the presidential chair.

### Carr of York.

Mr. S. D. KITSON, M.A., F.R.I.B.A., then gave an extremely entertaining lecture, which was illustrated by a large number of slides, on the above subject.

Carr of York flourished between 1750 and 1800. His work has escaped the attention lately given to the architecture of the eighteenth century. The reason for this is that Carr's work is dull and uninspired. It forms a part of the last chapter in the history of the English building tradition.

Carr was a busy and highly successful man. In the last half of the eighteenth century, a very large number of the country houses in Yorkshire were rebuilt, and many new ones arose. Almost the whole of the building was designed by Carr of York. He had a similar origin to that of the master-masons of six centuries before. He was the son, grandson, and great grandson of masons, and he had all the practical knowledge and hereditary tradition which then made for progress. But Carr tried no experiments, he made no advance, and the old building tradition after his fifty years of abundant employment had almost disappeared.

John Carr was born at Horbury, near Wakefield, in 1723. After passing through the village school he was early set to work either in the quarry at Horbury which his father owned, or upon buildings such as Chevet Park and Bretton Hall in the neighbourhood, on which his father was master-mason. Carr, conscious of the lack of scope for his ability, removed to York before 1750. He quickly gained employment, and soon he had the field to himself. Indeed no other architect would seem to have done work in Yorkshire when once Carr had established himself in the confidence of his fellow-Yorkshiremen.

When Carr settled in York it was both by population and tradition the metropolis of the north. Lord Burlington had been the Lord Lieutenant, and his headquarters were still at York.

Social interest centred round the race-course on the Knavesmire, and the erection of the grand-stand there marked the beginning of Carr's architectural success.

Carr is first heard of in York as the builder of Kirby Hall at Great Ouseburn in 1750, the designs of which were supplied by Lord Burlington and Morris. In 1752 the York Corporation voted him 83*l*. for enclosing the Pikeing Well with an ornamental building; 25*l*. were to be returned as redemption money for the freedom of the city. But "John Carr, stone-cutter," did not become a freeman until 1757.

In 1754 the grand-stand on the Knavesmire was designed and built by Carr. It was paid for by the issue of five-guinea admission tickets. The grand-stand was a broad and simple piece of Palladian design, and it gave the greatest satisfaction. Lord Rockingham, the chief promoter, was delighted with it, and remained a good friend to Carr throughout his life. The other country gentlemen followed his example and exclusively employed Carr as architect.

Henceforward Carr ceased to practise as a master-mason and became solely a designer of buildings. His training for this new rôle was mainly the inheritance of a sound building tradition and his practical upbringing, added to the example of straightforward work by James Paine in the West Riding and the guidance of Lord Burlington and one of his professional architects. Besides these there were numerous pattern books and Carr's own shrewdness. His training equally explains the severe limitations which are so noticeable in his designs, the excellence of his masonry and the practical character of his planning. The demands then made upon the knowledge of the architect were small, clients being content with very ordinary designs so long as the houses were well built and had spacious rooms.

The first houses which Carr designed were large red brick buildings in Castlegate, York, one of which contains elaborate plaster ceilings showing French influence. He also built for himself a house in Skeldergate which is characteristically plain. A little after 1750 York began to decline as a centre of fashion, and Carr's activities were in the direction of country houses. Two early examples are Arncliffe Hall and Whitewindows, near Halifax.

The first building which marked the turning point in Carr's career was the grand-stand at York; the second was Harewood House. It brought him into contact with the Brothers Adam, and henceforward his work loses in robustness what it gains in "elegance." A complete set of plans and elevations for Harewood House by Adam exist in the Soane Museum. These are so similar to Carr's design that Carr must have been influenced by the competition work, modifying it and supplying the detail drawings. The chief interest of the house is the flat relief plasterwork by the Brothers Adam. Thomas Chippendale designed the furniture, and "Capability Brown" designed the lay-out of the grounds. Carr learnt a great deal from each. But much more characteristic of Carr is the village of Harewood. The semicircular arch is almost the only form of decoration, and by its means the cottages are marshalled into regular blocks, with the larger houses of the doctor and the agent set between. The effect is fine and dignified.

After the building of Harewood House Carr's position was undisputed in the North of England. Denton Park is a typical example of his larger houses, with wings attached. The masonry is faultless, the design is cold, regular and uncompromising. There is the usual entrance on the south front direct into a large square hall—Carr never built a porch to his entrances. There is his favourite device of a bay window extending the whole width of the room and balanced on the other side by chamfered angles, in which, when the room was used for a dining-room, the sideboards were placed. The planning of the earlier part of the century had been much improved upon; it was no longer necessary to go through one room to get to another, the living rooms being now always entered from hall or corridor. The interior decoration can hardly be distinguished from the Adam's work. The rooms were comfortable, with every detail exactly right. The floors were of double thickness, and the cross walls were usually very thick, with double doors, so that his houses are practically sound-proof.

Constable Burton, in the North Riding, is a smaller house without supporting wings. The principal floor is on the first storey, and the columned portico with the flight of steps forms a fine approach to the entrance hall. The plan is compact and good. Carr was driven by his square plan to top-lighting for dressing-rooms and closets.

When the principal floor is so far from the ground the inconvenience of the outside steps on a rainy night is obvious. Carr seems to have been conscious of this, for at Basildon Park, in Berkshire, the only example of Carr's work in the south, the steps are inside the loggia under the portico.

At Gledhow Hall the principal rooms are upon the ground floor, as was Carr's practice in nearly all his later houses.

In 1767 the project of building an infirmary for Leeds was set on foot. Carr was approached, and wrote from Aston Hall:—"I can perhaps be of use to you in composing the necessary convenienceys which are requisite in such a building with some degree of art, but have not the opportunity of conducting the execution for you."

Among the latest examples of Carr's domestic work is Hackness Hall. It is one of the largest houses of his single-block type, but beyond a greater tendency to refinement of detail, due to the Greek revival fashion, and an unhappy attempt to broaden his windows, it is similar to his work of thirty years earlier. The house is a fine example of mason's work, like all Carr's buildings. He always selected the very best stone and used it with knowledge and judgment. Almost everywhere he found excellent building stone to hand.

For buildings near towns he often preferred brick. In Wakefield, for example, he is responsible for some of those great plain, comfortable-looking brick houses in Westgate. Thornes House is another of these brick houses.

Carr also made additions to many existing houses, but he never introduced any other style than his own. He planted down his additions exactly as and where requirements dictated. The gallery at Wentworth Castle and the entrance hall form part of an addition by him; and of this Horace Walpole wrote:—"Mr. Gilpin sillily could see nothing but faults there. The new front, in my opinion, is one of the lightest and most beautiful buildings on earth."

Carr was for long an alderman and on two occasions Lord Mayor of York. His portrait by Sir William Beechey shows him as a genial and shrewd old man. By his side are his plans of the Crescent at Buxton, designed for the Duke of Devonshire. More interesting is the great riding school behind the Crescent, now a hospital.

In York the County Lunatic Asylum with its simple lines and pleasant colouring forms a dignified termination to a long strip of park. The semi-circular relieving arches of brickwork over the first-floor windows form one of Carr's favourite motifs. The Court House and Debtors' Prison at York, facing each other on Castle Green, and which are precisely similar in design, form the only opportunity which Carr was given in York for formal grouping. The plan of the Court House was modelled upon the Roman basilicas. The town halls of Lincoln, Newark and Chesterfield show Carr's usual careful treatment, and form an appropriate setting for the deliberate municipal life of the period.

In 1790 Carr obtained permission to pull down the village church at Horbury, where he had worshipped as a boy, and to build a new church of Classic character at his own expense. Its poverty of design and want of appropriateness reflects the spirit then existing in the Church of England. The church was regarded as a triumph of artistic skill.

Carr made occasional excursions into Gothic, and the aisles of Dewsbury Church and the east part of Sheffield Church show that he neither understood nor appreciated it.

There is a lithographed portrait of Carr, drawn in 1796 by George Dance. It shows his face in profile. In 1791 he was elected one of the nineteen original members of the London Architectural Club, who met monthly at the Thatched House Tavern for the purpose of dining together. So exclusive was the Club that future candidates were to be Academicians or gold medallists in architecture, and one blackball was to exclude.

During his last years—he died in 1807 at the age of eighty-four—Carr retired to a country life at Askham Hall. He seems to have enjoyed nothing so much as his long driving tours, when he would show his nieces the work he had done.

Carr belonged to the old, leisurely order of things. He accepted the traditional style and method which he found, and was content to maintain the high technical level of workmanship for which the eighteenth century is famous. And so, if Carr's buildings are sometimes dull, they are always sensible and fulfil Inigo Jones's requirement that architecture should be "solid, masculine and unaffected." He himself merely claimed to be able "to arrange the necessary convenienceys with some degree of art."

Mr. J. A. GOTCH, F.S.A., F.R.I.B.A., in opening the discussion on Mr. Kitson's paper said that all those who were interested in the history of architecture must be grateful to anybody who went to the trouble of writing a monograph on one of its practitioners. In one point he thought that Mr. Kitson had done an injustice to the architects of Yorkshire, in that he had only pointed to two periods of great building activity, thereby omitting all that had been done in the seventeenth and sixteenth centuries, so much of which was entirely suitable to the environment. That was the only mild exception he could take to Mr. Kitson. The history of Carr of York was very interesting; he seems to have been one of the last of the mason-architects who did so much towards filling the country with all the beautiful buildings which now exist. The mason of those times was certainly responsible for the detail if not for the actual planning of the buildings which were erected. Carr was a man who combined the two. He seems to have been only thirty-one when he designed the grand-stand at York and became a full-blown architect. This sudden development prompted the reflection as to how much training was then necessary. At the present day the young architect has to have his "years of learning" and his "years of wandering." But in Carr's time they got off much more cheaply in time and money. Of course the conditions had entirely changed, as was emphasised by those recent decisions in the law courts which point to the architect's ever-increasing responsibility, and suggest the necessity of experts forming themselves into a company for the practice of architecture, one a builder, another a designer, one a lawyer, and perhaps, "judging from a late experience," one a naturalist. These and other troubles, including dry rot, Carr of York seems to have been entirely free from. The training he got was entirely sufficient for his period. In those times there was no complexity of planning; so long as the architect got his ground plan fairly evenly divided and the façade nicely balanced, his troubles were over, the plan, of course, being made to fit the façade. All this was very easy, for there were no special requirements. No house had then an ignoble side. In the previous houses, however, it was considered no disadvantage to approach the main structure through buildings more or less given up to ignoble uses. In the eighteenth century the façades were equal or nearly equal, and both the plan and the elements of design were simple. The pattern books were of the utmost use to architects. Perhaps to-day we err rather on the other side and there is a little too much originality. Two centuries ago when you turned round the corner of a house you knew exactly what you were going to find, while nowadays you usually find something unexpected, and often something undesirable. The pattern books led to the general adoption of one style instead of as now following a number of different ones. However, there was reason for thinking that this latter fault was becoming modified, for there were not now the fantastic designs rampant fifteen or twenty years ago. Carr's ambition was one shared by most architects, viz., to design the necessary conveniences of building with some degree of art.

Mr. H. A. TIPPING, M.A., F.S.A., expressed a wish that there were more students who would let us know about the architects of the past. In considering Carr it was important to bear in mind his lowly origin. It was customary to say that after Inigo Jones's time all was changed in the personal side of architecture. But it had just been shown that as late as Carr's time there were architects who had derived their education not from the drawing-board but solely from the workshop. Lord Burlington and the architects who worked with him travelled to Italy to drink at the very sources of classical art; but on the other hand there were many embryo architects in the masons' yards. Thus Sir Robert Taylor was the son of a stonemason and started life as a maker of lead statues. Several Yorkshire architects were connected with the building trade. Kent began as a coach-painter, and others were carpenters. Indeed a great number of eighteenth century architects were carrying on the tradition of the mediæval craftsmen-designers, so that it appeared as if there was a great deal to be said for the training derived from the workshop. Carr was only concerned with carrying on the traditions which he found. He always looked back longingly to the pattern-books, and he was essentially conservative. There were other little known architects besides Carr who would repay detailed investigation, as for instance Smith of Warwick. These offered splendid scope for local architects willing to follow up this field of inquiry.

Mr. H. H. STATHAM said that although the architectural work of Carr may have been dull, Mr. Kitson had been able to read a paper which was the very reverse. It might not be generally known that Elmes in designing St. George's Hall, Liverpool, tried to get a vista from one end to the other in the same way as Carr had done at York. When it was proposed to erect an organ Elmes was extremely indignant as it threatened to spoil the effect. As to the external staircase and piano nobile which formed such a fine feature of Carr's best work, every one nowadays seemed afraid to go up an external staircase in the rain. But the speaker said he would like to see someone revert to them, for a finely planned one offered compensation for getting wet. As to the portrait of Carr by Dance, it was among the pictures shown recently at the Royal Academy. The notion of Capability Brown as to the best way of laying out an estate seemed to be to cut down the trees and then introduce a sunk fence. Mr. Statham, in concluding, again referred to the most interesting and charming paper which had been read.

Mr. E. GUY DAWBER said that he was very interested in the subject of the architects of the different towns of England for it had always seemed to him that a great many bore the impress of one man. At Stamford, for example, all the interesting and delightful work was due to one man. A little known personage was Henry Bell of Lynn, who was twice mayor of that town where he had settled. Towards the end of the seventeenth century he built there one of the most beautiful buildings we had in this country, viz., the Custom House; he also built a series of remarkably beautiful houses which are as fine as anything Wren ever did. Similar cases of a single architect making his individual mark on a town were to be found all through the country.

Mr. S. D. Kitson, in replying to the vote of thanks, related a story of Carr's connection with Constable Burton, in the North Riding. It was said that Carr was called to the house for the purpose of remedying some defects in the kitchen range. When the owner returned it was to find that his home had been rebuilt from Carr's designs. Until quite lately there was no interest at all manifested in this eighteenth century house. The plan had been used for waste paper. In dealing with Carr it had to be admitted that he simply looked upon his work as a means of making money and of raising himself out of his class. When he died he left 160,000*l*. What really interested him was not his art, but to become a country gentleman. That explained his lack of originality.

The award of prizes and studentships was made immediately after the reading of Mr. Kitson's paper.

Six essays were submitted for the Institute silver medal and twenty-five guineas. The subject set was "The Treatment of Gardens in connection with Buildings." The first place was awarded to Mr. J. A. O. Allan of Aberdeen ("Domus et Hortus"), and a certificate of hon. mention to Mr. J. Nixon Horsfield, A.R.I.B.A. ("Rez de Chaussée").

There were twelve competitors for the Institute silver medal and ten guineas for drawings, the subject being "Measured Drawings of Ancient Buildings in the United Kingdom or Abroad." Mr. James Whitelaw, London ("Roma"), secured the prize with six strainers (No. 11) of the Wellington Monument. The second place and a certificate of hon. mention with five guineas was awarded to Mr. Cyril Farey, London ("François Mansart"), with six strainers (No. 5) of the Hôtel Carnavalet, Paris; a certificate of hon. mention to Mr. J. Rowse, Liverpool ("Adige"), with five strainers (No. 2) of the Palazzo Pompeii and Palazzo della Gran Guardia Vecchia, Verona.

The subject for the Soane medallion and 100*l*. (for continental travel) was "Design for a Shakespeare Memorial Theatre." There were seventeen designs, and of these the five strainers (No. 17) by Mr. Alick G. Horsnell, Chelsea ("Mirth"), were awarded the first place. The second place went to Mr. Adrian Berrington, Chelsea ("Horse Shoe"), with four strainers (No. 5), who receives a certificate of hon. mention and ten guineas.

For the Owen Jones Studentship, certificate and 100*l*. (for travel and study of colour), there were three competitors. The studentship goes to Mr. W. O. Miller, who sent six strainers; Mr. H. R. Wilkinson was placed second, and will receive a certificate of hon. mention and ten guineas.

For the Pugin Studentship, silver medal and 40*l*. (for travel in the United Kingdom), there were six competitors. Mr. H. Hubert Fraser was placed first; Mr. D. J. Chisholm and Mr. J. B. F. Cowper will each receive a certificate of hon. mention and ten guineas.

The Tite Prize, certificate and 30*l*. (for travel in Italy), was not awarded this year, but the Council awarded a certificate of hon. mention and ten guineas to No. 4 ("Jupiter"), Mr. William A. Robb, Glasgow. Certificates will be received by Mr. A. R. Barker, No. 12 ("Comprised Within") and Mr. W. Friskin, No. 10 ("Tomahawk"). The subject was "Design (according to the Principles of Palladio, Vignola, Wren or Chambers) for a Sunk Garden, surrounded by Loggie."

The Arthur Cates (forty guineas) was awarded to Mr. C. D. Carus-Wilson out of five competitors.

The Grissell gold medal and ten guineas (for design and construction) was awarded to Mr. C. P. Walgate, London ("Fra Angelico"). The subject was "Design for Two Western Bays forming a portion of a Vaulted Church."

The Godwin Bursary, silver medal and 65*l*., was awarded to Mr. W. Milburn, jun.

The Ashpitel prize was awarded to Mr. W. J. Roberts, of Manchester.

## BEAUTY IN ARCHITECTURE.

By B. R. Gribbon.

*(Concluded from last week.)*

VITALITY is the power which some buildings possess of suggesting life. Compare such buildings as the Choragic Monument of Lysicrates and Trajan's column at Rome. Do not the delicate leaves and scrolls of the capitals in the Athenian monument, the exquisitely proportioned entablature and the curves of its surmounting scrolls as they sweep upward to the graceful finial, suggest life and aspiration? Is there not something in the whole design which suggests its relationship to the most emotional of arts—music? It seems to be almost the embodiment of music in stone. Then turn to Trajan's column. It is strong, vigorous, striking. It has no want of vitality, and yet no two conceptions could differ more. Trajan's column is outcome of a bold and strident claim to honour for material prowess. It flaunts the record of its creator before the world and demands rather than appeals for admiration. It makes no attempt to stir the imagination, it simply holds up a vast scroll of pictorial record and on that bases its claim to honour and existence. Both these monuments are instinct with vitality; but the one is of the spirit, the other of the world.

Restraint comes next, and was more usual in Grecian work than it has been in any other. In the buildings of ancient Greece it seems to have been recognised as it has been in no others, that superfluity is an impertinence. So in all that work we find no feature which is not structurally or artistically necessary. Take the Temple of Apollo at Bassæ for example. We know that the typical Greek temple design was essentially simple, yet here we find three orders in one building, a door on the eastern side at the south end of the cella, as well as the usual one at the end, and internal wing walls against which the half-round Ionic columns abut. Why? There was a reason for each and all of these innovations we may be sure, and so perfectly is the purpose of the design expressed, its beauty in the truest sense, that we can at least suggest what were the probable reasons. The Doric was the order most naturally adopted at Bassæ: it was the national type of Arcadia. But internally higher columns were required, so to avoid distorting the Doric columns, Ictinus, the architect, adopted the expedient which we have already noticed he introduced in the Parthenon, and used the Ionic order. These columns being so much slighter may have appeared to him to be artistically insufficient to support the heavy roof, or perhaps he doubted the ability of the walls to bear its weight. Be this as it may, he introduced short walls which buttress both the columns and the outer walls, and placed his columns, now reduced to semi-columns, at the ends of these. A door must have been required for access to the statue at the south end, and perhaps also to light it, while the column adjacent to it seemed to require distinction from those of the cella, and this was obtained by making it of the Corinthian order, no doubt a reminiscence of the garlanded votive column which it virtually replaced. And a glance at the drawing showing a restoration of the temple by Professor Cockerell shows what a wonderfully impressive interior the whole design produced. It may be objected that this design is Cockerell's, not Ictinus's, but the very fact that from the fragmentary remains at his disposal Cockerell has been able to produce a wonderfully impressive drawing at least correct in all its essential details shows that the original design must have possessed the essentials of that living principle which we have defined beauty to be, and must have possessed them in no ordinary degree, since it has enabled a skilful antiquarian to produce after an interval of 2,300 years an interior little if at all inferior to that of the Parthenon itself. It is the perfect restraint, the rigid exclusion of everything not essential, that has given to the Parthenon and to the Temple of Apollo their extreme beauty.

And now look at the Temple of Castor at Rome. First take the features one by one. Each is well designed and cleverly carved, good in itself and fairly refined in detail. Then look at the building as a whole. Restless and overburdened with ornament, it is tiring to look at it; impossible to grasp the import of each carved line. There is no restraint, no relief in plain surface, to set off the too abundant ornament, and what might and should have been an added glory to the building has ruined its effect, and made it merely a museum of Roman skill in ornament.

And, lastly, we come to the fourth essential—"freedom from affectation." This seems to be almost a modification of restraint, for affectation is the adoption of the unreal and unnecessary. No feature in the building should pretend to be what it is not: structural parts must reveal their purpose and not be weakened artistically with futile ornament. The scale, the actual size of each part of the building, must be appropriate to its purpose; no feature of any style must be used for any other than its traditional and legitimate use. The universal standard for judging scale is the human figure, and if when seen in comparison with it any portion of the building seems unduly large or insignificantly small, the scale is wrong, and the beauty of the building will suffer through an affectation of sham importance or will seem petty and insignificant. Compare the Temple of Jupiter at Agrigentum with the Colosseum, Rome. Monumental and impressive the temple is, but if we could see a human figure by the side of one of those mammoth steps of the stylobate the sensation of the unfitness of such a scale for practical purposes must greatly lessen our appreciation of such an otherwise successful design.

The Colosseum is nearly twice the size of the Temple of Jupiter (the length is 620 feet against 323), but the sensation of inappropriate size is wanting here: the scale is human. The vast building is divided into so many bays, all of which are in perfect unison, that while the size of the building is fully appreciated, it does not seem too great for human use; while the temple at Agrigentum seems fitter for the habitation of the god in whose honour it was erected than for the purposes of his human votaries.

So Inigo Jones's definition seems to cover all that is included by the term of "Beauty in Architecture." Of course, each of his factors is reliant on many minor considerations. The site, the aspect of the building, the position of the various materials, their characteristics, texture and colour, all play their part; but each of these is comprehended in the definition he has given, and no building which is "solid, proportional according to rules, masculine, and unaffected" in all respects can ever be said to be deficient in "Architectural Beauty."

## LLANDAFF CATHEDRAL.*

By S. Bowen Williams, M.S.A.

*(Continued from last week.)*

We will now in imagination enter at the west door and pass through the cathedral, taking note of the more important features as we proceed.

On opening the west door you remark the absence of a porch, and you have a vista of the whole length of the cathedral revealed before you.

You are led down the long, unbroken range of the main arcade, with its graceful line, until the eye rests on the remarkable Norman arch at the east end of the presbytery. The small size of the cathedral prevents the effect of this unbroken arcade from being overdone, as is so frequently the case in larger cathedrals. The nave arcade is Early English and original; it is very well proportioned and the scanty foliage is excellent and typically Early English. The arcade in the choir is very similar, but later in date and Decorated in character. The piers, you will note, are by no means commonplace and well worth examination.

The absence of a triforium will at once strike the eye; the clerestory is new work, but is a faithful reproduction of the original work, there having been left intact one complete bay to serve as a guide to Mr. Pritchard. A wall passage is carried round the church at the clerestory level, this being rather unusual.

The aisles are original Decorated work, with the exception of the external buttresses, which were inserted during the restoration to strengthen the nave arcade. The windows are all of one type and are original. You will notice the ogee turn at the top of the window arches. The two small doorways towards the east end of the nave aisles are Decorated work, but the two larger portals towards the west end on the north and south sides are portions of Urban's church. We will refer to them later.

The west end of the nave is a very ingenious arrangement and produces a very good effect. The few steps down into the nave from outside give greater height to the inside as compared with the outside, and hence the sills of the main range of windows can be brought lower and so increase the apparent window space. The two outside jamb mouldings are brought right down to the floor, and so the first two compartments of this end are united. The rich moulding of the window jambs and the splay of the sill give a very rich and pleasing effect, especially considering the small material there is to play with. The arrangement of this west end is well worth study.

At the east end is the great Norman arch over the altar. It is a portion of Urban's church, but it is a moot point whether it marks the division of nave from choir or whether, as at present, it was at the east end of the choir. It is a very fine specimen of its kind, and has been likened to one at Hereford Cathedral, built about the same time; but this is the better of the two and compels attention as soon as you enter the church.

It recedes in four orders, and has the usual mouldings peculiar to Norman work. The abacus of the capitals is moulded and is continued along the wall on either side of the arch. Its most striking feature, however, is the studded moulding round the outside of the arch. This consists of a number of circlets, with a centre of eight leaves and an outer ring of small rounded projections. It is unique, or at all events of very rare occurrence. The arch is slightly stilted and has a tendency to be "horseshoe" in shape.

Over this arch is a gallery and arcade, with a traceried window in the centre and a blind arch on either side.

In the presbytery is to be seen some curious work. This portion of Urban's church was rebuilt in the Decorated period as already stated, and in doing so the Norman work has been allowed to remain as far as possible. There are still to be seen the heads and jambs of two Norman windows, cutting into the Decorated work in a peculiar and somewhat awkward manner. The reason is hard to find, but it has been suggested that the remains of St. Dubricius were placed here and that the builders did not wish to do anything which would disturb the tomb.

It has been thought possible that there was at one time a pair of flanking towers to the choir, but this is not easy to decide. No remains of any value are to be found indicative of this.

It was in this portion of the church that Mr. Wood erected his Italian temple, and after it was removed and the plaster scraped away the original reredos was discovered. It was a fine piece of Decorated work, but was too much mutilated to be of any use. It was removed and a new one put in its place, consisting of three gabled arches and battlemented cornice. The three panels under the arches contain paintings by Dante Gabriel Rossetti. The old reredos is now to be seen in the north aisle of the choir.

The stalls, organ, and episcopal throne are all new, and have all been done in Llandaff by Mr. Clark, under direction of Mr. Pritchard. They are very elaborately carved in teak, with inlays of various woods, and are well worth a close scrutiny.

*(To be continued.)*

## ILLUSTRATIONS.

### CATHEDRAL SERIES, LLANDAFF.—WESTERN TOWERS AND SPIRE.

The description of Llandaff Cathedral is continued and this view forms one of the series of illustrations.

### SKETCHES IN SOMERSET.

These sketches are part of a series by Mr. John Th. Westbye, which we shall continue in following issues, and of which the article on Wells and Glastonbury, published last week, is explanatory.

### COMPETITION DESIGN FOR ADDITIONS TO TOWN HALL, STOKE-UPON-TRENT.

The accompanying drawings illustrate the design submitted by Mr. Arthur J. Gale, F.R.I.B.A., F.S.I., in the recent competition for the above. The plans explain themselves. It might be mentioned that an endeavour was made to group the whole of the buildings and departments so as to be easily accessible from one to another, hence the altered position of the Council Chamber. The acoustics of the Great Hall were carefully studied, which was planned on lines which were found the most successful both here and on the Continent. The Magistrates' Court was brought down from the first floor and placed on the left of County Court, and its place above utilised for the new Banqueting Room.

## THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening
last at the premises in Tufton Street, Westminster, Mr.
Tanner, F.R.I.B.A., President, in the chair.

On the motion of the President it was agreed that a
essage of congratulation be sent to Mr. Ernest George on
e honour he had received in being elected an Associate of
e Royal Academy.

A vote of thanks was passed to Mr. Howard Chatfeild
larke for a donation to the library of bound copies of *The
rchitect* and R.I.B.A. Transactions.

Mr. J. Starkie Gardner read a paper illustrated by
ntern views entitled—

### A Comparison between English and Continental Ironwork.

Throughout the Renaissance period in France the iron-
ork, like the architecture, was traditional, but pro-
undly influenced by that of Italy, for François I. and
enry II. and his consort encouraged Italian artists to work
nd settle, just as his contemporary Henry VIII. encouraged
em to settle here. His fickle continental alliances, how-
er, led him also to favour Germans and Flemings. Such
fluences were not lasting as regards ironworking, and
cept richly decorative locksmithing, which had always
en a cherished art in France and one neglected here, the
onwork in both countries was alike meagre and utilitarian.

The first indication of a revival is seen in France, and
actically coincides with the accession of Louis XIII. in
10. The Italian influence had long since waned there,
d Henry IV. had himself suffered through it. It was
ue that ironworking was in full swing in the bordering
untries of Germany and Spain, where the smiths were
dulging in *tours de force*. But the revival in France is
solutely free from any trace of the influence of either of
ese countries. It was a new style, gradually evolving,
egant and restrained, in the native taste, but with an
er-growing tendency towards the rich and sumptuous
rves and scrolls of the Baroque. Rubens had a command-
g influence in France from 1622, when he was decorating
e Luxembourg for Marie de Medici, almost to the time of
s death. The arts, painting, sculpture and architecture
lt his influence deeply; how should ironworking escape it?
ubens may personally never have prompted a design in
onwork during his life, but he powerfully influenced, if
did not inaugurate, the sumptuous freedom and splendour
colour which characterised French art for upwards of a
ntury. The ironwork followed the same lines as far as the
aterial permitted, and as might be expected from a mate-
al so facile when hot, and in the hand at the outset of
fted craftsmen, wholly unrestrained by traditions and
les, it developed even more rapidly, but more consistently,
an in Spain or Germany. Ironworking became a firmly
tablished art in France, and it remained so, apart from
odifications due to changes of fashion and sentiment, until
e monarchy itself ceased to exist. To trace its develop-
ent, however, is a difficult task, and one I am not qualified
follow up to-night. The French smiths began to engrave
d publish their designs in 1615, following the example
t by Androuet du Cerceau. Louis XIII., who died in
43, had been a great patron, and it is certain that much
e ironwork had come into existence in France during the
st half of the seventeenth century, which could hardly
il to attract the attention of travelling Englishmen. The
ils around the statue of Henry IV. on the Pont Neuf,
dered by Richelieu in 1640, were lofty and of plain bars
th a rich cresting, and Evelyn notes them as a "strong
d beautiful grate of iron." He also observes, under date
49, of the gardens of the Château de Maisons, "the iron
tes are very magnificent." These were perhaps those by
an Marot, who was but thirty years old, but his illustration
them was not published till much later. They would well
serve the encomium of "very magnificent," for they are
deed the well-known gates that now, brilliant and polished,
se the Galérie d'Apollon of the Louvre.

It is strange that the taste for rich ironwork did not at
ce penetrate from France to England under the artistic and
ltured Charles I., who was such a princely patron of Van-
ke and Rubens. Under Cromwell the English Channel was
obably a mare clausum to French art; but it is almost
olly inexplicable that the reign of Charles II., with its
flux of highly-skilled Huguenot craftsmen, should have
iled to welcome it, just when it was at its zenith in France.
the young King Louis XIV. expanded into the grand
narque towards 1660 the field for the smith's art rapidly
dened. In France royal and noble palaces were approached
rough spacious courtyards surrounded by iron railings with magnificent gates; while the gardens, parks, and avenues by which they were environed demanded elaborate iron fences, gates, and wickets. Staircases were enlarged into grand architectural features of palatial dimensions, and occupying central positions, these required iron balustrades of the most sumptuous possible character. The smiths thus stimulated, naturally vied with each other in the magnificent pride of their work and the increasing difficulties demanded from its execution. The greatest architects entered the arena of rivalry and supplied the designs. Mansard designed the screens for Clagny and for Meudon; Girard that for St. Cloud, and Gittard that for St. Maur. Men of such boundless influence as Jean Lepautre, Jean and Daniel Marot, Jean Bérain, Jean le Blond, and Langlois, published "Livres de Serrurerie," or included numerous designs for smiths in their works on ornament. Lesser men followed suit, while the smiths themselves by no means desisted from publishing pattern-books of their own work throughout the reign. These publishers among the craftsmen were, as in all times, by no means the best workmen.

The commissions given by the King for Versailles alone amounted to over a million livres between 1664 and 1680. This extravagance led to the disgrace, and thus, indirectly, to the death of Colbert; as a mistake in the measurement of a window led to a quarrel with Louvois, who only averted disgrace by plunging the Roi Soleil into a new war. Of these works, the smiths, Godignon and Dezeutres, executed the great screen, and Luchet the gates, to the Court of Honour at Versailles, at a cost of 32,500 livres. Simon Delobel made the doors to the escalier du Roi, and numerous balconies; and Caffieri and Lespagnandel the stair-rail. The royal work was divided impartially, and every capable smith had his share. There was work for all under such a patron.

Though Charles II. patronised Frenchmen like de Grammont, and raised Louise de la Quérouaille to the peerage, and had his grounds laid out in the French taste of Le Nôtre by Verrio, no ironwork in the French manner appears in England during his reign. Such as there is is extremely plain, not more advanced than that produced in France a hundred years before. There are, however, a few notices and other slight indications of the existence of some more decorative ironwork scattered here and there, but not enough to be convincing. It is strange, too, that Wren was in Paris in 1665, "prying into trades and arts," as he wrote home, while the superb gates, railings and balustrades to the Palais Royal, the Bibliothèque, and the Palace at Fontainebleau, and in many of the churches were already in position, work such as had excited the admiration of Evelyn sixteen years before passed without notice by him. Wren was no doubt impressed, but he showed no desire to encourage similar work at home.

On the contrary, there is a curiously plain and geometric pair of gates to the Ashmolean at Oxford, built probably by Wren in 1677. The railings to the Sheldonian Theatre at Oxford, completed in 1668, are interesting as associated with a building erected by Wren so soon after his return from Paris. The bars are lofty and straight, but perfectly plain, with the horizontal bar very low down, the only relief being a scrolled head to the central standard of each bay. These are between the great stone piers with heads of fawns a landmark for visitors. A contemporary engraving shows them to have been put up with the building. A pair of gates of the same construction and destitute of ornament still remain in the corridor behind the rich and later gates of the Clarendon Press. The taste for fine ironwork was thus clearly not due to Wren, who apparently appreciated it as little as his great predecessor, Inigo Jones.

The accession of James made little difference, and it was not until the arrival of the Prince and Princess of Orange, who were inimical to France, that a taste for rich ironwork in the French manner arose in England. The year 1689 is a momentous one in the history of English smithing, for it introduces "Monsieur Jean Tijou," a mysterious person as to whom little beside his work is for certain known. He was no doubt a French Protestant with whom the Princess of Orange must have been acquainted before or from the moment of her arrival in England. It may therefore be safely inferred that he was one of the French Protestant refugees in the Netherlands, and that he came over in the Princess's train. He was unknown, or had at least published nothing in France, for Guilmard, in his exhaustive work on the "Maitres Ornamentistes" only records him as a dessinateur anglais who worked towards 1720. It seems that he became a parishioner of St. Martin's-in-the-Fields, for his daughter was married there to Louis Laguerre, the French decorative artist and pupil of Verrio. A Mrs. Ann Tijou, possibly his mother, who died in 1708, another Tijou, and Laguerre were all buried there, and descendants still live in Soho. His own place of burial and residence and his wife's are unknown, and no will was proved.

However, scarce had the Prince and Princess become King and Queen before Tijou rendered his first bill for six iron vanes "finely wrought in leaves and scrollwork," 80*l.*, and a rich iron balcony, over the river, to the water-gallery, where the Queen was to reside while the palace was building. In this balcony she and her maids were accustomed to sit, work, and receive visitors. His second bill, still extant, was rendered in 1690 for the famous garden screen, 775*l.* 7*s.* This was for the Fountain Garden, a semicircle taken out of the Home Park by Charles II., and which Evelyn saw finishing in 1689. It comprised five fountains and three broad walks, two to the great avenues in the park, the third to the head of the Long Water. Such a screen, of unusual extent and richness, was required perhaps to insure privacy, while clipped yew hedges, beloved of the Dutch, were growing, for the garden faced the principal front of the palace, and was the first laid out for King William and hurriedly completed. Two "lion gates" formed part of the screen. This work for the water-gallery and garden being finished, there was probably a lull till the new palace was ready, but in the interval Tijou was at work elsewhere, the Chatsworth work being completed before 1692, at a cost of 528*l.*; and on that at Burleigh; and perhaps he was also getting on with the magnificent gates for the triple arches of the new front to the palace, opening to the gardens. They still exist, and are examples of his richest work, and standing in shelter they remain to this day in perfect preservation. Each consists of one oblong panel half the height of the gate, a wide and richly-worked lock-rail, and a square panel beneath, the central pair of the three being the richest. The upper panels are scrolled round a central oval, the whole almost hidden by embossed acanthus and flowers. The lock-rail is as rich, and the square panel below repeats a four-way scrolled design radiating from a centre. All are in the rectangular double frames joined at the angles by short diagonal bars characteristic of his work. The side gates are similar, but less rich, and above them is a lintel of scrolls and acanthus. They form the chief item in Tijou's 1694 bill for 1,153*l.* 12*s.* 6*d.*, which comprised some plain staircase rails. Two other pairs of gates are shown in Sutton Nicholl's engraving of 1695, which no longer exist at Hampton Court, though one may now be at Eaton Hall.

From these bills it is clear that from the moment of his arrival he was under the immediate patronage of the Queen, who is known to have taken the greatest interest in the gardens and probably ordered the ironwork personally, and on her own initiative, the King, as is well known, being too much occupied and away. In 1693 Tijou published his great book of designs, and paid Her Majesty the graceful compliment, as it then was, of portraying her as Juno reclining, attended by Vulcan, Mercury, Saturn, Amorini, and a group of the Arts. The man in the frontispiece, with strongly marked features, long hair, and heavy moustache, in redingote and cravat, who is closely inspecting the work of four brawny smiths, is almost certainly Tijou himself, a portrait by his talented son-in-law, Laguerre, who designed it. The other engravers were well-known artists hailing from Antwerp and Amsterdam. This most expensively got-up book is the first of its kind ever published in England, and introduced the custom long before in vogue in France. It is marked as on sale in London without further address, proving that Tijou resided here and believed himself to be a well-known personage. The plates comprise, in addition to designs for royalty, those for Chatsworth, Burleigh, and Wimpole, with others impossible of execution in iron. The book was "for the use of smiths." Partridge, a London smith, seems to have borrowed one of the baluster designs for the library staircase of Trinity College, Cambridge, built by Wren.

In 1694 a heavy and unforeseen misfortune befell Tijou in the lamented death of his great patron the Queen. Work at Hampton Court practically ceased in consequence till the destruction by fire of Whitehall Palace in 1698 drove the King to complete it. The Fountain Garden was enlarged for eight additional fountains, and the beautiful screen was removed to the Privy Garden on the south front, then being laid out, where 832*l.* was apparently expended on masonry to receive it. The gates remained still to shut off the garden walks from the Park avenues, and the balustrade for the king's staircase, designed five years before, was ordered from Tijou. This enlargement of the garden and removal of the screen necessitated 1,442 feet of new iron rails with 172 panels for both sides of the Fountain Garden, which were designed by Talman, clerk of the works, who also estimated the cost at 2,132*l.* 16*s.*, at 5*d.* per lb. Tijou undertook the work, but charged 3,675*l.* for it, and a balance of 1,889*l.* 1*s.* 6½*d.* became the subject of appeals and petitions. It was unpaid when William III. died in 1702, and Anne, who cared little for Hampton Court, was loath to pay her own bills, much less those of her predecessors. Tijou enjoyed no more royal patronage, and Talman was not the man to pass such an overcharge. Other existing works of his seem to be gates at the Clarendon Press and Bridewell, similar to those of the triple arch, an entrance to Burley-on-the-Hill, and part of the work at Drayton House.

His work in St. Paul's is well known. It commenced as early as 1691, with windows for the choir at 6*d.* per lb. which were made at Hampton Court and brought to London. All the panels, screens, altar-rails, choir-gates and balusters, in which embossing is extensively used, are by him apparently aggregating to a total of between 4,000*l.* and 5,000*l.*, and extending over a period of nineteen years. His work finished in 1711, when he pressed to have his account settled in terms which make it appear that he was not in easy circumstances after twenty years of work. He left the country leaving his wife to collect the money and follow him, the family tradition says, broken-hearted. At St. Paul's the plainer work was only given subject to competition with two English smiths, one of whom undersold him. He probably went to Paris to dispose of his copper-plates and designs to a celebrated smith named Fordrin, who later published them in his own name. He is reputed to have worked at Canons, but if he commenced there he must have abandoned the work, leaving it perhaps to his assistants.

That Tijou was an artist of the first rank in his day can never be disputed. He must certainly have executed the masks and finer embossing with his own hands, for it is by a master. It is also clear that he set out his own work, for a joiner is paid for glueing boards for Mr. Tijou to draw the iron screen upon. We may reproach Tijou for redundant richness, and that the actual smith's work is little more than material to hang his foliage on. He was clearly an artist and an embosser, but never a practical smith, as is evident from the designs he published.

The credit of the work has been assigned to Huntingdon Shaw, a smith of Nottingham. There is no evidence to sustain such a claim, which rested solely on the inscription on a monument in Hampton Church, and it has been conclusively demolished. We may, however, believe that the tradition had some basis of fact if we please, for Tijou must have had a working foreman, his works were for a time at Hampton Court, and Shaw's death in 1710 almost coincides with Tijou's relinquishing business. Shaw was never either a master craftsman or designer, and as far as actual proof goes there is none whatever that he was even a smith. His statue nevertheless adorns the new Victoria and Albert Museum as our only representative of smithcraft, though an official inquiry made by the Board of Education had demonstrated long before that Shaw's name is nowhere recorded in connection with any ironwork at Hampton Court or elsewhere.

I have dwelt at some length on Tijou, for whatever we may think of his work, and no one visiting St. Paul's can deny that it is appropriate and beautiful, he alone raised smithcraft from the lowest level into a flourishing craft patronised almost immediately by royalty, and almost the entire aristocracy of the country. As to his designs, most are essentially in the French taste of Louis XIV.; but when executed the work becomes something different. Whether modified by the taste of the patron or the architect with whose buildings it is so generally associated, it appears, as I am pleased to think, more English in design, less grandiose and assertive, stronger and more practical.

We have some ground for believing that Tijou's very florid ironwork was not to Wren's taste, and, therefore, that he was no willing patron, for while he extols Grinling Gibbons in his memoirs, he is silent as to Tijou. This is strange afte an association of twenty years. Tijou similarly ignores Wren in the dedication of his book of designs; he sent his estimate and bills direct both to the Crown and to the cathedral authorities, and the indoor work at Hampton Court, such as woul naturally be left in Wren's hands, like the balustrades to the King's and Queen's back staircases, the Privy stairs, Lor Portland's and others, are as plain as can be, with no trace of the beaten leaf work of which Tijou was so lavish.

When Tijou disappeared his apprentices, assistants smiths, or whoever he employed must have remained Whether he actually brought any foreign workmen with him is unknown, but none are heard of after his departure. Presuming Shaw to have been his foreman of works, he, too, ha departed, and the road was clear for successors. The onl work in the Home Counties, however, that can certainly b tributed to a pupil is a pair of gates made for Canons, and ow at the Durdans. They are designed after Tijou's style, it not carried out by a masterful hand.

*(To be concluded.)*

## COMMENTS ON ARTESIAN WELLS.

By F. J. WARDEN-STEVENS, M.I.M.E., A.M.I.E.E.

N view of the large number of artesian wells which have been bored comparatively recently in the London district ) provide independent or private water supplies, some com- ients on mechanical details may be opportune. Artesian ells are here intended to include deep borings and not sunk ells, and where the water level is at a considerable depth rom the ground surface, so that the pump has to be lowered ito the boring and worked by rods from gearing at the ground irface.*

In order to decide upon the diameter of a well boring, the rst question to consider is the pump, as it has to be lowered ito the boring. Upon the size of the pump and the quantity f water required will depend the diameter of the boring.

A pump for a deep well boring is essentially a slow-speed nd long-stroke pump. A good average length of stroke is hree feet, although this depends to some extent upon the ize of the pump; the average speed is about 80 to 120 feet er minute, and it is generally inadvisable to increase this peed much more on account of acceleration forces. Allowing 00 feet per minute as being the speed, then 50 cubic feet per iinute is the maximum delivery of the pump per foot area of he pump bucket, or allow about 300 gallons per minute.

Now, of course, the diameter of the lining tubes of the oring must be larger than the diameter of the pump, to allow or the thickness of the barrel and clearance; for example, pump with an 8-inch diameter barrel will require a boring ith about 10-inch diameter lining tubes, and the size of the ising main will be about 8 inches diameter.

The depth the boring will be required to be extended to is lways an uncertainty. A depth of water in the boring of at east over 100 feet is desirable, and allowance must be made ) facilitate increasing the depth or extending the lining ubes should circumstances require it. The depth of the ning tubes, if the source of the water supply is the chalk, hould preferably extend several feet into the solid chalk, nd in any case below the pump suction pipe.

The guide pipe driven into the subsoil at the starting of he boring should extend sufficiently far to shut out all surface r subsoil waters, and to act as a protection to the lining ubes.

The lining tubes for the boring are a most important part f an artesian well. Lap welded steel tubes of only the best uality should be used, and of ample thickness, to prevent uckling when being driven. The ends of each length of tube hould be faced, screwed with a fine thread and butt to make tight joint in the connecting sockets. If the ends of the ubes do not properly butt at the joint, when the tubes are riven the threads will be damaged, which may result in ercolation of undesirable water into the boring.

As regards the pump, the barrel, which is screwed at one nd into the suction pipe and at the other end into the rising iain, should preferably be of brass, of ample thickness to ithstand wear for a reasonable time, its length being, of ourse, rather longer than the length of the stroke.

The valves of the pump, as will be understood, require articularly careful construction, as it is important that they hould not require frequent attention, necessitating not only toppage of the supply, but considerable time and trouble in isconnecting the rods and withdrawing the bucket and valves. he suction valve and its seating are usually so arranged that ey can be removed from the boring by a screwed rod. The ump rods are sometimes of hard wood, the advantage of such eing particularly the reduced weight, as a considerable length required. It may be here noted that the pump should be sually placed at least 50 feet below the normal water level, allow for the water level falling during pumping.

As to the driving gear and power at the ground surface, here is the opportunity of a varied selection of arrangements. f steam is already available for other purposes, the direct-acting steam drive is certainly simple. Again, if hydraulic power is available, say in cases where there are hydraulic lifts, the hydraulic direct drive is both simple and practically noiseless, although perhaps the working cost is generally rather higher than with most other types of gear.

Other arrangements which may be mentioned are the electrically driven gear, the worm and wheel type of which, as well as the machine-cut double reduction gear, are very compact and also practically noiseless. Then, of course, there is belt-driven gear from shafting or engine available.

Another question of no little importance in view of satisfactory pumping from artesian wells is that of balancing. It will readily be understood that, apart from the weight of the pump bucket and rods, especially if the latter are of iron, there is the weight of the column of water in the rising main on the up-stroke. On the down-stroke, of course, the valve is open and the water is not acting on the bucket. The power to be exerted, therefore, is not uniform, and it is to be remembered that the weight has to be set in motion and stopped each stroke. The power can only be equalised by balancing all moving parts. There is, however, still the difficulty with the variation of water level.

As regards the question of air lift for the water instead of the use of a pump, this is certainly attractive. The air lift, briefly described, consists of two tubes suspended down the boring, compressed air being conveyed down one tube and forcing the water up the other tube. The great advantage of the air-lift system is that no pump is necessary in the boring, with its accompanying working parts, valves, &c., and, of course, no pump rods or gearing are required, only the air compressor at the ground surface driven by a suitable source of power. It must also be mentioned that the output of an artesian well may be greater with air lift than with a deep boring pump. The cost of working, however, may be said to be higher with the air lift, and a considerable noise results from the working of the air compressor.

A detail apt to be neglected in connection with artesian well gear is that of lubrication. All bearings should have an oil pipe conveyed from a syphon or regulated sight-feed lubricator; in the case of moving parts, such as connecting-rod ends, an oil box with dip catcher should be provided.

In concluding, note perhaps should be made regarding facilities being provided for easy removal of the pump rods to get at the valves. Three-leg tackle and gear with winch should always be available, and there must be sufficient head room in the pump house to allow of withdrawal of the rods. There should preferably be an elevated guide beam in the pump house over the centre of the boring, with a platform a few feet below to facilitate handling of the rods.

These comments on some of the important mechanical details relating to water supply from artesian wells will, it is hoped, be of interest to many who are no doubt considering the advisability of obtaining such a supply. It will be noticed that no reference has been made to the geological considerations in connection with the subject, which, whilst of no less importance, are outside the scope of these comments.

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

ON Thursday evening, January 13, at a meeting of the Society, Professor S. D. Adshead, of Liverpool, introduced the subject of town planning with special reference to the Housing and Town Planning Act and its bearing upon suburban dwellings.

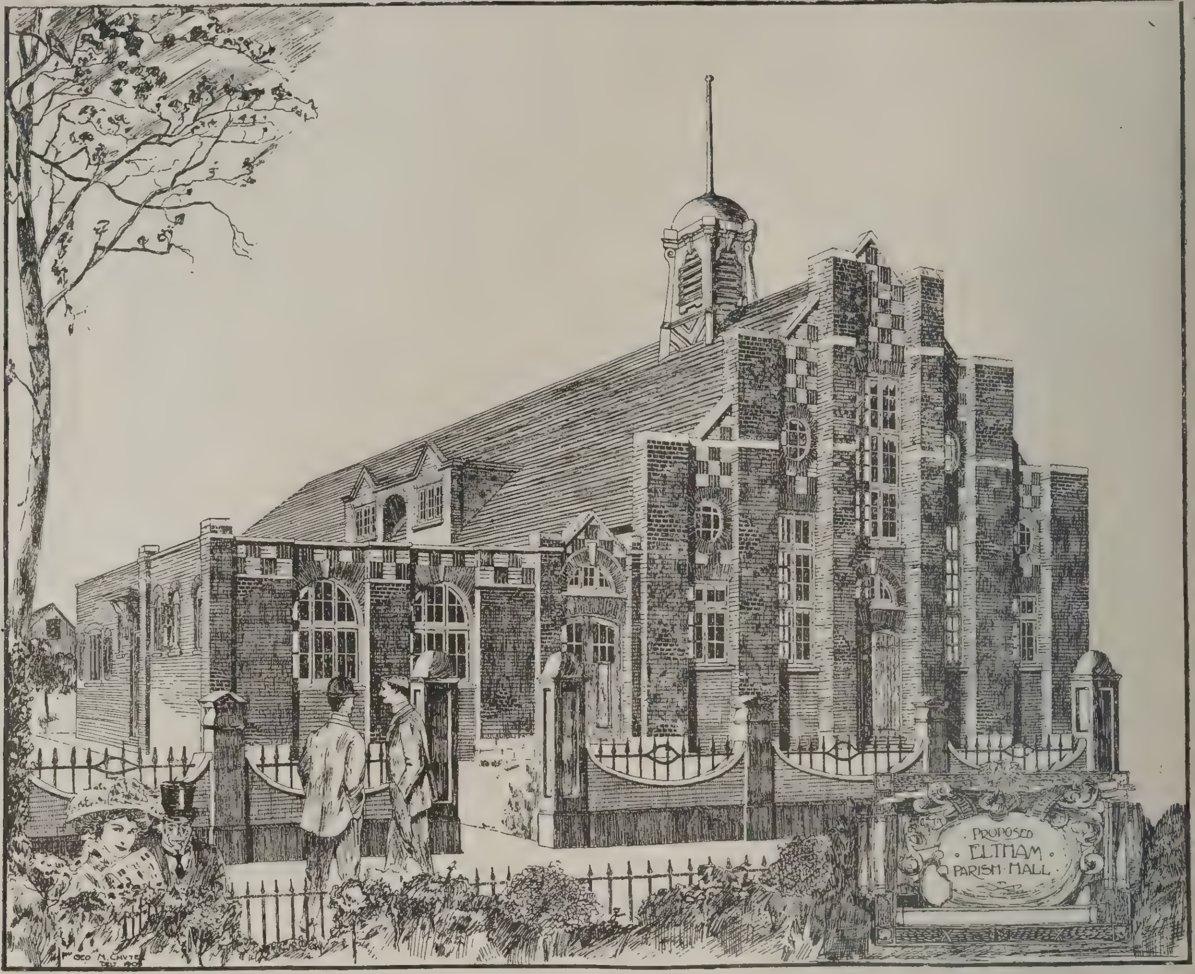
Professor Adshead in discussing the Act pointed out to what extent the exercise of goodwill and tact on the part of those concerned in negotiations would be required for its satisfactory administration. He urged the necessity for a unity of purpose and warned against the danger of isolated areas being "town planned" without due reference to the whole, a possible result of a too literal reading of the Act. Town planning had in the past been largely responsible for the tastes and inclinations of the working man. He was, unless taken in hand by his employer, either driven into a slum or catered for by the speculating builder, whose taste was the very worst.

What could town planning do for him?

With improved communications there was no reason why working men should not, if they so desired, live outside the town where land was plentiful and cheap and the pleasure of a garden could be enjoyed. So long as town dwellings were adhered to, these should be on the block system—an arrangement adapted in many ways to modern conditions. Concerning

---

* [An "artesian" well, properly speaking, is one in which the ater rises to the mouth of the well, without pumping, but the rm has now become very generally used to mean tube wells of onsiderable depth.—ED.]



COMPETITION DESIGN by REGINALD PYWELL and GEORGE N. CHUTER, Joint Architects.

the middle classes, here again a lack of appreciation of real art had rendered them a ready prey to the speculating builder, who while conforming to the by-laws had produced monotonous rows of cubicles which attracted the unsophisticated with a thin veneer of respectability in the shape of sham ornament. The individual building owner had attempted to make his building the climax of the street. Self-assertion had been unchecked. Thus, the Town Planning Act was destined to become one of the most important and consequential of all recent reforms.

For the future a new beginning was impossible, we must make the best of what we possess. Terraces could be with little alteration converted into blocks of tenements, while stripped of its "ornament" the mid-Victorian house might even attain to a stuccoed simplicity. The chief opportunity for real development, however, was offered by the outer ring of undeveloped land extending beyond our suburbs. Here, the choice of a suitable and utilitarian style for future buildings suggested wide possibilities. There was much to be said for the pedimented villa of the Regency and Early Victorian periods, the fine simplicity of which, combined with its compatibility with modern needs must appeal to the increasing artistic intelligence of the people.

Referring to recent examples of suburban development, Professor Adshead pointed out that they must by no means be regarded as final results but as experiments in a far-reaching movement. There was much confusion of refinement with rusticity; these did not go necessarily hand in hand; the magnificent cottage did not suggest the residence of pretension; there was a limit to the stretching capabilities of the rustic cottage. In planning the residential quarter of a town, the occupation and taste, the tendencies either rusticated or refined of its prospective population must all be equally considered, and a disposition and an architecture evolved at once utilitarian, harmonious and beautiful.

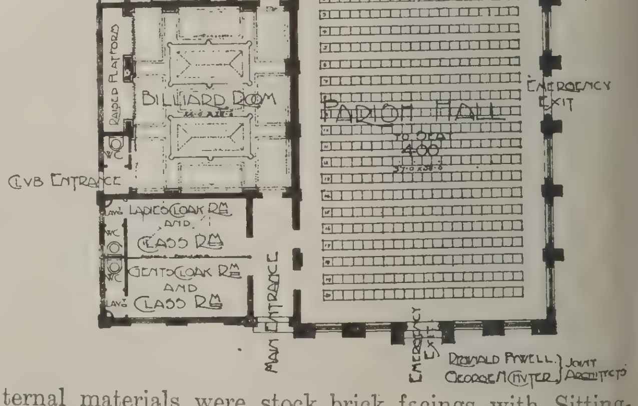
The lecture was illustrated by plans and views having reference to town planning both in this country and abroad.

A vote of thanks was accorded the lecturer on the motion of Councillor Boyle, and a discussion ensued in which Messrs. Percy Robinson, S. D. Kitson and Butler Wilson joined.

The next general meeting of the Society will be held on Thursday, January 27, when J. A. Gotch, F.S.A., F.R.I.B.A., will discuss "The Elizabethan House, as Illustrated by Contemporary Architectural Drawings."

## ELTHAM PARISH HALL.

THIS design was submitted in the above recent competition. The conditions asked for a hall to seat 400, separate cloak-rooms for ladies and gentlemen, which could be used for two class-rooms, or be converted into one room for small parochial meetings; billiard-room, kitchen, and heating chamber, &c. The proposed external materials were stock brick facings with Sittingbourne red dressings and Bath stone bands and copings, the roofs to be covered with sand-faced tiles. The internal walls to be faced with Flettons and distempered; all internal joinery to be stained green. The authors of the design were Mr. REGINALD PYWELL and Mr. GEORGE N. CHUTER.



## PENSHURST AND THE SIDNEYS.*

EN—the Celtic word for high—remains in many place-names, and in the same sense it was applied to an exalted rsonage, as the Pendragon. The earlier name of Pennas- rst, Pencahurst, or Penshurst, was Pencestre, Pencester, Penchester, and would indicate that the Celts had reared earthen camp or castle on the hill; but as ages passed and ature spread her forest, the castle gave place in importance the wood or hurst. As Penchester, however, it was still own in the reign of Henry the Third, and one of his knights, r Stephen de Penchester, whose ancestors had held the operty from the time of the Conquest, was allowed to re-edify e manor house; and being constable of Dover Castle and rden of the Cinque Ports, he acquired great fame in the ys of the first Edward. Sir Stephen, who occasionally re- led at his castle at Allington, died in 1299, and having no to succeed him, bequeathed his "manners" to his ughters, Joan and Alwys (or Alice).

On the marriage of Alice de Penchester, Penshurst passed her husband, Sir John de Columbers, and their sons, Thomas d Stephen, in 1338 sold the manor to Sir John de Pulteney, important citizen of London; and three years later, by ters patent of Edward the Third, he was licensed to engthen the residence with walls of chalk and stone and battle it, and it is stated that the king became his guest en on his way to Tonbridge. Again and again the bells the City churches made mad music in the air when four nes in succession John de Pulteney was proclaimed Lord ayor of London. He died in 1360, and from John Stow learn that he was a draper, and in 1337 built a fair chapel St. Paul's Cathedral, wherein he was buried; that he nded a college in the parish church of St. Laurence, called ultney after him; built the church of Little All Hallows Thames Street; the Carmelite Church in Coventry; and ve relief to prisoners in Newgate and the Fleet, besides ing other charitable acts.

His son, Sir William, dying, the mother's second husband, Nicholas Louvaine, became possessed of Penshurst. cholas, their son, died without issue, and his widow married hn Devereux, who had fought with Edward the Third. By chard the Second he was made knight-banneret, was ap- inted steward of the king's household, and in 1393 Richard ensed him to further fortify Penshurst. He died in 1394, d on his wife's death the property again passed to the uvaines. Later, by marriage, Sir Philip St. Clere of tham became the owner, and his son John sold the manor John, Duke of Bedford, third son of Henry the Fourth.

The Duke enlarged the house, and this would be the time became known as Penshurst Place (or Palace). In 1422 brother, Henry the Fifth, died, and he was appointed gent of France, and martyred the Maid of Orleans, recently tified. His death in 1435 caused the loss to us of France.

The next owner of Penshurst was the late Regent's brother, mphrey, Duke of Gloucester (Humphrey the Good), who ring the minority of Henry the Sixth was Protector of Eng- nd, but owing to his opposition to the king's marriage with rgaret of Anjou he was arrested in 1447 and, it is believed, assinated. He built the Divinity Schools at Oxford, and nded the library from which the Bodleian arose. He lies the cathedral of St. Albans.

Penshurst passed to Henry the Sixth, and he at once nted the manor to Humphrey Stafford, Duke of Bucking- n. In 1460 he fell in the Wars of the Roses at the battle of rthampton. His son Humphrey having been killed at battle of St. Albans, his grandson Henry inherited the e and estates, and in 1483, mainly through his agency, hard the Third was placed on the throne; but favouring nry, Earl of Richmond, who became Henry the Seventh, was beheaded at Salisbury. His son Edward succeeded the estates and title; and on a charge of treason against nry the Eighth he was executed on Tower Hill in 1521, and property again reverted to the Crown; and at this time nry the Eighth and Anne Boleyn rode there from Hever tle.

By Edward the Sixth Penshurst was granted to John, Earl Warwick, and later to Sir Ralph Fane, who, charged with g an accomplice of the Duke of Somerset, ended his life Tower Hill in 1552. Edward then granted the estates to yr William Sydney," whose ancestors had lived in fair rmandy, and in the time of Henry the Second owned the nor of Sutton. He had fought at Flodden Field, and was sent at the meeting of Henry and Francis on the field of Cloth of Gold, and became chamberlain and steward of household of the young King Edward.

Sir William died within the year, and was succeeded by his son, "Sir Henrie Sidney," chief cupbearer to Edward the Sixth. In 1551 Henry had been privately married at Esher to Lady Mary Dudley, daughter of John Dudley, Duke of Northumberland, Earl of Warwick, and Baron Lisle; and later the union was publicly solemnised in the church of St. Ethelreda, Ely Place. In right of his wife he used the badge the bear and ragged staff with the Sidney crest of the porcupine. In his arms Edward breathed his last in 1553, and he it was who caused the statutes of the realm to be first printed.

In 1554 Philip Sidney was born, and the acorn planted in the park in honour of his birth inspired the strains of Ben Jonson and Edmund Waller. Southey deplored that it had fallen to decay; Gifford records that inadvertently it was cut down, and Zouch gives the date 1768. This seems to be correct; and to the neighbouring Bear Oak the memory of Philip Sidney has been popularly transferred, though the Hon. Mary Sidney states it was an old oak when Philip was born.

In 1566 Mr. Philip Sidney paid his first visit to his "uncle of Leicester" at Kenilworth Castle. His father, as Deputy of Ireland and Lord President of Wales, during many anxious years did splendid work in quelling the ever-recurring rebellions, and spent his fortune doing so; yet, although we may believe the tradition that Elizabeth visited him at Penshurst, he was never quite in her favour; but when she complained of his extravagance, Philip went to her at Oatlands and successfully refuted the charges. In 1578 Sir Henry resigned his office in Ireland, and with his wife and Philip he is believed to have spent some time with the queen at Hampton Court.

Philip was knighted in 1583, and in the same year he married Frances, daughter of Sir Francis Walsingham, and they often visited his wife's parents at Barn Elms. What need to recount his story as student, cleric, poet, traveller, courtier, politician, ambassador, and soldier! His acts are known to all, for, as William Camden wrote, he was "the glory of the world." Campbell describes his life as "poetry put into action," and Oldys catalogued two hundred authors who had written in his praise. In 1585, under his uncle, the Earl of Leicester, Elizabeth sent him to the Netherlands to aid the Dutch against the Spaniards. Sir Philip held a commission as Governor of Flushing, and there he heard of his father's death; and three months later his mother died, and he never returned to England as owner of Penshurst Place, for six weeks later he received a wound in his leg which caused his death. Never will the incident be forgotten how, when weak from loss of blood, he was raising a borrowed flask to his lips, but seeing a wounded soldier he passed it to him, saying, "Thy necessity is greater than mine." He was conveyed from Zutphen to Arnheim, where after nearly a month's suffering he peacefully passed away (October 17, 1586), true to his Maker and his queen. The body was embalmed and brought to London in his own ship, "The Black Pinnace." The coffin was landed on Tower Hill and was conveyed to a house in the Minories, where, owing to an informality in his will, it remained for three months. Finally he was buried in the lady chapel of St. Paul's Cathedral, more than seven hundred mourners taking part in the procession. Not until after his death was his "Arcadia" published; his first known work was a masque performed at the Earl of Leicester's house at Wanstead (April 1578) in presence of the queen.

Philip had bequeathed his estates to his brother Robert, who took part in the engagement at Zutphen and was knighted by his uncle. For twenty-eight years he was Governor of Flushing, and while he was abroad Ben Jonson records how his wife, Barbara Gamage, entertained King James at Penshurst. In 1606, by James the First, he was created Viscount Lisle; some ten years later he became chamberlain to the queen consort, and in 1618 he received the title of Earl of Leicester. He died in 1627.

His only surviving son, Robert, had been married to Lady Dorothy Percy, daughter of Henry, Duke of Northumberland, and among their children were Philip, Algernon, Robert, Henry, and the beautiful Lady Dorothy—the "Sacharissa" of Waller—called in the family circle "Doll." She married Henry Lord Spencer, later Earl of Sunderland, who fell at the battle of Newbury.

After the execution of Charles the First, 1649, his two youngest children, the Duke of Gloucester and the unfortunate Princess Elizabeth, were confided to the care of Lord and Lady Leicester at Penshurst, and they remained there for over a year. In 1667, in his eighty-second year, the old Earl died, and his son Philip succeeded to the title and estates.

Algernon in 1645 had been appointed Governor of Chichester, and two years later of Dover Castle. He became a member of Parliament, travelled abroad, and returning aided his friend William Penn in drawing up a plan of twenty-four

---

articles for the Government of Pennsylvania. Various charges, possibly without foundation, from time to time were brought against him, and in 1683 he was arrested as one of the members of the council of six concerned in the Rye House plot to assassinate Charles the Second. Judge Jeffreys, denying him the aid of counsel and not permitting him to call any witnesses, sentenced him to death, and his head fell on Tower Hill.

Few in those days were contented to live in peace, and Algernon's brother Henry was one of the principal promoters of the rebellion against James the Second in 1688, and from Ladye Place, where he had been in hiding, he went to William of Orange inviting him to invade England, and he received him on his arrival. William showered honours on him, and in 1694 created him Earl of Romney; and while Master of the Ordnance he introduced his own arms, the pheon or broad arrow, as the Government mark. He died in 1704 and was buried in St. James's Church, Piccadilly.

Philip, Earl of Leicester, had died in 1697 at the advanced age of eighty, and was succeeded by his son Robert, three of whose sons, Philip, John and Joceline, successively succeeded to the title, and on the death of Joceline in 1743 it became extinct.

Penshurst passed to Joceline's niece Elizabeth, who becam the wife of William Perryng or Perry, and in 1752 Georg the Second granted permission for them to assume the nam and arms of Sidney. Their daughter Elizabeth married Si Bysshe Shelley, and their son, Sir John Shelley, in 1793 b sign-manual of George the Third took the name and arms Sidney. His son Philip Charles in 1835 was created Baro de L'Isle and Dudley by William the Fourth, and he marrie Sophia FitzClarence, a daughter of the king. His son Phili succeeded to the title and manors, and his son Philip, wh married a daughter of Viscount Gort, is the present Lord L'Isle and Dudley and Master of Penshurst; and it may mentioned that among Royal guests at Penshurst was Edwar the Seventh when Prince of Wales.

John Carter in 1803 read the story of Penshurst Pla from its stones and bricks, and various portions of the arch tecture he ascribed to the reigns of Henry the Second, Richa the Third, Henry the Eighth, Elizabeth, James the First, a the first and second Georges. To the less trained eye, howeve the falcon and ibex of the Duke of Bedford, the broad arro of Sir Henry Sidney, his later bear and ragged staff and t porcupine, and the Gamage griffin, besides various inscri tions, fairly indicate how the building was from time to tin

## MODERN EUROPEAN ARCHITECTURE.

DOORWAY TO SALON IN HOUSE, HEERENGRACHT, AMSTERDAM.

nlarged; yet, though such a splendid and stately pile, foundations exist which show that portions have been swept away.

In 1863 John Henry Parker said it was a perfect example of a wealthy gentleman's house of the time of Edward the Third or A.D. 1341. The house, apart from the additions, was really perfect as originally built, only excepting the kitchen, which had been destroyed by fire, and probably some of the towers. The great hall remains almost unaltered, and such an open-timber roof and such decorated mouldings were not to be found out of England. The fine windows with their Kentish tracery, consisting of a square opening in the head, with foliation and with transome bars embattled, are unknown in foreign countries. In the centre of the hall is the original hearth or reredos, almost the only one remaining, and with its andirons or fire dogs. Although fireplaces and chimneys of the twelfth and thirteenth centuries are found in chambers, it was not customary to use them in halls till the fifteenth century, the smoke escaping by the open louvre in the roof. The tables and benches in the hall are among the earliest pieces of furniture in England, and the trestles or legs have every appearance of belonging to the time of Edward the Third. The daïs remains with the staircase eading to the solar or upper chamber, and by its side a door eading to the cellar, originally the lower chamber under the solar, or lord's chamber, where from a look-out he could scan the hall. At the lower end the music gallery remains with a fine specimen of modern panelling, shaped with axe and chisel. Under the gallery was the passage called the screens, with the porch or principal entrance at one end, and at the other the entrance to the servants' court at the back of the hall. Along the passage are the doors to the buttery, where the beer, cider, and other drinks were given out, and to the pantry, where the bread and dry stores were kept. The meat was brought direct from the kitchen. The chapel was usually near the daïs, but at Penshurst, according to Parker, it was probably destroyed in the days of Elizabeth.

The gateway tower, as the inscription records, was built by Sir Henry Sidney in 1585, and in the porch hangs the original key. Horace Walpole in 1752 wrote, "The apartments are the grandest I have seen in any of these old palaces," and everywhere pictures and other works of art abound.

In the pages' room, to quote the words of Horace Walpole, "are four great curiosities, I believe as old portraits as any existing in England—FitzAllen, Archbishop of Canterbury; Humphrey Stafford, first Duke of Buckingham; J. Wentworth; and John Foxle—all four with dates of commissions as Constables of Queenborough Castle. They are not very ill done. Six more are heads. Sir Edward Hobby, last but one of the constables, is said to have collected these portraits." Other noticeable paintings are a head of "Christ and the

Madonna," ascribed to Simon Memmi, 1340; "Madonna and Child," by Guido; "St. Peter," by Steenwick; "Sleeping Venus," by Titian; "A Female Head," by Giorgione; "Sir William Sidney," by Lucas de Heere; "Sir Henry Sidney"; "Edward the Sixth," by Holbein, and "John Dudley, Duke of Northumberland," by the same artist; "Lady Mary Dudley"; "Sir Philip Sidney" when twenty-three, and a second portrait of him, by Zucchero; his sister, "Mary Countess of Pembroke"—the Urania of Edmund Spencer—by M. Gerrard, and one of her by Marc Geeraent; Philip's special friend "Hubert Languet"; "Queen Elizabeth," by Zucchero, and one where she is dancing with her favourite, Robert Dudley, Earl of Leicester, of whom there is also a portrait by Gerrard; "Robert, Earl of Leicester, 1632," by Vandyke; "Philip, Lord Lisle," by Vandyke; "Charles the First on Horseback," by Mytens; "Prince Rupert," who for a time took refuge at Penshurst; "A Halt of Cavaliers," by Wouvermans; "Charles the First's son, the Duke of Gloucester"; "Nell Gwyn as Venus," by Lely, and one of her son, the Duke of St. Albans; "Henry Rich, Earl of Holland," by Vandyke; "Robert, Earl of Leicester," by Van Somer; "The Brothers Philip, Robert, and Algernon," by Dobson; "Dorothea" (Sacharissa), by Vandyke, and another by Hoskins; "Algernon Sidney," by Justus Verus van Egmont; and "Barbara Gamage, Countess of Leicester, with six of her children." The later portraits include "George the Third," by Gainsborough; "Queen Charlotte," by the same artist; and "William the Fourth," by Sir Thomas Lawrence. Pictures by Peter Thone (1560), Murillo, Guercino da Cento, N. Poussin, Rubens, and others, also adorn the walls.

Interesting too is the tapestry by Giles and John Gobelins and the frescoes by Vanderbrecht; and antiquaries linger by the black wooden cradle of the Duke of Buckingham (dated 1585) and his bridle; the bushel measure (dated 1601) and the large bell bearing the date 1647. Here too is the spinet, with black keys and white sharps and flats, made for Christiana, Queen of Sweden, in 1680; the old lamp which, as the oil was consumed, showed how the hours were passing; the glass chandeliers from Venice, given by the Maiden Queen, and a piece of her needlework let into a card table; the ebony cabinet, with panels by Polemberg, Berghem, Both, and Peters, presented by James the First; and the riding boots of Algernon Sidney; locks of hair of Sir Philip and Algernon Sidney, and Sir Philip's helmet and shaving-glass, and Robert Dudley's sword are also among the treasures of the house.

In old days Penshurst possessed the most valuable collection of armour in England, at least, but most of it was sold by Sir Joceline Sidney, who also disposed of the larger part of the library; and though there is still an important collection of historic documents in the hands of the family, Ireland had been allowed to arrange them, and through him many passed into the hands of private collectors, while others were offered for sale in London shops.

Penshurst Church was dedicated in honour of St. John the Baptist; the architecture is mainly Decorated and Perpendicular, though portions are believed to date from about 1200. It contains the mutilated effigy of Sir Stephen de Penchester (1299), and the altar tomb of Sir William Sidney. Many Sidneys are buried in the vault of the Sidney chapel, and Algernon's coffin with others having fallen down about seventy years ago, his remains are now contained in a small stone chest. There are brasses to the two wives and seven children of Walter Draynocott (1507), Pacole Iden (1514), Margaret, the infant daughter of Sir Henry Sidney (1558), and an unidentified one of the fifteenth century. Two ornate stone coffin-lids are also of interest.

Few families have made a greater mark in history than the Sidneys, and for many ages may they live and enjoy the rest and peace they have earned.

For many of the foregoing particulars I am indebted to the compendious and charmingly written story of "Penshurst," by the Hon. Mary Sidney; from the writings of John Timbs, F.S.A., William Howitt, the Rev. J. L. Ward Petley, M.A., and Mr. Frank Hird I have also gleaned, and for assistance given me I thank Mr. W. F. Harradence.

## COMPETITIONS.

Tralee.—In our issue of December 31 we stated that the first premium in the competition for a Carnegie library and technical school at Tralee had been awarded to Mr. J. Clarke, Liverpool. We have since been informed that it should have been announced as Mr. W. T. Clarke, A.R.I.B.A., Bank Buildings, 60 Castle Street, Liverpool.

## OUR CONTEMPORARIES FROM OVER-SEAS.

The *American Architect* devotes its last number of the past year to motor garages, of which it illustrates several examples, mostly belonging to private individuals. The Council of Fine Arts established by order of President Roosevelt has been abolished by a revoking order of President Taft, not it is said from want of sympathy with the object of the Council, but because the present President holds that any such bodies should be created by legislative action.

*La Construction Moderne* with its New Year's number gives a coloured plate of the interior of the Mosque of Omar at Jerusalem, after a water-colour drawing by M. René Binet, architect. Illustrations are also given of a private mansion at Amiens, of which MM. G. Antoine & Son are the architects.

*Zodtchy* has an excellent Christmas number with numerous illustrations of piquant and refreshing modern designs for various buildings, a school, a club house, a bridge, a convent, and some sculptured monuments.

The *Engineering Record* has an interesting article in description of "A Convenient Rack for Holding Drawings," by John H. Gregory, M.Am.Soc.C.E., in which is also advocated the use of typewriting for lettering plans. The application of the slide-rule to the calculation of reinforced concrete is the subject of a descriptive letter from Mr. Arthur W. French, of the Worcester Polytechnic Institute.

The *Architectural Record* is devoted entirely this month to the work of Messrs. Carrère & Hastings, from their start in the several buildings at St. Augustine, Florida, to the present time. To understand modern American architecture it is essential to study the work of this firm and to note the influence they have exerted particularly in imparting the unmistakable French cachet that is now so prominent in the States.

## Correspondence

*[The Editor will not be responsible for the opinions expressed by Correspondents.]*

### "Tenders" for a Surveyorship.

Sir,—Are your columns too austere for a wee little joke? The Thurles Urban District Council desire "tenders" from competent persons for the position of town surveyor, at a remuneration of 20*l.* per annum. It does not state how this munificent amount will be paid. Oh ye gods and little fishes! Who wants employment? Think of the possibilities and look at the position; fancy your card printed Mr. Job Hoof, Town Surveyor, Thurles.

I have not yet heard how many tenders were received.—Yours, &c., Hard Up.

## GENERAL.

Mr. Thomas Worthington, F.R.I.B.A., of Broomfield, Alderley Edge, and of Manchester, a former president of the Manchester Society of Architects, and a former vice-president of the Royal Institute of British Architects, who died on November 9 last, aged eighty-three years, left estate of the gross value of 13,907*l.*, of which the net personalty has been sworn at 13,747*l.*

The Auld Brig preservation committee at Ayr have been granted an extension of the time for completing their operations on the bridge to April 30. The extension was necessary on account of the frost having kept the work back.

Mr. Eustace L. Haynes, architect and surveyor, has removed his offices to more commodious premises at 120 Newgate Street, E.C. His telephone number is as before, Holborn 2390.

Mr. William H. Thorp has taken his son, Ralph W. Thorp, A.R.I.B.A., into partnership. The name of the firm in future will be William H. Thorp & Son, and they continue to practise as architects at Phœnix Chambers, South Parade, Leeds, as heretofore.

The ninth International Housing Congress will take place in Vienna from May 30 to June 2, under the auspices of the permanent international housing committee. A party of British delegates will be organised by the National Housing and Town Planning Council to attend the Congress.

Mr. W. J. Steele, deputy city engineer and surveyor, Bristol, was last week elected city engineer and town surveyor of Newcastle-on-Tyne.

## FORTHCOMING EVENTS.

*Saturday, January 29.*

The Royal Institute of British Architects : Annual Exhibition of Designs and Drawings submitted for the Institute Studentships at the Alpine Club closes.

*Monday, January 31.*

The Royal Institute of British Architects : President's address to students. Presentation of prizes and studentships.

Royal Academy : Course of Four Lectures on Sculpture, by Professor W. R. Colton, A.R.A. : (1) "On the Making of the Sculptor."

Royal Society of Arts : Cantor Lecture (3), "Textile Ornamentation," by Mr. Alan S. Cole, C.B.

*Tuesday, February 1.*

Northern Architectural Association : Paper on "Architecture on the Eastern Side of the Adriatic," by Mr. George Hubbard, F.S.A., F.R.I.B.A.

*Wednesday, February 2.*

Royal Archæological Institute : Paper on "Discovery of Early Wall-Paintings in Kingsdown Church, Farnham, Kent," by Mr. Philip M. Johnston, F.S.A., F.R.I.B.A.

Carpenters' Company : Paper on "The Joiner's Craft," by Sir Brumwell Thomas, F.R.I.B.A.

## EXHIBITION OF THE ARTS AND CRAFTS SOCIETY.

THE ninth exhibition of the Arts and Crafts Exhibition Society, and the last to be held at the New Gallery, now provides us with a further collection of the same type of design to which we have become accustomed as representing the art ideals of the members. In earlier days there was undoubtedly much that was crude and extravagant, but now, with the exception of a certain small amount of affectation of the defective technique of past ages, there is not much that one can regard otherwise than with satisfaction.

Of the various classes of exhibits, we are inclined to give the palm of excellence to the metalwork, whether it be wrought iron in the form of fireirons, fenders, grates, lamps, or the fine lecterns to be seen in the north room, or whether it be in the form of jewellery and table silver such as are to be seen in the case of silverwork in the central hall designed by Mr. C. R. Ashbee, and executed by A. Miller, W. Mark, G. Horwood, G. Hart, and J. Baily of the Guild of Handicraft, or in the case of jewellery designed by Mr. Alexander Fisher and executed by him and his assistants, which is also in the central hall. Of quite a different type, but equally excellent, are the small plaques by Mr. Frank Lutiger or Luttiger, for the name is differently spelt on separate pages of the cataogue, of H.M.S. *Lord Nelson* and H.M.S. *Glory*, which are interesting, not only in themselves, but as showing that a modern battleship is capable of forming the subject of a real work of art.

The lecterns in the north room, to which we have alluded, are an eagle lectern in brass, designed by Mr. W. Bainbridge Reynolds and executed by A. Dufour, D. Brooker, and F. Porter, and a wrought-iron ectern designed by Mr. Edward Spencer and executed by Walter Spencer and B. Edwards, with some apital book-rests in leather by Florence George. Each of these displays originality of treatment and excellent design suitable to the material without extravaance or eccentricity. They would not both be in harmony with any and every church, but given the right environment would put to shame ninety-nine out of a hundred of the things that do duty for lecterns.

A pair of church candlesticks in wrought iron, also designed by Mr. Edward Spencer and executed by the same craftsmen as the lectern are to be noted mongst the excellent things in metalwork to be found in the north room.

Woodwork has always been a strong point amongst the work shown by the Arts and Crafts Exhibition Society, and in the portico we are at once struck by the settle with carved panels designed by M. Grace Mead. The music cabinet designed by Mr. George Jack and executed by himself and Laurence Turner is, spite of its general merit, one of those examples to which we have referred as showing an exaggerated affectation of poor technique, in this instance in the carved frieze. Another curiosity of affectation is the ebony and walnut cabinet executed by Henry Daroll from the design of Mr. Ernest Gimson, who is as usually well represented. In this case the top and ends are treated in matched veneer in such a way as to suggest that the piece of furniture is made out of a single log, which apparently has been dug out to allow of the planting in of a chequer work of dark and light drawers. Mr. Gimson's chest of drawers in English oak, executed by F. Orton, has an almost extreme simplicity, to which contributes the single cut-wood handle of each drawer, a device to which we do not object, as they are eminently comfortable and the drawers run well.

A magnificent piece of work is the wardrobe of satinwood and sycamore, with inlaid ornamentation and silver mounts, designed by Mr. E. J. Minihane and executed by E. R. Gribble, with silverwork by H. Davis. This is priced at 126*l*., a sum that not everyone can afford for a wardrobe. The bookcase designed by Mr. F. C. Neilson and executed by Petersen is not in accord with the best traditions of the Society, the badly designed quasi-architectural detail of the cornice being quite unsuitable even if it be not a deliberate piece of affectation. Mr. Ambrose Heal's inlaid oak wardrobe is a good piece of design; and Mr. W. A. S. Benson's inlaid rosewood cabinet with metal mountings is quite a striking affair, even if rather overdone with metal.

The mantelpiece, grate, and accessories designed by Mr. H. Longden are repellent from the coarseness of the detail of the mantel, which, whilst reminiscent in general lines of the chimney-pieces of the Adam period is entirely destitute of the refinement that we expect to accompany any work based on that period. Another piece of furniture that jars upon us is the carved and painted bedstead designed by Alberta Plymouth, and executed by Henry Tremlett and Alfred Westover, which seems to us to have entailed a lamentable waste of time and labour in carving as a ground for a hideous colour scheme. Surely the design of a bedstead should suggest rest and not nightmare. Mr. Ambrose Heal's painted four-post bedstead close by tells quite a different story, and for a cheap piece of artistic furniture is commendable; albeit, the method of decoration is not of the most permanent. It would, however, probably last long enough to allow of a change of taste in its owner and a desire for a revision of the decoration.

The most striking object in the west room is Mr. JOHN D. BATTEN's triptych for St. Martin's Church, Kensal Rise, painted *in tempera*, the carving and gilding of the framework being executed by MARY BATTEN and assistants, whilst the hinges were damascened by HAROLD STABLER. This and the studies for the various figures occupy a great part of the space of the longest wall. Of the remaining exhibits in this room, the majority are designs for either stained glass or wall decoration of pictorial character, not always quite legitimate in treatment, as in Mr. HENRY A. PAYNE's cartoons for window in St. Martin's Church, Kensal Rise. In this room also are some more examples of excellent jewellery.

In the south room Mr. HEYWOOD SUMNER's cartoons for sgraffito in his well-known method of varied coloured grounds stand out prominently, the examples being a piece of decoration for St. John's Church, Miles Platting, Manchester, and another for a garden house at Doveleys, Staffordshire. Near by, and very interesting, are Mr. HERBERT A. BONE's pictorial stencils, but one hardly sees the object of such work, except as a curiosity, for the reason of stencilling is to provide a ready means of repeating a decorative design, and a picture loses its value if it is to be repeated at a cost closely approaching that of a single painting.

Architecture is hidden away in the gallery, and consists only of a few photographs and rather indifferent drawings of the picturesquely simple type of architecture that is suitable enough for the week-end cottage or the garden city, but does not extend beyond this.

## NOTES AND COMMENTS.

WE are gratified in having received twenty-one drawings in our newly-started Students' Sketching and Measuring Club, and shall next week give a criticism on these and announce the name of the author of the design we consider the best. Our subject for February is a measured drawing, or drawings, full particulars of which will be found in our advertisement columns. We should be glad if those of our students who have adopted a *nom de plume* would keep to the same throughout.

ONE great difficulty that often occurs in the building trade is the desire of various unions to obtain for their members an exclusive right to work to which architects and contractors think they are not strictly entitled. Thus there has been trouble in the past because bricklayers thought they only ought to be allowed to lay tiles on roofs. We know of architects who have avoided the use of tiling rather than have it done by bricklayers, who seem unable to get on without mortar, a substance that is not desirable for more than the miminum extent in the construction of a tiled roof.

AT Leicester there has recently been a dispute between the plumbers and the heating and domestic engineers as to who was entitled to the right of doing hot-water work. The matter was referred to arbitration under the Conciliation Act 1896, and the arbitrator, Mr. JOHN SMITH, has given his award, which is published in the January number of the journal of the National Association of Master Heating and Domestic Engineers, with an abstract of the evidence on both sides. The gist of the arbitrator's award is that plumbers are to do all leadwork and all domestic waste, soil or ventilating pipes above ground, but that other work may be done either by plumbers or by hot-water, heating and ventilating engineers.

THE recent development of interest in Town Planning in England lends additional force to the attractiveness of the ninth International Housing Congress which is to be held at Vienna from May 30 to June 2 of this year, and the National Housing and Town Planning Council is organising arrangements for a party of British delegates to attend the Congress and to extend the journey to enable Berlin and probably Dresden to be visited.

ALL lovers of Rome's antiquities will regret to hear that Commendatore BONI has resigned his membership of the Commission for the Zona Monumentale. The members of the Commission for the most part are simply intent on converting a portion of the Via San Sebastian into a boulevard. Commendatore BONI wishes to maintain and restore its archæological interest.

BLACKFRIARS BRIDGE will shortly be altered in order to improve the appearance of the structure, which by some people is considered unsightly. When the bridge was widened recently it was found impossible to rebuild at either end of the west side the two large masonry pedestals which added to the appearance of the bridge from up the river, and in their place a refuge containing seats was constructed on the south side, and at the corner of the Embankment a wide curve and staircase were made. The two remaining pedestals on the old portion of the bridge now give the structure an unbalanced appearance from the street, and do not have a beautifying effect from the river, as they are hidden by the S.E. & C. Railway bridge. It has, therefore, been decided to remove the pedestal on the southern side, and a refuge similar to that on the opposite side of the road will be constructed in its place. The work will be commenced early in February. It is probable that the then solitary pillar on the northern side at the corner of Queen Victoria Street will be modified slightly.

## MODERN COLD STORAGE AND REFRIGERATION.

By W. S. DOUGLAS, B.Sc.

### III.—ICE CHAMBERS—(*continued*).

IN chambers cooled by ice alone, the blocks are supported in an open crate, which allows free circulation of air all round the ice. This ensures efficient cooling, and, at the same time, lessens the danger of moisture being deposited on the goods in storage, owing to the fact that the air, as it flows towards the ice, becomes, for the time being, very cold. Its "hygrometric state" (explained below) is thus momentarily brought below saturation point, and the surplus moisture carried by it deposited on the nearest and coldest object—the ice—instead of as sometimes happens through bad design, on the walls of the chamber or the produce stored.

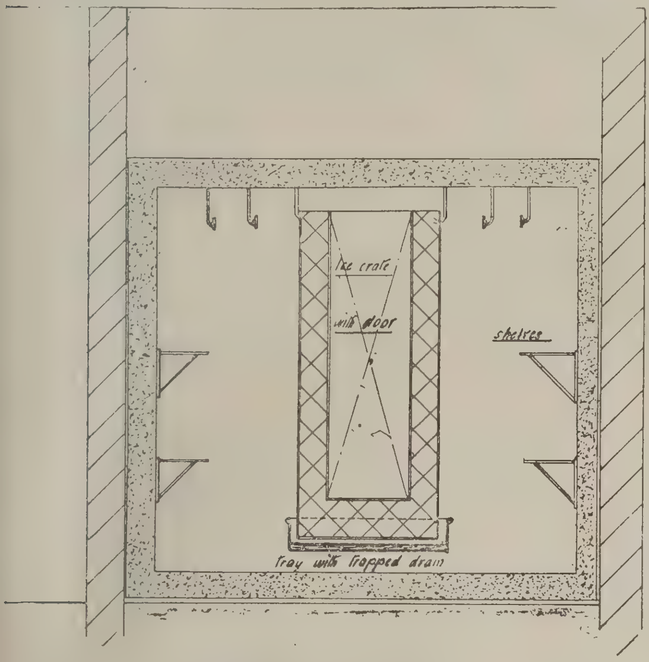
At one time the crate was made of wood, but owing to the rot set up by the wet ice, this construction has been abandoned, and modern practice is to carry the blocks in an oblong basket of galvanised lattice work. This should be supported on galvanised slings of suitable strength, and underneath a zinc tray should be provided to catch the drips caused by the melting ice. As the tray necessarily becomes very cold, moisture is apt to condense on the under side of it, and fall thence on to the floor, or on to any shelves which may be below. To prevent this, it should be well insulated, and the ice water drained from the top as quickly as it is formed. This is accomplished by means of an ample-sized pipe, which is soldered water-tight to the tray, and carried through one of the walls to the outside of the chamber. In order to form a water seal and keep the warm air outside from penetrating, when no water is flowing, a horseshoe bend is made, and the mouth of the pipe should be covered with a strainer to retain all solid matter, such as sawdust, dirt, &c., which might otherwise block the outlet.

An ice chamber constructed on these lines, which was built for a London hotel, is shown in fig. 6. The arrangement of the drain is seen, and it will be noticed that shelves are fixed to the walls to hold the small stuff, which is commonly stored in these places.

The essential differences between the two types of ice chambers outlined above are those just described. In other respects they are very similar, and it will not therefore be necessary to differentiate in describing the methods of construction which are usually followed.

Before proceeding to this, however, the merits and demerits of the two systems will be briefly considered. The use of each is quite clearly defined, and it is only in special cases that they overlap. It may be said that the division is a question of temperature. Below freezing point, ice and salt is indisputably superior, but for ordinary storage it is equally certain that block ice is more economical, and, at the same time, keeps the goods in better condition. The reason for this is that the danger of moisture deposit becomes, at ordinary storage temperature, more serious with ice and salt than it does with ice alone. Hence, under these conditions the latter system is much to be preferred. On the other hand temperatures below 32° Fahr. cannot be attained by the use of ice alone, and as in these circumstances, just where it is most useful, the ice and salt system has, owing to the freezing of the moisture, no ill effects, it is then universally employed.

Moisture condensation is a very important factor, which has to be reckoned with in the design of ice chambers. It is caused by the fact that a given quantity of air cannot hold in suspension more than a certain definite percentage of water vapour. If it is charged with the full amount it is then said to be saturated, and under no circumstances can more than this amount be carried. The difficulty, as far as ice cooling is concerned, is that the percentage necessary to bring about saturation varies with the temperature. As this becomes lower, less and less water can be carried by the air. The result is that air, whose hygrometric state at normal temperature is below saturation point will, if cooled sufficiently, find that it is required to carry more moisture than it is able to do, and will promptly discharge the surplus. Taking as an example air at 70° Fahr., with a hygrometric state of 80 per cent. (*i.e.*, carrying 80 per cent. of the maximum charge for that particular temperature), it is found that, on being cooled to 61° Fahr., it will become supersaturated as much as 10 per cent. Hence, as no more moisture than just enough to cause saturation can be held in suspension, the extra 10 per cent. is at once condensed, and, if the condensing surfaces are formed by the goods in an ice chamber, trouble begins.



SECTIONAL ELEVATION.

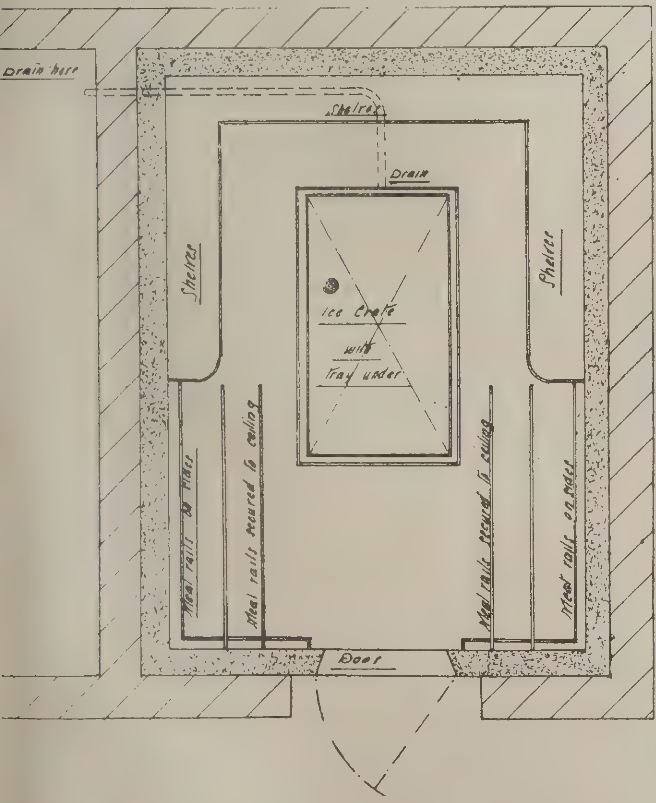


FIG. 6.—PLAN.

It is clear, then, that the greater the reduction in temperature, the larger the condensation. Now the air, circulating by convection currents in an ice room, varies in temperature throughout its circuit, the direction of which is shown by the arrows in fig. 7. When it leaves the provisions stored, it is comparatively warm, but as it flows towards the cooling apparatus, supplanting the air already cooled which is falling downwards, it becomes suddenly chilled. The result, as explained above, is a condensation of moisture, the amount condensed being larger the bigger the temperature drop. Hence, if it is sought to maintain an ordinary storage temperature with ice and salt, there is more condensation than there is with ice alone, as the mixture is far colder than the plain blocks and, consequently, the temperature drop is greater when the air approaches the cooling tank. Further, whereas with ice and salt condensation may be effected on any convenient surface, with ice blocks in an open crate, the air, having perfectly free access, simply deposits its moisture on the ice itself.

It will be seen, then, that owing to the greater tendency to create dampness, the ice and salt system should not be used for ordinary storage temperatures. But, on the other hand, below freezing point it works perfectly. Less moisture is formed owing to the smaller temperature drop, and what is formed is frozen at once. Further, the temperature required can be attained with ease, owing to the low melting point of the salt solution.

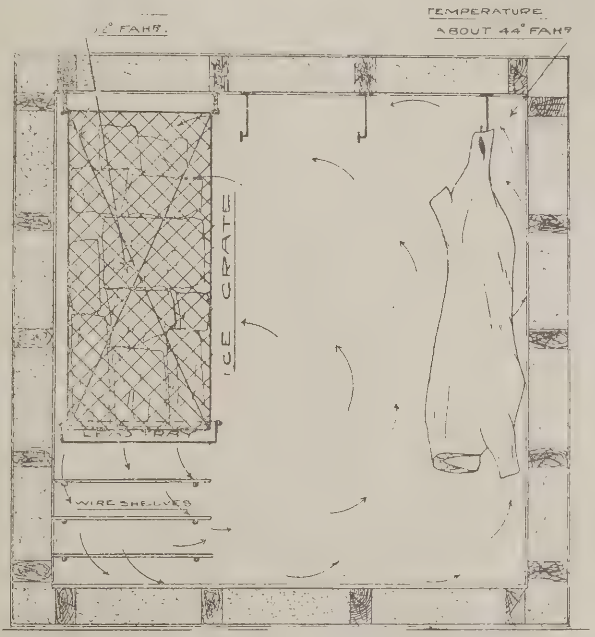

FIG 7.—ELEVATION.

Certain purely mechanical points are also to be taken into account. For instance, an advantage possessed by the crate and block ice is, that the opening in the crate and the corresponding ice door in the insulation may be arranged in any of the sides or at the top, just as desired. With the ice and salt tank, on the contrary, it can necessarily be only at the top. Where head room is scanty this is inconvenient, as sufficient space must always be allowed between the top of the chamber and the ceiling of the room to get the ice in, and this loses one, in some cases as much as two feet of height inside the chamber. Also, a ladder must be used to reach the top, and the ice and salt must be laboriously carried up by this means. These defects are inevitably present with the ordinary chamber, but they may of course be nullified by using a room in the basement, and cutting a trap above the cooling tank, to admit the broken ice and salt. With larger chambers a further disadvantage of the system is the breaking up of the ice in order to mix it with the salt. When a large quantity has to be negotiated, this operation is apt to become very troublesome.

Both systems, therefore, have their disadvantages, but notwithstanding, if used in the proper way, and for the right purpose, each may attain to considerable efficiency. Many chambers, however, whose designs are in other ways perfect, are completely spoilt by deficient insulation, and great care must be taken to avoid this, by selecting only the best materials, and using those chosen to the best advantage. This is especially important with ice and salt, as, should the temperature rise above freezing point the main reason for the efficiency of the system is at once destroyed.

One of the best materials that can be used for this purpose is silicate cotton, as, owing to its high efficiency, a comparatively small thickness may be employed, and a saving effected, both in space and cost. Also, although it has a certain amount of capillary attraction, it is not spongy, and does not absorb and retain moisture to any great extent. Granulated cork and charcoal share most of these properties, but are a shade less efficient as far as heat resistance is concerned. Otherwise they may be regarded as on a par with silicate, although charcoal, of course, burns readily in case of fire. Peat moss litter should not be used alone on account of its low resistance, but a good combination is obtained by mixing it with cork. This reduces the cost, and, although the efficiency is a trifle less, a compensating advantage is gained in the preservative effect exerted by the peat. Sawdust is also employed for ice chambers, but, owing to its low resistance to heat, its great attraction for moisture and its liability to decay, it should be as far as possible avoided, and specified only where cheapness is a *sine qua non*. If, for this reason, it has been adopted, then the walls should be made of greater thickness than is common with other materials, and the zinc lining inside should on no account be omitted.

Fig. 9.

The exact method of constructing the insulation varies considerably in different cases, and is influenced by considerations of first cost. If a chamber where ice consumption will be reduced to the absolute minimum is desired, the walls must then be made very thick and the first cost will thus be at its maximum. Similarly a minimum of initial cost, with thin insulation, corresponds to a maximum of ice wastage, although at the same time it effects an economy in space. In practice the inclinations of the purchaser must be consulted, but in all cases it is undoubtedly to his advantage to invest more capital in the first instance, and in this way save ultimately in his running costs.

Any figures, therefore, that are given for the thickness of insulation in different cases are merely arbitrary, and those recommended here must be accepted as striking an average balance between prime cost, on the one hand, and running expenditure on the other.

Working on this basis, it may be said that with the ordinary storage temperature of 42° Fahr., and up to about 200 feet cube of inside capacity, a thickness of 3 inches should be employed when using silicate cotton, granulated cork, or flake charcoal. The insulating material should be packed between 3 inch by 2 inch runners spaced 18 inches apart, as in fig. 8, and should be sheeted on either side with one layer of ¾ inch T. G. and V. white matching, a layer of waterproof insulating paper being interposed between the inner layer and the insulation. The floor would be similarly insulated, except that 1 inch T. and G. white flooring would be employed instead of the inner layer of ¾ inch matching, and insulating paper, as before, would be placed between the floor and the packing. The chamber should be built in six sections, and put together in its final position, thus allowing of easy removal at any time to another situation.

At larger storage capacities it is generally found that an ordinary room or cellar is used to form the cold store, and in this case the walls are lined with insulation as they stand, the work being carried out on the spot instead of, as in the former case, mostly in the makers' workshops. It is common practice in these larger sizes to increase the thickness of the insulation to about 4 inches, and instead of a single layer of ¾-inch matching on the inside, a double sheeting may be used, with waterproof paper between. A 2-inch air-space should be left between the outer layer and the walls to promote free circulation of air all round and prevent dampness attacking the insulation. This can readily be effected as shown in fig. 9, by using 2 inch by 2 inch battens as distance pieces.

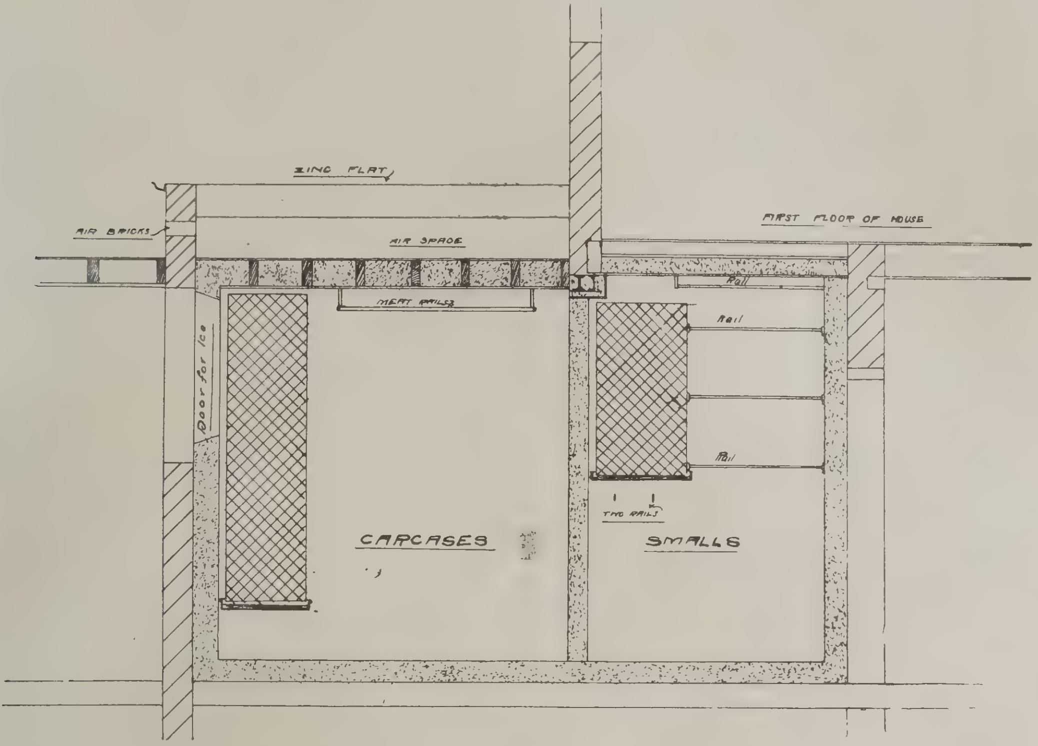
Theoretically this increase of thickness of insulation at larger capacities is incorrect, as the proportion of the radiating surface to the volume of the chamber is then considerably greater. Practically, however, it is admissible, as in small chambers economy of space and first cost are both important factors, and can be attained only by reducing the thickness of the walls to a minimum. Further, the total consumption of ice in these chambers does not amount to very much, and economy in this respect is not so essential as it is in the larger sizes. It is on this principle that in very small boxes where the insulation should theoretically be thickest, 2 inches of insulating material is usually considered sufficient.

The figures just given apply only to silicate cotton, granulated cork, and flake charcoal. If sawdust is used the thickness must obviously be increased in direct proportion to the heat leakage permitted. That is to say, that the thickness of sawdust must be to the thickness of silicate cotton as .10 is to 0.06, or in the ratio of 5 to 3. This holds good in all cases.

When low temperatures are maintained for longer storage periods yet another increase takes place. Here the difference between the temperature of storage and that of the atmosphere is usually about 50 per cent. greater than under ordinary conditions, and the tendency to heat leakage is, by Newton's law, in the same ratio; consequently, in order to maintain the same efficiency, the thickness of insulating material must be increased in proportion. Hence, at these temperatures, the figures given for ordinary storage are to e multiplied by 1.5; if sawdust is employed by 1.5, and gain by 1.66; that is by 2.5 altogether.

Whatever form the insulation takes, the inside of the hamber should invariably be lined with zinc. By this means ny moisture which may condense on the walls can be readily riped off with a cloth, whereas if the lining is omitted it oaks into the wood, and not only damages the insulation, ut affords a favourable breeding ground for germs.

Two doors are necessary in an ice chamber, one for ice dmission, and the other for entrance. They must be inulated in the same way as the walls, and made either played or rabbetted. In both cases efficient lever fasteners hould be fitted, and a joint made either with felt or rubberubbing to ensure the door being air-tight when closed. The ain door should be about 5 feet 6 inches by 2 feet 2 inches n the clear, but the size of the ice door is naturally fixed y that of the ice-crate or tank, the capacity of which aries from an eighth to a sixth of the volume of the chamber.



ELEVATION.

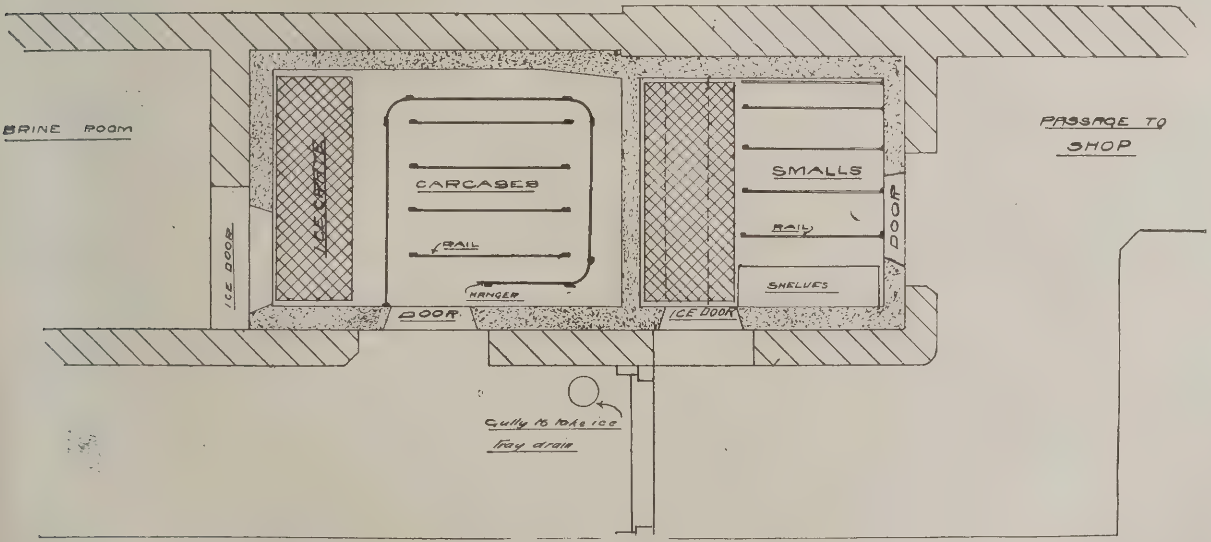


FIG. 10.—PLAN.

The fittings which are to be specified depend on the urpose for which the chamber is to be used. For storing neat in quarters, joints, &c., galvanised bars should be laced near the ceiling, supported by galvanised hangers and vall sockets. If small articles, such as game or provisions, re being preserved, then shelves, either of galvanised-wire attice work, or of wood, are more useful. One or two of hese may also be used with advantage in conjunction with he bars, and, in any case, where bars are employed for hanging larger pieces of meat, rails should be fixed all round the walls for the small stuff.

A convenient arrangement of bar work is shown in fig. 10, which represents two cold stores built for a butcher with a large business, and in the hotel chamber, illustrated in fig. 6, the shelves used to carry provisions and small goods have already been pointed out.

The floor of the ice chamber and the bottom of the ice crate should always be covered with wooden mats to prevent damage, and in dairy work lengths of half-round iron should be screwed, at about 3 inches pitch, to the top of the floor mat. This is in order that the churns of milk stored may be slid easily in and out of the chamber. Also, the door sill, to obviate injury to the woodwork, should be covered with chequered plate, such as is used for engine-room floors.

Another point which must always be accorded due attention in the design of the chamber is ventilation. This is preferably carried out automatically by sensitive ventilators in the roof, using light mica flaps, very delicately hinged. By this means the hot air charged with impurities and moisture, which arises from meat newly put into the chamber, is at once expelled, and only the fresh cold air allowed to remain.

This point, with the others already mentioned, should be made clear in making out specifications.

(*To be continued.*)

## THE ART OF BUILDING.*

WHENEVER one sees an artist sketching in some old world village, one realises afresh how modern art is divorced from the realities of life. No artist in the old days ever contented himself with producing merely shadows of reality. He was busy creating the very stuff of the world, weaving a garment of the gods to adorn the earth. His canvas was flung wide over the country side, and all his pictures were painted in the real. When he had done his work in the valley, the valley was a more beautiful valley than before. He adorned the hills with castles, and set the plains with many a jewel—in moated grange, manor, and farmhouse. In the walled town, too, he was still a creator of beauty in the real. The mother art was the essential thing—nothing was or ever could be so important.

Let us now briefly consider then the materials we may use in building: and first let us take stone.

We have in many districts stone of various kinds for building; and in most of these districts we have object lessons in old buildings, showing how stone may be beautifully used. It is unfortunate, however, that the modern mason seems quite unable to profit by such examples: he always wants to improve on them. The art of masonry may often be made a kind of rude mosaic, in which stones of various shapes and sizes and tints can be combined and arranged. In old cottages in Surrey you may find the irregular spaces between the stones adorned with scraps of flint, iron stone, and broken red pottery, with excellent effect. Another instance of the same mosaic in masonry may be found in the old castle at Peel, in the Isle of Man, where the wide scale of tints in the local stone from various shades of red to grey and yellow is taken full advantage of. Is it necessary to add that in the local modern buildings of the same stone, the material has been reduced to an absolute regularity of tint and surface? When the modern mason does descend to rough walling he lets us know it, and can only give us an exaggerated excrescence in the centre of each stone—a confection known as rock-faced. And he seldom knows how to deal with the mortar joint, which in good old work makes such a beautiful reticulated pattern of varying shades of grey.

If only, instead of ignoring the qualities of materials and forcing them into these meaningless forms, we were to begin at the other end, what a new world of art would be disclosed to us. A visit to the site of our building may disclose, perhaps, the fact that flints are the essential local materials for walling. What a palette is there for the artist, of tones of pearly grey; what a variety of textures can be obtained, too. Here the soft rounded outlines of the uncut stones, and here, to mark some special feature, the cut flints. The surfaces of the walling enriched, perhaps, with the shivers of the broken flints set in the joints, or notes of red brick or brown stone. And all this you won't find anything about in books, or learn anything about in offices, or art schools. It is a kind of rude natural mosaic, and if rightly done implies the use of materials in the right way, inasmuch as it develops to the utmost their possibilities, instead of obliterating their character by forcing them into preconceived academic formulas. It seems that we are too apt to put the cart before the horse in these matters, and instead of letting the materials influence us and suggest the design, we let them have no voice in the matter at all, but simply shape them into the arbitrary forms we have learnt at school.

Passing on to consider bricks and brickwork, I suppose every architect has in his office one of those perfect bricks that is the manufacturer's pride and joy, absolutely regular in form and uniform in tint, and which is just everything that a brick should not be—from the point of view of the artist in building. A brick is after all a piece of baked clay, and its beauty consists in its character. It should have the characteristic surface and texture of mother earth. It should be of the earth earthy. In this connection, I remember a great collector of Japanese pottery once showing me a little rude earthen pot. It had no elegance of shape, and would have been scorned by the average buyer of vases. And yet in Japan it was held a perfect thing; and its chief claim to beauty rested in the fact that its form implied the expression of the character of its material. The object of the artist in making it had been to express its inherent clayeyness: subordinating all his own personal aspirations about form, he had sympathetically divined the character of his material. And a nation of artists understood his aims, and appreciated his efforts. And so our bricks must first of all express the true inwardness of the stuff they are made of.

Then as to their colour, a tint which is subtly varied must necessarily be more beautiful than a uniform shade, and more in harmony with natural surroundings. The mortar joint should not be a succession of mechanically ruled lines, and should be neither too light nor too dark in tone, but introduce into the colour scheme a tone of neutral grey, which is always so useful in the general effect of the work—helping to give it that kind of bloom, that indescribable quality of tone, which we find in old brickwork, such as that at Cambridge, for instance.

Then in the matter of roofing materials: the most important quality here is texture, and so tiles should be thick, and if their new colour, as is generally the case, is too even in tint to be good, they must have such a texture as will weather and vegetate quickly. It is most important also that the tiles should have those slight irregularities of form and surface which give such interest and charm to old roofs. Nothing is so fatal to the beauty of a roof as tiles which are absolutely regular—giving the effect of a surface ruled with absolutely rigid horizontal lines. You might just as well cover your building with galvanised iron at once. There are at present perhaps no entirely satisfactory tiles made from the point of view of the building artist. The best of them will strike a jarring note of red in the country, and the darker ones are too even in tone to be good. If it is impossible to get old tiles, one is bound to accept a tile which is very crude in its effect for the first few years. Perhaps some day tile makers will weather and mature our tiles for us.

Probably you will agree with me that the finest kind of roof is one of stone—such as the Colley Weston. It is one of the few materials for roofs which is beautiful when new and grows in grace with age.

Slates have the defect that they do not readily yield to nature's inimitable colouring. The rougher and thicker they are, the better the artist in building will like them; and except in their own special locality he will perhaps prefer a good grey tone to the more fashionable green. There is a kind of harshness about slates which makes them specially at home in bleak and barren uplands, or in wind-swept open spaces by the sea; while the kindly warmth of tiles makes them more adapted in wooded and sheltered places.

It is unfortunate that thatch is not more widely used for small buildings. If it is treated with some preparation to make it fireproof, the main objection to it is removed. It affords far the best protection against outside conditions either of heat or cold, and so is well adapted for small buildings where the bedrooms are in the roof.

In the use of timber for building many opportunities and possibilities are lost in the initial preparation of the material, as well as in its subsequent treatment in the workshop. In dealing with materials generally, and perhaps timber in particular, there are two main ideals which may be followed. In the case of timber which has no great hidden beauties to bring to light by high finish, it is wise to aim at securing some suggestion of those natural graces which belong to its living existence as a tree. In the case of other special timbers we may give up this natural beauty for those qualities which can only be educed by a high degree of finish. The great thing to avoid is to halt between these two ideals, and so spoil our horn without achieving a spoon.

I cannot help but note here how strangely these general principles apply to all departments of life. You may remember how this was illustrated in one of those charming early novels by Bernard Shaw, where the hero, merely from being a master of the art of prize-fighting, gained in a degree an insight into the principles which should govern all arts. That is perhaps an extreme case. But the point I specially want to note here is, that in writing an essay on the treatment of materials and in showing how they may be educated, I find the same remarks apply exactly to the whole question of education; and the same defects occur in educating human beings as in educating planks of wood. In both cases we so often spoil our horns without making spoons, and so often try to make silk purses out of sow's ears. But while the human problem is an immensely difficult one, involving a sympathetic insight into the nature of the pupil and his possibilities, in the education of materials in the workshop it is relatively simple; and by the use of hand tools, at any rate for finishing the work, we cannot go very far wrong.

It is better in most cases to finish such timber as oak with the adze instead of the plane. Let me add a few words as to the higher education of such materials as mahogany, rosewood, and the like.

---

* A lecture by Mr. M. H. Baillie Scott, delivered on January 19 at Carpenters' Hall, London, E.C

Even here I don't want an absolute level surface or straightness of line; but just such subtle undulations as a sculptor might make in highly finished marble. The surface must just so far be alive as that. And then not glassy French polish with its disconcerting stare that is like that excess in glossiness and shininess in boots and hat which we associate with a certain type of City gentleman. Instead of that, let us have the quiet, unobtrusive sheen which a wax polish gives.

In the development of design from the suggestions of the material, a very good instance is that kind of inlay work which consists of a landscape in which the markings of the timber, which so often suggest landscapes, are taken as the basis of a design. Another example is in the use of cross sections of laburnum wood. This material, as you are probably aware, has the annular rings extremely well marked, and these cross sections were often used in old work in hexagons, or in what I think is called the oyster-shell pattern, with very fine effect. The grain of wood, as well as its natural colour, will give the best basis of design for inlay; and unless the designer is in close touch with his material here as elsewhere, he will lose all his opportunities. In this mosaic of wood, which we call inlay, I believe that the best results may be gained by slight varieties of plane in the surface.

In wood carving what suggestions has the material to offer? We must respect its limitations and possibilities, and our wood carving must be primarily just another means of educing the woodenness of the wood. That is the main characteristic which strikes us in old work. The woodwork is essentially wooden: there is a kind of blunt knobbiness about it. The material has been educated, and its hidden characteristics brought to the surface. When the Renaissance came that ideal was lost, and the material was used merely as an unregarded medium for expressing the conceptions of the designer.

Let us take the case of that famous carver Grinling Gibbons, and let us begin by paying a proper tribute to that almost miraculous skill which places his work almost beyond criticism. He is such a master of his tools that we find he has fallen into the too common fault of ignoring and overriding all the true inwardness of his timber. He is not interested in it at all, but only in his own designs, and merely wants a nice obedient and accommodating material, and so he carves in soft wood. He will then give us a lobster, perhaps, or a bunch of pheasants, rendered with marvellous imitative exactitude. We may wonder, as we do wonder, at these Renaissance triumphs, just as we wonder at fireworks. But art should move us to something more than that. If we want to look at lobsters we can see them in any fishmonger's shop. This imitative rivalry with Nature is the stupidest kind of ideal. And so the work of Grinling Gibbons, wonderful as it is, seldom becomes more than a kind of curiosity of art—a triumph of mechanical skill.

It is a difficult matter for the building artist to find a modern glazed tile which he can use. The manufacturers have all aimed at a mechanical regularity of shape, uniformity of pattern and staring glassiness of glaze, which make practically all modern tiles impossible. There are, of course, or rather there were, the de Morgan tiles, which, excellent in colour and design, were still somewhat glassy in their effect; and certain modern makers have produced dull tiles which err on the other side, and have a dead lack lustre aspect. Where then is the perfect glazed tile to be found? Probably only nowadays in the old Dutch tiles. In these the glaze has a thick and creamy quality of subtly varied tones, and in form, texture, and patterning they are full of individual character. It is the same story over again, and beauty has been achieved by sympathetic treatment of material and expression of its qualities. The drawings on these tiles would probably be a matter of scorn to any modern draughtsman, and yet they are perfect in their way, because they speak eloquently of material and process of manufacture. Is it too much to hope that some of our modern makers can learn this simple art, and give us tiles which do not fix us with a glassy stare? In the meantime, the building artist must do without tiles altogether, or use the old Dutch tiles.

No one has done more than Mr. Bankart to revive the possibilities of the use of plasterwork, and in his work you cannot find a better example of design in close association with workmanship—design which evolves and emphasises the qualities of the material. There are two points in regard to plasterwork which I should like to bring before you. One is texture. Mechanical ideals in this, as in other materials, have led to absolutely smooth rigidity of finish, which obliterates all the character of the material, and those suggestions of methods of workmanship which lend such interest to the work. Do not then necessarily finish your plaster with fine stuff, but preserve the texture which the sand gives, and finish from the float with subtile variations in plane. In the arrises, such as those which occur at the sides of a dormer window, do not work to a rigid line such as is given by a cement or wooden bead, but let the line of the arris take the characteristic line which results from deviations in plane of the surface of the plaster, and let this slight waviness of line occur in your plaster cornices as vague and soft in its outlines as waves of the sea. Let the finished plaster still retain some hint that it was soft and yielding when used; let it flow round the woodwork perhaps engulphing it partially, as if it had risen like a flood which had been frozen. You will find many examples of these qualities of plaster in old work, and but few in modern times. Then as to colour, the natural tint given by the sand will often be found to be a good one, and in such cases the plaster may be left untinted. If, however, the plastering is tinted, let it be for choice some tint which is germane to the material—an earthy colour, such as ochre, and not Nile green, peacock blue, or any of those shades dear to the art decorator.

The use of glass in building is generally wisely confined to the windows. Here, again, we building artists want it to be made and used in the old way—in comparatively small planes, with those slight variations of surface which give our windows a friendly twinkle, instead of a glassy stare. Glass is a material to be used with caution in a building. The less we have of it the better, unless its surface is very much broken up, as in glass mosaic, for instance. Glass tiles are harsh and glaring in their effect. Glass shades so much in vogue in the Victorian era have now been happily banished to the garden.

In considering the metals used in building, I have to weary you with the same demand for the evolution of character. In wrought iron, for instance, the particular form you may fancy for the hinges or latches of your doors gains its chief value as design, according to the extent to which it expresses the qualities of the material. In wrought iron we have a substance which, rigid when cold, becomes in the heat of the fire a soft and ductile thing, and the expression of that gentler mood of the iron is the most charming thing we can express about it. It can be shown by outlines which seem to be the resultant of surface pressure—by the swelling of the soft metal round the stamp of the die, as in old coins and in many other ways. In simple ironwork the filing of the cold iron may be combined with the hammering of the hot metal. In finishing such work do not obliterate all the varied tints of the surface with black paint, but finish with linseed oil instead, so that you retain the brighter notes of the file work with the grey tones of the forged iron. In cast-iron work we have plenty of fine examples in the old fire-backs that used to be made in Sussex, and many more examples in modern work of inferior work which has made the very name of cast-iron a reproach. The same suggestion and somewhat vague modelling that expresses the qualities of plaster is equally right here, and these qualities in the mould will save the work from that forbidding precision and rigidity which we associate with the term cast-iron.

In this brief review of materials, considered from the standpoint of the building artist, a word may be said as to that extremely revolutionary and radical material, ferro-concrete. There is something necessarily illogical in the use of this in connection with those architectural forms which have been evolved as vital and essentially structural features in the buildings of the past. If we are going to use ferro-concrete let us be logical about it, and recognising its revolutionary character, let us have here, if nowhere else, a new style. Let the adornment of the structure within and without be admittedly superficial in character, with no sham features about it.

In Venice the greatest painters of the time used to adorn the external walls of their buildings with paintings. That would hardly serve in London to-day; but nothing could be better than mosaic and tiles, and such like washable materials used in decorative ways. And in the country this surface mosaic may take a local flavour, which, by the use of pebbles in the form of rough-cast or flints, as already referred to, may bring the building into harmony with nature. If we consider our function as adorners of the earth's crust, we must make our adornments out of the same materials as that crust—just as a pastrycook adorns his pies with pie-crust. Stone, brick and timber are all sound materials to expose to view in the building, but not iron.

Now I daresay there are some of you here who may think that all this talk about art in connection with building, is not very practical. But what does art mean to the worker?

It means pleasure in his work. It means the gilding of dull necessary tasks with delight. More and more in the modern world it has become to be the custom to consider work as merely a means of making money to buy our pleasures with; and we lose sight of the fact that the best of all the pleasures that the world has to offer is in the production of work which we believe to be good. If we are going to spend the greater part of our lives in some pursuit, is it not well to see that we get all the delight out of it we can? That would seem a selfish kind of argument were it not happily true that pleasure in the worker begets pleasure in the beholder too. Is there no room in the modern world for the craftsman? Kipling pictures—

> Who lest all thought of Eden fade
>   Brings Eden to the craftsman's brain,
> To Godlike muse o'er his own trade,
>   And manlike stand with God again.

Let us hope that the artist of the future will find both his work and his pleasure in the creation of the world in which we live—the world of building. Instead of arranging colours on a canvas, let him arrange brick, stone, and wood on hill and dale, in such simple and noble forms that the very spirit of the country will be explained and rendered articulate by his work. Instead of communities of little artistic villas, smugly conscious of their prettiness, let us try to achieve in our smallest buildings those qualities of reality and earnestness which will alone make them seem at home with the creations of nature. And in conjunction with the house builder let us have the garden maker confirming his efforts, not merely in the grooming of suburban villa plots, but in making the wilderness to blossom as the rose. We do not want the dilletante pedantries of architectural art. Let Roman art be for the Romans, and Grecian for the Greek. Here in our Northern clime let us evolve our own art as our fathers did, from our natural conditions of climate and of race.

## LLANDAFF CATHEDRAL.*

By S. BOWEN WILLIAMS, M.S.A.

(*Continued from last week.*)

WE will now return to the roof, which is entirely new. The effect of an open timbered roof is undoubtedly exceedingly fine when viewed in a long, unbroken line, and there is no doubt this effect has been attained by Mr. PRITCHARD. Yet it seems most probable that the original roof was flat. You will note that the vaulting shafts are carried up to the top of the clerestory walls with a moulded cap, and suggest that they carried the heavy beams of a flat ceiling. Had it been stone vaulted the moulded caps would have been placed much below the top of the walls.

Before we leave the nave, a glance might be given to the pulpit, which is of Caen stone and of good design, with some striking figures of St. PAUL, MOSES, DAVID, and JOHN THE BAPTIST.

The font also deserves mention. It was designed by Mr. PRITCHARD'S partner, Mr. J. P. SEDDON, and is a fine piece of work. There are carved on it representations of the Flood and the Miraculous Draught of Fishes.

At the extreme east is the Lady chapel, erected by Bishop DE BRAOSE. It is Decorated work and is vaulted in stone. It is almost entirely original; the east window, which Mr. WOOD had replaced with a wood one, having been restored by Mr. PRITCHARD. The design of this window is based on those of York chapter-house. It is the only part of the cathedral which did not fall into absolute ruin.

The chapter-house is entered from the south aisle and is remarkable in form. It is square, with a central pillar to support the stone vaulting, and is very similar to the great staircase of Christ Church, Oxford. The upper storey is now octagonal and is used for the library. It was formerly square and was used at one time as a schoolhouse.

This completes the interior, and we will now go outside and consider the more important external features.

We will first take the west front. This consists of a gable centre flanked by two towers. The tower on the south side is new; the rest is original. The gable centre is Early English and is the original work. It is a very fine example and one of the most successful in the country. It is divided up in the typical Early English way—a doorway; above, the main range of windows; next, a blind arcade with a central light; and finally, a seated figure of CHRIST in the apex. The proportions are excellent and each part bears a very harmonious relation to the whole. It is similar to Ripon west front, and though Ripon is larger and grander, yet it has not the grace and variety of Llandaff. The poor portal in Llandaff rather spoils the comparison, however. St. Remi at Rheims, before its alteration, was also so similar to Llandaff that it has been suggested that the architect for both was the same man.

The doorway is of unusual form. It consists of two round-headed archways united under a single round arch; and though it would seem that there must have been a column between the two archways, yet the construction of the archstones indicates that this was not so. The vesica contains a statue of St. TEILO or St. DUBRICIUS. The doorway can hardly be called beautiful, though it is peculiar. The mouldings indicate that it is undoubtedly Early English, though its arches are round.

The wall on either side is blank, but above the door comes the main range of windows, which consists of three lights and two blank arches. These fill the breadth of the gable.

Above this and within the slope of the gable is a blind arcade of trefoiled arches, but graduating in such a way that one leaf of each trefoil is missing. In this way the arcade follows in some degree the slope of the roof. The central opening is a window.

(*To be concluded.*)

* See Illustration.

## ILLUSTRATIONS.

### DODFORD CHURCH FROM THE SOUTH-EAST.

THE new parish of Dodford, Worcestershire, was carved out of the mother parish of Bromsgrove some two years ago. The living was endowed and the church buildings erected through the generosity of a former curate of Bromsgrove, the Rev. W. G. WHINFIELD. The site is on the western slope of a gently-rising hill, facing the Malvern Hills. The house (to be illustrated later) will ultimately be used as the vicarage. It has been planned in a somewhat irregular manner to fit the contour lines of the hill and also to command a singularly charming prospect. The central tower of the house was contrived, on the instructions of the client, to get a view of the Malverns.

The cloister court of the church has an outside pulpit and is used for open-air services in the summer. The rood beam shown in the photo of the interior is made of polished grey wood with emblems in gilded lime-tree carved by Messrs. MARTYN, of Cheltenham. The cross surmounting the beam, of enamels and metals, is the work and gift of Miss AMY WALFORD. The whole of the structural work of the church and house was carried out by Messrs. BRAZIER, of Bromsgrove, from the designs of Mr. ARTHUR BARTLETT. The photos are by Mr. T. LEWIS, of Birmingham.

### CATHEDRAL SERIES, LLANDAFF.—INTERIOR, LOOKING EASTWARDS.

THIS is in continuation of our series of illustrations from Llandaff.

### THE CHAIN GATEWAY, WELLS CATHEDRAL.

THIS is the first of a series of measured drawings by Mr. WESTBYE of the gateway to the Vicars' Close, and was described in the article on "Wells and Glastonbury" in our issue of January 14.

A Sketch by HAROLD OAKLEY.

# COMPARISON BETWEEN ENGLISH AND CONTINENTAL IRONWORK.*

*(Concluded from last week.)*

OBERT BAKEWELL was probably one of his original assistants, but must have seceded before 707, perhaps from ill-health. He adopted Tijou's yle, but diverged from it greatly as time went on. e made a summerhouse for Melbourne, the work on hich was interrupted by long illnesses, and not finished ll late in 1711. He then set up a workshop in Derby, and s work is widely spread over this and neighbouring counties. e hear of him for over a dozen years more, and he probly worked on much longer. Two brothers at Chester folwed more or less in Bakewell's footsteps, and produced some ry important and noble and original forecourt screens. They ay have worked at Drayton House, but so far are first heard some time after Tijou had departed. A very fine smith at ristol had a great vogue round about, and executed splendid ork in the manner of Tijou, though his designs were often eak and bizarre. These men practically monopolised the est Country and the Midlands, but, strange to say, no sciple of Tijou's settled in the Metropolis, and the very stinctive styles these men introduced died out with them.

The English style came into existence and developed side side with Tijou's work. As far as can be traced at present, homas Robinson is the man to be most honoured.

The earliest mention of this name I have yet met with is 1697, when he had produced the beautiful railing to the orning Prayer Chapel in St. Paul's Cathedral. The fine af-shaped spikes on hollow balls, fashioned by the hammer, e latter from sheet iron, and the more massive standards tween, are excellent work in the English spirit. Two years ter we find Robinson supplying the wrought windows for e cathedral at 5*d*. per lb., when Tijou was getting 6*d*. Later her work followed, which it is needless to specify. The thedral accounts show that he was employed until 1711, hen Tijou's departure left him a clear field. In this year was erecting the very fine gate and railings at New College, xford, and an eye-witness records that he was an "inenious" smith, at that time the term of highest praise, and at his works were at Hyde Park Corner. There are thus several works known of his, and from these it is possible to identify many others, though less certainly than in the case of Tijou's followers, whose mannerisms leave us in no possible doubt. Conditions of work in London make it so very easy to appropriate other people's ideas. Other names have come to light, men perhaps taught in Robinson's workshops, and yet others will be discovered, all working practically on much the same lines. Robinson, however, must have had a long career or very capable successors. Indeed, I have been told that the firm continued as a foundry on the site of Victoria Station till the railway took it over. The effects aimed at by Robinson were lofty and perpendicular, never horizontal, and he obtained them not only by carrying the bars to a great height, but by avoiding interruption of their vertical lines by horizontal ones. The piers were carried right up through and interrupting the top horizontal without any break, and were relatively slender and surmounted by high pyramids of scrolls and finials, with perpendicular effects like those of the Gothic architecture around. The finely-designed overthrow to the gates is also aspiring and lofty, and the whole design remarkable for its sparing use of embossed work, a rich appearance conferred by the numbers of sharply crinkled welded water leaves, which diffuse a beaded look over the whole surface. The contrast between this and Tijou's work is very striking, for he and his school never purposely aimed at obtaining commanding and lofty effects by the use of uninterrupted vertical bars, but sought them chiefly through the magnificence and richness of detail of the embossed work.

Robinson repeated his success at Trinity College, Oxford, where little of his work now remains, and it seems safe to regard the fine works at Belton and at Beddington as his, these having similar characteristics. It is more difficult to claim for him the immense screen or grille at Carshalton Park, which presents the most dignified and grandly Perpendicular effect of any screen in England. This is largely obtained by using massive vertical bars for the piers, which are unusually severe, with solid caps and bases, and limiting and concentrating the scroll work with telling effect. It was probably erected after 1723, when plans and elevations for the contemplated mansion were engraved. The design betrays French influence, but further research will, I believe, disclose more facts.

By analogy and inference many of the most scholarly and best designed gates in and around London would be assigned to Robinson. Among them the gates now at Devonshire House, which our valued friend, Mr. Phenè Spiers, has traced back to Lord Heathfield's house at Turnham Green, probably not their original site, whence they were brought in the last century to Chiswick, and quite recently to Piccadilly. There are gates at Clandon Park of the same make, the real history of which is lost in a tradition that they were brought from Naples. I am engaged in classifying and unravelling the history of the numerous gates still existing in London and its environs, now, alas, very rapidly disappearing! This is a difficult task, as appropriation of ideas has always been so easy in London that few distinguishing peculiarities can be relied on.

---

* A paper read by Mr. J. Starkie Gardner at the last meeting of e Architectural Association.

One rival to Robinson is a smith, presumably in London, who executed several magnificent works in and around Cambridge and elsewhere, with a sufficiently distinctive style. His name was Warren.

It does not appear so far that any English smiths were directly influenced by French work, except through Tijou, who had been the sole channel, and had introduced by his own example alone a taste for richly worked wrought iron into England. Entirely French at the outset, it was but natural that Tijou, who was a genius, should after twenty years of residence in England and of intercourse with English patrons and architects, bring it somewhat into line with English sentiment, which in the main is wholly different to the French. Those who had been immediately associated in his work followed his ideas and traditions, but these almost died out in a single generation. On the other hand, our smiths, who were onlookers, caught some of his enthusiasm and imbibed his ideas, but had to find out for themselves how to put them in execution. Embossing, for those who were brought up as smiths, was a difficult, tedious and expensive process, and they therefore used it sparingly, their designs being modified to suit their own conditions. Thus was produced the English school of ironwork, of well-knitted, restrained and graceful lines, combining a simple dignity and fitness which harmonised so admirably with the national temperament and general surroundings. The essentially English treatment may be described as refined, and never approaching the commonplace or vulgar.

We were, however, at all times of our history open to receive French fashions and impulses, and ironworking was not altogether exempt. Architecture certainly borrowed much from France, but Gibb's book of architecture, published in 1728, is the first book by an English architect which includes designs for ironwork. Two plates are devoted to forecourt screens and one to gates. The forecourt screen for country mansions, however, had become almost a thing of the past before the book was published, and apparently none of the designs were ever executed. The designs appear to be adapted from the French, particularly from the grilles and gates to the front of Versailles, and are evidently subject to some definite and unexplained rules of proportion, for though variety is obviously aimed at, either design might be chosen indifferently, for all produce the same effect. The details are not all actually different from those then in use by our smiths, but purely French details are recognised in the railing with pike-heads and tassels, and the borders of small circles, of which we have seen so much in our London park gates of late. Massive cast baluster standards are also introduced, like those of the railings to St. Martin's in-the-Fields.

The grand forecourt to Wentworth Castle, built about 1715, with its wide and stately bowed front, also presents a similar sweep of railings to that of Versailles, with lofty gates and wickets in the French taste. These are of long, vertical bars, with the lock-rail low down, under a rich overthrow, horizontally treated, with a pyramid scrolled top comprising the fully displayed arms and supporters of Thomas Wentworth, Earl of Strafford. Many other details suggest French design.

Powis House, in Great Ormond Street, was burnt in 1712, while occupied by the French ambassador, and rebuilt in a sumptuous manner by Louis XIV., who defrayed the cost, though the building was insured. The ironwork is of the utmost richness, and was probably renewed by order of Louis XIV. It is less distinctly French than that to Wentworth, but the fleur-de-lis terminals to the scrolled pyramid tops of the railings, and the magnificent scroll-work buttresses to the gates, &c., are unmistakably foreign. The gates to Newcastle House, in Lincoln's Inn, were also typically French. These have disappeared, and I believe the enclosure to the forecourt at Elvaston is really almost the only one actually of French make existing in England. It is said to have come from the Palace of Madrid, presumably the one near Paris, though I have failed to find any illustration of this château showing such an enclosure.

With the publication of Gibb's book smithcraft seems to have waned. The few gates that are dated are plain and massive, like those to Gray's Inn and the Temple, and of about Gibb's date. The grilles to the Mansion House and Bank of England are heavy and severe. The screen to the forecourt of the Horse Guards was probably designed by Vardy, though illustrated in Ware's "Body of Architecture" in 1756. Two or three guides for smiths published at about this time chiefly reproduced French designs. Batty Langley, in his "Ancient Masonry," took his designs from a German, J. J. Schübler. Jores borrowed from Huquier, and the plates of the "Smith's Right Hand" are also taken chiefly from French sources. Few, if any, of their designs were ever carried out in England.

The links between English and French work do not exist, and it seems owing to Wren, who never took up with florid ironwork, that a more ornate style was not in vogue before the advent of Tijou. It was perfectly clear that we should not have had a decorative school of ironworking in this country had it not been for this designer, and whatever we may think about his designs he was certainly a man who for his time, and considering the contemporary work in France was in the very front rank, and yet so far as we know the whole of his work was done in England, for there was no trace of him in France or Holland. It is a remarkable fact that a man should arrive in England in 1689, with the Prince and Princess of Orange, apparently without assistants, and yet within a year execute a quantity of work, and within two years make the garden screen at Hampton Court. Therefore I think you will feel as I certainly do that to put up a statue on the museum at South Kensington to Huntingdon Shaw, who really, so far as we know, is a myth, is misleading. The greatest search has been made to discover traces of Huntingdon Shaw, but his name is never mentioned in connection with smithcraft.

Mr. **MATT GARBUTT**, who proposed a vote of thanks to the author for his paper, said many of the facts relating to Tijou and the smiths who followed him were quite new, but the illustrations put before them were by no means examples of blacksmithing. The embossing, so characteristic of French work did not involve welding on the anvil, and came near to mortising, which was fitters' work. He thought they were always sorry to have the legends of their youth damaged, and so it was with regret that he heard Huntingdon Shaw described as a myth, yet when they looked at the mass of work done under the name of Tijou it was quite clear that he could not have executed it all; it was the work of many men. The drawings they had seen made by Tijou were hardly so good as the executed iron work, which suggested that h had men to carry out his designs who knew more about smith work than he did. A comparison between English and Continental ironwork might be difficult, and it would have been interesting if Mr. Gardner had explained the actual methods of work, the means by which effects were arrived at. They had recently seen examples of ironwork in Italy consistin of a collection of flat bars gathered together in a bunch an then leading off into scroll work with scarcely any welding It would have been interesting to know the differences in th actual handling of the heavy bar work, and to compare th top of one of the gates at Hampton Court with similar wor in France, for it was of the kind they recognised as Englis work in Chelsea and elsewhere.

Mr. **MAXWELL AYRTON** seconded the vote of thanks, an said he would have liked to have heard something about th fourteenth, fifteenth and sixteenth century work, for i seemed to him that although the later work could clai dexterity of handling, and certainly more strictly architectural treatment in design, yet they lost a good deal of th simple directness of the earlier work, which he thought compelled admiration from the wonderful way in which th designers obtained richness of ornamentation, and yet sti kept within the confined limits of the material. The seventeenth century work failed in that direction. It would difficult, he said, to find more beautiful fourteenth and fi teenth century Spanish and German work than was to be see on their locks and hinges, and all of it was legitimate smith work.

Mr. **GERALD HORSLEY** said the point in the paper whic seemed of importance was that the ironwork which M Gardner described as beginning with Tijou only lasted f about two generations. Tijou was succeeded by Robertso Edwards, Bakewell, and others. About 1728 when Gibb book was published, the school of ornamental ironwork di out. In France, however, the ironwork proceeded along wi the architecture as it did to-day.

Mr. **GARDNER** briefly replied to the vote of thanks, a the meeting terminated.

# THE MEASUREMENT OF ILLUMINATION, DAYLIGHT AND ARTIFICIAL.

## WITH SPECIAL REFERENCE TO ANCIENT LIGHT DISPUTES.[*]

THE daylight and artificial illumination of buildings is a matter which the architect is constantly called upon to determine, and to determine in most cases for the whole life of the building. It is difficult to imagine any building where the decisions of the designer with regard to the shape and size of windows and the provision of artificial illuminants are not of the utmost importance. In schools, libraries, hospitals and workshops the efficiency and sufficiency of the lighting has to be his first consideration, and in very few buildings indeed can he afford to make it a secondary one.

At the same time, rooms which are built with an unduly large proportion of window space can only be warmed in winter with difficulty and at great expense, whilst in summer they are insufferably hot. Even greater care has to be exercised in order to avoid excessive artificial lighting, which is not only expensive but extremely detrimental to the eyesight. The human eye, which will readily adapt itself to very large variations of diffused sunlight, which will read print with equal ease at sunset in December indoors and at noon in June outdoors, is extremely sensitive with regard to artificial illumination, and will be strained and injured by anything outside a very limited range.

One would therefore naturally expect the subject of illumination to have been fully investigated by architects and to receive from students as much attention as the proportions of Greek temples. One would expect that it would be the subject of minute regulations in the London Building Acts and in local bye-laws, in the regulations of the Board of Education, and in the Government requirements for the proper lighting of factories and workshops. It would be expected that in the intensely populated towns and cities of England, where land is valued by the square foot and almost by the square inch, and where a light well costs a modest competence in dead rent, that the limiting angles of good, bad, and indifferent lighting would be known exactly. But this is hardly what we do find. What is the information possessed by the average architect upon the subject of windows? He knows that the window space of every room should be at least one-tenth of the floor space—text books written 100 years ago will tell him that—and he probably knows that the same proportion in schools should approximate to one-fifth. But how many could say what proportion of the outside daylight is enjoyed in any room; how many could say what difference would be caused by any given degree of obstruction, or whether the height of the window head makes any difference? How many can define the relative efficiencies of a square foot of glass in a wall and a square foot of glass in a skylight? How many can tell a client what would be the relative amount of light absorbed by or reflected from wall papers of different colours, or by different kinds of glass?

With regard to artificial light many architects know that a provision of 30 candle-power per square of 100 feet super of floor area is considered ordinary, that 50 candle-power per square gives bright, and 60 candle-power per square gives brilliant effects. But how many can say at what height from the floor the lights should be placed in order to give these effects, what would be the results at other heights, or what would be the effect of using frosted or tinted globes or shades, and whether the result would be the same with many lights or few? Is it too much to say that the ideas of the average architect upon the subject of illumination are almost as hazy as those of other people? If so, then that is saying a very great deal.

There is no technical literature on the subject. The average architectural school gives perhaps one lecture on window areas to third or fourth year students, whilst the subject of different systems of artificial lighting is ignored as completely as it is in the syllabus and papers of the qualifying examinations. One seldom finds illumination referred to in the technical press, and then only in vague and general terms, and as far as the author is aware no architectural institution has ever suggested the formation of a committee to investigate it and collect information.

The Building Act and local bye-laws merely demand a minimum proportion between window and floor area, irrespective of whether such windows are at the bottom of a deep area or overlooking a park. The Regulations of the Board of Education for new schools (1907) are excellent as far as they go, except that they forbid the most efficient possible window, viz., a ceiling light. But they do not go very far and they are absolutely silent upon the subject of artificial lighting. Details for the approval of the Board are required of sanitary arrangements, ventilation, boundary walls, desks, fireplaces, &c., but artificial lighting is not even mentioned. The requirement of the Home Office with regard to the lighting of workshops is that it should be "adequate," which is, to say the least, a little indefinite.

The reason for this state of surprising ignorance is not far to seek. Exact knowledge is impossible without measurements and standards; and the measurement of light has been unfortunately confined almost entirely to the measurement of the intensity of light sources, whilst the measurement of results, *i.e.*, the general illumination to be derived from arrangements of lamps, has been neglected. Hence, we have ample data as to the candle-power of lamps, but no data at all of the illumination at table height which can be secured by using them. A few weeks ago the author asked three well-known electrical firms to tender for the wiring of a village hall on the basis of a given illumination at a certain height above the floor. The reply of each one was to the effect that having no data on illumination they were unable to tender. Text books tell us that illumination varies inversely as the square of the distance between the source of illumination and the surface illuminated. So it does in the laboratory, with single lights and blackened walls, but it does not do anything of the kind in the presence of the reflecting surfaces of walls and ceilings.

In the second place the measurement of such an everyday matter as daylight has not been considered worthy of attention. In consequence, the inaccuracies and vagaries of the human eye remain unknown, and it is commonly regarded as an efficient instrument for measuring illumination. As a matter of fact, the impressions received by the eye are no more an accurate criterion of daylight illumination than a landscape photograph is a measure of the acreage of a field. A piece of printed paper upon a table in the centre of a room upon a fine day appears to be illuminated to very much the same extent as when it is held outside the window. But try to photograph in the two positions; outside it may require, say, one-fifth of a second or less, inside it will probably take five minutes. The photographic plate records a difference in the relative illuminations of no less that 1,500 to 1; to the human eye this enormous difference is almost imperceptible. This is only one instance of the utter unreliability of the eye as a measuring instrument. Many others might be cited. For instance, most people would feel insulted if it were suggested that they were unable to estimate the relative brightness of different classes of sky such as:—(1) Cloudless; (2) blue predominating; (3) clouds predominating; (4) no blue; (5) overcast. But nine people out of ten who were not expert photographers would place them in the wrong order. Very few would expect to find that clouds *increase* illumination, still fewer would believe that the illumination from a cloudy sky is more than double that received from a clear blue.

Again, the effects of different tints of wall paper on the eye are most extraordinary. Nearly everyone would be favourably impressed with the lighting of a room papered in light pink, and would be extremely liable to consider inadequate that of a room with light buff or pale grey walls. Yet the latter colours reflect nearly four times as much light as pink. Certain wall papers mean a very considerable difference to one's bills for artificial light.

How many people would hold up the Strand Law Courts as an example of daylight lighting? But try and read a piece of fine print at sunset in the witness-box or counsel's seat of any of the Courts, and afterwards try it at the same hour in the centre of an ordinary office with large windows; the difference is surprising. The chief reason for this is that the windows are high up in the walls, and the enormously high relative value of high angle light is a matter of which the eye takes little notice, and which is seldom properly recognised. Its effect, however, can be easily studied by darkening different parts of any ordinary window with brown paper screens. The loss of the bottom two or three feet in height will hardly make any difference at all, but shutting off a few inches from the top may reduce the general illumination of a room by 30 to 50 per cent.

It will sometimes be found that high rooms on lower floors with badly restricted horizons are actually *lighter* than low rooms on upper floors with the same proportion of glass to floor area and with absolutely open horizons.

In this connection it might be mentioned that the ordinary north light roof would be very much more efficient if the flatter slopes were turned to the north and glazed. The illumination would be greatly increased, and the workman would not stand in his own light when facing south.

---

[*] A paper read by Mr. P. J. Waldram, F.S.I., before the Society of Architects on January 13.

The daylight illumination of every room varies by several hundred per cent. from sunrise to noon and from noon to sunset; and it also varies from day to day and from month to month. But the wonderful adjustable iris diaphragm of the eye deliberately stops down all illuminations which are above a common level of efficiency, so that the mind is quite unconscious of these large middle-day excesses of illumination, and may very well remain ignorant of them.

A very little consideration of these facts will show that unaided visual impressions are quite worthless as a criterion of the daylight illumination of any room, and how extremely unlikely it is that different experts, trusting to their eyes alone, will arrive at the same opinion; for it is no exaggeration to say that there are few experts who know how to *mistrust* their own eyes to such a degree as will enable them to form approximately reliable opinions.

Fortunately, however, the daylight illumination of interiors can be measured in spite of its constantly fluctuating character; because the proportion of the outside daylight which any room receives is always a fixed ratio. As sky brilliancy increases and decreases, so does the interior illumination, and in precisely the same proportion, except when the room is lit by the direct rays of the sun or directly reflected rays. If the middle of a room receives $\frac{1}{1000}$th of the outside light at sunrise in December, it receives $\frac{1}{1000}$th at noon in June. This proportion is also the same in a scale model of the room as in the room itself. All that is required is a photometer with a large adjustable range and which will record not candle-power but illumination in candle-feet, viz., degrees of illumination equivalent to so many standard candles at a distance of 1 foot.

The chief object of this paper is to show that the measurement both of artificial and daylight illumination is such a very simple matter, requiring neither special skill nor expensive apparatus, that it ought to be largely undertaken by architects. The photometry of lamps and other light sources demands very delicate and expensive apparatus, specially constructed laboratories, and the exercise of technical and mathematical ability of no mean order. But the photometry of lamps is a matter for the engineer and not for the architect; he is concerned with the results, not the means. The photometry of illumination, both daylight and artificial, can be performed with instruments of about the same size, weight, and cost as a good hand camera; and demands neither technical skill nor mathematical knowledge.

The principle of illumination photometers is to compare the illumination which falls upon a card outside the instrument with the light of a standard electric lamp inside, and viewed through a slot in the same card. The light of the standard lamp is graduated by turning a milled head at the side of the instrument until the illumination of the slot is equal to that of the rest of the card. The same operation turns an index needle on a dial which automatically indicates the degree of illumination in the slot. The difficulty of balancing lights of different colours is in most instruments met by passing the light through a rapidly rotating sector. The resulting flicker is, however, not a little trying to the eyes, and the author prefers the well-known Preece-Trotter type, in which the difficulty is overcome by using slotted cards of different standard tints.

The author described this instrument in detail, with the aid of a diagram.

The following are a few examples of inside and unrestricted outside illumination:—

*Proportion of Unrestricted Outside Illumination Received by Interiors of Buildings.*

In cases where the obstruction of the visible horizon has already taken place, the proportion of light still remaining can be compared with that of other rooms in the neighbourhood; but the more customary problem is to estimate the future damage of a proposed obstruction. This can be ascertained in three ways.

(1) By erecting the proposed obstruction in the form of temporary screens and noting their effect on the percentage of light enjoyed.

(2) By reproducing the room and its aspect in a scale model and similarly noting the effect.

(3) By deducing the damage from known and recognised data of the difference caused by any given degree of obstruction.

The first two methods are comparatively simple, and they are the only ways open to us at the present time; but if we only had the data referred to in (3) the trouble, anxiety, and needless expense of ancient light disputes might be avoided altogether, and at the same time one of the greatest difficulties connected with town building would become a matter of simple calculation.

Finally we have to consider what is the real effect of any given obstruction. Over the greater part of the working day it is negligible, for if a room be lit at all at sunrise and sunset, then it has a very large excess between those hours. It may suffer æsthetically, and in rental value, from loss of prospect; but prospect is not an easement.

The real loss, as regards reading, writing, and industrial occupations, is that more artificial light will be required in the morning and evening. The extent of this loss can only be exactly arrived at if the average of increase and decrease of outside daylight be known. There is need for exact and authoritative data, but approximately this may be put at a rise or fall of about 1,000 candle-feet in 45 minutes on clear days in June, and in 180 minutes in average weather in December. In other words, at a point in a room enjoying $\frac{1}{1000}$th of the outside light the illumination would increase and diminish at the average rate throughout the year of about 1 candle-foot per 120 minutes. But a room only enjoying half that proportion would require twice as long to acquire a working light in the morning, and would lose it so much sooner in the evening.

A rough approximation of a standard well-lit room would be one enjoying an average of 1 candle-foot (*i.e.* a fair reading light) at half an hour after sunrise and at sunset on a clear day, which is given by a proportion of about $\frac{1}{1000}$th of the outside illumination.

The great present-day need is that architects should take an active and intelligent interest in illumination. They can at least insist that gas and electric sub-contractors should guarantee a given illumination at table height in candle-feet. The demand will soon create the supply, and instruments for testing the results are neither expensive nor difficult to use. But, above all, we need workers who will record data and results. Architects, and architects alone, can do this satisfactorily, and their labours would benefit not only their own profession, but the whole of the working community.

---

THE Royal Institute of the Architects of Ireland held their annual dinner in the Shelbourne Hotel, Dublin, last week. The President, Mr. Frederick Batchelor, presided. Among the guests were the President of the Incorporated Law Society, the President of the Royal College of Surgeons, the President of the Royal College of Physicians, the President of the Chamber of Commerce, the President of the Architectural Association, the President of the Institute of Civil Engineers.

THE Dublin Corporation have once more referred back a proposal for the erection of new municipal offices. The scheme was to utilise the site in Lord Edward Street purchased for the purpose some years ago, and to spend at least 50,000*l.* on the building.

## GUILD OF ARCHITECTS' ASSISTANTS.

IE inaugural meeting of the Manchester branch of the Guild of Architects' Assistants took place last week at rooms of the Manchester Society of Architects, with Mr. E. Corbett, A.R.I.B.A., in the chair. The Chairman ressed himself as being in general sympathy with the ects of the Guild, but in regard to education he thought t assistants might well leave the question to older men, who had more experience of actual practice. He also gested that the insurance programme of the Guild might y well be extended to sick and death insurance, and the rth object of the Guild, that of the formation of a leral Council of all existing societies, he regarded as very ious of accomplishment. Mr. Herbert Cox, a member of provisional committee of the Guild, then delivered an lress explaining its objects and methods. He pointed out arrival of a purely commercial type of principal who was only entering into competition with, but gradually eezing out the older men, and had proved themselves more ely to expect an assistant to work under irksome conditions h as to salary and employment. The report of the pro- ional committee was then read and the procedure of the ild in the matter of employment bureau and insurance fully described. The R.I.B.A. examinations were then icised by the speaker and the examination in steel work cially referred to. He hinted that the character of the minations would be much improved by the introduction paid examiners. The object of the Guild was to set up a re exclusive standard and to assist only those actually hin the profession. The movement in relation to the posed Federal Council could only be brought about by a ong organised body of assistants, and then their case education as well as for other, perhaps more important, tters would obtain the official recognition of the profes- 1. The meeting was then thrown open to discussion, in course of which the Chairman stated he had recently ertised for an assistant and found his own Society in- quate. He had received many replies from men who had n in practice for themselves, and some had held good vernment appointments. It was shown that the scheme unemployment insurance would be managed by a special -committee of the finance committee, the members of ich would only be elected by those participating in un- ployment benefit. There would be no place for the astrel," because the qualifications of all members would carefully studied. The committee for the branch was n elected, Mr. P. Caminesky, A.R.I.B.A., 24 Brunswick eet, Chorlton-on-Medlock, Manchester, as hon. secretary. meeting closed with a vote of thanks to Mr. A. E. bett, the Chairman, and to Mr. Herbert Cox of the pro- ional committee.

## REINFORCED-CONCRETE CHIMNEY CONSTRUCTION.

HE seventh general meeting of the Concrete Institute was held at the Royal United Service Institution, hitehall, S.W., on January 20, when a paper on "Rein- ced Concrete Chimney Construction" was read by Ernest Matthews, A.M.Inst.C.E., F.R.S.Ed. (Borough Engineer Bridlington). The chairman was Mr. W. T. Hatch.

In his introduction Mr. Matthews stated that reinforced crete was considered by American engineers and archi- ts to be suitable for the construction of chimneys. This ght be gathered from the fact that during the past seven rs one firm alone had erected nearly a thousand such mneys in America, under the direction of some of the st able engineers and architects in that continent. The ject-matter of this paper he divided into—(*a*) The ad- itages of using reinforced concrete for the construction of mneys; (*b*) the erection of reinforced concrete chimneys Great Britain; (*c*) a tabulated statement giving particu- s of a number of these chimneys constructed in the United tes; (*d*) the methods of calculating the stresses and ains in such chimneys, and reason for the recent failure a shaft in the United States; (*e*) the effect of excessive t upon concrete and reinforcement; (*f*) general notes h respect to reinforced concrete chimneys.

It had been found in America that reinforced concrete mneys could be built by a well-organised firm at less than -half the cost of a brick shaft, and that the larger the ft the greater the saving, since a large brick chimney of siderable height must have brickwork of great thickness its base to prevent overturning. It was also usually nd that in districts where brickwork was expensive con- te was also costly, so that there was no difference in the ratio of their respective cost. It would appear, therefore, that on the ground of economy reinforced concrete had much to recommend it as a material for the construction of chimneys.

Saving of space was often a great consideration. In a shaft 300 feet in height, for example, the brickwork at the base, according to the building regulations of our English cities and boroughs, would be about 4 feet 10 inches, whereas the thickness of the walls at the base of a reinforced concrete chimney would probably be as follows: outer wall 9 inches, inner wall 5 inches, with a space of 4 inches between the two walls. Therefore considerable economy of space was attainable by the employment of reinforced concrete for chimney construction.

In addition it had less weight than brick shaft. This naturally arose out of the foregoing, and was a matter of the greatest importance where a treacherous soil had to be built upon.

Reinforced concrete chimneys had been erected in the United States for some years past, and the author knew of only one failure. Reinforced concrete lent itself admirably to chimney construction, a recommendation which could not be so confidently asserted with regard to brickwork. The author considered that a reinforced-concrete chimney, if properly designed, was of greater stability than one built of brick, since the former had no joints, whereas in a brick shaft failure might occur at any of the joints.

Once erected, reinforced concrete chimney shafts required practically no repairs, while steel-plate chimneys required painting about every four years, and brick chimneys occasionally required repairing.

The rapidity of execution of work was well known; a reinforced concrete chimney could be erected in half the time that it took to build a brick shaft.

The author then referred very briefly before giving American examples, to one or two of the reinforced concrete chimneys which had been erected during the past few years in this country. Several of such chimneys might be referred to, but the object of the paper was to deal chiefly with those erected in the United States, so that only a few were mentioned.

The shaft erected a short time ago at the works of Messrs. Abraham Lyle & Sons, Ltd., of London, E., was a good example of what could be done in reinforced concrete. This chimney was 261 feet in height and 20 feet in diameter. The walls, for the upper two-thirds, were 8 inches in thickness, double walls being built in the lower third. The reinforcement consisted of vertical bars consisting of $1\frac{1}{4}$ inches × $1\frac{1}{4}$ inches × $\frac{3}{16}$ inch T's, and horizontal rings of $\frac{5}{8}$ inch steel rods spaced at 18 inch centres, vertical bars extending into the concrete foundations.

The chimneys recently erected for the Cape Copper Co., Briton Ferry, Glamorgan, and for Messrs. J. & S. M. Greeves, Ltd., of Belfast, were also good examples. The dimensions were as follows:—Heights, 150 feet and 200 feet; diameters of outer shells, 13 feet and 8 feet 6 inches respectively.

A large chimney at Northfleet had recently been erected; it was 8 feet 6 inches inside diameter, and 247 feet in height above bottom of foundations, and was a fine example of reinforced concrete construction. The foundations, the bottom of which were 35 feet below ground-level, were remarkably shallow, being only 4 feet tapering to 2 feet in thickness, and 18 feet × 18 feet in area. A 6-inch baffle wall was constructed across the lower portion of the shaft, and the thickness of the shell up to 62 feet above the ground-level was as follows:—Outer shell, 12 inches; cavity, 4 inches; inner shell, 4 inches. Above this the chimney consisted of a single shell 9 inches in thickness. The reinforcement in the foundations consisted of $1\frac{1}{4}$ inches × $1\frac{1}{4}$ inches × $\frac{3}{16}$ inch T's, and in the shell of horizontal rings of steel $\frac{5}{8}$ inch diameter, spaced 18 inches apart, and vertical bars formed of $1\frac{1}{4}$ inches × $1\frac{1}{4}$ inches × $\frac{3}{16}$ inch T's.

Although a smaller chimney, 130 feet high, the one recently erected at the Bevan's Works, Northfleet, was of much interest. The shallow depth of the foundation was rather remarkable. While this was 15 feet 6 inches square in area, the depth was only 3 feet tapering to 2 feet. The inside diameter of the chimney was 5 feet. The bottom of the foundation was 16 feet below ground-level, and this was reinforced by $1\frac{1}{4}$ inches × $1\frac{1}{4}$ inches × $\frac{3}{16}$ inch bars. For a height of 41 feet above ground-level the outer shell was 6 inches, the inner 4 inches in thickness with a 4-inch cavity between; 9-inch diameter air inlets occurred at intervals; above this the chimney consisted of a single shell only 5 inches in thickness. The shell was reinforced by means of vertical bars and horizontal rings, the former being

FLAT-RESIDENCES, CHARLOTTENBURG, BERLIN.—Façade designed by Rudolf Maté, Architect.

deflected around smoke flues. The vertical bars consisted of 1¼ inches × 1¼ inches × 3/16 inch Γ's, the rings being ⅝ inch diameter steel rods placed 18 inches apart. At the bottom of the offset flat rings 3 inches by ½ inch were inserted.

The two foregoing shafts had been erected for the Associated Portland Cement Manufacturers, Ltd., at their works at Northfleet.

An excellent article, entitled "The Design of Ferro-Concrete Chimneys," appeared in *Engineering* in March 1908. In this the authors—Messrs. Taylor, Glenday, and Faber—describe in detail the methods of calculating the stresses in chimneys of this material. There was not sufficient space in the paper in which to deal with this part of the subject, and Mr. Matthews therefore referred members to the before-mentioned article.

With regard to the recent failure of a chimney in the United States the conclusions arrived at by the authors before named were interesting and instructive. They said:—"It would appear, therefore, that while the thickness of concrete was ample, there was not nearly enough steel t ensure safety, and, of course, this deficiency in steel greatl increased the pressure on the concrete by throwing the lin of zero stress away from the centre of the chimney, and thu leaving a very small proportion of the section in compression. . . . The failure of this chimney cannot be said t cast any reflection upon the use of properly designed reinforced concrete for such structures."

The effect of high temperatures being such an importan matter, Mr. Matthews, in order to obtain some reliable data determined to carry out series of tests, and he gave detaile particulars.

Some most useful information regarding the condition o the concrete and reinforcement in an existing reinforce concrete chimney was supplied by Mr. H. K. G. Bamber F.I.C., of the Associated Portland Cement Manufacturers Ltd.

In order to ascertain if concrete deteriorated through th effects of heat, Mr. Bamber inspected on several occasions th

Hart & Lesser Architects.

face of the concrete shell inside the reinforced-concrete chimney at the works of his firm at Northfleet, and he failed to observe any signs of deterioration. Not contenting himself with this, he subjected the ash in this chimney, on various dates, to an analysis, and compared this with an analysis of the ash taken from the base of a brick Custodis shaft, also at his firm's works at Northfleet. The comparison was most interesting; there was very little difference in the percentage of insoluble residue present, which residue would, of course, include any portions of sand that might, from deterioration, be coming away from the inside of the inner shell of the concrete chimney.

Mr. Bamber had a small hole cut out for the author in the base of the inner and outer shells of the reinforced-concrete chimney at Northfleet for the purpose of exposing a portion of the reinforcement. These were made just over the flue opening where the heat would be most likely to affect the concrete. The result was most satisfactory, the steel being in as good condition as when first inserted in the concrete.

*(To be concluded.)*

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* devotes its illustrations to domestic work of no very great interest, but there is an interesting article on "The House and Its Environment," written around one of the houses illustrated.

*La Construction Moderne* has some views of old Italian doorways of the late Renaissance period selected from Milan. In the current description of old Paris, the Rue Saint-Jacques is now dealt with.

*Arkitektur og Dekorativ Kunst* has some photographic illustrations of the carved figure grotesques executed for Trondhjem Cathedral under the direction of the architect, Olaf Nordhagen, by W. Rasmussen. Furniture from the designs of the architect, Carl Berners, is also illustrated.

*Moderne Bauformen* makes a special feature of the work of Rudolf Schmid, of Freiburg in Breisgau, who does not despise the detail of the past, though much of his work has the meritorious simplicity of those who do. There are some excellent examples of modern interiors, and Henry Wilson, Edgar Wood, Heywood Haslam and Ernest Newton are all represented by examples of their work.

*Stone*, besides dealing, as usual, with some of the quarries in the States, illustrates as examples of the use of stone the Astor Hotel and the Harkness residence at the corner of Fifth Avenue, Seventy-fifth Street, New York.

*Zodtchy* illustrates plans and details of some modern hospitals.

*Engineering Record* has two interesting papers of a practical, scientific character, one by Mr. Albert Moyer on the "Possible Use of Mineral Oils Mixed with Concrete," the other on the "Effect of Superheated Steam on Metals," as discussed at a meeting of the American Society of Mechanical Engineers.

The Council of the Royal Glasgow Institute of the Fine Arts have under consideration a suggestion that the Institute should acquire ground and erect for itself galleries of a spacious and dignified character, and of a size which would enable its exhibitions to maintain their pre-eminent position in the provinces.

### Financial Loss to Architects caused by Competitions.—Suggested Remedy.

SIR,—It has recently occurred to me that the profession does not realise the enormous waste of time and money which is due to competitions; and as the "Regulations for Architectural Competitions" are now under consideration by the Institute, I take the opportunity to draw attention to the financial loss, with the hope that some means may be found to minimise it.

Take a typical case of 10,000l. competition for a limited number of ten; the average out-of-pocket expenses would be at least 20l. each, or a total of 200l., the average value of the designs say 100l. each, or a total of 1,000l. That is, the competitors pay 200l. in expenses, or give 1,000l. value of designs for one of them to receive instructions to carry out the work with a commission of 500l. If the competitors be twenty-five in number then they pay as much in expenses—500l.—as is the commission. Take a 10,000l. unlimited competition; the number of competitors is almost certain to be fifty, when the expenses at 20l. each would be 1,000l., and the competitors pay twice as much out of pocket in expenses as is received by the successful architect, and prepare designs worth 5,000l., or half the value of the building to be erected. If there be 100 competitors, which is not unusual, then they pay in expenses 2,000l., one-fifth of the value of the building, and prepare designs worth 10,000l., the full value of it.

The competition for the London County Hall was a most severe tax on the profession. The design which I prepared cost 320l. in out-of-pocket expenses, allowing nothing for my own services, and much time given to it. I am told that other designs cost double that sum. But take the 320l. as an average, then the 199 competitors paid 63,680l., which is 20,180l. more than the 5 per cent. commission on the 850,000l. proposed expenditure on the building. If each competitor had put 320l. into a sweepstake, Mr. Ralph Knott might have drawn a prize of 63,680l. instead of a commission of 43,500l., and would have had no further work and responsibility; and the other 198 competitors would have saved all their time and thought in the preparation of useless designs, the value of which cannot be put at less than 1,000l. each, or 198,000l.

I notice considerable difference in the comparative affluence of members of other professions and of architects, and incidentally in their social position, and I attribute this to the unproductive labour and expenses of competitions. I doubt if there is any other profession or trade which does so much without remuneration, except perhaps the medical profession, and they have the satisfaction of doing good to their fellow men, and are not called upon to pay the hospital expenses. We brighten our wits and give the younger men a chance by competitions, but the promoters are the supposed gainers; so long as we offer so much for so little, they naturally accept it. I think, however, that we should have the sympathy and help of promoters in any proposals to minimise the loss to the profession, if the regulations were reasonable ones, issued with the authority of the Institute, and as loyally supported by the profession as is the recognised scale of commission.

The remedy I have to suggest is that a scale of the approximate value of payments for out-of-pocket expenses should be adopted by the Institute (ranging from say 1l. per cent. for a 1,000l. building, to 1s. per cent. for a 850,000l. building) payable by promoters of all competitions, and made part of the contract between promoters and competitors, and that members of the Institute should be required not to compete unless such contract were entered into by the promoters.

I would apply this scale to the three classes of competitions named under clause 5 of the "Regulations for Architectural Competitions" as follows:—

(*a*) By advertisement and unlimited, half the scale to each competitor sending in a bona-fide design and complete drawings.

(*b*) By advertisement and limited by selection, the full scale.

(*c*) By personal invitation and limited, the full scale plus a specified sum for the design.

The sums payable by the promoters would be very small in proportion to the value of the designs obtained by them. For a 1,000l. building there could be obtained five designs for 5 per cent. extra to the usual commission; for a 10,000l. building, say at 4s. per cent., there could be obtained twenty-five designs for an extra 5 per cent., or ten designs for an extra 2 per cent.; and the London County Council could have had their 199 designs for 42,188l., practically an extra 5 per cent., a large sum for them to pay, but over 20,000l. less than what the competitors probably did actually pay for out-of-pocket expenses.

The obligation to pay on such a scale would no doubt deter the promoters from indulging so frequently, readily and often unnecessarily in the luxury of a competition; it would also tend to limit and to reduce the number of competitors.

The payments made by the promoters of each competition would be little and due by them, but the aggregate increased annual income to the profession would be very substantial and due to them.

Incidentally the limitation would cause more careful selection of competitors, and improve the chances of those selected.

It has been suggested to me that these proposals might not commend themselves to promoters. But if supported by a regulation of the Institute many promoters would accept the scale as a matter of course, and if any did not do so members of the Institute could then without offence decline to compete. At present I find I cannot decline without liability to give offence to some good friend or other who has brought my name to the notice of the promoters, and consequently sometimes I do compete under conditions which I feel to be humiliating. The Institute by improving its regulations is at the least helping us to help ourselves.

I am taking the unusual course of writing a similar letter to the editors of each of the professional papers, and have to ask for your indulgence for doing so, as I wish the whole profession to have the opportunity of considering my suggestions before the meeting of the Institute on February 7, when the "Regulations for Architectural Competitions" are to be considered.—Yours faithfully,

January 25, 1910. EDWARD M. GIBBS.

### The Japan-British Exhibition.

SIR,—The Japanese exhibits under the auspices of the Imperial Japanese Government at the Japan-British Exhibition at the White City next summer promise to be a complete demonstration of the progress made by that wonderful nation. It is absolutely necessary, therefore, if we as a nation are to be adequately represented, that immediate steps be taken to render the British exhibits an equal demonstration of the progress made by the United Kingdom. As president of the Section of Public Health and Sanitation, I hope you will allow me to call the attention of all those who are engaged in matters which come within the scope of this section to help in making it worthy of the occasion. Great Britain is the leader in all matters connected with hygiene, and it is hoped that this section will adequately exhibit all that our most advanced sanitarians are doing. The Japanese Government and people are keenly interested in all matters connected with public health and sanitation, and already are purchasers of our sanitary goods, and are anxious to know where the most perfect appliances can be obtained. It is with a view of calling upon the patriotism of sanitarians to see that this section worthily represents the place that Great Britain holds in sanitary science that I venture to make this appeal to them.—Yours faithfully, H. D. SEARLES-WOOD,

Chairman, Public Health and Sanitation Section,
Japan-British Exhibition.

January 25.

## GENERAL.

THE Swiss Federal Chamber have issued the programme of a competition for the erection of a monument at Berne to commemorate the foundation of the International Telegraph Union. The competition is open to all artists in the world, and an international jury, on which Sir George Frampton, R.A., is the British representative, will pronounce on the merits of the designs submitted. The artist chosen will be entrusted with the execution of the monument at a cost not exceeding 6,800l.

THE late Mr. H. Bayly Garling, F.R.I.B.A., Folkestone, has left estate of the value of 21,363l.

MR. R. A. BRIGGS, F.R.I.B.A., announces that he has taken into partnership Mr. Harry Le C. Browning. The firm will be known as Messrs. R. A. Briggs & Browning, and will conduct business at Amberley House, 12 Norfolk Street, Strand, W.C.

## "THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

WE are pleased to find that the first set of drawings sent in for our new Club are evidently the work of genuine students, and therefore the level of excellence attained is not that of finished draughtsmen, but leaves room for improvement.

In making a pen-and-ink drawing of an architectural subject there are two distinct bases from which a student can start, the diagram and the picture, and one or other of these should be kept in view. Architects' drawings, plans, sections and elevations are essentially diagrams; they do not portray a building as it looks, but as it is, and a perspective drawing in pen and ink can be treated exactly in the same way. The highwater mark of such a method has been reached on several occasions by the perspective drawings in outline of architectural subjects which have been awarded prizes by the Royal Academy to their students. Such drawings are still of the nature of diagrams, and in no way show a building as it looks, but are useful as a study of architecture and show it as it is more clearly though not so literally as a scale drawing.

The pictorial method of delineating architecture may further be subdivided according as the aim of the draughtsman is to show the building as it looks or to make a pretty drawing or picture of which the building is the foundation. In a perspective drawing of a building from the pictorial point of view it is well to remember and adopt the old-time landscape painter's convention of three planes, foreground, middle distance and distance, and to put the building into the middle distance. The composition of light and shade should be carefully studied, and in so doing the student may work either from light to dark or from dark to light. There should be a concentration of interest on some part of the drawing, and not a diffused all-overish kind of effect. Sparkle can be obtained by strong contrast of light and dark, but multiplicity of sparkle should be avoided.

Taking the drawings sent in, not in order of excellence, but as they come, we have first before us Mr. Reginald Pywell's "View of the north-west corner of the Fountain Court, Hampton Court Palace." This is a "diagram" perspective, and, though not in outline, the shadows and shading are so generally uniform that, as a drawing, there is an uncomfortable feeling of flatness, and the perspective is little more than an elevation on a plane diagonal to the walls. In order to realise what the Fountain Court really looks like, one has to bring one's mind's eye into operation just as an architect does when he realises from plan, section and elevation what the effect of a design for a building will be. Mr. Pywell's drawing has taken a great deal of work and labour, and his industry is commendable. In a few minor points the perspective is incorrect, and the reflections in the fountain pool are false, as the ripples from the fountain would extend throughout. The correct drawing of these reflections with the fountain playing is a big undertaking. We award Mr. Pywell a high place, though not the first.

"Esek" sends a drawing of the south aisle of Kirkstall Abbey, which is effectively suggestive and informative to an architect without being laboured or attempting a pictorial treatment. The sense of scale and of distance is very cleverly conveyed, and the drawing is a good example of what an architect's sketch ought to be.

"Derick" is on the way to learn pen-and-ink drawing, but needs to study more thoroughly the question of values and of texture. There is too obvious a falsification of lighting which could not be quite covered by any theory of accidentals. The desire for brilliancy in a drawing should not be allowed to overcome truthfulness. The subject is the entrance of the Fishermen's Hospital, Great Yarmouth.

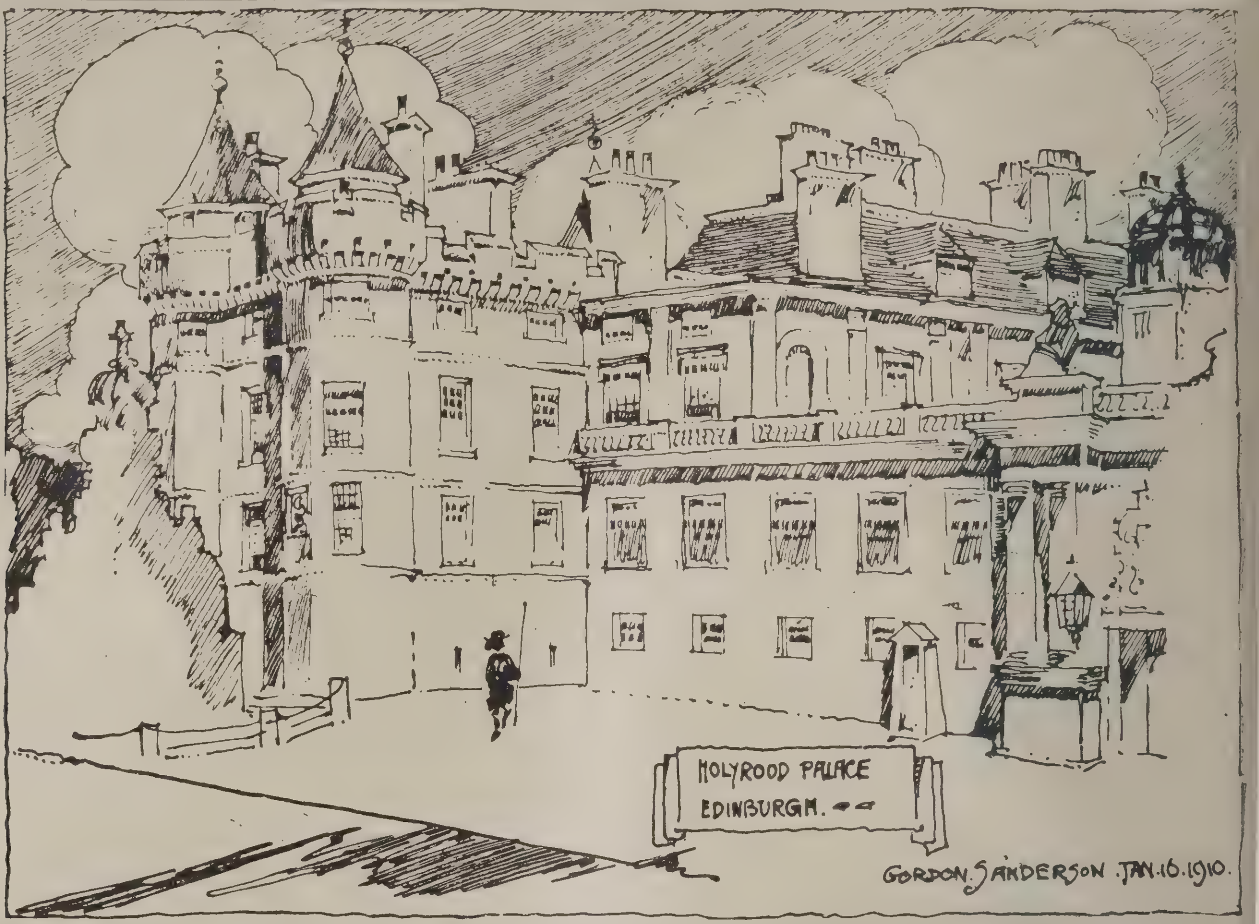
Mr. Percy Bartlett, in his sketch of "A corner of Old Buildings, Lincoln's Inn," has given us an example of the way in which a pretty drawing can be made of a poor subject. The Old Buildings of Lincoln's Inn are interesting as an example of old London, but can scarcely by any stretch of imagination be considered beautiful. Mr. Bartlett's drawing is pretty and effective, the values well expressed.

"Roath" succeeds in conveying a good idea of the architectural design of the old houses at Shepton Mallet, Somerset, which he delineates, but his drawing suffers from a very common fault of young architectural draughtsmen, the falsification of the scale of figures in the foreground. This is a great mistake, as not only does it convey a false idea of the building, but it loses the great advantage of foreground figures or other objects, that of putting the building into the middle distance. There is also too much lack of colour in the shade and shadow by reason of an excess of laborious monotony.

Mr. Adrian Hardman sends an effective sketch of the south porch of the church at Cley-next-the-Sea, Norfolk, which is good in its pen-and-ink treatment, but a little out of drawing in the main arch and the perspective of the buttresses. The effect of middle distance for the main subject is cleverly obtained by a very simple use of foreground objects.

Mr. Frank Suddard, in his drawing of a half-timbered house at Derby, suffers from too much desire for sparkle, the result being all-overish flatness and a lack of atmosphere or distance. The author should study a more pleasing convention for his rendering of tree foliage.

"Sans Peur" is evidently quite a tyro at pen and ink, but everyone must have a beginning. The black



boundary line to his top edges in the drawing of Ryton Church is a mistake, as, generally speaking, a pen-and-ink drawing is better vignetted. Mass lining should be very cautiously used, if at all. The right way to employ it is seen in Mr. Leslie Wilkinson's sketches of Caudebec in our issue of January 7. We hope "Sans Peur" will stick to his motto and pluckily persevere. The subject he has chosen is a difficult one, and something easier would be better for early attempts.

"Sans Peur's" second sketch, the lantern and tower of St. Nicholas Cathedral, Newcastle-on-Tyne, is a subject more within the limit of his present powers, but is utterly ruined by the mass lining. The perspective is also not quite right. The junction of the pinnacle and buttress should not be slurred. It is worth study as a solution of an architectural problem.

"Vamok" is also another tyro, and must learn to walk before he tries to run. It serves no good purpose to splash in ink until a draughtsman has learnt to draw the curve of an arch with fair approximation to truthfulness. The author of this drawing will find it worth while to study carefully the principles of perspective before making further attempts to sketch.

Mr. J. Nelson Meredith has attempted in his drawing of St. Mary's Church, Mold, a subject too difficult for him at present. If the gravestones really reel as he has depicted it would have been better to have suppressed them. Their value as foreground is lost from the thinness of line with which they are delineated. The drawing suffers from flatness, which is emphasised rather than relieved by the black splodges in the belfry windows.

Mr. Meredith's sketch of the church tower is better, because there is less of it; but here again the dead, unrelieved black in the windows spoils and kills everything. The foreground again needs strength.

Mr. Charles T. Whiteley has set himself too severe a task in Magdalen College Tower, and should try a simpler subject next time. He must also give attention to tree drawing, which in pen-and-ink work must adopt a conventional rendering, but at the same time retain some semblance of tree form and structure.

Mr. Harry Collings in his interior of St. Michael' Church, Ravenstone, has a drawing which is too hard i effect, the roof in particular being too mechanical in it drawing. The falsity of the lighting is rather to apparent, although there is a praiseworthy attempt at definite scheme of light and shade. Further study fro actual buildings will be the best corrective for the fault of the author's work at present.

Mr. J. W. Carmichel, Mr. F. D. Browne, and th authors of "Precentor," "Ambo," "Tyke," "Can bus," and "Hotot" may take the advice we have give to "Vamok" as suitable to them also.

We have awarded the prize for January to "Esek, who has been closely run by Mr. Percy Bartlett an Mr. Adrian Hardman.

## NOTES AND COMMENTS.

It is a pity that the annual prize-giving at the Roy Institute on Monday last was less well attended tha usual, for if Mr. Ernest George is not a great orato he at least knows how to give sound advice, pithily e pressed, and every young student of architecture ought t read, mark, learn, and inwardly digest the useful lesso inculcated in the latest presidential address. Of the mar such that we have heard or read in the past, we cann recall one that contains so much sound advice to a your architect compressed into so small a compass as is to b found in that delivered last Monday.

The letter that appeared in our columns last wee from Mr. E. M. Gibbs is worthy of attention from a the numerous architects who take part, either regularly occasionally, in competitions. Mr. Gibbs has in no wa overstated the facts as they stand. Indeed, he has n mentioned some glaring instances in which the cost of th competition drawings to the architectural profession ha at a moderate computation, actually exceeded the sum be expended on the building. While we think Mr. Gibbs proposal is quite feasible, with perhaps the somewh obviously necessary proviso that the assessor should ha power to determine what designs were bona-fide, and therefore deserving of an honorarium, there are other lines on which the present flagrant abuse of the competition system might be amended.

---

OUR colleagues in Germany have succeeded, it seems to us, in persuading their public that a far higher scale of premiums should be adopted in competitions, and that far less expensive drawings are necessary to show to competent judges the merits of a design than are the usual custom among ourselves. We think that our assessors are somewhat to blame in respect of the latter point. If an assessor is worth his salt he ought to be able to pick out the most likely design from quite simple sketches. One or two plans on squared paper, to the smallest possible scale, sixteenth at most, and a small perspective sketch should be enough. Then let the author work out his scheme fully, with half-inch detail, at a proper remuneration, for the final approval or disapproval of the assessor.

---

SOME little time ago we reported the ancient light case concerning the new Wesleyan Methodist building and the Westminster Hospital, and noted that the Judge referred the case to Mr. JOHN SLATER, B.A., F.R.I.B.A., for report instead of himself deciding between the evidence of expert witnesses on both sides. This week we report the case of SMITH *v.* Anglo-American Oil Company, which concerns a new and important building in course of erection at Queen Anne's Gate. It will be seen from our report that the judge, Mr. Justice JOYCE, instead of hearing any evidence, at once referred the matter to Mr. SLATER for his report. It is evident that the judges of the High Court are becoming tired of listening to the conflicting evidence that is always given by expert witnesses in technical questions and realise the extreme difficulty for a learned lawyer in deciding fairly the usually complicated points and delicate distinctions that necessarily occur in ancient light and other technical matters.

---

IT becomes a question, therefore, whether it would not be well for architects to advise their clients to avoid the law courts, and submit such questions always to arbitration. The expense of getting up cases relating to buildings for trial in the High Court is enormous, and if this is to be positively wasted by the matter being referred to an independent expert for report, who thus virtually becomes an arbitrator, it would surely be better to go to the arbitrator direct. There is no doubt that the course adopted by Mr. Justice JOYCE in the present case is more likely to result in a fair decision than if he had relied solely on his own ability to comprehend the merits of the points put forward by both sides.

---

PROFESSOR GARSTANG, who is now working in the Soudan, has made some interesting and valuable discoveries on the site of Meroe, the ancient capital of Ethiopia, including the Temple of the Sun, mentioned by DIODORUS as having been founded by ERGAMENES, the inventor of the Meroitic script. The Temple of Ammon has been further excavated and the extent of the building has been found to be greater than was expected. So that altogether Meroe is proving a fruitful field for exploitation.

---

THE case of MEASURES BROTHERS, LTD., *v.* MEASURES, decided by Mr. Justice JOYCE, makes clear some principles of law with regard to service that are worth remembering. The plaintiff company is in course of liquidation, and Mr. HERBERT MEASURES, the defendant and a director of the company, having thus been summarily dismissed, it was decided by the learned Judge that he was at liberty to set up in business in competition with the company, but that he was not entitled to make use of lists of the company's customers obtained during his service as a director of the company in order to specially solicit their custom. We understand that this would not prevent Mr. HERBERT MEASURES from circularising all and sundry who might become customers.

## A WEEK END IN EDINBURGH.

"A city that is set on a hill cannot be hid."

THE architecture of Edinburgh has been so often illustrated and described that some sort of apology seems due for its being the subject of this short article, which is intended to show how a student of architecture may, if so inclined, turn a week-end visit to some account, and so carry away with him notes which may be of use to him professionally, and also be a memento of his visit. In the individuality of position of its site as a city, of its old street architecture, Edinburgh stands alone. The old part of the town, the High Street and Canongate and the West Bow, are steep, narrow streets with high houses on either side and "wynds" or "closes" running off them. They were formerly the residences of earls and noblemen, and up these quaint, narrow streets passed the Royal processions to the castle.

Edinburgh was not a town of much consequence till the latter part of the fourteenth century. In 1385 it was styled the Paris of Scotland by a visiting Frenchman. Wood was largely used in the construction of the houses, which were roofed with thatch and consequently easily rebuilt. A French admiral who visited Edinburgh at this time could not get accommodation in the town for his suite, and had to quarter them in neighbouring villages.

A sketch of the type of house in the thirteenth century is given. Its characteristic features are a strong skeleton of stone with a wooden front 6 or 7 feet in advance, and the outside stone stair projecting into the street, while underneath the projecting balcony there were probably booths and stalls for the display of merchandise.

The next important stage in the development of Edinburgh domestic architecture took place in the middle of the sixteenth century. Wood was still largely used, but construction was better understood and more ornament was lavished on the work. The houses were three or four storeys high, with a common stair, which on the ground floor formed a pig house. The gables were decorated and the houses generally much ornamented. In street pageants or royal processions loyal citizens hung tapestries over the balconies or strung flags across the street, and the general effect must have been most pleasing. A good example of the sixteenth century type of house is shown in the sketch.

In the early seventeenth century wood had given way to stone, and the handsome stone house had attained its highest elegance. Over its shop floor, which presented to the street a neat form of arcade, rose three or four storeys each accommodating some respectable townsman. Access to these was provided by a common stair which was generally a projecting stone turret. The skyline was fantastically broken up by chimney stacks and crow-stepped gables and by roses, thistles or fleurs-de-lis crowning the apices of the roof.

After the reign of CHARLES II., although the boundaries of the city remained the same, the population had very considerably increased. This led to flats being erected, and a twelve-storey tenement was built in 1700. Conveniences of cleanliness and light and water supply were unknown, while the stair acted as a form of "refuse shoot." One can understand that "calling" in those days was no sinecure. Up the stair had to be carried all the water and fuel for the various "flats," and down the same stair had to come all refuse and dirty water, unless these were thrown out of the window into the street below. However, in spite of the lack of all these sanitary conveniences, the owner of every house had a little closet provided, off the dining-room, which served him as a private oratory. It must be admitted that these huge clusters of dwellings set at defiance all laws of sanitation and physical health. The disregard of sanitary laws sobers the æsthetic feeling and spirit of romance which these houses undoubtedly inspire. Still, Edinburgh is beaten on by winds from all quarters, and no doubt they, by their healthy freshness, lessen the evils which these unsanitary dwellings possess.

The cathedral of St. Giles consists of a nave and choir crossed by a transept, while at the sides are chapels and aisles. The four octagonal pillars which support the tower at the transept crossing are supposed to be part of the original Norman church of 1120, founded by Alexander I. of Scotland. The height of the stone roof under the tower was increased in 1400. The various aisles were added between the years 1409 and 1516 A.D. The fine-groined roofs of the church are especially worthy of notice, and the choir contains some very fine foliated capitals. It must be admitted, however, that the tower is the chief feature of the church. Its builders had determined on

something new, and imitating the crown of their sovereign in the tower of their cathedral they showed ingenuity and a pleasing imaginative spirit which is perhaps somewhat lacking to-day. This tower was completed in 1495 A.D.

GORDON SANDERSON. DEL.

CHAIR IN HOLYROOD PALACE EDINBURGH

he cathedral has passed through many vicissitudes. urnt by English raiders in 1323, and again by Richard [. of England in 1385 A.D., nevertheless the loyal citi-ens of Edinburgh were not dismayed, but set to work to rebuild it when it was destroyed. It is a noteworthy fact that in it were held the meetings at which the raids into England were planned. At the Reformation it suffered, and its ministers have at various times suffered imprisonment. Restorations have been frequent and not always good. One in 1829 was most unfortunate, but in 1879 a better one took place. A chapel to the Knights of the Thistle is now being added, and bids fair to add yet another charm to Edinburgh's most picturesque building.

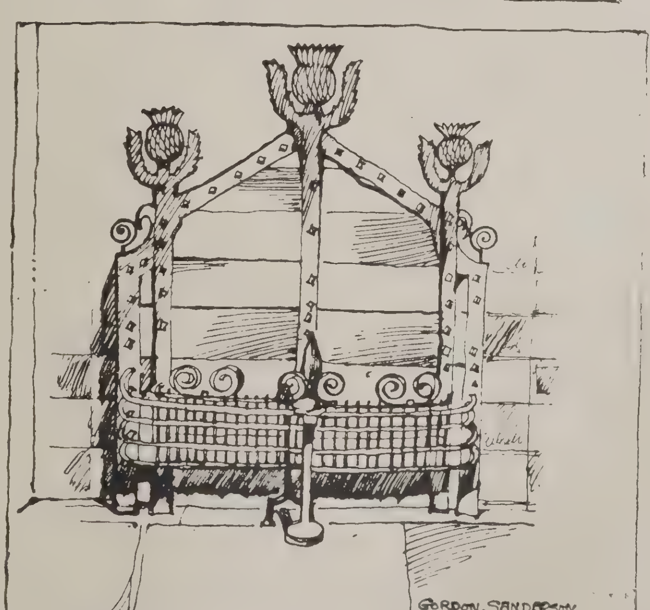
GORDON SANDERSON. JAN. 16. 1910.



GORDON SANDERSON.

WROUGHT IRON GRATE. HOLYROOD PALACE

The altered method of access to the city and the absence of Royalty with its necessary appendages have left Holyrood Palace in an inferior part of the present town. The ruined chapel is in sad harmony with the changed surroundings of the palace. However, there is a lingering of tradition cherished by many for this old palace, which is now no longer a royal residence. Built by JAMES V., it was burnt by the English in 1544, and after restoration was the chief court residence of Queen MARY and her son. It was again burnt at the close of the Civil War, but in the reign of CHARLES II. was rebuilt as it now stands.

The sun dial is a very good example of its kind, being raised from the ground by octagonal steps, while the face of steps is ornamented by panels. A well-designed pedestal carries the dial, which has twenty facets.

The Chapel Royal is part of the Abbey founded by DAVID I. in 1128, and still retains some of the Norman architecture. Some of the foliated capitals are very delicately carved, and the vaulting is fine and the whole building well repays a visit.

One of the most striking characteristics of this city is the diversity of its skylines. Ridge after ridge of chimney stacks, with church spires rising from them, gradually lead up to the culminating point, the castle. The architects of the modern work that flanks either side of the South Bridge have thoroughly grasped the general feeling of the city, and have paid the greatest attention to their skylines. Edinburgh is full of interest to the architect and there is no city of the same distinction. The jumble of architectural styles is reduced to a pleasing series of contrasts by the mass of rock on which the castle stands. Like Venice, Edinburgh inspires sentiment. No one can visit the city without being impressed by it, and for the architect there is a boundless field for study.

---

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last at Conduit Street, W., Mr. Ernest George, A.R.A. (President), in the chair.

Mr. H. T. HARE (Hon. Secretary) announced the decease of Benjamin Tabberer, who was elected Fellow in 1882. Mr. Tabberer was district surveyor for East Deptford and Greenwich, and had served on the Board of Examiners and on the science standing committee of the Institute. It was agreed that a letter of condolence should be sent to the relatives of the deceased member.

### Royal Gold Medallist.

The PRESIDENT announced that Mr. T. G. Jackson, R.A., had been nominated by the Council, subject to the approval of His Majesty the King, as the recipient for the Royal Gold Medal.

### President's Address to Students.

He said:—By established custom I address the junior members of our craft, those who have the inestimable gift of youth, and who will be filling the seats of their elders, I trust with benefit to the community.

Last year I gave my own experiences and expressed such views as I had arrived at, experience often showing what not to do again. Yet if we in life could be allowed a second innings, probably we might not do more wisely. It is the common lot to work, and it is a matter of the first importance that your work should be that which interests you. Instinct and inclination may be taken as guides in your general direction.

I trust you have chosen the study of architecture because it is attractive to you. It would be dull work for you, and the results would be deadly dull, if you took to the artist's career as you would to brewing or baking, with the humble aim of making an income. The latter is rather illusory and unsubstantial, and when it comes is the result of much hard work in which the artist finds his pleasure, but which would be drudgery to the unillumined soul.

I assume, then, that you are each conscious of the divine fire; it remains with you to see that it burns clear. To this end earnest application is necessary, and a thorough education both in science and art as well as in wider fields of knowledge. You will be called upon to make sacrifices and to relinquish some of the amusements and harmless frivolities of youth if you are faithful to your art; your pleasure must be in serving that exacting mistress.

Architecture is associated with every condition of man, and it should find appropriate use either for the temple or the tavern. The problems that will come before you are endless, giving constant variety to the work. There will be no time for idling. A painter may desist from his work awaiting inspiration; the architect, when grounded for lack of matter, may turn from composition to the many practical details that his occupation demands. He must recognise that he is a man of business, with grave responsibilities to his client; he must not pose as the brilliant genius, above mundane affairs. He must cultivate methodical habits and exactness.

In the schools or in the office you will find young men sharing your pursuits and aims; and among them may be good companions and friends. Seek the society of fellow artists of all kinds; be they painters, sculptors, or craftsmen, it will be a mutual advantage. You will still have time to spare for the outer world, where you must not be unseen or unknown: it is there you find the client who gives you the chance of beautifying the world. Cultivate tact in the treatment of the client when you get him; consider things from his point of view, his doubts and anxieties, financial and other, when starting on an important building enterprise. You probably know better than he does what he wants or what he ought to want; do not vaunt that knowledge, but let your scheme seem to emanate from him. The plain man may tell you he "knows what he likes," and he possibly likes what is abominable; do not tell him so he will be converted by degrees to like what is good. You cannot have all your own way, and your pet schemes may often be frustrated. After all, it is not your house that you build, though you are allowed the fun of shaping it. I have spoken of the natural man, the untutored, but I mus acknowledge having worked for those whose refined taste and judgment have been an unqualified advantage to th architect and to the building.

Education and cultivation of the mind should be alway going on. Read much, and think much, and primaril make careful study of noble buildings; see why they impres you; measure, plot, and sketch them. Cultivate observation and memory, so that these fine things remain with you they will influence your work for good when you think to b drawing upon your inner consciousness.

The things that Solomon knew are nothing to the catalogue of details that you are expected to grasp. It behove you to know the history of architecture and to follow through its many phases. It is well to be familiar with th literature of our art—the splendid books that have been produced in past times and in various languages. It is muc to your advantage to have the command of foreign tongue

Indeed there is no branch of culture that is not a valuable asset in shaping the accomplished architect. I trust that you are gaining all the time a knowledge of construction, the paramount essential in the curriculum. Use every opportunity of visiting works in progress, builders' workshops and masons' yards; if also your hand can acquire some skill in any of the trades, it is all for your good. The limits of time and the shortness of life must be taken into account in making choice of subjects to be mastered.

While holding that for a modern-day architect this large mental equipment is desired, it is fair to remind you that good work has been done without it. A fortnight ago we had from Mr. Kitson an interesting paper upon an architect who built many of the eighteenth-century mansions of Yorkshire. He was the son and the grandson of a mason, and was perhaps the last of the old order of men who accomplished their work with only the master-mason's traditions. Such a man was not disturbed by a knowledge of all the styles, nor by familiarity with all the building materials at our disposal; nor did the science of heating, lighting and sanitation complicate his problem. Incidentally, it was mentioned that this provincial architect left 160,000*l.*; but that is a minor detail in the career of our artist. I can conceive that from such a man and under such conditions a quiet breadth of treatment would come naturally. The man of higher attainment and with knowledge of our many inventions would be under more disturbing influences.

Yet I think we all accept the fact that sound training is necessary. First and foremost, acquire the art of drawing; it is the language in which your ideas must be told. Whether you are to be an architect or a landscape painter, drawing is best learned by the study of the figure from life or from the cast; it is the best training for the eye, demanding accuracy and judgment. The hand and the mind should learn to work together, evolving schemes or forms, and feeling for that which is best.

Avoiding all tricks, acquire a pleasant manner of drawing, one that makes your building presentable; for I have seen fair composition so expressed as to look forbidding—perhaps with capitals, mouldings and carving put in with a heavy hand, such detail making dark splotches of those parts which would be the high lights of the building.

But drawing has generally received its full meed of attention, and the greater danger is of regarding it as an end instead of a means. We have known such facility acquired that the hand has moved in advance of the mind—a fluency that speaks before thinking what is best to say. There is also drawing so pretty in its technique as to give fictitious attraction to a bad design.

The prizes we have the pleasure of giving to-night are for studies and compositions in some of which the drawing is, in my opinion, nearly as good as possible. My friend Mr. Macartney will be critically reviewing this work presently, and his discriminating judgment will probably find some faults. We have on the walls of this room the recent works of last year's prizemen, and I think you will agree that the fine colour-scheme of Puvis de Chavannes is beautifully rendered by the drawings of Mr. Martin. The admirable drawings by Mr. Drysdale and Mr. Miller speak for themselves.

Archæology will enter into your historical studies, but let it not be a matter of dry bones with you; do not follow it too far, troubling yourself with curious or unprofitable speculations; do not become the pedant. You should be conversant with the great achievements of all periods, yet I think the mind should be occupied with one method of building, of construction, and of treatment at a time. While examining the refinements and subtleties of Greek art and following on through the works of the great Roman builders, it would be undesirable to distract the mind with the study of the Gothic shrines, the soaring towers and spires of the North; they have their origin in another inspiration, another conception of the beautiful. There is the glory of dazzling light in the one case, while solemnity and mystery are the aim of the dim vaulted aisles of the mediæval sanctuary.

With all the striving after originality, I hope the rising architect will retain a reverence for tradition. His best education is in the study of the fine work that his forerunners have done. As a change and recreation he has also the study of Nature, her laws, her methods, and her marvellous arrangements of colour. He must not, however, transplant the actual forms of verdure, chiselling them in stone, or using the fronds of ferns for metal castings.

Proportion is perhaps the most essential element of good architecture. It costs nothing, and it is applicable to the humblest as well as to the noblest of works. How is it to be secured? It is the product of the trained mind and the practised eye. True, it has been reduced to a science, and there are lines laid down, with mathematical rules to be observed—rules that can be applied to the just proportion of length to breadth and height.

But the beauty of proportion comes in with every detail: with doors, windows, and their appropriate mouldings; and I think it can only be secured by a refinement of knowledge and taste—the subtlety of feeling that is indispensable to the production of fine music or painting. It is in a measure intuitive to the artist, but it is also a faculty for cultivation, and perhaps is gained most by the mental assimilation of great work.

Texture, though secondary to proportion or shape, greatly affects the building; indeed, proportion is upset by over-large mouldings, keystones, or by sculpture in the wrong place or to a wrong scale. The touches that should be the crowning glory of a work may, by ignorance, be made subversive to beauty. I must be forgiven for putting sculpture under the head of texture to the building, but as such it must be taken into account.

The sizes and jointing of stone courses are a factor in the matter of scale. We know the charm of small bricks as seen in the Flemish buildings, and we admire the long thin brick in the Roman walls, while none can fail to be impressed by cyclopean stones as seen in the temple or in the bastions and walls that girdle an Etruscan city.

Smooth walls of ashlar stone or of gauged brickwork seem right with Classic work and its delicate mouldings; while rough brickwork is in vogue for buildings of other types, some of our friends specifying that no mortar joint shall measure less than half an inch. The broken colour so obtained is pleasant, but the beauty of your work must not depend mainly on the accidents of texture and colour.

What may be said of colour? It has an influence that appeals to us directly, for our happiness or distress; light and darkness are in its train. As a nation we are not colourists, and we have been shy of colour since the primitive Briton discontinued woad as a costume. Within the house there is the fear of losing light, while out of doors the feeling is that in our London streets all will presently be of the same low tone. There have been daring experiments with glazed materials, some with distinct success, but a shiny surface is not generally acceptable.

If for our street fronts we could be offered the frescoes of the Verona market-place, I am not sure that they would be cheerfully accepted, and if we should have them in their pristine condition I am sure we should consider them crude and garish. Our taste is for the old masters, old tapestry or stuffs, when colours have been lowered by the passing of three hundred years. Perhaps it needs a sunnier clime than ours to appreciate real colour.

As a broad principle I think that raised surfaces and colour are seldom wanted together. A coffered ceiling or a good piece of modelling with its projections well considered does not want its background picked out with colour—its light and shade are an equivalent to colour; also a fine painted or mosaic ceiling is best as a flat or curved surface, or with only the slight projections of gesso.

We know that the Parthenon and other inimitable Greek monuments were originally in colour, the mouldings picked out, while the marble gods and goddesses were tinted in flesh tones with coloured draperies. To me it seems that breadth would be exchanged for realism, the Greek masterpieces sharing the quality of waxwork; but I dare not question what was done by the consummate artists of the great age.

In mediæval times the Gothic churches and castles had their shafts, ribs, and mouldings in positive colours; the devices of heraldry supplying the *motif* of decoration, and the scheme, though vivid and crude, must have been splendid. The full glory of colour is found in fine stained glass, and that is at its best when throwing its tints on uncoloured walls. Walls of precious material or rich in decoration are best under the unobscured light of day.

In the study of colour make careful notes of such good combinations as you find either in man's work or in Nature, especially noting the quantities in which they are used. The blue cornflower is gem-like when dotted in a field of golden corn, but it has an altered value in larger mass, as when covering the human frame. As a reaction from varied and disturbing colours, the simplicity of whitewash has been found refreshing; in broad light or in reflected light it is altogether beautiful. Brown paper was discovered as a pleasant and retiring background, and I am told of a house that a young enthusiast papered thus from attic to basement. Another instance I call to mind of a room painted black; but I do not feel that a resort to brown paper, to black, or to whitewash is solving the subtle problem of colour.

I will not talk to you of styles, to advocate one or to disparage another; we have ceased to fight on that field. I will only say that the qualities making for good or bad are, in all styles, the same—viz., truth of construction, justness of proportion, breadth and simplicity, and, above all, simplicity. All the tawdry vulgarities that shock you are the violation of that quality; efforts after the pretentious or pompous; the assumption of something that is not. A building may be rich and yet broad in treatment; our Houses of Parliament may be taken as an example. The fascinating devices of Pugin give richness and texture to the whole surface, but they are so employed that the broad masses of Sir Charles Barry's composition only gain thereby. In contrast to this, the Horse Guards, Whitehall, is a building severely plain, hardly a moulding to arches or openings, yet it gives almost an impression of richness by the proportion and disposition of the parts and the skill in arrangement of its lights and shadows. Misplaced ornament is the bane of architecture, as is also ornament that is out of scale.

We have touched upon the many things that it is good for you to know and to do; though you may be an Admirable Crichton, you will not accomplish all. You must make choice of that which comes best to you and for which you have affinity. In some cases combination meets the many requirements of the architect, who must play the parts of artist and man of business. If any two of you, quite sure of one another, agree thus to divide the work, it may be for your mutual happiness. The work will be done with fewer disturbing interruptions, and you will have companionship to lighten the worries that must arrive from time to time.

I have said study simplicity in design; I would further urge simplicity of life. Let your wants and your encumbrances be few, that you may be free in the race. Concentration of mind and of aim is essential if you are to be successful. I mean real success, which is not always to be measured by income. Comfort, cushioned ease, and expensive cigars are not a stimulus to the artist; discipline he needs, and the best form is self-discipline.

The Duke of Wellington said that Waterloo was won in the cricket field—and manly sport has had a fine influence on our race; but sport has become with us a fetish to be worshipped. Sir William Richmond has been bold enough to say that "games will be the ruin of England"; Rudyard Kipling created a shock when he spoke of "flannelled fools"; and we must admit that the devotee of art can hardly be prominent as an athlete; he starts with a different temperament, moreover he cannot spare the time to become distinguished in various sports, although we have among us one or two brilliant exceptions to my theory. To you the sketching on Saturdays is more important than the following of games, and your life will take different lines from that of the man of leisure or of commerce.

I have before expressed my belief that it is well you should have to live by your art. It is good for you personally, and I think it is also good for the work. An architect has no opportunity of producing pot-boilers even when money is scarce. I do not know how many of you have been born with the traditional silver spoon in the mouth—I do not specially congratulate those who have. You have the harder fight against the spirit of indolence that is in us all. There is also the temptation to use the brains of others if you have them at command, to become mere dilettante or, saddest, to become the art critic instead of the art worker.

When sufficient knowledge and discrimination for the purpose have been attained by the student, foreign travel comes to him as an inspiration. With delight he will see in substance the monuments that have been familiar to him only in diagrams and text-books. There is joy in the freedom of life, and fascination in the change of scene, of climate, and of human interest. With these pleasant distractions discipline and application are specially called upon for the gathering of that which is precious and the refusal of all that is ephemeral or meretricious though attractive.

It is our desire that those who go out with our travelling scholarships should accept the task of making a thorough and exhaustive study of one or more notable buildings, the intimate knowledge of which will be a lasting influence. There is the further interest that the best of such work will be published in some permanent form, making a contribution to our architectural records.

For those who are not privileged to make the grand tour there are priceless treasures to be found in our museums; doorways, fountains, monuments and bronzes of the great periods, and those now seen judiciously placed and well lighted in their spacious new home, accessible to all, and giving the student a quieter time for measuring and drawing than the traveller would obtain in a continental street. These objects demonstrate the treatment and workmanship of the artist and craftsman, but much of their meaning is lost when these features are divorced from their natural surroundings. The student must look at things as a whole, noting the important element of scale; he must not be absorbed by details.

I have spoken of foreign travel with its advantages and pleasures, but how much we have close at hand that is an education—with Hampton Court on one side of the town, Greenwich Hospital on the other, our City itself with its domed centre, its many churches, Chelsea Hospital and Somerset House, to say nothing of modern work, some of which I hope reaches a high standard and is worth your consideration.

I will not define how far sketching, painting, or etching may occupy your time with the many pursuits that are necessary; they form a happy recreation, a change of vision, and are restful while training the hand, the eye, and the mind. If facility is attained such work may become too attractive, taking the place of the more plodding and painstaking duties that claim your attention.

Our technical schools, State or rate aided, have been turning out batches of young men partially equipped for doing your work, and they will be provided from the public funds with drawing boards and T-squares for the purpose. Till they get outside the schools they do not learn, poor fellows, that the field is overcrowded and that we have no use for them; there is at the same time a great lack of good mechanics, a deficiency which they ought to supply.

There is an effort among ourselves to raise the standard, both social and educational, of the practitioner, believing that thereby the quality of work will be raised. It will be only by the use of your higher endowments that you will keep the field. Our "art" teaching has been fraught with curious results, and I fear we have many bad artists who might have been fine craftsmen.

It is worth much to you to acquire literary style, your letters and reports being terse and clear of verbiage. The art of public speaking should be part of your equipment; you may take the advice as sound from one who lacks it. It will always be pleasant in this room to hear the voice of any young man who will add to the interest of the subject considered; he may often contribute profitably to the discussions. I speak of debating, not of bear-baiting. We have instances, fortunately rare, of young persons seeking prominence by the latter process; perhaps giving notice to "ask questions"—a string of them, pertinent or impertinent. Of all things avoid professional politics and cabals. They disturb that tranquillity which is essential to the performance of good work, while they occupy time that should be given to the claims of art.

In this Institute, our Brotherhood, our aim must be to help one another. We do not all meet with equal fortune, and if success comes to you give a helping hand to your fellow who has less luck in the lottery. Fortune is a fickle dame, and none can tell which of you now entering the arena is to be the great architect of the future. The ranks are well filled, I will not say overcrowded, but for those of you who use your opportunities aright, who train seriously and possess your own souls, there will be work for your hands to do.

We are in the habit of judging the standard of architecture by the public or prominent buildings of the year, and by such pretty pictures as appear in the professional journals. It is painful, however, to remember that these are a very small portion of the building that is done in the country, the mass of which knows no architect and is subject to no laws. In the future we trust that the speculating builder, and the hard-headed lawyer who finds him the money, will realise the advantage of the architect's help to improve his plan, to give pleasant proportion to his building, and a semblance to some recognised style, while saving him his present outlay on lavish and misplaced ornament.

There is with us the beginning of an appreciation of architecture. There is the idea, comparatively new to us, called town planning; the knowledge that we must work not only on our own plot, but consider also our neighbour, combining with him for a pleasant lay-out, a monumental disposition and grouping of buildings.

I verily believe, in the period that you enter upon, architecture will rise to a higher level than it has known in our day. I earnestly hope to achieve that end is the steadfast aim of you architects of the future. I wish you good luck, and a large store of happiness to be found in the work which it will be your privilege to do.

*(To be concluded.)*

### CATHEDRAL SERIES, LLANDAFF.—FROM THE SOUTH-EAST.

HIS view of the cathedral from the south-east is in continuation of the series of photographs from landaff which have been taken by Mr. JAMES BORLAND, amateur member of our staff.

### THE CHAIN GATEWAY, WELLS CATHEDRAL.

E now give a section through this building, by Mr. WESTBYE.

### SKETCHES BY BANISTER F. FLETCHER, F.R.I.B.A.

HESE were prepared from Mr. FLETCHER's sketch-books in illustration of his lecture at Carpenters' all, a full report of which we give on p. 81.

## THE CARPENTER'S CRAFT.*

### *Introduction.*

HE carpenter comes to us as an almost heroic figure out of the dim dawn of the world's history.

From the earliest ages until the present day, when every hoolboy loves to whittle a stick, working in wood has ercised an extraordinary fascination over mankind. Wood, th strong and pliable, was naturally the material most sily adapted to the service of man. Its very growth with its pward spring and its arching boughs has suggested the anner of its employment, and its influence on the architecre of all centuries and all civilisations can easily be traced. has been used for bridges, it has stood as posts in half-mber houses, and as beams it has borne aloft the roofs of udal halls, tithe barns and churches. It has been sunk as les on which were reared those glorious palaces of Venice, d it has also been worked into their rich and glowing ilings.

The German mediæval artificers wrought it into cunning vices, and our own Grinling Gibbons swung it into garlands living fruit and flowers. It has also been hollowed into noes, has determined the shape of ships, and suggested the ising of their masts. It has been scooped out as water conits, and thus laid underground has formed drains even for is city. It has been fashioned into wagons and played its rt alike in the chariots of ancient races and in the coach the Lord Mayor's show.

Everywhere and at all times, whether as ships, coaches or idges, wood as a material has been a great medium for man intercourse. Further, it was cut into blocks for the st printed books, and thus gave an impetus to learning and rew open to all the doors of knowledge. This then is how e carpenter acquired his craft, which, however, has been bject to the same laws of specialisation as other arts and afts: thus we find the carpenter, the joiner and the carver l fellow-workers in the same useful material. There is no finite record of the beginning of joinery, but in "A Midmmer Night's Dream," Shakespeare makes Quince the carnter and Snug the joiner quite naturally, and as a matter course, as distinct from one another as any trades union ws or economic division of labour could make them in our y.

The joiner's art first appears in the thrones, pulpits, stalls d screens of our cathedrals and churches, but it is there lied with the art of the carver. Suffice it to say that the rpenter's craft was at the beginning of things, and we shall w pass it in pictorial review, bearing in mind that this is e pioneer craft from which in later times sprang those of the iner and wood carver.

The influence of carpentry on architectural forms has deed been great, for from the simple hut the Doric order s derived, with its well-known entablature, in which the glyphs represent the ends of wooden beams, the mutules dicate the rafter ends, and the sloping roof gives the outline the pediment. Thus were evolved those wonderful marble mples of the Greeks which have exercised such great influence on all subsequent lithic art. Although all wooden structures of this early period have long since disappeared, yet in out of the way districts of the world simple timber dwellings are still constructed, as in the hut at Uganda near Lake Victoria Nyanza. This hut which is seen in process of construction with a framework of twigs covered with rushes to form a shelter against the elements, gives a good idea of one type of prehistoric building, and therefore has a passing interest for us, as showing how under primitive conditions carpentry forms are similar.

Other quaint and interesting specimens of the craft are frequently met with, and in the Bosphorus some years ago I saw a unique dwelling which was occupied by some of the sturdy Turks who gain their living in a precarious way among the small villages on the banks. Here supported upon long poles sunk deep in the bed of the sea is a little dwelling reached by a ladder, while at one end of the structure there is a framework from which the fisherman can ply his craft.

The time at my disposal, however, compels me at once to proceed with the craft as we know it, and to keep almost exclusively to work in this country, dividing my subject broadly into external and internal craftsmanship and furniture.

### *External Carpentry.*

*Half-Timber Country Examples.*—The craft of the carpenter in its simplest aspect is seen in many a country cottage, of which the oldest type is probably that which still exists near Winchcombe (Gloucestershire), where bent trees called "crucks" were set in the ground and meet at their apex in the ridge piece. These crucks are strengthened by cross braces secured by wooden pegs, and are placed about 16 feet apart, each forming an architectural unit or "bay."

In these early homes there was no upper storey and the walls were either made of "wattle and daub" filled in between the timber framing, or of planking nailed to the "crucks." The side walls of this house are later in date, as is of course the paltry looking entrance porch.

Anne Hathaway's cottage at Shottery is a world famous example of the carpenter's craft, in which post, rail, and brace are the structural parts, while the brickwork merely forms a filling between the timbers.

This type of construction is frequently found in old cottages, and eventually, as will be seen, led to very elaborate examples of what is known as "half-timber work."

Grimshaw Hall is an illustration in which the lower part of the walls are entirely of timber studding, while the upper part is of brickwork between timbers pinned together with stout oak pegs. The gable itself projects on a beam supported by timber brackets, while interest is given to the façade by the projecting central latticed oriel.

A still more elaborate and very beautiful example is Ockwells Manor, Berkshire, where the system is applied to a large house framed up of stout oak posts and rails, between which the brickwork, in herring-bone pattern gives colour and contrast. The porch with its battlemented beam and richly ornamented barge-boards is a striking piece of mediæval carpentry.

Adlington Hall, Cheshire, is a half-timber building in a district where forests were plentiful, and it is only natural that the carpenter's craft should have had its fullest scope in such localities where wood was the most easily available material. The walls are honestly designed in timber, the projecting upper floor on the right wing being connected with the lower by curved braces, while variety and strength are given by the inclined struts between the posts. The plaster filling between the timbers makes a good contrast with the black tarring used as a preservative.

The courtyard of Little Moreton Hall, Cheshire, shows a further development in which the coving under the window sills is formed in squares, with the crosses of St. Andrew and St. George in plaster, while the doorway is emphasised with a double row of quatrefoils between uprights carved as pillars. The gables too have quatrefoil fillings, the whiteness of which contrasts effectively with the deep shadows thrown by the projecting barge-boards.

Agecroft Hall, Lancashire, is a beautiful example in which the timbers over the doorway are closer together and formed into bold quatrefoils. Here as in many other buildings is seen the genuine timber character produced by frankly exposing the oak pins or pegs which hold the framing together, and thereby giving that vitality of expression which should be aimed at in all honest craftsmanship.

The gables of some of the half-timber houses as at Ruthall (near Ross), Herefordshire, have rich yet bold carving which should be within the scope of a competent carpenter. The barge-board with its series of repeating arches and foiled cusps, the fine carved pendant at the apex, and the battlemented tiebeam with the Prince of Wales's feathers in the centre, all add to the rich character of this interesting house.

---

* A lecture delivered at Carpenters' Hall on January 25 by . Banister F. Fletcher, F.R.I.B.A.

The "Old American Colonial" architecture of the early eighteenth century and onwards provides many examples such as Hurd House, Charlestown, Massachusetts, in which timber from the surrounding primæval forests was utilised, and into which was translated the homely architecture of Queen Anne and the early Georges. Such houses are thoroughly suited to the material, and were built by carpenters. In the colonnades and entrance porticos the orders of architecture are made of slighter proportions suited to wood instead of stone. They form some of the most charming details of this timber architecture, and mark a return of the "Orders" to their original material. It is possible that with more enlightened building laws and the use of non-flammable paint, houses of timber, which is a non-conductor, may again come into vogue, resulting in buildings which are comparatively warm in winter and cool in summer. It is not only in country districts, however, but also in towns that beautiful building examples of the carpenter's craft are to be found.

*Half-Timber Town Examples.*—The Rectory at Winchester is a simple and sturdy structure, in which the massive beams of the first floor project boldly and throw a deep shadow, while the upper part is framed up with widely spaced posts, beams, and curved braces, between which is plastered brickwork. The march of progress has caused a large number of the smaller wooden houses to be destroyed in England, but many examples still fortunately remain, both here and on the Continent, as an evidence that timber was much used in town buildings during the mediæval period.

The fifteenth century wooden house at Ypres in Belgium is entirely framed of timber, faced with vertical oak boarding, which has taken some beautiful weather stained hues. Variety is here given to the upper part by forming the gable as a pointed arch, underneath which a trefoil design gives interest to an otherwise plain treatment.

The old houses in Lisieux have the upper storey, which forms the dwelling, overhanging the lower. This method was often employed in the narrow streets of mediæval towns to increase the size of the upper rooms, and it also incidentally protected the passer-by from garbage thrown from the upper windows. The timbers are well strutted and have plaster filling, while coupled brackets support a pointed arch, which gives shadow and prominence to the overhanging gable.

London, although so greatly modernised, still possesses in Staple Inn, Holborn, a beautiful example of the craft, dating from about 1600, and giving a good idea of the buildings of that period. The projecting storeys one above the other, the oriel windows under the storey beams, and the long undulating horizontal lines of the timbers form a composition most charming in its simplicity and unity of treatment, and show how well this example of English craftsmanship, having escaped the devastating Great Fire, has stood for over 300 years.

Smaller and more elaborate is the house originally erected by Sir Paul Pindar in Bishopsgate Street. The upper part shows the variety of treatment obtainable by the projection of the floors and by the formation of a splayed bay and circular oriel in each storey carrying up the central line of the front. The house is fortunately still preserved in the Victoria and Albert Museum.

The Feathers Inn, Ludlow, built in the early part of the seventeenth century, is one of the numerous inns where good cheer was dispensed in the days that are gone. Considerable richness has been given to the façade, the two upper storeys having posts and beams ornamented with quatrefoils, while the gables above have elaborate barge-boards with finial and arched ornamentation beneath. The lower part of the building has unfortunately been painted to imitate the timber work.

Leicester's Hospital, Warwick, is an evidence of the philanthropy of the Middle Ages, and owes a good deal of its picturesqueness to its quaint position above the roadway which passes under the church. The upper storey in this case projects considerably and rests on the beams of the lower storey, interest being imparted by the varied use of timbers both vertical and in a herring-bone pattern.

Ford's Hospital, Coventry, is more pretentious, and appears to have been erected before A.D. 1517, as a will of that date exists giving property to the hospital.

The posts to the upper and lower storeys are carved with buttresses and pinnacles, which show clearly the influence of the architecture of the time. The upper part is chiefly remarkable for the three projecting oriels, the filigree work at the top of the windows, the richly carved barge-boards and the moulded finials.

The internal courtyard has that reposeful character which
good, honest work generally imparts. The long lines of
window lights on the ground floor are shaded by the projecting upper storeys, so arranged in order to give large
rooms. The upright timbers, quaintly fronted with smal
buttresses and pinnacles, and the gable at the end of th
court, are similar in treatment to those on the street façade.
What can be more delightful and tranquillising than this
haunt of ancient peace in the midst of the great motor industry of to-day?

Chartres possesses an old house, part of which has
spiral staircase designed as an external feature, and it is
very beautiful example of the use of spiral forms in archi
tecture. The raking beams show the line of the steps and th
main posts are terminated in pendants so as not to interfer
with people using the entrance doorway. The intermediat
ornamented studs are connected with arches roughly forme
and those on the upper storey have carved figures supportin
a bold projecting cornice.

The detail of the lower part shows very clearly the fram
ing up and pegging together of this genuine piece of car
pentry, patched here and there as occasion has demanded t
arrest decay. From the consideration of these timbe
houses as a whole, we pass to some characteristic featur
which lend themselves in a special manner to the craft of th
carpenter.

*Turrets.*—Heveringham Hall, Suffolk, has an eighteent
century roof turret over the stable entrance whic
is designed in accordance with the architecture of the perio
The wooden posts supported by the main roof have capita
over which is a cornice and ogee-shaped roof covered wit
copper now of a varied and beautiful green.

Guildford Town Hall has a fine hexagonal turret whic
sits boldly on the roof. The turned balustrading and corni
are all in keeping with the wooden entablature and pedime
of the main structure below, which is a typical example
the Georgian era. The clock projects boldly from the gab
so as to be visible up and down the High Street, and t
clock-case in itself is a beautiful piece of decorati
carpentry.

*Porches.*—The entrance porchway at Agecroft Hall, Lanc
shire, is a simple treatment for a porch, although later e
amples were of a richer character. It is recessed behind t
main wall; the side posts are strengthened with broad baul
of oak, resting on a stone base, to protect them from dam
and some character is imparted by the insertion of a spandr
piece pegged to the posts and beam. At the apex of the openi
is a carved shield, above which a rounded shaft with mould
capital supports a little oriel window, the underside of whi
is vigorously carved with simple tracery.

The entrance porchway to Little Moreton Hall, Cheshi
is reached from the bridge over the moat, and is a rich
carved example, suitable to a nobleman's mansion.
either side is seen some of the "black and white" timb
framing, and beyond, on the other side of the courtyard, o
of the bay windows which light the old hall.

Huddington Church has a projecting porch, and t
weather-beaten piece of carpentry, although devoid of orn
ment, is perhaps for that reason all the more effective. T
posts are housed into longitudinal sills resting on rough sto
walls, the tie of the roof being formed into a simple ogee cu
with small battlements along the upper edge. The bar
board takes the same ogee outline, under which bold cuspi
give a subtle variety, and are very effective against the da
cavity formed by the roof behind.

The porch at Shoreham, Kent, is more elaborate, but
been much restored. The lower part is formed as a poin
arch and is of a sturdy character well suited to last
centuries. Above are cusped and traceried barge-boar
which are in strong contrast to the horizontal and cambe
beam below.

The doorhead from Uxbridge, Middlesex, is of a la
type, principally found in towns where the building l
prevents the use of posts to support a projecting roof. T
small lower consoles with cherubs' heads harmonise well w
the graceful contour of the upper ones supporting the corn
and sloping pediment.

The carpenter should be trained to carry out such ca
ing as this, for nothing tends so much to demoralise a craf
man as merely preparing work for another to finish.

Having dealt with the timber houses of our forefathe
we may now consider other works in carpentry.

*Market Crosses.*—The Market Cross at Dunster, Som
set, is one of many which in the past engaged the carpent
skill. It is descended from the earliest type, which appe
to have consisted merely of a simple timber cross placed u
steps and afterwards adorned with statues of saints, wh

RUNTON OLD HALL, CROMER.—PART OF TERRACE.
M. H. BAILLIE-SCOTT, Architect.

no doubt occasionally reminded traders of the sacredness of bargains. It is an octagonal structure of most pleasing proportions, supported on stout oak posts, with pyramidal roof having generous eaves as a protection against the weather. The simple crowning turret and dormer windows all add to the utility and effectiveness of this charming structure.

The Market Cross at Ledbury, Herefordshire, is a rectangular example of an even more pronounced timber-type fulfilling its purpose with that directness which is always pleasing. Here the open ground storey forming the market space and protected from rain by the market hall above, has oak posts standing upon a masonry foundation. This market hall is reached by a staircase at one end and is supported on brackets springing from the tops of the posts, the walls being formed of oak studs and rails.

*Windmills.*—The windmill at Haarlem, in Holland, is an example from the country consecrated to windmills, and is a type of structure which in the past formed no inconsiderable portion of the carpenter's craft. In the low-lying districts of Norfolk and Suffolk, windmills help in an effective manner to give interest and contrast to the flatness of the country, and as they are placed to catch as much wind as possible, the timbers have to be strongly braced, tenoned and pegged together.

*Bridges.*—From windmills we pass to bridges, and the simple foot-bridge over a small creek in the Fens indicates how the craft aided intercourse in rural districts, and there is always something to learn from the framing and arrangement of the timbers in such structures which vary sufficiently to make each one a novelty in itself.

The covered bridge erected at Great Tangley Manor, Surrey, from the designs of Mr. Philip Webb, is a most pleasing example which might be more often followed nowadays in the laying out of gardens through which runs a stream. This modern example has strutted beams carrying the timber floor and posts and struts supporting the trellis roof, which is covered with many coloured clematis.

*Pergolas.*—The Tea House and Pergola at Easton Lodge, Essex, by Mr. H. A. Peto, are features which at a moderate cost might well be more frequently employed in the lay-out of country gardens, for one of the great charms of outdoor carpentry is that timber sooner takes on the appearance of age than any other material.

The pergola with its simple balustrade rests on posts and the upper part is treated with plain squared timbers. The little lake tea-house on the right is formed of oak uprights and provided with shuttered windows.

I have now dealt with external carpentry, which in all periods has been kept comparatively free from ornament; but with internal carpentry it should be observed that more freedom is naturally allowed in this respect as it is sheltered from the elements.

### *Internal Carpentry.*

*Floors.*—The dining-room at Ockwells Manor, Berkshire, shows the straightforward mediæval treatment of floor timbers, which were left exposed and truthfully indicated their purpose. In the sixteenth century, however, architects began to be ashamed to show the floor timbers, and so plastered them up, with insanitary results, since it made a home for mice and filth of all kinds. This interior shows the main beams fulfilling their purpose of supporting the sturdy joists and forming a much more effective treatment than the whitewashed plaster of the usual modern type.

Henry the Eighth's apartment at Hever Castle is a more elaborate example, with main beams into which the subsidiary joists are framed, both being enriched by mouldings. This room shows also the wall panelling, a wooden bedstead with carved oak posts, and a table, all of which indicate the good work done in the Tudor period.

The interior of the hall at "Homeleigh," Potter's Bar, is a small example of a modern building treated in the same way. It has exposed joists, above which two thicknesses of floor boards are laid with felt between to prevent the passage of sound. The upright timbers supporting the walls above honestly express their purpose, and the furniture and panelling are all in keeping.

The living room in the same house is treated similarly, and cupboards are formed above the ingle-nook. Thus by applying the principles of the past to the needs of the present we can obtain simple and satisfactory results.

*Roofs.*—The carpenter's craft provided the most ready means for effectually protecting the interiors of all buildings from the elements.

The roof at St. Sabina, Rome, was one of the first built by the early Christians, and its "king post" roof trusses are placed about 10 feet apart and support purlins on which rest the ordinary rafters and roof covering. From this simple type the mediæval craftsman evolved those elaborate roofs which are so essentially English that they stand out as unique in the annals of carpentry, for in no other country are such magnificent examples to be found.

Causton Church, Norfolk, is a splendid example of a roof which is known as the "hammer beam," and which is most frequently found in Norfolk and Suffolk. This type of roof was introduced in order to obtain greater apparent internal height by omitting the horizontal tie beam. The hammer beam, which is the short horizontal beam projecting at right angles from the walls, supports a vertical post which is framed into the principal rafter, and the weight of the roof is taken low down the wall by means of a curved brace connecting the inner end of the hammer beam to a wall piece supported by a stone corbel. The hammer beams, in this example supporting carved angels, have beautiful mouldings carried along the wall plate, beneath which are other carved angels holding shields. The roof is further enriched with tracery in the spaces between the hammer beams, curved braces and principal rafters. This form of roof causes a considerable amount of outward pressure on the walls, which, however, were strengthened by the massive buttresses of the Gothic period.

The "Angel" roof of March Church has two tiers of hammer beams, the upper one occurring at the level of the lower purlin. A number of carved angels with wide-spreading wings ornament the corbels, hammer beams, and upper part of the roof above the collar beam. The panelling at the feet of the rafters and the two supporting purlins are beautifully floriated and carved, while the curved braces to the hammer beams spring from the pinnacled canopies ornamenting the wall pieces. Although the various parts are strongly pegged together, it has been found necessary to introduce four tie rods to prevent the feet of the principal rafters from spreading.

The roof at Eltham Palace, Kent, is a splendid example of those domestic hammer-beam roofs often found in the feudal halls of our ancestors. The hammer beams project boldly from the walls and support the vertical posts which connect them with the principal rafters. From their extremities spring four-centred curved ribs to the underside of the moulded collar beams, which support ornamental wooden posts. The curved ribs are also continued down to the feet of the rafters to give additional strength, but as will be seen this has not been sufficient for the purpose, and iron straps have been introduced. The purlins support the common rafters, and are stiffened by curved wind braces in each bay.

The moulded pendants at the end of the hammer beams give considerable richness to this remarkable piece of carpentry and form a good starting point for the curved ribs which span the central part, and also for the braces which connect it below to the wall piece. These pendants were originally encased with perforated tracery secured by oak pins, but this has disappeared, the post itself being now exposed.

Staple Inn, Holborn, has a roof over the hall which although very plain and simple compared with Eltham Palace and the church roofs of Norfolk, is yet worthy of careful study. The hammer beams project boldly, and are connected by the usual curved braces to the wall pieces. The posts at the end of the hammer beams have carved pendants, and from about half-way up their sides spring curved braces, as in the old roof tree, to give intermediate support both to the collar beams spanning the hall and the purlins, which stretch from one truss to the next. The plaster applied to the underside of the common rafters has unfortunately destroyed the *raison d'être* of the visible timbers.

Westminster Hall roof is the most remarkable hammer-beam example. The hall, 290 feet long by 68 feet broad, is, with the exception of the Hall of Justice at Padua, by far the largest unobstructed area covered by a wooden roof of an artistic character. The carved hammer beams project boldly and are connected by curved braces to the wall pieces, which are taken, for precaution, low down the wall. A curved brace, as at Eltham, is here introduced to stiffen the whole framing, and it is carried from the base of the wall pieces to the underside of the collar, being joined by a second curved brace starting from the end of the hammer beams. This unrivalled example of the carpenter's craft emphasises the nobility of wood as a building material, as it more than holds its own against the fretted vault of stone, and has for over 500 years been the admiration of the civilised world.

The nave of Bangor Cathedral has a typical fifteenth-century roof of almost flat pitch which is covered with lead. This type was popular for economical reasons, as less timber was required and there was little outward pressure on the walls owing to their flatness, and they partake of the character of floors. In this example the principals have curved braces where they reach the walls, and support secondary beams which are formed into panels with carved bosses at their intersections.

The choir roof at Hexham Abbey, Yorkshire, well shows such a roof in which the principal rafters and purlins are framed into each other, their joints being marked by fine carved bosses. The broad rafters are here laid so as to show their greatest width, thus giving boldness to the design and a generous use of material, which is important, for architecture is an æsthetic art which should impress the beholder with apparent as well as with real strength.

Brinsop Court, Herefordshire, illustrates very appropriately the term "roof tree," which is so often employed to express our conception of "home." The beam not only serves the purpose of a tie to prevent the rafters pushing out the walls, but is made extra strong to support the central timbers, which spread out like the branches of a tree, helping to support the roof ridge, and give a characteristically substantial appearance to the hall.

It is not only, however, the better known buildings which are worthy of study, for many an old ruined barn, such as that at Leamington Pele, Northumberland, tells us how the craftsman took his material very much as he found it and roughly shaped it to answer the required conditions. Here the principal rafters are carried down below the tie to rest upon stone corbels, and the interest given to the framing by the natural contours of the timbers is a delightful contrast with the machine-made regularity of much modern work.

The study of old work is most of all profitable when it can be applied to modern structures, and I therefore show you two examples of timber roofs recently erected.

The plain queen post roof was constructed a few years back over a small mission room in the East End of London. Money was scarce, and the instructions were to provide a weather-proof shed at the smallest possible cost, and this design was the result. Later on, however, money was forthcoming from a liberal donor, and the alteration from a simple mission room to a more dignified church was decided upon. The view shows the transformation effected by removing the tie beams, queen posts and struts without touching the original roof covering. The tie beams were replaced by iron tie rods, and the queen posts by vertical queen rods. Curved arch pieces were inserted between the ends of what have now become hammer beams. The purlins, which had now lost their supporting struts, were trussed by means of steel rods which are truthfully exposed between the vertical studding above the hammer beams. A small king post over the collar completed the transformed roof, thus adding to the apparent height of the structure by the inclusion of the roof in its general proportion.

King's College School, Wimbledon, recently constructed, has a queen post timber roof over the school hall, which is one of the largest in England, measuring 85 feet by 42 feet 6 inches. In this case economy had to be studied, and the roof was designed to be as effective as possible under the circumstances. The tie-beam is in one piece of Carolina pine, and character is given by the use of wall pieces and struts supported on carved corbels, and by the introduction of thin slats of wood giving the appearance of tracery, and effectively helping the acoustic properties. These practical examples will, I think, be of interest to those of you who are actual craftsmen.

*Arcading.*—The arcading at Rushton Hall, Northants, shows another use for carpentry where timber columns of the Doric type, raised on sturdy pedestals, are employed to support arches which carry an upper landing. Timber, indeed, is the most suitable material for the interiors of houses, and is so much more homely and cosy than cold-looking stone or marble, that there is always something satisfactory in its use.

*Staircases.*—From arcading we pass to staircases, and that at the Castle House, Deddington, is one of a type in use since the days of the Tudors. It is a plain and unpretentious example of the Georgian period, formed with solid oak steps and, owing to the narrow opening caused by the returning flights, has a single wide newel which receives the tenons of the plain-moulded strings and solid handrails, and gives a fine breadth of treatment to the design.

*Furniture.*—I have now dealt briefly, but I hope suggestively, with the work of the carpenter in its external and internal aspects, but there yet remains the consideration of the fitting up of buildings for use and convenience. I give you some examples which are well within the domain of the carpenter, and which exhibit that solidity and appropriateness which is so pleasing.

*Table.*—The oak table is a sturdy example of the Jacobean period (A.D. 1640), the excellent workmanship of which is evident from the fact that it has lasted for 270 years. The turned legs with the footrails tenoned and pegged into them at the base satisfy the æsthetic taste, and the upper part is also well and solidly framed together. The small stool at the side with legs leaning inwards towards the top is a characteristic example of the period and was designed to be packed away under the table when not in use.

*Settle.*—The old oak table settle may fairly be regarded as the work of a carpenter. The posts are left square to receive the foot and seat rails, the former being secured to cross pieces, and the latter supported by turned legs. The shaped elbow-rests and the simple planked back, which hinges forward on wooden pegs for use as a table, indicate a desire for utility and compactness, which should commend itself to these matter-of-fact days when many try to make their homes in flats or seek the simple life in an old-style country cottage.

*Chair.*—The armchair of the time of Elizabeth has all the characteristics of previous examples, and as it has fulfilled its purpose for well over 300 years, and is still capable of being used for a similar period, it is a piece of solid workmanship which it is well to study.

*Bedstead.*—The oak bedstead at Brede Place, Sussex, is of the same period. It has solid posts with the strap pattern, above which turned balusters of excellent design support the canopy, carved with running ornament. It is a curious commentary on the repetition of history that after wooden bedsteads have been so long discarded they are now again in use. There is something so very pleasing in the solidity and simplicity of seventeenth century furniture which renders it specially suitable as an inspiration for designs for the prizes now offered by the Carpenters' Company. How much, indeed, of the later work of Chippendale, Sheraton, and Hepplewhite will thus stand the test of time, and how much of the modern gimcrack furniture with spider-like legs and meagre frames will still exist to bear evidence of sound craftsmanship 300 years hence?

*Finale.*—A lecture, however, at the best only gives general ideas, and its principal use is to stimulate imagination and kindle enthusiasm. I have, therefore, brought up for your inspection a number of sketches, made at different times, of work in wood, and also a collection of large diagrams bearing on the subject, which I hope will interest you.

Although we have now ranged over a wide field and made a cursory inspection of many buildings, we have by no means exhausted the scope of the carpenter's work, much of which is seen in the marvellous carved choir stalls, reredoses, and numerous other fittings in our cathedrals. We have, indeed, seen how a plentiful supply of excellent timber has contributed to the making of sturdy examples of craftsmanship, and ope that the pressing question of afforestation in this ntry will soon be taken up. It is certainly nothing less n a national scandal that we have to get our timber from rway and the Baltic, and that our craftsmen have to use specially grown for them by the paternal Governments Austria and Italy. The Local Government Board should lude a Forestry Department on the lines of the United tes Forest Service, which has produced such excellent re- ts in that country.

It is difficult indeed to talk of carpentry without en- siasm, and for those who have worked at the bench, as I e done, there is something in the actual making of any- ng useful and suitable for its purpose which is very in- ring. Timber in itself is a delightful material, and the asant smell of freshly-worked wood, the music produced by h successive saw-cut and the sound of the plane producing crisp shavings, act in an exhilarating way as an aid to craftsman, so very different to the unpleasant conditions aching to the dust and chippings produced by the sculptor's sel or the smell of the painter's oils. Ruskin, in the Bible of Amiens," gives us some thoughts on the beauty of ber as a material, in referring to the stalls of that hedral. "Aisles and porches, lancet windows and roses can see elsewhere as well as here, but such carpenter's k you cannot. It is late, fully developed Flamboyant, t past the fifteenth century, and has some Flemish stoli- y mixed with the playing French fire of it; but woodcarv- was the Picard's joy from his youth up, and so far as I ow, there is nothing else so beautiful cut out of the goodly es of the world. Sweet and young grained wood it is; , trained and chosen for such work, sound now as 400 rs since. Under the carver's hand it seems to cut like y, to fold like silk, to grow like living branches, to leap living flames. Canopy crowning canopy, pinnacle pierc- pinnacle—it shoots and wreaths itself into an enchanted de, inextricable, imperishable, fuller of leafage than any est, and fuller of story than any book."

I hope that those of you who are actual craftsmen will e away some pleasant recollections of the work of the past; l have renewed your belief in the nobility of the craft ich it is the special aim of the Worshipful Company of rpenters to encourage and maintain, and have gained some a of the varied treatment of timber, while those of you who otherwise interested will, I hope, henceforth do your best support good, solid and honest craftsmanship, devoid of retricious ornament, and suitable for its purpose.

## EEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

T a meeting of the Society held on Thursday, January 27— Mr. Ascough Chapman occupying the chair in the ence of the President, Mr. Percy Robinson—Mr. J. A. tch, of Kettering, author of several important works deal- with English architecture, delivered a lecture on "The zabethan House as Illustrated by Contemporary Archi- tural Drawings." In his introductory remarks Mr. Gotch, erring to the Smithson collection of drawings, recounted v Mr. Pegge, an antiquary living in the last years of the hteenth century, had mentioned as having recently been d a collection of drawings and plans of houses made by an hitect named Smithson in the reigns of Elizabeth and nes. This collection had been lost to public view until two rs ago, when it was exhibited at a meeting of the R.I.B.A. It turned out to be of unusual historical interest, showing, t did, the methods of house planning in James the First's e. There was already well known to architects another ection of a similar kind made largely in Elizabeth's reign he architect John Thorpe. The two collections supplement h other, and together afford a complete picture of the elopment of house design during the sixty years from 0-1630, a period during which were built all the fine houses wn as Elizabethan and Jacobean, including such places Burghley House, Kirby Hall, Holdenby House, Hatfield Huse, Bolsover Castle, Wollaton Hall, and many others. lecturer described many of the drawings and showed re- ductions of them upon the screen. They indicated, he l, the gradual and very interesting change which took place house planning at that period. Prior to the sixteenth tury planning had been rather haphazard; the hall, how- r, had always been the chief apartment, forming the tre of the house, with the family rooms at one end and se for the servants at the other.

John Thorpe, the typical designer of Elizabeth's time, ained this root idea, but arranged his rooms in a sym- rical manner, wing balancing wing and window answering to window. Gradually, however, the hall ceased to be the heart of the house, and instead of being the principal living-room, it became a vestibule leading to the rooms in constant use. This change was also perceptible in the Smithson drawings, and when the hall ceased to play its former part and became a vestibule, one of the strongest links with the mediæval past was broken.

The elevations (or views) of the houses included in the two collections also showed the change from the semi-Gothic treatment of the early days of Elizabeth to the more formal and Classic treatment which became fashionable at the end of James the First's reign. These changes, which led house design from mediæval ways into paths of modern methods, were admirably illustrated by reproductions from the Thorpe and Smithson drawings, which displayed at the same time the powers of draughtsmanship and of design of architects in the sixteenth and seventeenth centuries.

Mr. Gotch was at the close accorded a vote of thanks for his paper, and a discussion ensued, in which Messrs. W. H. Thorpe, S. D. Kitson, and Ascough Chapman participated.

The next meeting of the Society will be held on February 10, when Mr. Raymond Unwin will discuss the planning of garden suburbs, with special reference to the Hampstead Garden Suburb.

## ANCIENT LIGHT CASE.

IN the Chancery Division on Tuesday, February 1, Mr. Justice Joyce had before him an action by Mr. Alexander Murray Smith, owner of the freehold houses 40 and 42 Queen Anne's Gate, Westminster, against the Anglo-American Oil Company, Ltd., to restrain an alleged obstruction of ancient lights from a building now being erected by the defendants opposite on the site of 36 and 38 Queen Anne's Gate, lately pulled down.

Mr. Hughes, K.C., and Mr. Sheldon appeared for the plaintiff, and Mr. Younger, K.C., and Mr. Neville for the defendants.

Mr. Hughes stated that the title of the plaintiff and the antiquity of the lights were admitted subject to one small point, and the question would be whether the obstruction that would be caused by the defendants' new building, which was not yet erected, was one that plaintiff was entitled to complain of and have stopped.

His Lordship: Not yet erected?

Mr. Hughes: Not completed. The building is in course of erection.

His Lordship: Have they begun to interfere with your lights already?

Mr. Hughes: No. At present our light is better than ever it was before because we have nothing in front of us except a steel skeleton.

His Lordship: Where is it?

Mr. Hughes: Queen Anne's Gate. Nos. 40 and 42 belong to Mr. Murray Smith. He lives in No. 40. They are old houses. He bought one in 1899 and the other in 1902. They are not lofty houses; they have windows looking towards the north. On the north side were two houses comparatively modern, having been built in 1871. They were Nos. 36 and 38. One was occupied by the late Sir Clinton Dawkins and the other by Sir Charles Forster. His Lordship would notice from the plans that these two houses were very high relative to the width of the street, with the result that there was very little light before they were pulled down. The new building of the defendants was to be 5 feet longer to the west. Instead of being rounded off at the corner it was continued in a straight line for 5 feet further than the old houses. That was a very important point, because it very largely reduced the light coming to the plaintiff's houses. The wall of the new building was to be the same height from the ground to the cornice, 62 feet 6 inches, but the roof was totally different. The old roof sloped back at an angle of something like 60 degrees, and had in it three narrow dormers only 4 feet 9 inches wide. The new building would have four large, almost continuous, dormers 12 feet wide, in addition to big trusses.

Counsel said that in the new building there would be an equivalent to an enormous increase in the height of the wall, reducing the light in this narrow street very substantially having regard to the little there was before. With respect to No. 40 it was a matter of importance because it interfered with the immediate comfort of the plaintiff, and with respect to No. 42, which was unoccupied, it would greatly depreciate the selling or letting value.

Mr. Younger said that the case for the defence was that the height was very little above the height of the old buildings, and that there were compensations in the way of

DESIGN FOR BIOLOGICAL DEPARTMENT OF THE UNIVERSITY OF ST. PETERSBURG.—F. Korsoukhine, Architect.

absence of obstructions which would more than make up for the light taken away.

His Lordship suggested referring the matter for report to an independent expert, and both parties agreeing to Mr. John Slater, it was arranged that a joint letter should be sent to that gentleman asking him to act.

## REINFORCED-CONCRETE CHIMNEY CONSTRUCTION,*

*(Concluded from last week.)*

THE author's experiments led him to the following conclusions:—

(1) That neat cement behaved better under great heat than out of it. The average compressive strength of $2\frac{3}{4}$-inch cubes placed in flue for 28 days, after having remained in air for 14 days, was 52.6 tons on the cube compared with 33.6 tons when placed in water for a similar period; the tensile strength per square inch of the briquettes being 1,008 lbs., compared with 850 lbs. in the water test.

(2) That concrete (3 parts standard sand to 1 part Portland cement) if not well set behaved very badly under heat. The average tensile strength of briquettes 1-inch section (3 to 1) placed in flue for 28 days, after being in air for 14 days, was 105 lbs., compared with 310 lbs. at 7 days, and 460 lbs. at 28 days in water.

(3) That if the concrete had had at least a two-months' set before heat was applied a temperature of 900 deg. Fahr. would not affect it in the least. This might be taken as the safe temperature in reinforced-concrete chimneys.

(4) That the 3 to 1 specimens in these tests giving such poor results pointed to the necessity of having no voids whatever in any concrete work, it being well known that 3 to 1 briquettes made of standard sand contained a considerable quantity of air spaces.

(5) That only allowing the specimens 14 days before subjecting them to the heat was far too short a period in actual work. The greatest advantage was obtained by letting the heat get at the concrete after the longest time had been given for the cement to set.

(6) Concrete mixed with 10 per cent. of water (which should be the maximum in work of this class) would contain only about 1 per cent. of free water after a two-months' set. Heat should not be applied to concrete until the latter had had a two-months' set, a longer set than say three months would be preferable.

Reinforced-concrete chimneys had been objected to o
the following grounds:—(1) Because occasionally during th
hardening of the concrete hair cracks have been noticed o
the concrete surface, and it had been thought that thes
might affect the temperature in the chimney and conse
quently the draught; (2) because chimneys constructed o
this material were, in the opinion of some, unsightly.

With regard to the first objection, Mr. Matthews ad
mitted that hair cracks did frequently occur when a larg
concrete surface was setting, but these were only skin deep
and in the case of a chimney could not possibly affect the in
ternal temperature. As to the second objection, there wa
no reason why a reinforced-concrete chimney should be u
sightly; it could be made ornamental if required so, and a
no great extra cost.

The aggregate in the concrete in the case of chimney
was fine, but coarser material was used in the foundation
All concrete was well tamped. The factor of safety used b
well-known chimney builders in America was between 4 and
and provision was frequently made for stresses which woul
be set up by a maximum wind velocity of 100 miles an hou
a velocity which was practically unknown here.

In this country it is not at all likely that a chimney woul
ever be subjected to such a test, but in America there was
likelihood that it might be. During the Galveston (Tex
tornado, for example, which occurred in September, 190
the force of the wind was registered at 50 lbs. per squa
foot on a surface at right angles to the direction of the win
It had been the custom both in Great Britain and Ameri
to take the maximum wind pressure at 50 lbs. per squa
foot on a square shaft, and half this on a circular shaft.

No tensile stresses on the concrete were allowed for. T
chimneys were well anchored by continuing the vertical ste
bars into the foundation and then bending them through
degrees. The large number of vertical bars in the outer sh
was divided into two portions, one-half of which were be
to reinforce the upper part of the foundation slab, and t
other half, which alternated around the chimney, were be
at the bottom of the slab. All of the vertical bars in t
inner or expansion shell were carried down into the found
tions and bent over. Continuity in the steel was provid
by overlapping the ends of the bars at least 30 diamete
All wind stresses were provided for by the vertical steel re
forcement and temperature stresses by the horizontal rin
of plain round rods (as already described) bent to a tr
circle. These latter were spaced not more than 18 inc
apart vertically, and, as in the case of joists in the verti
steel, the breaks in the bars were staggered so as to occur u
evenly and form no plane of cleavage. Additional ring st
was placed at any bends in the vertical steel, as at the off
and foundation. In designing a chimney the stresses w
computed at several sections.

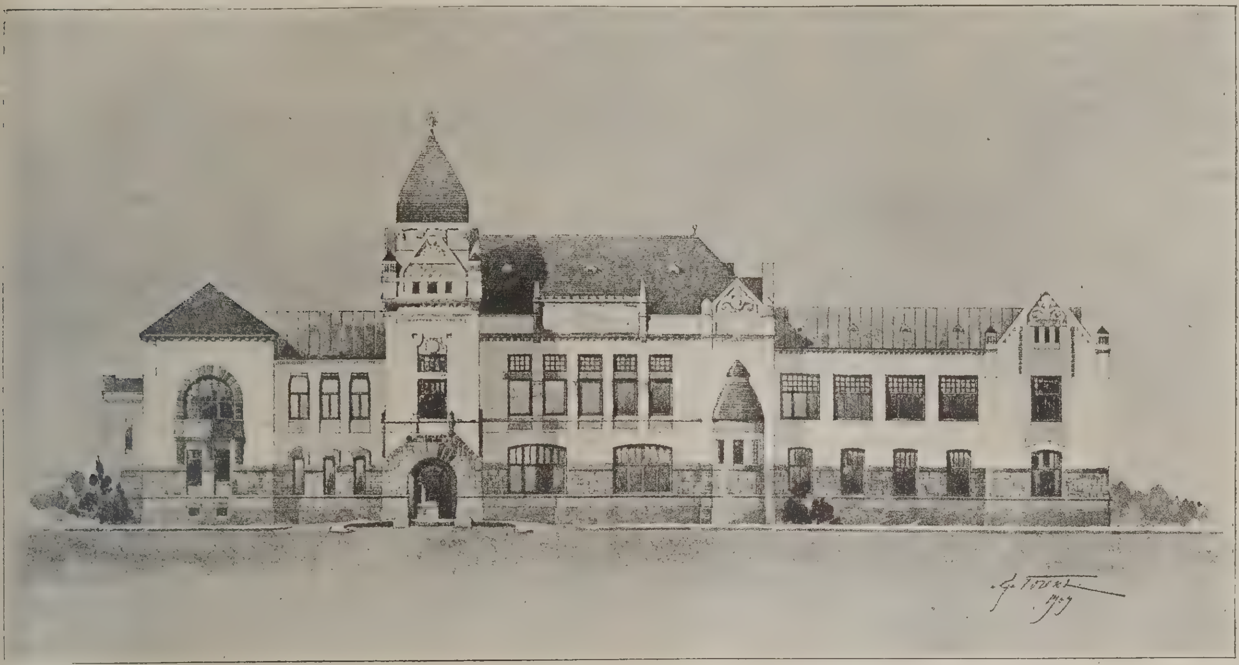
## MODERN EUROPEAN ARCHITECTURE.

### RUSSIA.



[From *Zodtchy*.

BANK OF THE CREDIT FONCIER OF PENSA.—A. VON HOHEN, Architect.

The foundations were frequently reinforced by two meshes f steel bars as already explained, the top mesh running at ight angles to the side of the foundation for its full width, he bottom mesh consisting of bars laid diagonally in each lirection at an angle of 45 degrees from the side of the oundation. Additional vertical bars should be placed on he sides of the smoke opening to take the place of those mitted in that opening, and additional bars placed above nd below the smoke opening to furnish lintel and sill einforcement.

The forms used in the construction of reinforced chimneys vere necessarily somewhat complicated and intricate.

Mr. WILLIAM DUNN, in opening the discussion, said that here was no doubt that reinforced concrete was a suitable naterial for chimney construction ; the few failures were due o defects within their power to control, such as faulty con-truction or design. Up to three years ago in America there ad been about half a dozen complete failures, blown down, allen down, or torn down. But it was highly probable that American builders of such chimneys had now learnt some-hing from those failures. Mr. Dunn said that he built a rick chimney about 130 feet high some ten years ago, which ad been in use but a very short time when it badly cracked. This, however, was not due to any defect in the design of the himney, but to excessive heat from the boiler flues. The tem-erature of the escaping gases at the base of a chimney hould never exceed 400° to 600°; in this case an automatic toker had been fitted to the boiler, the coal supply had caked, nd the supply of oxygen was insufficient for proper combus-ion, with the result that the temperature reached about 1,400°. When the stoking was put right and the temperature educed to normal the cracking ceased. Brick chimneys sually show cracks owing to the temperature inside being o much above that outside, especially when there is a gale of vind and sleet. The inside lining in the lower part is a rotection, but the temperature all up the shaft remains igh, indeed, it is only about 20 to 30 per cent. less near the op than it is at the bottom. Horizontal and vertical cracks ppear in reinforced concrete chimneys, though not of an larming character. Special care with the reinforcement had o be exercised at the point where there was a reduction in he diameter of the shaft. The lesser weight of concrete himneys was not always an advantage, as, for instance, in onsidering the stability of the chimney this lesser weight on he stresses in the steel and concrete is considerable. The greater the weight of the chimney in relation to the xposed surface the less the relative effect produced by the ending moment due to wind. In a well-designed brick himney there is no tension on the windward side, as brick annot resist tension. But in a reinforced concrete chimney the line of action of the wind and dead load may be allowed to cut any horizontal section beyond the kern, as the steel takes up any tension. The durability of a chimney is largely a question of temperature: it appears from experiments with cubes and actual experience that temperatures of 400° to 600° do not injuriously affect gravel concrete. It is only when the temperature is 750° or so that injury results. This leaves only a small margin in case of excessive temperatures. Concrete formed of limestone should never be used for work exposed to great heat, as it begins to lose strength under 500°. A slightly wetter mixture than usual is desirable to secure proper adhesion to the bars. Circular rods seem preferable to T bars for the reinforcement, owing to the special care required in tamping the concrete round the T bars to secure adhesion. The contention put forward that reinforced concrete chimneys saved about half the time compared with brick ones was open to doubt, as it was very doubtful wisdom to allow the workmen to build more than a few feet a day. Another objection to the concrete chimney was its parallel form as dictated by considerations of economy. This was less pleasing than the tapered shaft. However, in America tapered shafts are now being constructed by special centring.

Mr. PERCY TAYLOR claimed that when it was considered that the stresses of a chimney were due first to weight and then to wind it would be agreed that concrete was an ideal material. None of the author's experimental samples had been in the flues for more than twenty-eight days; this was not, in his opinion, enough. He himself had been making experiments on samples that had been in the flues for more than fifteen months, and some he had not even yet taken out. A common mistake in chimney construction was to stop the lining a third of the way up; whereas if a lining was required at the bottom it was also necessary at the top, though perhaps a little thinner there.

Mr. JOHNSON described the experiments that he had conducted in connection with a reinforced concrete chimney erected at the works of Messrs. Lyle & Sons. According to his experience the concrete should be as dry as possible in order to withstand the heat. After their chimney had been erected twelve months the lining was thoroughly examined and seven or eight cracks—not hair cracks, but definite fractures—were discovered. There were not the same number on the outside as on the inside. Their experience was that the outer chimney and the lining should not be made simultaneously, as the expansion of the latter is very great. They were also led to the conclusion that the method of introducing an offset was wrong, as it was the alteration in the thickness which caused the trouble. He did not believe if at their works they had another chimney to build that they would decide to again adopt reinforced concrete. There was far more than the shape and the materials in the making of a chimney. A competent superintendent ought to be on the spot during the whole period of construction, for if a single mistake were made the chimney might be ruined.

Mr. FABER pointed out the desirability in designing a chimney of keeping the thickness as small as possible by a liberal introduction of steel. The general experience at the works of the Associated Portland Cement Manufacturers had been that in every case there was a tendency to crack on the outside of the chimney much more than on the inside. It was not yet known what exactly determines these cracks; in their case it appeared to be the temperature. If cracks are more likely to occur on the outside than on the inside, it would appear to be better to put the reinforcement nearer the outside than near the centre. It was always advisable to take a fairly low unit of stress, because the tendency of the concrete to crack made the conditions very indeterminate. It should be remembered that the expansion and contraction which occurred in concrete chimneys was not due to temperature alone, but also to the nature of the material itself.

At the conclusion of the discussion a vote of thanks was passed by acclamation to Mr. E. R. Matthews for his paper.

## BOOKS OF REFERENCE.

"Laxton's Builders' Price Book for 1910." (Kelly's Directories, Ltd. 4*s.*)

THE doyen of price books still maintains its position and its level of prices as well as its old familiar form and arrangement, from which it would be foolish to depart, as those who are accustomed to use "Laxton" would be inconvenienced if they were unable to find things where they are wont to be. At the same time due note is taken of advances in building matters. Thus electric lighting, its rules and prices, are brought up to date; the London County Council General Powers Act, 1909, so far as amending the London Building Acts, is included, and so also is the Cinematograph Act, 1909, together with the regulations under that Act.

"Lockwood's Builder's, Architect's, Contractor's, and Engineer's Price Book for 1910." Edited by Francis T. W. Miller, A.R.I.B.A. (Crosby Lockwood & Co. 4*s.*)

Lockwood's Price Book also makes its yearly appearance, and retains its own points which make some prefer it to "Laxton." The prices are not on the high grade, but on what is now the ordinary level of good everyday work. A useful feature is the annotations from the London Building Acts with references to decided cases, by Mr. A. J. David, B.A., LL.M.

"Spon's Architects' and Builders' Pocket Price Book." Edited by Clyde Young, A.R.I.B.A. Revised by Stanford M. Brooks. (E. & F. N. Spon, Ltd. 3*s.* net.)

Being a pocket-book, Spon's does not vie in size or completeness as regards prices with more bulky volumes, but it is more than a price book and contains a large amount of useful information on many matters connected with building. An addition to the present edition is the inclusion of tables of constants of labour in all trades, which gives particulars of the time in which workmen ought to do specific kinds of work.

"Jordan's Tabulated Weights of Angle, Tee and Bulb Iron and Steel." By Chas. H. Jordan, M.I.B.A. (E. & F. M. Spon, Ltd. 7*s.* 6*d.*)

Although primarily intended for the use of naval architects, shipbuilders and manufacturers, these tables should also be valuable to architects and builders as giving information as to the weights, sizes and sectional areas of various forms of rolled steel that are less used than they might be in building by reason of the non-recognition that H steel joists, angles and channels are not the only shapes on the market.

"The Local Government Annual and Official Directory, 1910." Edited by S. Edgecumbe Rogers. (The Local Government Journal Office. 1*s.* 6*d.*)

Besides its use as a directory of the officials connected with local government this annual contains useful abstracts of the more important legislation of the past year connected with and affecting local government.

"The Local Government Manual," 1910. (Shaw & Sons. 7*s.* 6*d.* net.)

This volume has now reached its fifty-fifth year of publication, and it becomes more comprehensive with each edition as the ramifications of the Local Government Board steadily increase. The publishers say that it is corrected up to December of last year, and they have included some additional matter. The 800 odd pages are crammed full of lists of public bodies and public officers of all sorts. The list of urban districts and rural district councils, with the names and, in many cases, the addresses of the officers, alone occupies 160 pages. The arrangement is most orderly, and the information sought can be quickly obtained.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* illustrates two church buildings which are not very successful renderings of Gothic, and a number of drawings by students of the Society of Beaux-Arts Architects.

*La Construction Moderne* gives a full account, with illustrations, of the church of Jesus Adolescent, which is in course of construction at Nazareth, Palestine, as the centre of an orphanage founded by the R.P. Athanase Pruy, and has been designed by M. L. Gauthier.

*Berliner Architekturwelt* is devoted entirely to the work of Alfred Grenander, one of the leading architects of Berlin, whose work, with an ultra simplicity of detail, is full of piquancy and evidence of thought.

*Het Huis* continues its account of the charming old town of Oud-Deventer, and also has an article on Old and New Enkhuizen, both of which are fully illustrated. Some examples are also given of modern internal treatments.

The *Architectural Review*, in its August number, which has just reached us, illustrates the work of Messrs. York & Sawyer, which is largely concerned with banks and other financial institutions, and is remarkable for its severely classical treatment.

*Engineering Record* has an interesting illustrated description of the grand stand at the Minnesota State Fair Grounds, in which is included a formula for the design of an isacoustic curve.

The *Engineering Magazine* commences a series of articles on "Industrial Applications of Reinforced Concrete," with references to examples erected in the United States, in which is discussed in general terms the merits of the various methods of constructing buildings of steel and concrete.

## Correspondence

*[The Editor will not be responsible for the opinions expressed by Correspondents.]*

### The Competition Question.

SIR,—Mr. Gibbs's suggestion—excellent as it is—is unlikely to be adopted by promoters. Why not go to the root of the matter and prevent architects from wasting their time? We all prepare sketch plans which are subsequently only elaborated, and if we get on wrong lines in the draft plan all work is thereafter wasted. Consequently we suggest that competitors submit their sketches in the initial stage to the assessor, from which a limited number could be selected. To ensure the assessor being safeguarded from suspicion of preference the sketches could be sent through the President of the Institute (in whom we all have confidence), who could number same and return after being submitted as suggested.—We are, &c.,

February 1, 1910. LEEMING & LEEMING.

## GENERAL.

DUMBARTON Burgh School Board have asked the local architects to submit competitive plans for a Burgh Academy to be erected at Braehead. The plans will be sent to an assessor yet to be appointed for adjudication. The new academy, or higher-grade school, is expected to cost 20,000*l.*

"SELECTIONS from the Portfolios of J. MacWhirter, R.A.," is the title of an exhibition which is to be opened to-morrow (Saturday) at the Leicester Galleries, Leicester Square, W. It will comprise water colours painted in Scotland, Norway, Switzerland, Italy, Greece, and America during Mr. MacWhirter's various visits.

## MAKING THE BEST OF THE HOME.

HOW to make the best of their homes is the lesson that Mr. W. S. Sparrow is endeavouring to teach the British public in his latest book,* and as the basis of his lesson is the necessity for good architecture, we hope he may find intelligent and receptive pupils.

In a pleasant and chatty fashion Mr. Sparrow traces the growth of the English home from the cave-hall and penn-pit of prehistoric man through the hall of Saxon and mediæval days to modern times, wherein he rightly notices the recognition by modern architects of the value of a great house-place, a fine hall, and formulates as the principles that govern the best modern work the desire (1) to treat with common sense and a just freedom the best traditions, both Gothic and Classic; (2) to break away from that intricate planning which from the sixteenth century to the eighteenth gradually separated household comforts into so many rooms that they became expensive discomforts; (3) to arrive at moderation and economy without any loss of essential comfort and privacy. The author points out the connection of the problem of modern home-planning with the social conditions that should now receive attention:—(1) A growing cost of production, and therefore an urgent need to simplify all workmanship, so that money may be spent on essentials and not on unnecessary walls, superfluous bandbox rooms, and meretricious ornamentation; (2) a greater cost for household expenses, owing to higher rents and to train fares and 'bus fares, and to dearer wages for service; (3) more labour and less pay for those of us who are not considered working men, because our day's toil is twelve hours or so of brain effort; (4) a decreasing birth-rate, particularly among those that know the penalties of trying to succeed to-day without capital.

As a protagonist for improvement in home-making, Mr. Sparrow deals with those factors of modern life which he considers to be "hindrances to success in home-making," and discourses of (i.) want of public criticism, (ii.) the power of advertisement, (iii.) the shop system as architect and decorator, (iv.) the abuse of mechanical aids in craftsmanship, (v.) the popularity of shams, (vi.) an excessive pride in home-making, (vii.) want of popular education in house architecture, (viii.) the house-servant difficulty, (ix.) differences of taste between women and men, (x.) local by-laws. Of all these the author treats in trenchant fashion and inculcates many useful lessons and suggestions.

In his chapter on the house plan, Mr. Sparrow emphasises the importance not only of a well-considered arrangement by the architect, but of a proper comprehension of the plan by the client, and advocates the employment of the method he has recommended for laying out full size the plan of a house on the site before the contract is settled. The various points that should receive attention in the full-size plan are dealt with in detail, the positions and size of windows, of fireplaces, of doors, the question of large halls and few rooms rather than many small ones, a type of planning of which Mr. Sparrow is a strenuous advocate, as giving with economy a wholesome sense of bigness and comfort.

Having discussed the varied aspects of planning, our author then directs his readers to the consideration of "Homes from outside," and, dealing with roofs, discusses the question of pitch, as to which he lays down no dogma, but takes a broad and catholic view, of tiles and slates and thatch, pointing out what is good and what cheap and nasty. Then he treats of walls and their materials, and starts on ferro-concrete, which he rather seems to think has a claim to cheapness and a lack of humanity that bodes ill for home-building. This, however, is a groundless fear at present, for ferro-concrete has a long journey to go before it will reach the level, even on the score of expense, of good honest brick and stone, tile and rough-cast. Monolithic concrete, as he points out, has failed to compete on economic grounds with the older methods of building, and we have little fear that ferro-concrete will be more successful. Should it be so, then no doubt our modern architects will still find a way of imparting to the new method an artistic expression.

The characteristics of various kinds of stone and of brick are fully discussed, both practically and æsthetically. We are not surprised that Mr. Sparrow, filled as he is with hearty appreciation for the quiet repose of old English building, looks askance at the suggestions for polychromatic treatment of walls that have been frequently made and sometimes attempted, but we do not share his views entirely, and think that when the right colourist comes along, polychromatic architecture will be a success. But we may have to wait a long time for the right colourist.

From walls the author passes to windows and doors, but in a book evidently intended for the lay reader and the amateur the æsthetic merits of pointed windows have received somewhat too much emphasis and may cause trouble to architects whose lady clients imbibe enthusiasm for a form that experience has shown to be inconvenient in the presence of blinds and curtains. Not much is said about doorways except to extol the eighteenth-century treatment that made the portal the one bright spot of design in a wilderness of monotonous plainness in many a town house.

---

* *Our Homes and How to Make the Best of Them.* By Walter Shaw Sparrow. (London: Hodder & Stoughton. 7*s.* 6*d.* net.)

Having dealt with the house from the outside as well as from its organic construction on plan, Mr. Sparrow then proceeds to talk of furniture and teaches further useful lessons, the desirability of good wood and honest craftsmanship, the economy of thoroughness, the avoidance of that which is much advertised and of that which is sold by retailers and the superiority of furniture produced by the craftsman, all of whose price is exchanged for honest value in material and workmanship. But how is the uninformed public to find the skilful and the honest craftsman who does not advertise?

Furniture is followed by a chapter on "Rooms and Their Decoration," and the author deals with just severity as among the things to be avoided, "faults of realism," whether in carpets, upholstery, wall-papers, or fabrics for curtains. The maxims laid down by William Morris as regulating the use of patterns in design are quoted, and moderation in the use of patterns is advocated even to the disparagement of Morris, who, as the author points out, was on occasion apt to overload his decoration with pattern design.

Scarcely anything in this very informative book is of more value than the pages on "Decorative Colour," which commence thus:—"Colour, you will understand, is very different from colours. Colours are pigments such as are bought in tubes and in cakes, while colour is a perfect harmony produced by a fortunate combination of several or of many. Colour, in even its simplest effect, is never pure pigment. Its white is not cold, but warm like the tint of cream or iridescent like the inner part of a sea-shell. Its reds and blues are not known by the names of paints; each is a composed tint, a thing created by a fine sense of colour, as rhymes and cadences in poetry are created by a nicely-balanced feeling for the music of words. And this gives you one guiding principle: *Having learnt by heart the pigments sold in shops, decline to accept them pure in anything pretending to be a work of harmonious decoration.*"

Definite instruction is given as to the mental effect of various colours and definite advice as to the best practical methods of judging the harmony or discord of tints and materials in juxtaposition. Especially sound is the author's doctrine and one well worthy of note by his lady readers, that "carpets and walls should oppose each other, should make contrastive harmonies, and not have tints of the same colour." If there is one pitfall into which the amateur decorator is more likely to fall than any other, it is that harmony is to be obtained by matching the tints of the carpet and the draperies, and repeating these in the painting of wood work and the colours of the paper hangings.

The part that is played by the ceiling, the frieze, the filling and the dado, and their desirable treatment are severally elucidated, and so also is the right use of water-colour drawings and etchings as part of the general scheme.

"Flats and Flats" is the subject of the final chapter, and is chiefly dealt with as a disparagement of the flat as a home, but suggestions are given for the minimising of its defects.

Needless to say, Mr. Sparrow's latest book is full of excellent illustrations, both in black and white and in colour, of some of the best work of some of our best modern architects of homes as they should be.

## NOTES AND COMMENTS.

The report which we give elsewhere of the further proceedings in the ancient light case of Smith *v.* Anglo-American Oil Company shows how the new method now adopted by the High Court for settling these technical questions is being operated, and illustrates how much expense could be saved to architects' clients by a simple reference to an impartial adjudicator like Mr. John Slater. Arbitrations are sometimes very expensive affairs when crowds of witnesses, counsel, and solicitors spend days and weeks in thrashing out a multiplicity of technical details; but the system now adopted by Mr Justice Joyce is simplicity itself, and can be worked with the minimum of assistance from the lawyers.

Dry-rot is troublesome in the United States as well as in Great Britain, and in a leading article the *Engineering Record* gives instances of some recent occurrences. A suggestion is made with regard to the use of wooden posts that these should have an 1½-inch hole bored through them lengthways and two ½-inch holes cross-wise near the top and bottom, with the view of removing the pith, which is particularly liable to rot, and of providing ventilation through the middle of the post. As here, our contemporary is able to quote instances of the rapid decay of wood flooring laid on concrete and covered with linoleum, about the most effective agent in inducing the spread of dry-rot that modern conditions of life have introduced.

The *Times* devotes a column and a half to an eulogistic account of Mr. Herbert Baker's work in South Africa and his scheme for the erection of the new public buildings of the Transvaal Government on the heights of Meintjes Kop, overlooking the city of Pretoria, and, as described by the *Times*' correspondent, an ideal site for a South African acropolis. Mr. Baker proposes to place two identical blocks of offices on the level ground of the shelf of Meintjes Kop, one at either side of the break, and to link them with a semicircular colonnade running round the hollow behind them. He suggests that the hollow itself might be converted some day into an outdoor amphitheatre of seats after the old Greek fashion, where a large gathering of people could be assembled on occasions of national ceremonial. In front and facing the town there will, in process of time, be gardens and terraces and public statues. On the slopes below the shelf will be room for future additional blocks of offices. There is every prospect, too, that the municipality, which (like most of these bodies in South Africa) owns a large tract of "town lands" at the base of the kopje, will co-operate with the Governmen by laying it out as a public park. Finally, Mr. Baker has designs on the extreme spur of the kop to the west for a Union monument or "Temple of Peace."

Glasgow has probably suffered as much as any city in Great Britain, not even excepting London, from fog and the Corporation are taking active steps to minimise the evil. At a meeting held on Wednesday in last week presided over by the Lord Provost, it was resolved to form in Glasgow and the West of Scotland a branch of the Smoke Abatement League of Great Britain, and in opening the meeting the Lord Provost referred to the formation about twenty years ago of the now defunct Glasgow and West of Scotland Smoke Abatement Association the most important result of whose labours was the valuable smoke-prevention section of the Glasgow Police (Further Powers) Act, 1892. That Association, he said had also left the Corporation a legacy, now amounting to 182*l.*, under the proviso that it should be employed in furthering the objects of the Association; and it seemed now that the time was fully ripe for the utilisation of that legacy. They had experienced afresh, during last November and December, the debilitating and destructive effects of "black fogs," by which many deaths were caused, health was endangered, shipping was paralysed, trains were delayed, goods were besmirched and spoiled, and even the streets became unsafe. After emphasising the point about the number of deaths traceable to the fogs, his Lordship proceeded to say that the Corporation of Glasgow had agreed to hold an exhibition in the city of heating appliances to show that they would yield the warmth desired without smoke production. They had also passed a resolution calling upon the heads of departments to report upon heating appliances at present being used, with a view to the substitution in the various offices and halls under the Corporation of a method of warming which would not pollute the air. In this way they sought to be an example to the citizens, as well as a terror to evil-doers.

Mr. John Watson, F.R.I.B.A., at a recent meeting of the Edinburgh Photographic Society, read an interesting paper on "The building of Holyrood Abbey Church, as evidenced by the existing remains." Mr. Watson pointed out that when the building was contemplated the prevailing style of architecture was that of the Norman Romanesque. By that time the component parts of the church had attained to perfect clearness in arrangement and expression of form. The great churches of the first-class were usually planned on the Latin basilican type with transepts, while those of what might be called the second class were built on the parish church plan, consisting of a nave, chancel, and apse, with or without aisles or transepts. The former type of plan passed from France through England into Scotland, and was particularly associated with buildings of the Benedictines. Durham Cathedral was an early and important instance, and in the North of England its plan formed the type of a distinct school, whose influence spread to Scotland. There seemed to be little doubt that the plans of both Dunfermline Abbey and Kirkwall Cathedral were directly inspired from that source, and from the similarity it might be assumed that Holyrood as well was a near descendant. The nave conformed to the Durham Benedictine type, and that the vanished eastern portion of the church did so also might be inferred. This view was not unwarranted, as the greater part of the South of Scotland was in the See of Durham. In dealing with the existing remains, Mr. Watson traced the history of its foundation in King David's time to its present condition, assuming that building operations began under the first charter granted in 1128. There had been at least five distinct periods of erection—(1) The original choir, represented by the Norman doorway in the south aisle; (2) the transitional work of the north aisle and lower part of the west front followed by the very early First Pointed work corresponding to the Early English; (3) the arcades on the north tower, the upper parts of the west front, the triforia, and later the clerestory and vaulting; (4) the north transept, and (5), the south transept. The church, they might assume, would take about 250 years to complete in all its essential parts. In another generation others were called in to erect those sturdy buttresses possessing such a Scottish flavour which they saw on the north and south sides of the church. They were erected by Abbot Archibald Crawford early in the second half of the fifteenth century. Towards the close of Charles II.'s reign it appeared that the abbey was Government property, and in 1672 the nave was reconstituted as the Chapel Royal of Holyrood House for the use of the Royal Family. In 1758 the attention of the Government was called to its condition, and the builder called in loaded the vault with a deadweight it was never intended to carry, with disastrous results. Since the fabric came under the care of Mr. Oldrieve, of the Board of Works, the preservation of the old walls had received careful attention, and the repairs supervised by him for their preservation were being done in a manner which made one regret that the same thorough method had not been adopted earlier.

# MODERN COLD STORAGE AND REFRIGERATION.

## IV.—THE REFRIGERATING MACHINE.

By W. S. Douglas, B.Sc.

Ice cooling does very well for small chambers, and even at fairly large capacities can still, in some cases, be used with good effect. But its principal advantage, which renders it so suitable for small work, is its low first cost, and this, as the storage volume increases, becomes less and less in proportion until it is finally altogether eclipsed by the substantial benefits attending the use of mechanical refrigeration. The circulation of dry air made possible with this system eliminates all danger from dampness, and this, combined with the low maintenance and running expenses, and the simplicity of operation, renders it at higher capacities in every way superior to ice. It is now used without exception for all purposes, where a large amount of cooling is required.

The system depends for its existence on the refrigerating machine, which appears at the present day in four different forms, based on four distinct principles. These are:—(1) Water evaporation; (2) cold air expansion; (3) vapour absorption; (4) vapour compression. The first type is only for very small machines. The second type is now almost out of date, and, although used to a certain extent in marine work, its application even there is very limited. The third has a fair amount of popularity on land, and is useful where exhaust steam can be utilised, but the great majority of the machines now made work on the fourth principle, known as "vapour compression." With this system greater simplicity, less waste of floor space, and, unless exhaust steam is available, higher economy are obtained, than with either of the others.

Beginning with the most important system, vapour compression machines may be sub-divided into three main classes. The use of volatile gas, alternately compressed and expanded, is common to the three divisions, but the nature of the gas employed differs. Those principally in use are:—(1) Carbon dioxide; (2) ammonia; (3) sulphur dioxide. Others such as ether, methyl chloride, water vapour, bi-sulphide of carbon, &c., have been tried, but although the two first-named are employed by one or two makers on the Continent, none of them is practically applied in this country. Each of the three principal gases has its advantages and disadvantages, as far as refrigeration is concerned, but the fundamental principle underlying their action is the same for all, and, up to a certain stage, without going into the question of individual superiority, they may be considered together.

The cooling effect in vapour compression, and also in absorption machines is produced by the agency of what is known as "latent heat." To call this agency into being, a change of physical state is necessary, for example from the liquid form to the vapour, and it is for this reason that easily vaporised substances, such as the volatile gases named above must be employed.

Latent heat is the direct opposite of "sensible heat"; the latter has a visible effect on the thermometer, but the former has none whatsoever. This sounds at first rather puzzling, but an easy explanation is furnished by considering a very common substance as it changes successively from the solid form to the liquid, and from the liquid to the vaporous.

It will be supposed that we have a small block of ice, and that in it is embedded the bulb of a mercury thermometer; the temperature at the beginning is regulated to say, zero Fahrenheit,—thirty-two degrees below freezing point—and heat is then steadily applied. What takes place? The ice does not melt, but the temperature gradually rises, and the mercury creeps up the thermometer scale until it registers 32° Fahr. Melting then begins, and a very curious thing is seen to happen. Heat is still being absorbed as steadily as before, but, in spite of that, not the slightest change can be observed for some minutes in the position of the mercury column. It remains constant at the thirty-two mark, and continues to do so until the last particle of ice has disappeared. Then, and not before, the temperature again begins to rise, but this time at only half its previous speed, and at this reduced rate the advance is continued until the water is at 212° Fahr., but at that point, as the formation of steam commences, the same phenomenon is again observed. No change is made in the rate of absorption of heat, and yet the temperature remains stationary until every drop of water has been evaporated. In fact, in this case, an even more striking example is furnished than in the case of ice, as the period during which the temperature rise is retarded is nearly seven times as long.

Further heating, when all the water has been converted into steam, causes the mercury once more to expand in the usual way, the speed being restored to rather more, if anything, than its original value with ice, and the advance is continued until, at a very high temperature, chemical dissociation occurs.

Now it is apparent, since heat was supplied all the time during the formation of water from ice, and of steam from water, that, although in both cases no sign was given by the thermometer, absorption must necessarily have taken place. In fact, the heat has been, as it were, secreted, and is called for obvious reasons "latent." This mysterious absorption is explained by scientists on the lines of the Kinetic Theory, but as yet no definite numerical relation has been established to connect the theory with practice. Nevertheless, it is quite real, and to prove its actuality, reference may once more be made to the sensation of cold, which is produced by the evaporation of ether in the palm of the hand. This is solely due to absorption of latent heat.

Any change of state is accompanied by the same phenomenon, and although in some cases it is more pronounced than in others, it is common to all substances. The latent heat of ammonia, for instance, is under corresponding conditions 4.55 times that of carbon dioxide. That is to say, in order to vaporise the latter gas, one need employ only 0.22 of the heat necessary with the former. There are also two values for each different substance; one refers to the latent heat of fusion (*i.e.* melting), and the other to the latent heat of vaporisation. Of these the first-named, in accordance with the Kinetic Theory, is always the smaller.

The other terms used in connection with heat are well known; one British thermal unit, or B.T.U., is the amount of heat necessary to raise the temperature of 1 lb. of water by 1° Fahr. The number of these units required to cause the same rise in 1 lb. of any other substance is known as its "specific heat," and is generally less than unity.

Adopting the B.T.U., definite values can now be assigned to the latent heats of fusion, and vaporisation for each different substance, and by judging these values on the same basis as ordinary or sensible heat, their relative importance will be made clear. Taking the case of water, already discussed, the data necessary are as follows:—

| | |
|---|---|
| Specific heat of ice . . . . . | 0·50 |
| Latent heat of fusion . . . . . | 142 B.T.U's. |
| Specific heat of water (average) . . | 1·00 |
| Latent heat of vaporisation . . . | 966 B.T.U's. |
| Specific heat of steam . . . . | 0·48 |

Working from these figures the quantities of heat necessary for each operation may easily be calculated, as shown in the following table:—

| Physical Form of Substance. | Operation. | Nature of Heat Transferred. | B. T. U.'s Expended. |
|---|---|---|---|
| Ice . . | Heating, 0·32° F. | Sensible | 16 |
| | Melting at 0° F. | Latent | 142 |
| Water . | Heating, 32·212° F. | Sensible | 180 |
| | Vaporisation at 212° F. | Latent | 966 |
| Steam . | Heating, 212° – 244° F. | Sensible | 15·4 |

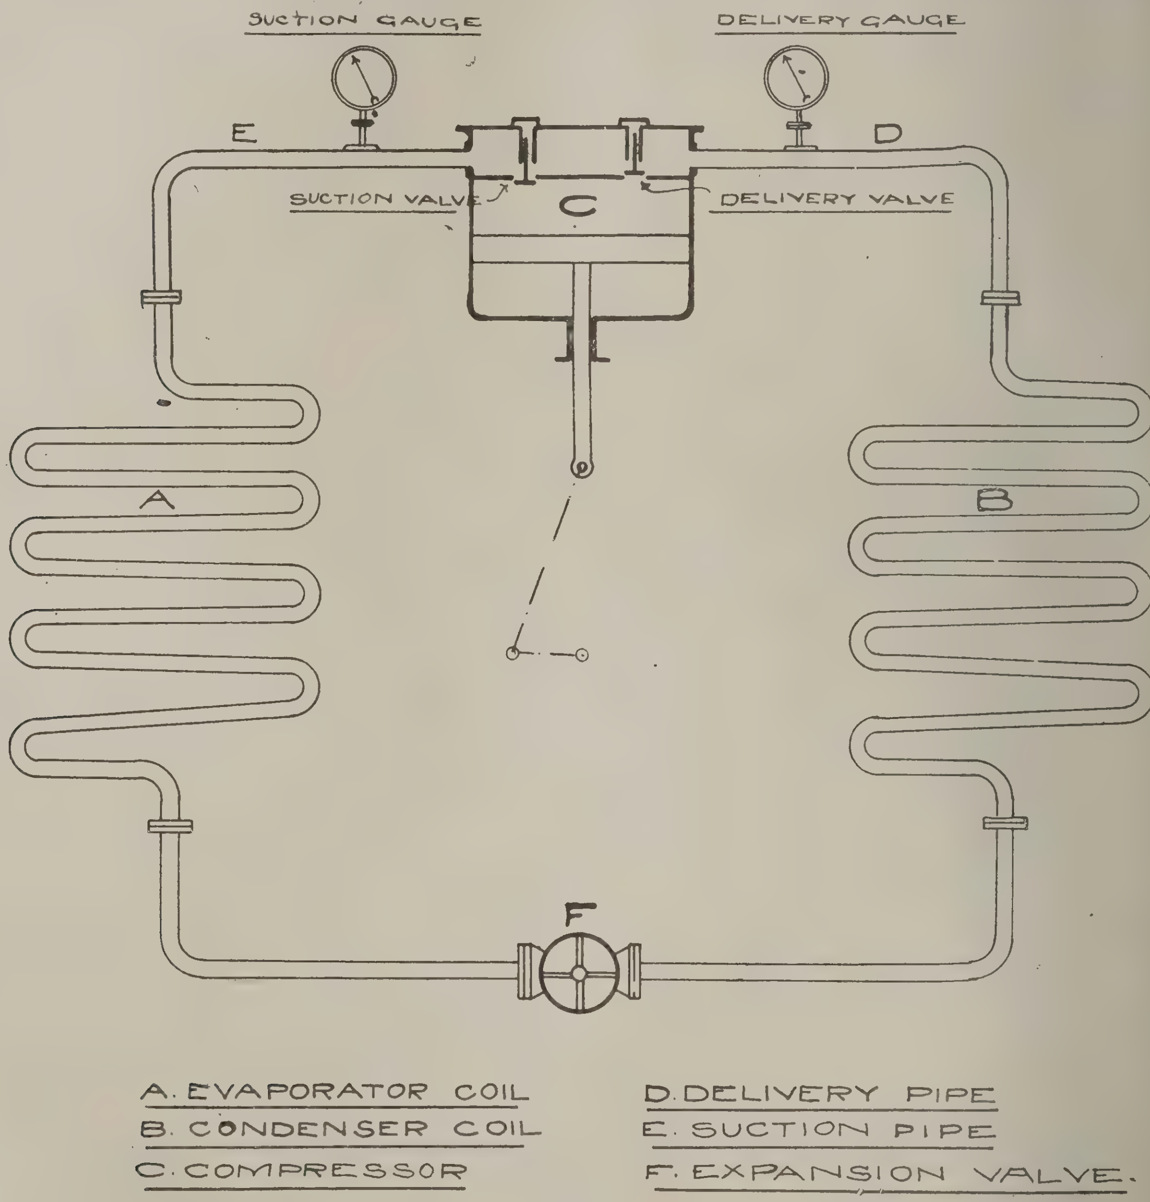

Fig. 11.

The super-heat of the steam has been taken at 32° render its sensible heat comparable with that of the ice.

The table clearly shows that each change of physical sta is accompanied by a large transference of heat. Such a tran ference, needless to say, is the sole aim of refrigeration, an the object of the vapour compression machine is to ensure i practical accomplishment.

The action of this machine, once the importance of late heat has been realised, will be found to be extremely simpl Its principal organs are shown diagrammatically in fig. 1 They are:—

A. Evaporating coil.
B. Condensing coil.
C. Compressor.
D. Delivery pipe.
E. Suction pipe.
F. Expansion valve.

The whole of this system is filled with a volatile substanc vaporous in some parts and liquid in others, which is know technically as the "refrigerant" or "refrigerating medium. That part of it which lies to the right of the compressor an expansion valve is maintained by the former at a high pre sure, which varies, according to the gas employed, from 9 to 35 lbs. per square inch. On the left hand of the centre li its pressure is much lower, and the limits are 380 lbs. p square inch, and zero (*i.e.* equal to the atmosphere).

Immediately to the right of the expansion valve the r frigerant exists as a liquid at the high pressure mentione The result is, that when the valve is slightly opened th volatile liquid spurts into the coil A, and is gradually evap rated at the low pressure there prevailing. During the proce each pound of the refrigerant absorbs a definite quantity latent heat from the surroundings of the coil, and in this wa these can be reduced to a very low temperature. The evap rating coil—which may be placed in a cold store, an ic making tank, or wherever the cooling is required—is ther fore the essential part of the machine, and its other co ponents may be regarded as necessary additions.

In fact, although the compressor, except in absorption plants, must always be used, a machine can be imagined where the condenser is entirely eliminated. Its place would then be taken by a limitless reservoir filled with liquid refrigerant at the required potential. The expansion valve would be fed from this reservoir, evaporation would proceed in the ordinary way, and the gas in the vapour form would be discharged into the atmosphere as waste from the compressor. Such a scheme is, of course, entirely impracticable, as the quantity of refrigerant used would be tremendous. The gas is, therefore, instead of being allowed to escape, compressed into the condensing coil C. Over the coil cold water is flowing continuously, with the result that, aided by the high pressure, the gas is gradually liquefied and arrives finally at the expansion valve, ready to begin the cycle afresh. In this way a continuous round of operations is set up, and theoretically one charge of the refrigerant would last for ever. Unfortunately the ideal is not realised in practice, as small leakages must always occur; but cases have actually been known, with low pressure machines, where the original charge of gas, without renewal, has been used for as long as three years.

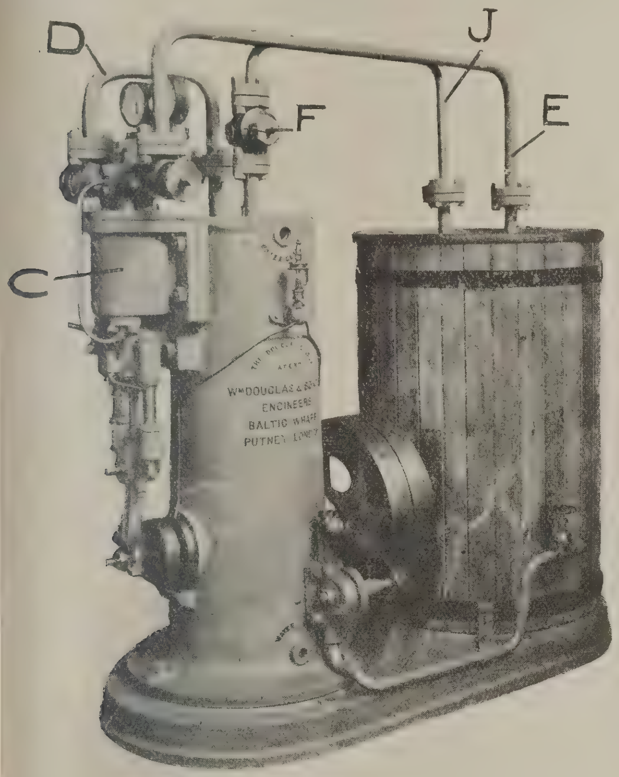

Fig. 12.

The function of the compressor is to maintain the evaporator and condenser at their respective potentials, and to keep the medium in movement round the circuit. At the beginning of the suction stroke an automatic suction valve opens and connects it to the evaporator by the pipe E. During the stroke a corresponding quantity of liquid is vaporised, absorbing the requisite heat, and exactly the same quantity spurts through the expansion valve to take its place. The compression stroke then begins, the suction valve closes, and, when the pressure has risen sufficiently, connection to the condenser is established by means of another automatic valve, and the delivery pipe D. A corresponding volume of the gas is then condensed in the coil B.

A strong analogy exists between the refrigerating machine and the ordinary water-pump. In the latter case water is pumped from a low to a higher level, and in the former, an exactly similar operation is performed, as it were, on heat, the varying levels being replaced by the evaporator and condenser temperatures. Heat is lifted, in fact, from a body at a low temperature (the goods in cold store for instance) to another at a high temperature (the cooling water in the condenser). On the strength of this resemblance the machine has been aptly named the "heat pump."

The practical forms of the vapour-compression machine are legion, but one of the simplest is shown in fig. 12. Here the evaporating coil is circular and is placed in a well insulated tank, filled with unfreezable brine. The condensing coil is similar in shape, and is inside the cast-iron tank seen on the left of the illustration. To one side of this tank is bolted the compressor C, and the driving pulleys which are to take the belt giving power to the compressor will be observed on the opposite side near the base. The cooling water is admitted at the bottom of the tank, and as it absorbs heat from the gas

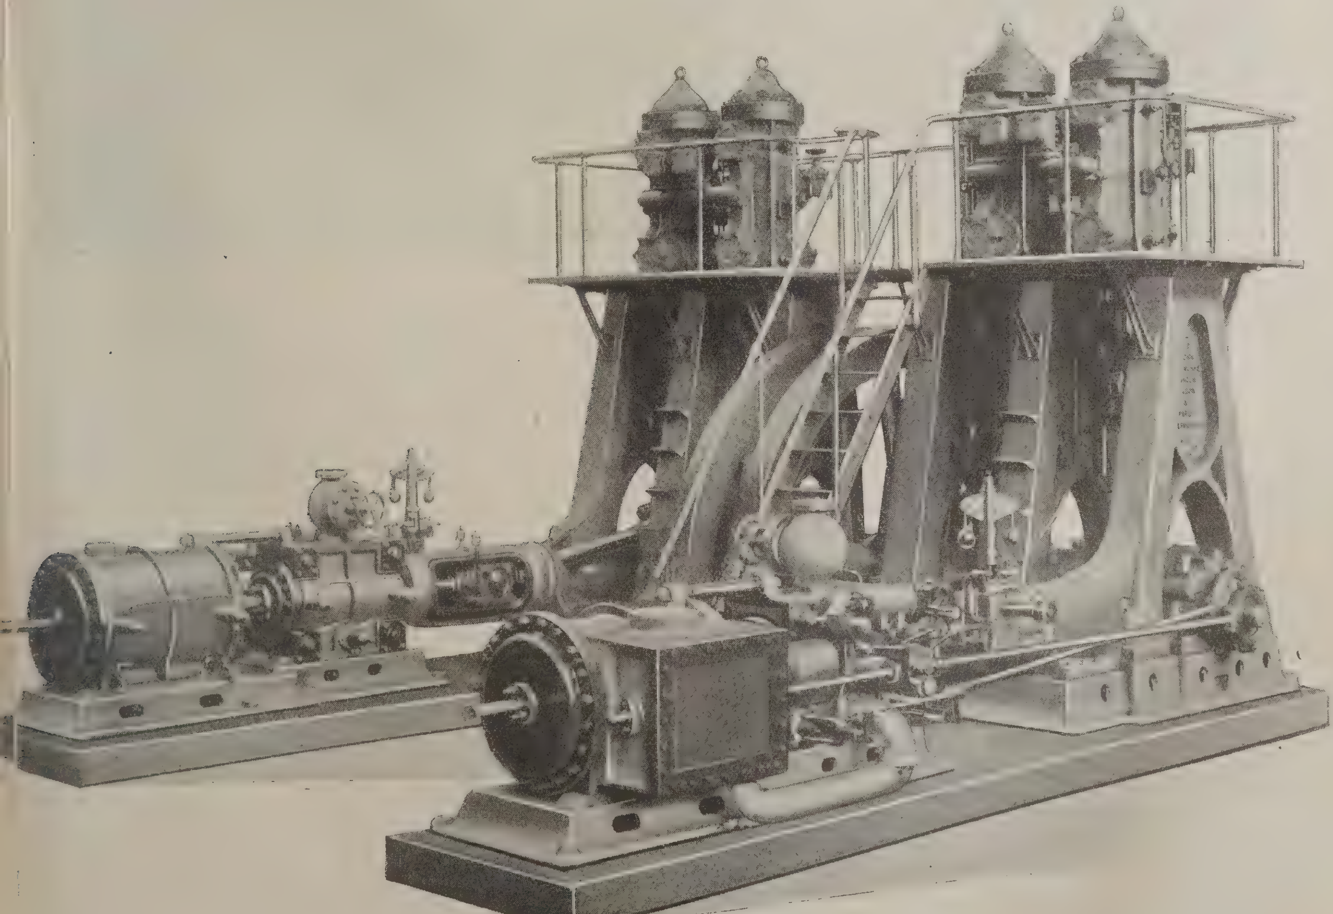

Fig. 13.

inside the coil, rises to the top and overflows into the outlet, thus forming what is known as a "submerged type condenser." Both condenser and evaporator are fixed to a common bed-plate, and the pipe connections are permanently fitted.

The path of the refrigerant is exactly as explained from the skeleton diagram. Leaving the compressing cylinder C at the pressure of the condenser, it passes through the automatic delivery valve, and is conducted by means of the delivery pipe D to the top of the condensing coil. There under the combined action of the high pressure and the cooling water it is gradually liquefied, and, arriving at the bottom, rises by the other leg of the coil to the expansion valve F. This is slightly opened, and the liquid, spurting through, passes by the liquid pipe J to the evaporator, where vaporisation takes place. The low pressure necessary for this operation (zero in the machine illustrated) is maintained by the suction of the compressor, which is connected to the top of the coil by the suction pipe E.

In this system the unfreezable brine contained in the evaporator tank is cooled to the desired temperature by the latent heat absorption into the gas, and is then circulated to and from the point, where the actual refrigeration is to be done, by the brine pump. For this purpose an outlet for cold brine is made in the bottom of the evaporator tank and connected to the suction of the pump. No inlet for the hotter brine returned is necessary, as this can be run in at the top, which is usually left uncovered. The brine pump can be isolated for cleaning or repairs by wheel valves, and the compressor by the shut-off cocks G and H.

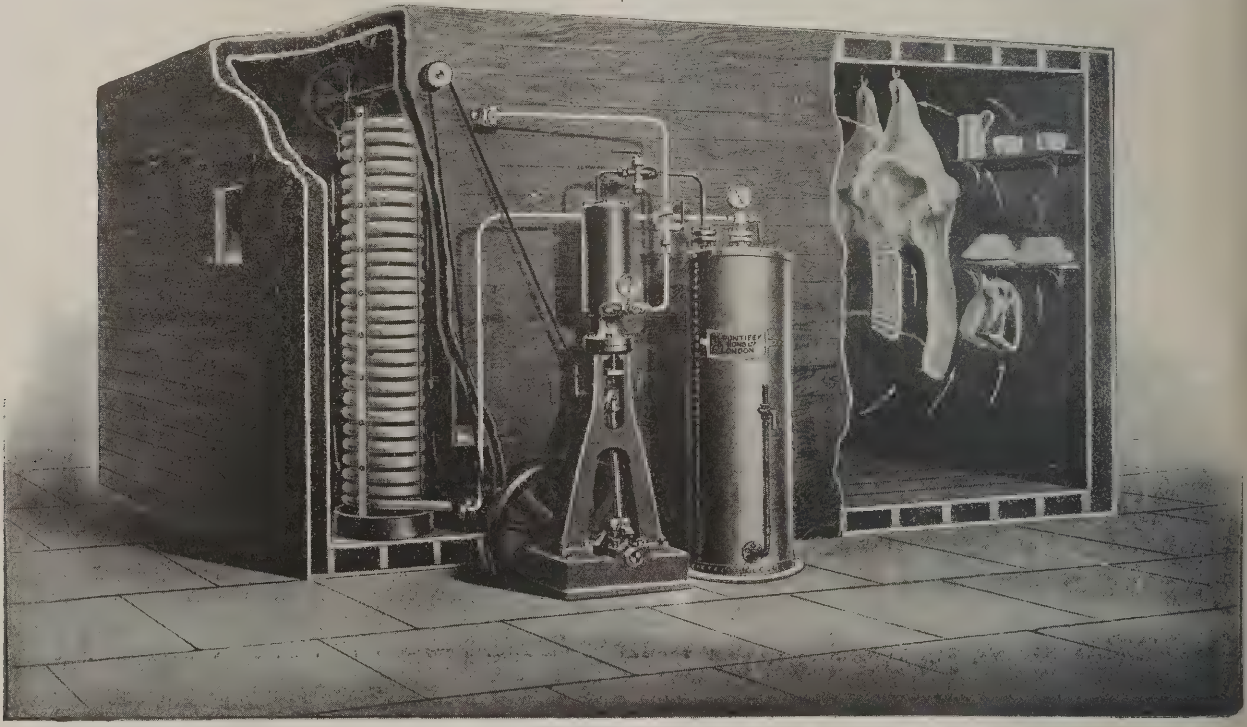

Fig. 14

This machine is one of small size by Messrs. William Douglas & Sons, Ltd., and the refrigerant used is sulphur dioxide. A larger compressor by Messrs. L. Sterne & Co., Ltd., working with ammonia, is illustrated in fig. 13. The four vertical cylinders seen are for compression, and the two horizontal cylinders form direct-driving steam engines. As far as motive power is concerned the plant is therefore self-contained, but the condenser and evaporator—or direct expansion pipes, as the case may be—are necessarily separate.

Evaporators.—The term "evaporator" is usually restricted to insulated tanks, such as that shown in fig. 11, which are filled with unfreezable brine and contain the evaporating coils of the machine. They are employed where it is necessary to have brine circulation, as opposed to direct expansion of the gas. These two systems have different uses, which will be indicated at a later stage, but at present it may be said that the former is employed chiefly for the direct cooling of such liquids as milk, yeast, and beer, marine work generally, and the maintenance of even temperatures in curing-cellars, &c. The brine itself is a solution in water of calcium chloride or chloride of sodium (ordinary salt), in the proportion by weight of 1 to 3. Such solutions have a low freezing point, and may therefore be reduced to low temperatures without fear of solidification. When made up in the above strength the calcium solution will register 34 on a Twaddell's hydrometer, or on the ordinary salinometer 92, and its specific gravity referred to water will be 1.186. For common salt th figures are respectively 38, 100, and 1,196. The freezi point in the first case is —8° F., and in the second zero.

The numbers just given are important, as it is essenti that the brine should never be allowed to drop below its prop density. Should it do so more calcium chloride or salt mu be added until the reading is correct; otherwise the freezi point of the solution will rise and solidification with co sequent blockage take place.

The evaporating coil is made of strong lapwelded tubin well stayed and supported. In larger machines several co centric coils and very often more than one tank are employe distribution from the liquid pipe and collection to the sucti pipe being effected by suitable headers. The tank itself is wrought iron, coated inside with bitumastic paint, and should be insulated with from five to six inches of cowha or silicate cotton, packed between suitable ground pieces a sheeted with a double layer of narrow matching.

Direct Expansion.—The feature of this system is th the cooling effect instead of being transmitted through intermediary, such as brine, is applied directly at the poi where it is required. In this way the evaporator is elim nated, and the vaporising coils, in the case of cold store, f example, abstract latent heat for the gas inside of them fro the air and from the goods themselves. They are no long circular, as in the evaporator, but assume a large variety different forms, according to the disposition of the roo cooled. In some cases they are arranged in grids on the ce ings and walls; in others they are built in stacks, over whi the air is driven by a fan. The system is thus very flexib and its only disadvantage is that there is no accumulati of "cold" such as is attained with brine. At a late sta the significance of this remark will be more fully appreciate

A room cooled by direct expansion is shown in part secti in fig. 14. A circular coil is used over which air is driv by a fan, and continuous circulation is thus established the direction of the arrows. The plant is by Messrs. Pontifex & Sons, Ltd., and their compressor and submerg condenser are seen outside the chamber. Suitable pipe co nections are made to carry the ammonia, which is the frigerant used, and its path throughout the system will easily followed. It differs from the sulphur dioxide pla already described only in the arrangement of the suction pip which is carried to the bottom of the compressing cylind instead of to the top.

It should be noted that the circular coil shown is by means the best for direct expansion cooling. A flat coil wou distribute the air more uniformly and allow of a better shap room. At the same time the coil, of whatever form, shou stand in a tank of brine in order that "cold" may be stor up to be given out when the machine is not running. Th arrangement, with others, will be discussed under "Metho of Cooling."

*(To be continued.)*

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT the last meeting of the Royal Institute of British Architects, on January 31, Mr. Mervyn Macartney ead the following

### Criticism of Drawings submitted for the Institute Prizes and Studentships, 1909-10.

I feel deeply honoured in having been invited to review he works submitted for the Institute prizes and studenthips. It is a privilege as well as an honour; but priviieges, to be worth anything, are generally hedged round with duties, and so it is in this case. To discharge conscientiously this task is no light matter, especially for one, ike myself, who has never entered any of these contests. I have never heard "the bells chime at midnight," nor have I racked my brain for recondite mottoes like "Touchsoane." There is this much to say for these competitions, that I firmly believe that they are awarded by the judges without fear or avour to the design or drawings considered best. I feel ertain that your tribunal is absolutely impartial; and this act must be of enormous value to you when entering these ists. It mitigates the soreness of defeat to know that you have lost because a better man has won. On the other hand, nothing discourages a man more than the feeling that he has been unjustly dealt with, especially when he is young and has not had any experience of the world's wicked ways. We should all be happy to stand in the shoes of the winners, and set out on our travels through the enticing lands which history points out as the birthplaces of our art—to Italy, to Greece, to France, or, less distant, to wander through our own land with all the blithe carelessness of youth, the enthusiasm, the whole-hearted devotion to art. And to those who have failed I would say, you can at least hope to follow them later. Although your work in the present nstance has proved unsuccessful, it will surely, by the experience, by the increase to your knowledge, help to make you cultivated architects. It will do that at the very least; t may also lead you to victory another time.

But, after all, the reward is his who has through months of self-denial carried to completion a definite and difficult piece of work. And the feelings of Gibbon on relinquishing his pen after his labours on "The Decline and Fall of the Roman Empire" are not very dissimilar to those of the weary student who lays down his pencil with his last drawing finished.

I may be allowed to say a word on the value of these competitions. As you all know, architectural education at the Beaux-Arts is almost entirely a matter of "concours," and those, too, of a magnitude that would make most of us greyheaded; but you also know with what results. The great American schools do no less, and their recent achievements are no less astonishing. There may be some disadvantages in this system of education, but they seem to me counterbalanced by its obvious advantages. Apart from the effect on the student of competing with his fellows, and learning from his blunders, and getting rid of all the nonsense he may have imbibed, it prepares him for the wider strife of his later life. Most public buildings nowadays are put to competition, and offer to the young man unequalled opportunities of displaying his ability. I may remind you, too, that it has nearly always been the same; you all know that Brunelleschi was unsuccessful in a certain competition for bronze gates, and yet lived to crown St. Mary-of-the-Flower with a great dome.

It is sometimes objected that these competitions are too academic in character, too much removed from everyday practice to be of much use to the student. From this view I entirely dissent. The exigencies and shifts of real practice will come soon enough, and these academic exercises, while teaching design, give to the intellect an agility to be acquired in no other way; and therefore I congratulate all students whose courage has successfully carried them through a long and arduous undertaking.

Two main branches of work have to be considered—studies of ancient building and original designs. Too much stress cannot be laid on the utility of the first of these studies. In no other way can the student learn to understand architecture as a thing of three dimensions—a thing solid and stable like the rocks and hills; a thing, like these, to stand through years and centuries exposed to the ravening teeth of time. This is one of the most useful lessons the student can learn—that architecture is not paper. By studying ancient buildings he will learn to understand the weights of architectural features, their values. If he analyses the impression made on his mind by a building, he will discover the qualities that made for sound architecture—repose, dignity and unity. However much he is interested in detail, he will find that these are like notes of music, serving merely to build up some grand symphony of sound.

The greatest thinker of the eighteenth century, one whose mind like the very sun irradiated everything, likened architecture to "frozen music." I like this simile, for it seems to crystallise in two words all criticism of great architecture. And no one who has been moved and delighted by some fine building will, I think, be inclined to doubt its truth. So that the student should try to discover the vital qualities in the building he chooses to delineate, and pay more attention to the masses than to the details which only help to build up the main conception. In his drawing out he should endeavour to be as clear and concise as possible, trying to express the spirit of the work—as far as this can be done by geometrical drawing—rather than his own idiosyncrasies.

With the original designs, clear and simple draughting should be striven for. But this is secondary to the design, and the student before entering this phase of his work should have made himself quite clear as to the requirements of the programme. From this brief premise let us pass to a short review of the work itself which has been submitted in the present instance.

The drawings as a whole are not of transcendent excellence. Indeed, I consider that, taking them *en masse*, they are below the average. There are some good examples of draughtsmanship and colour, but they are few. There is little unanimity in the rendering of drawings, which, by the way, adds considerably to the difficulty of judging, and points to the fact that there is at present no definite teaching in this country. There are almost as many styles of drawing as there are candidates. Some are in the French style, but they lag far behind the real thing; others are done in a slap-dash "Art Nouveau" with a Teutonic touch that is rather amusing.

The good old-fashioned type has still its followers. Originality has a certain charm, and has the additional, questionable advantage of attracting attention. This is notably the case in the design "Horseshoe," awarded the second prize in the Soane Medallion competition. But it would be impossible to live in the same house with that perspective.

Now, if one looks at the drawings collected at the Victoria and Albert Museum, one is struck by the sobriety and dignity of the exhibits. There is no attempt to advertise the cleverness of the draughtsman. It is good honest work, and attempts only to render truthfully what it set out to do without any *arrière pensée* of applause. It may be said here that this quiet unobtrusive draughting requires more skill and patience than the slap-dash method. Perhaps the extensive use of perspectives is the cause of this anxiety to shine. Personally I instinctively decline to be drawn by the alluring and meretricious. I should recommend students to leave out all unnecessary details, such as figures and motor cars—the guardsman and nursemaid seem to have had their day, but other figures as ill-advised and as badly drawn have taken their place, which always remind me of the blind man's remark in the New Testament that "he saw men as trees walking"; and as for the motors—no self-respecting inspector would give them a licence.

Taking the awards as they appear in the Institute *Journal*, we have the measured drawings first. The first prize is awarded to the author of a set of drawings showing the Wellington monument, "Roma." The details are beautifully drawn, but the half-inch drawings are less attractive. They lack crispness and decision, but on the whole they make a useful set, although below the average of other years.

The drawings placed second, "François Mansart," are remarkably good. His subject is the Hôtel Carnavalet, Paris, and if the large-scale drawings had been up to the standard of his small drawings it would have come into more serious competition with the winner.

"Adige" was placed third, with drawings of the Palazzo Pompeii and Palazzo della Gran Guardia Vecchia, Verona, but his execution lacked crispness and did not rise to his high theme.

Two sets of the West Front of St. Paul's were submitted, both conscientiously drawn. Those by "Puggins" are extremely accurate, and I would impress on students the necessity for absolute correctness. Another set shows Christ Church, Spitalfields—a rather gaunt looking subject when shown in grim outline of black and white. This last competitor would be well advised to consult the conditions more closely in future. He will find that six strainers are required, and if his drawings had been adjudged the best he would have been placed *hors concours*.

The next prize on the list—the Soane Medallion—is the most important, and although the subject of the competition was an inspiring one, it has not called forth any great merit. The fault lies to some extent in the conditions themselves, as perhaps the boundary of the site was too confined. However, the first two designs are good. The first, "Mirth," is a good sober study of Renaissance work, very well worked out, but indifferently drawn; a serious omission in the plan is the absence of a foyer. The perspective, however, does justice to the design; indeed, it is quite the best in the exhibition. The second, "Horseshoe," is an extremely clever design, but I fear in execution its crowning feature would be lost. Its clever perspective has been mentioned above. "Sunlight and Air" submits a design worked out with a French flavour. The effect in perspective is not quite happy. An imaginative study, cleverly rendered, is drawn by "L'Espoir." "Mafie's" drawings are extremely interesting, but the design fails as a whole. If it is allowed, I should recommend the author of "Budget" to retire quietly into political life.

Three sets of drawings were submitted for the Owen Jones Studentship, and the prize is awarded to Mr. W. O. Miller, whose work deserves great admiration, but it is regrettable that he did not choose a better illustration of modern work than the façade of the church of SS. Pudentiæ and Pudentianæ at Rome, the front of which has been covered in modern fresco decoration in imitation of mosaic. I endorse the recommendation that the sets of strainers submitted by Mr. H. R. Wilkinson should have some award. Mr. Gibbons should be commended for the most painstaking and careful drawing he has made of the Italian mosaic pavement from the Presbytery of Westminster Abbey, especially as the whole was drawn and coloured on the spot.

The drawings submitted for the Pugin Prize are on the whole very good. Mr. Hubert Frazer, who is awarded the prize, has an excellent variety of drawings clearly and well done. The two gentlemen, Messrs. Chisholm and Cowper, bracketed for second place have also done good work.

Thirteen competitors submitted designs for the Tite Prize. There seems to have been some misconception in their minds as to the kind of loggie best suited to the site. Here, again, if we may say so, the conditions were faulty. One has only to consider the size of the sunk garden—actually about one tenth of the area of Lincoln's Inn Fields—to see this. In spite of this confined area the bulk of the competitors choose to shut it in with raised loggie, which in reality would have a poor crowded effect. None of the designs was considered to possess sufficient merit to warrant the prize being awarded, and it is therefore withheld. The most meritorious scheme, "Jupiter," offers no obstruction. The sunk space (it cannot be called a garden) is surrounded by a terrace raised a little above the level of the street, and the corners are marked by raised shelters—quite a needless addition. His drawing is only fairly good, and his perspective is bad. "Tomahawk," placed second, has no obstruction opposite the palace, although he has surrounded the other three sides with screens. The triumphal arches at the sides are too heavy and quite out of place. "Comprised Within" is placed third, with a rather careless set of drawings. The perspective is the best of them. Most of these drawings are very much below the usual standard of the work in this competition.

Mr. C. D. Carus-Wilson is awarded the Arthur Cates Prize for some excellent drawings. His design for a country house is also good, at least as far as the exterior is concerned; the plan is poor. Mr. William Dean is commended for his drawings of the staircase of Cromwell House, which are extremely vigorous and crisp.

The Grissell Gold Medal is awarded to "Fra Angelico" for a fairly good study of a church in ferro-concrete. His competitor is commended for his constructive ability. The architecture is of a nondescript and futile character, and the perspective distinctly poor. Mr. W. Milburn, junior, has been awarded the Godwin Bursary in view of the convincing nature of his essay and knowledge of hospital work.

In conclusion I should like to say one word more to students. I have said above that the task of the judges is made extremely difficult by the fact that the drawings are finished in every conceivable style—shadows projected on plan till the scheme is hidden, others coloured like a kaleidoscope, and elevations treated in a hundred different and confusing ways. I should recommend students to alter all this and to finish their drawings simply in pen and ink, and to figure titles, names of rooms, &c., in legible and fair Roman lettering. I hope to see this embodied as a definite requirement in the instructions to competitors in the future. When a perspective is required it is obviously useless to project shadows on elevation. Do not imagine that it is easy to make a fine set of drawings i pen and ink—far from it; but it is by far the clearest and bes way of exposing a design.

Professor Reginald Blomfield, A.R.A., proposed a join vote of thanks to the President and to Mr. Macartney fo his critical notes. He hoped every student would read an re-read the President's address. It was direct and sincere kindly and sympathetic, and ought to be considered as sort of pilgrims' scrip. The only point he questioned wa the one in which reference was made to games, with quotations from Sir William Richmond and Mr. Rudyar Kipling. Speaking as an Englishman, Professor Blomfiel said the objection to sport proceeded from a misapprehension of some of the qualities of the English race. They hear too much of the professional man, and he did not think the could afford to lose sight of that splendid ideal of the Greek which combined intellectual attainment with perfection o the human form. In referring to Mr. Macartney's criticisms, he said he considered the gentlemen who framed th conditions of the competitions did not give sufficient elbow room to the designers, though it was perfectly true in regar to draughtsmanship that the English methods neede standardisation. He could not agree that this year's wor was not up to the average, and believed it to be well up t the standard of other years.

Sir W. B. Richmond, R.A., seconded the motion, an asked to be allowed to congratulate the Royal Academy o Mr. George's election to that institution, and he hoped th time would come when they would have more architects i its membership. He agreed entirely with the strictures th President had made upon games, but he believed in them As a young man he had joined in sport, and was therefor perhaps better able to judge of its dangers, for it involve a tremendous amount of wasted energy. Referring to th colouring of Greek architecture, he said the colours the used were not the same gaudy tones that would be use to-day, for the Greeks were too great lovers of form to us aggressive colours; and he maintained that architecture however pure, however exquisite in treatment and refine in design, was not injured, and could be enormously improved by a judicious use of colour.

The President then distributed the prizes and studentships to the successful competitors, the full list of whom was published in *The Architect* of January 21.

It was announced that a special general meeting woul be held on Monday evening next, February 7, to consider th revised regulations for architectural competitions, and als to sanction the alterations in the by-laws recommended b the Privy Council and the solicitors of the Institute.

## ILLUSTRATIONS.

### DODFORD CHURCH, AND "THE TOWER," FROM THE NORTH-WEST

THIS view shows the connection of the church and the house at Dodford, of which Mr. Arthu Bartlett is the architect.

### CATHEDRAL SERIES, LLANDAFF.—THE CHOIR EASTWARDS.

WE give this week a view of the interior of the choir looking eastwards.

### THE CHAIN GATEWAY, WELLS CATHEDRAL.

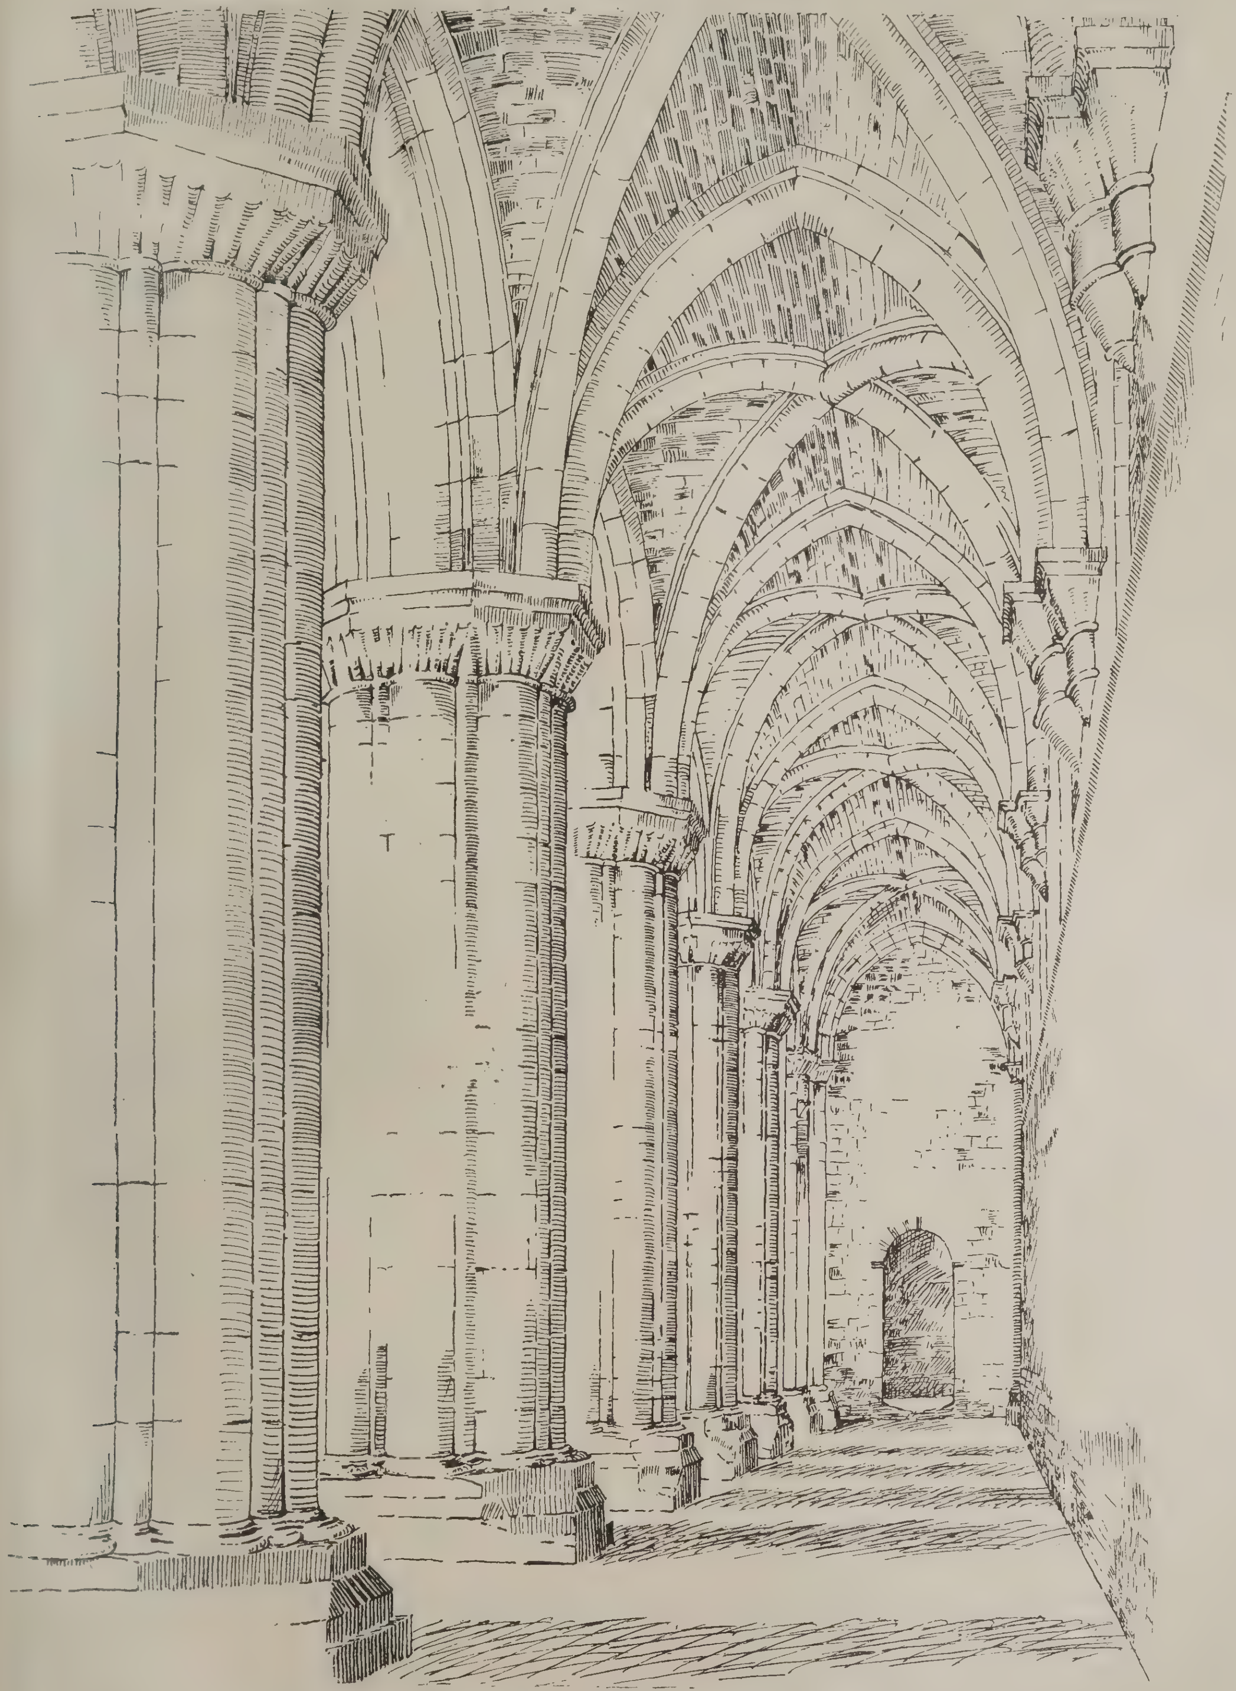
THIS week we present the section in the series o measured drawings by Mr. Westbye, which wil be completed in our next issue with some large scal detail of the mouldings.

## COMPETITIONS.

Bromley (Kent).—The following architects have bee invited by the trustees and managers to submit designs in limited competition for public elementary (Church) school to be erected at Mason's Hill, Bromley:—Mr. H. W. Burrows, Mr. Evelyn Hellicar, Mr. H. R. Latter, Messrs Russell & Cooper, Mr. C. H. B. Quennell. The assesso appointed is Mr. H. P. Burke Downing, F.R.I.B.A., o 12 Little College Street, Westminster Abbey, S.W.

London.—The design of Mr. James Miller, A.R.S.A. architect, Glasgow, has been selected for the new premises o the Institution of Civil Engineers, London. Some month ago the Institution invited six firms of architects to compete each receiving a premium of 200 guineas. The scheme wil involve an expenditure of over 100,000*l*. The site is in Grea George Street, Westminster, near the entrance to St. James' Park.

## "THE ARCHITECT" 'STUDENTS' SKETCHING AND MEASURING CLUB.



THE SOUTH AISLE, KIRKSTALL ABBEY.—Prize Drawing for January by "ESEK."

KIRKSTALL ABBEY was founded about 1152 A.D. by one HENRY DE LACY, and was erected by Cistercian ionks—the plan being typical of the Order—who came om Fountains Abbey, Yorkshire. It is interesting to ote in passing that when this HENRY was persuaded or ecided to lay the foundation of an abbey he consulted e Abbot of Fountains about 1145, and gave land at arnoldswick, near Skipton, for the purpose.

Twelve monks and twelve lay brethren were sent out and erected some buildings (probably consisting of presbytery and monks' and lay brethren's quarters), which they occupied for about seven years; but times were troublesome, and they were so continually harassed by lawless bands that they eventually pulled down the buildings and returned to Fountains.

Some time later the abbot in charge of these monks visited Airedale, and thought Kirkstall a suitable site, so Henry de Lacy arranged for the land with the Duke of Norfolk, and the present ruins show what a great work was accomplished. The plan is very wisely arranged: a cloister court with buildings around, the abbey on the north, chapter-house and monks' quarters on the east, lay brethren's quarters to the west, and refectory, kitchen, &c., to the south. The infirmary and abbot's lodging are to the south-east, and connected to the cloister by passages.

The first portions to be built were the presbytery, kitchen, refectory, monks' and lay brethren's quarters; then part of the chapter-house and nave and transepts. This part of the chapter-house was evidently built before the nave and aisles, as semi-circular vaulting ribs are used diagonally and transversely, while in the aisles pointed arches are used transversely.

About the end of the twelfth century the kitchen was enlarged, and refectory turned with its short sides north and south.

In the early thirteenth century an addition was made to the chapter-house, especially interesting as it shows the confidence and experience gained in vaulting, the whole span being covered without intermediate supports. About this time a portion of the abbot's lodging was built and part of the infirmary, both being completed and connected to the cloister towards the end of this century.

In the fourteenth century little was done beyond quarters for visiting abbots.

A new east window covering nearly the whole of the east wall of the presbytery was inserted in the fifteenth century, but no tracery remains. The tower was built prior to the suppression of the monasteries, and it is supposed that the monks, in anticipation of this suppression, built the tower to dispose of their accumulated wealth. In any case it appears to have been erected without much thought, as the foundations were not designed to carry such weight, and consequently collapsed.

The elevations are treated in the simple Romanesque style, with little ornament except to the doorways, yet the grouping of the various parts is so arranged that it gives a sense of dignity and grandeur to the whole conception.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. H. Tanner, F.R.I.B.A. (president), in the chair.

Messrs. E. C. Hallett, C. G. Simmons, P. Streitberger, and L. W. Baker were elected as members.

The President announced the third spring visit, fixed for February 12, to the new Y.M.C.A. building in Tottenham Court Road, by kind permission of the architect, Mr. Rowland Plumbe. Members to meet at the building at 1.30 p.m. A visit will afterwards be paid to the British Museum extensions at 2.30 p.m., by kind permission of the architect, Mr. J. J. Burnet.

The President said at the next meeting of the Camera and Sketching Club, on February 17, at 7.30 p.m., Mr. Michael Bunney would read a paper entitled "Georgian Architecture."

Mr. W. H. Ward read the following paper, illustrated by lantern views, entitled—

### Renaissance Church Architecture of the Sixteenth Century in France.

France in the sixteenth century, he said, offers the picture of the union of two architectures, so different in their aims and in their forms as to seem irreconcilable. Yet, as is often the case in a marriage between persons of strongly diverse characters, the union was not unhappy in its results, each party to it supplying elements which are lacking in the other. The products of the combination are so rich, so vigorous, so varied, and their development, though so often baulked by events, so rapid, that few more fascinating studies can be found in the history of architecture, and it will repay perhaps more than is usually thought to push the study even into such bypaths of the subject as that which forms the theme of this paper. It is a commonplace that the history of architecture is in most countries and ages the history of religious architecture. In the Middle Ages if church architecture were eliminated, nothing coherent, or indeed very important, would be left. But, at the time of the Renaissance, western Europe had largely outgrown the tutelage of the Church, the hitherto all-embracing institution, the all-pervading medium in which its life had moved. The idea of nationality was developing, and in England, Spain, and France the focus of national life was becoming a strong centralised monarchy. The architectural expression of this state of affairs is to be found, therefore, in secular building, and more particularly in the dwellings of the Sovereign and his court. The architecture of France in the sixteenth century is essentially an architecture of châteaux, of the pleasure-houses of a still half-feudal aristocracy. Church architecture is thus a bypath, but a pleasant and withal an instructive path to trace out.

Since, for brevity, it is convenient to indicate phases of style by the names of kings, I will at this point define the sense in which I use these names. The Louis XII. style is the transition from Gothic to Renaissance, in which elements from both schools are intermingled capriciously and without system; the Renaissance elements are chiefly decorative, and do not affect the structure. The Francis I. style corresponds with the Early Renaissance of Lombardy, which supplies its graceful and exuberant decorative system, but the structure is still in essentials unchanged. The Henry II. style corresponds with the advanced, or Roman Renaissance, which not only brings with it a more masculine code of forms governed by stricter rules, but usually exerts an influence on the design as a whole both in plan and elevation.

These definitions apply to all branches of architecture, but in dealing with church work further distinctions must be made. First, when the Francis I. style was fully established and its detail thoroughly understood, Gothic ideas persisted in the Church in conjunction with it far more than in secular work. Thus, for instance, the occurrence of a pointed window in a château would generally be sufficient for it to be classed as Louis XII., but in a church it might be found at any period almost up to the eighteenth century, and would be treated in contemporary detail. Secondly, the term "Henry II. style" may, more especially in church work, cover two very different classes of design; one, in which the influence of the advanced Renaissance is confined merely to a use of the Orders and a mode of profiling more correct according to contemporary Italian standards, and another in which the whole building is designed on Classical lines.

It is much more difficult to present a picture of church architecture in the sixteenth century than of contemporary secular architecture, because there is no large number either of extant buildings, of illustrations of destroyed ones, or o unexecuted designs, and, what is worse, no consecutive series of complete examples at all. If we except a short list o approximately complete buildings, a history of the style mus be compiled chiefly from additions and embellishments t Gothic churches—here a chapel, there a transept, elsewhere a vault or a portal, a tomb, a screen, or a reredos. We can but guess at the manner in which an architect of the second or third generation of the Renaissance would conceive a entire church, while the buildings of the first generation ar so few that the possibilities of style development which they seemed to promise were never fully worked out.

Yet if we examine the conditions under which this wor took shape, we shall be surprised that so much rather than s little was accomplished. If we consider the state of th Church, we see that, while politically she was increasingly subject to the civil power, morally as well as intellectually she was no longer the only, perhaps not even the principa leader. She might, however, have yet played an importan part in the pageant of architecture but for two circumstance —the building activity of the Middle Ages had left th country amply equipped with places of worship, and th internal condition of the Church was far from satisfactory The first of these propositions needs no amplification. Th second is shown by the fact that French Catholicism produce during the sixteenth century no conspicuous saint or theo logian except such as had leanings towards unorthodoxy. Th clergy were permeated with worldliness and superstition, an the most prominent churchmen were chiefly distinguishe either for secular learning and political ability, or for thei persecuting zeal. Meanwhile the operative forces of religiou life were, on the whole, to be found among the Reformers who were being forced by the prevailing repressive policy t form themselves into independent organisations. This stat of affairs was only temporary. In the seventeenth century when the counter-Reformation had done its work, the Frenc Church entered upon a new period of progress, and wa second to none in the piety, zeal, and learning of her divines. In the sixteenth, however, she had neither the need nor the moral impetus for building on a great scale.

If we turn, on the other hand, to the nascent Reformed churches, we find them even less favourably situated. The Reformation was not refractory to classical influences, and, at any rate, in its earlier stages went hand-in-hand with Humanism. Their architecture would thus naturally have assumed a Renaissance colour. But till the time of Henry IV. Protestants never received more than the barest toleration, and seldom even that. At the same time their numbers were smaller and their needs simpler than those of the Catholics. In rare cases existing churches were assigned to their use; more frequently they had to be content to meet in private dwellings, in buildings lent by some nobleman "of the religion," or in the open air, happy if their devotions were not disturbed by bloodshed. Some places of worship were erected *ad hoc*; others arranged by fitting up secular buildings, such as barns, with galleries. All were swept away by one or other of the contemporary bursts of fanaticism, or, at latest, did not long survive the Revocation of the Edict of Nantes (1684). There appears to be but one exception extant—a graceful Renaissance edifice in the abandoned city of Les Baux in Provence, which was probably erected as a Protestant chapel. The reaction against ceremonialism and superstitious practices naturally generated an iconoclastic spirit, under the influence of which buildings and their adjuncts associated with the Roman cult suffered at the hands of zealots. The period of civil and religious strife in the latter portion of the century was, in fact, a destructive rather than a creative one.

It has often been remarked that men are most conservative in matters of religion; in this respect architecture is no exception, and mediæval methods died hard in France. On general grounds it was to be expected that the resistance to a classic revival would be strongest in the cradle of Gothic art. More especially would French church architecture, whose development had been the inspiring idea of Gothic art, be its last stronghold. Accordingly, we find that side by side with the new tendencies pure, or all but pure, Gothic designs persisted in much church work of the first half of the sixteenth century. Some parish churches and large portions of several of the cathedrals commenced under Louis XII., and not finished till the reign of Henry II., are cases in point. Even beyond this period, when Renaissance forms had become as firmly established in religious architecture as elsewhere, sporadic instances of Gothic design are by no means rare. St. Merry in Paris (1520-1612) shows hardly a trace of them. The Gothic cathedral of Orleans was only begun under Henry IV., and its pseudo-Gothic west front not built till the reign of Louis XV.

As in secular architecture, the Renaissance movement spread from the top downward. The most strenuous opposition to innovation would seem to have come from the conservatism of the craftsmen specially attached to the service of the Church and trained by hereditary traditions of construction and technique, and from the lower clergy, often poor, ignorant, and superstitious. On the other hand, the heads of the profession, the great master masons of the cathedrals, seem to have been ready to accept hints from Italy. Thus Martin Chambige and Rouland le Roux, both members of dynasties of "maîtres des œuvres," who carried out important works, the former at Sens and Beauvais and the latter at Rouen, introduced Renaissance elements into them, or allowed the craftsmen under them to do so. Similarly the heads of the Church—that is, those among the clergy who were most open to new ideas—were just those who came most in contact with Italy. The relations between the French Church and the Holy See produced a constant interchange of visits. French clerics of standing usually journeyed at least once to Rome, and great political churchmen, such as the Cardinal of Amboise, the builder of Gaillon, and his nephew, or Cardinal Ippolito of Este, passed continuously to and fro. Again, French benefices were a convenient provision for Italian younger sons and "nephews" of popes and cardinals; these prelates often considered their duties discharged when they had drawn the revenues, but the personal belongings and church paraphernalia of those who did reside would be a revelation to their French neighbours, even when they did not directly introduce Italian artists or architects.

The field of possible Renaissance influence in church architecture is thus confined to the relatively small amount of work undertaken by Catholics, and a portion only of that. Church building was no longer a popular enthusiasm. Though it was occasionally paid for out of municipal funds, or by public subscription, it was more often due to the bounty or vanity of the rich. Nobles, lay and ecclesiastical, officials or wealthy "bourgeois," would provide a parish in which they were interested with a new church, or build themselves a private chapel or mausoleum. The bishops had lost the taste for lengthy constructions, and preferred to undertake something of moderate compass, which they might hope to see completed in their lifetime, such as a steeple, a doorway, a set of screens.

The comparative rarity of examples may account for the unfamiliarity of the subject; and this unfamiliarity may be partly responsible for the contemptuous manner in which the few examples generally known, beautiful as they are, have too often been dismissed as grotesque freaks or necessarily unsuccessful attempts to compass the impossible. To the structural appropriateness of classical forms there is often ground enough for objection, but it should not be forgotten in estimating at least French and Italian Renaissance churches that a possible evolution, such as that which took place in the Middle Ages, was arrested by foreign invasions, civil wars, and other disasters before complete assimilation could take place.

But the hostile attitude alluded to is also partly due to an assumed antagonism between classical forms and Christian worship, a view which seems to ignore the fact that all Christian architecture derives ultimately from a classical source, and that the nearer it is to the age of primitive Christianity the more classical it is. A High Church lady once told me that she could not worship in Marylebone parish church because it was so like a pagan temple. Could she have been transported to the second or third century she would have found no place fit to worship in at all. In the sixteenth century few educated people would have shared her opinion. The introduction of allusions to classical mythology is also freely condemned; but even here, grotesque as they may appear to us, it is hardly extravagant to recognise manifestations of a wider outlook on history which the recovery of a knowledge of antiquity brought with it. At a period when the subtlest minds were striving to harmonise ecclesiastical and pagan conceptions of the universe—a task with which Dante had busied himself two centuries earlier—when Marsilio Ficino was attempting to reconcile the philosophy of Plato with the teachings of Our Lord, when Leonardo da Vinci was painting John the Baptist with the attributes of Dionysus, these heathen allusions did not shock the faithful. All antiquity was in their eyes a part of the divine plan of the world's government, and equally available with the Scriptures and the lives of the saints for the illustration of moral and theological truths. Parallels were found without difficulty—Hercules with his club figured side by side with Samson and the ass's jaw, amorini were hard to distinguish from cherubs, satyrs from devils, or the queen of the gods from the Queen of Heaven. The ancients might have been pagans, but it was quite possible, "avec un peu de bonne volonté," to believe that their mythology was but an imperfect foreshadowing of Christian doctrine, and since in other things there was so much to be learnt from them, allowance might be made for the moral shortcomings of their divinities; in any case they were quite as edifying as the broad jests with which irreverent mediæval sculptors had decorated gargoyle and miserere. The Renaissance sculptor may have been pedantic when he represented God the Father with the attributes of Jove the Thunderer, but he was conscious of no more incongruity in doing so than the artists of the catacombs who portrayed the Saviour in the guise of Orpheus. It must not, however, be supposed that pagan elements, as distinct from definitely architectural forms, played a leading part in the decoration of churches. Everywhere scriptural and hagiological subjects predominated, together with emblems illustrative of theology and worship; they were merely expressed in a new manner.

Whatever view may be taken of the reimportation of classical forms into church architecture, there can be no question that it was inevitable. No institution forming a vital part of national life can remain unaffected by its intellectual environment, and church builders had to assimilate the humanistic tastes which were permeating the whole of educated society. In doing this they were confronted with the same problems as the castle-builders—the clothing of a mediæval framework in a modern dress; but there was this difference, that whereas in the castle the reason of its being—its fortification—was growing obsolete, and some semblance of it was retained only from habit and for sentimental reasons, in the church the functions were unaltered, and no change in essential arrangements was tolerated.

The architecture of the Church was thus, like all contemporary architecture, a compromise between French and Italian methods. It differed in retaining throughout a larger proportion of the essentially native element. The great interest in studying it is to trace out the way in which the builders set to work to translate traditional details, features, and types of composition into a new form-language as fast as they learnt it. It is curious to observe to what different results these attempts led; not only how they differed from decade to decade, but how simultaneous attempts differed from each other. This is due to differences not so much in the taste as in the cast of intellect of the designer. A man with an aptitude for grasping the grammatical principles of a language, but a poor head for vocabulary, will soon know how to construct sentences in a foreign tongue, but will have to fall back on his own for words. He is, however, a less common type than the man who can pick up words parrot-like and learn to speak a foreign language, fluently perhaps, but ungrammatically. Thus, in architecture we see more examples of rapid advance in forms keeping pace with the changes in fashion, but employed to express old types of design, than of a quick grasp of new general principles of design; and when the latter occur they are not always up to date in detail.

I hope to illustrate by slides some of these stages of development, together with others of an intermediate character. In the course of these translations we shall see some merely curious, or even grotesque results; but, on the other hand, many charming and ingenious ones, full of suggestion even to-day, which may well fill us with regret that various causes, and in particular the Wars of Religion which raged for thirty years in the latter half of the century, should have arrested the course of development, and that when development began again in the reorganising era of the seventeenth century it should have been inspired by quite another order of ideas.

(*To be concluded.*)

## THE JOINER'S CRAFT.*

### *General Introduction.*

THE subject chosen for me to address you upon to-night is that of the joiner's craft. When this subject was communicated to me I confess I accepted it with considerable pleasure, for if there is one thing that interests us all it is English woodwork, upon which we, as a nation, pride ourselves.

But when I found that my lecture was to be preceded by a lecture on carpentry it at once became necessary to consider how much of English woodwork strictly belonged to carpentry and how much to joinery.

Of course, the whole of the woodwork of mediæval times belongs to the carpenter; the term "master carpenter" is quite frequently met with, and there is no mention whatever of the joiner. I came to the conclusion, however, that I could safely go back to the beginning of the time of Elizabeth.

Then, in the course of my researches I came upon the record of a controversy which took place about two centuries ago between the members of the Carpenters' Company of those days and a newly incorporated guild, calling themselves the Joiners' Company, which was submitted to the judgment of the Court of Aldermen of the City of London. Curiously enough, the matter in dispute was then—as now—as to what work properly belonged to the carpenter and what to the joiner.

Now, the case for the carpenters was set out in the following terms, curiously worded and quaintly spelt:—

"The originall Charter of the Company of Joyners makes no mention what is their worke or what is not the worke of the carpenters. The statute of Elizabeth makes no mention at all nor speaks a tittle of a joyner, as it doth expressly mention the carpenter, turner, sawyer, and other trades and arts; therefore it is inferred that ye imployement of ye joyner is included in the carpenters' trade and mystery an so hath been promiscuously used and practised by one person. And without question the joyners' trade before incorporation was chiefly to make and sell joyned ware as bedsteads, tables, chaires, stools, &c., and not to doe any other work about the building of houses but what the carpenters employed them in (and this the carpenters did for expedition only), the carpenters themselves generally doing those works they employed the joyners in."

All this took place in 1675, the year of the laying of the first stone of St. Paul's Cathedral, and the joiner, as we
know him to-day, was apparently not yet, and all the best o
tradition passing by—bedsteads, tables, chairs, and stools.
really began to think that I should have to come and tell yo
that joinery proper commenced somewhere about the yea
1700, and that it suffered an existence only during a rathe
dull eighteenth century and a dreadfully dull nineteent
century.

But, after all, is this quite fair to the joiner? For if w
set aside all landmarks and consider the traditions of Eng
lish woodwork and enquire how it was done and by whom
I think we shall in the end find a more extended place i
history for him. Let us shortly examine all woodwor
which (if it were executed to-day) would be the work of th
joiner.

Now we find in the course of history that the crafts o
this country have received two strong artistic impulses, whic
have had very far-reaching effects. The first came fro
France and gave an impetus which resulted in three cen
turies of mediæval craftsmanship, during which th
ecclesiastical type of work was the style, not only of th
church work of the country, but also of the ordinary ever
day work of the period. The second impulse came fro
Italy, and resulted in three centuries of Renaissance craft
manship, during which the fifteenth century revival of le
ters in Italy began to influence this ecclesiastical type o
work in England, and finally displaced it by a style of wo
termed "Renaissance," the character of the work and th
mode of execution differing essentially in the two periods.

### *Mediæval.*

Now, in the mediæval period, the thirteenth, fourteent
and fifteenth centuries, stone was the chief material, a
woodwork follows stonework forms very closely, and, li
stone, it is worked out of the solid.

There is very little woodwork remaining of the earli
part of this period with the exception of roofs, porches, &
which very properly belong exclusively to the carpenter, a
were dealt with by Mr. Banister Fletcher last week.

One of the oldest pieces of joinery in the kingdom is t
Coronation Chair at Westminster Abbey. It belongs to t
great Edwardian period and exhibits the quatrefoil in t
lower part and the trefoil arches in the upper part.

The influence of the stone form is clearly seen by co
paring the chair with the stone screen behind.

The choir stalls and pulpit at Winchester Cathedr
also show the stone influence, for here the panelling behi
the stalls represents a stone-traceried window, while t
canopy above is essentially lithic in character with a slend
central mullion. The same may be said of the open-foil
parapet above: the rich pulpit with canopy on the right
of course, of later date.

The screen to the "Spring pew," at Lavenham Churc
Suffolk, is a delightful example, in which the craftsm
has revelled in producing beautiful form. It is impossi
to imagine anything richer than the tracery of the f
vaulting and pinnacle work of the upper portion.

The ecclesiastical work of this period is very rich in e
borate craftsmanship, and the Bishop's throne and stalls
Exeter are among the most elaborate we possess. Nothi
could well be richer than these foliated arches with ri
cusping, crockets, pinnacles, buttresses, finials.

The pew end from the choir at Beverley Minster is
example of a Perpendicular window reproduced in stone w
transomes, mullions and foliated openings. The carv
angel and poppy are excellent examples of mediæval carvi

The joinery of the period was often enriched with pai
ing, and the screen at Kersey, Suffolk, is a charming
ample. The quatrefoil openings below with engaged shie
and the traceried openings above, with foliated cusping,
Gothic windows in wood, between which the wood mullion
formed as a buttress, the painting taking the place of stai
glass.

Richness of craftsmanship knew no bounds, and
elaborate font cover at All Saints Church, Sudbury, is
Gothic spire of the richest type in miniature translated i
wood. At each stage are pointed tracery windows, buttress
and pinnacles, the whole being crowned by a pointed sp
with carved crockets.

The fifteenth century is, indeed, remarkable for its wea
of woodwork, and the rood-screen at Atherington, in Dev
shire, shows how the traditional design was steadfastly
hered to: each division is an open traceried window, be
which is represented wall panelling and above are porti
of fan vaulting with ribs and panels of wood. The rood-l
over is even richer in treatment on the lines of the lo
portion.

---

* A lecture delivered at Carpenters' Hall on February 2 by Sir A. Brumwell Thomas.

### *Early Renaissance.*

We now come to the sixteenth century, which marks the beginning of the Renaissance. Wolsey with his enormous wealth and love of beautiful things is outdone by the king himself, who inherited a vast amount of money accumulated by his parsimonious father, King Henry VII., and has as great a power of spending it as his father of saving it.

Young, handsome, rich—the power of the nobles broken—the power of the king absolute—Henry VIII. vied with young King Francis of France in the patronage of art. Lavish in expenditure, his accounts show the employment of many foreign artists and workmen, with the result that the influence of the revival of classical learning and classical art filtered into the country and this employment of Italian workmen by the king began to influence the ornament, carving, &c., of the work of the period.

In the screen of King's College, Cambridge, which is accounted the finest example of woodwork in England, there are distinct traces of this Italian influence, and it is quite clear from the detail that it must have been executed by foreign workmen, as the English workmen, at this time, could not have acquired the necessary skill.

As later on you will come to see the German influence, I want you to notice the purity of the detail, the proportion of the pilasters, the delicacy of the moulding and the distribution of the ornament in this example of the Italian influence, and in considering how mature and finished this work is, you must take into consideration that the revival in Italy began 100 years earlier than in England. The other side of the screen shows the stalls with their slender baluster shafts. It is not known who is the designer, but the date is fixed by the initials of Henry and Anne Boleyn, joined in a true lover's knot in the coved roof of one of the stalls.

This brings us on to the age of Elizabeth which was one of great national prosperity. The people had grown in riches, much of it derived from the suppressed monasteries; the population had increased from four to five millions, and was nearly equal to London of to-day.

The country was at peace, and every peaceful art prospered. By this time the Italians had left the country, probably owing to Henry's quarrels with Rome, and a new influence had begun through the coming of German workmen, who brought with them the Low Country interpretation of the Renaissance. Religious persecution no doubt brought them here, and they settled in great numbers.

Freedom from strife brought desire for domestic comfort, impossible while security from assault was the first consideration for house building, and an amiable contest began as to who should build the largest house, the longest gallery, noblest fireplace and the most beautiful staircase.

Audley End in Essex is one of the finest examples of an Elizabethan hall. The house formerly possessed a gallery 226 feet long, which was taken down at the beginning of the eighteenth century, but it still remains a fine and stately mansion. The caryatides at the doorway in the screen are typical of the German influence. The carved mantlepiece is, in the usual manner, decorated with an architectural order, and the coat of arms bulks large in the design. The flat roof divided into panels by wood beams with plaster filling marks the change from the mediæval open roofs dealt with in the carpentry lecture last week.

The hall screen is one of the features of the period, and that at Chastleton House, Oxford, has the two doorways in similar position to those of the mediæval period. The Ionic order beside the doors and the obelisk and open fret crowning the entablature are indicative of the period, which is also shown in the charming little clock case between the doors.

The Universities of Oxford and Cambridge still possess a number of fine screens of this period, and that at Jesus College is one of the best known. Here also the doorways are placed between the columned order, and the entablature is very richly carved. The treatment of the small panel in the wall space between the doors marks a step in the progress of panelling, and shows how the adoption of the "true mitre" in the place of the "mason's mitre" lent itself to the fanciful forms in panelling peculiar to Jacobean joinery and urniture.

The dissolution of the monasteries and the distribution of their treasure put an end to church building, but existing hurches were lavishly decorated with examples of the work f this period. Croscombe Church, Somerset, has a delightul screen with columns and entablature and fretted cresting nd bold Royal arms. The pulpit at the left is a most charming specimen of restraint in design with quite a sumptuous sounding board over, also with fret cresting.

An interesting feature belonging to the time is the internal porch, such as that at Broughton, in Oxfordshire. It is designed to give access from one room to another without entering the intermediate room. This is a well-known example. It has the Doric order and enriched entablature, the owner's arms in a circle and carved pinnacles on either side. There are a number of these in different parts of the country, and the one at the Red Lodge, Bristol, has the Ionic order beside the door and caryatid figures in the frieze.

The dining-room door at Levens Hall, in Westmoreland, is a very rich example, with lozenge-shaped panels within the square panels. On either side are caryatid figures on high pedestals, and the doorhead has the owner's coat of arms with supporters.

The bay window at Little Moreton Hall, in Cheshire, shows how traditional design still lingered. Here in a county remote from the influence of the Renaissance, we still find the mediæval wood mullion in the window, the walls panelled in a simple manner, the ceiling joists showing the true construction.

The fireplace at Blickling Hall, in Norfolk, is characteristic of the sumptuous taste of the time. The open dog grate is flanked with coupled baluster columns, and the overmantle is supported by the typical rounded cornice, and shows again the caryatides and the family arms.

In the development of house-planning, the hall, which originally served as general dining-room, underwent considerable change. When the long gallery came into vogue the principal apartments were transferred to the first floor, and their stateliness needed more sumptuous approach than the mediæval stone stair, and the broad, easy wood staircase became one of the features of the hall. That at Castle Ashby, Northamptonshire, shows how the craftsman lavished all his skill in the carved entablature and fretted panel. The newels in this instance are carried up as ornamental columns to support the landing over and the vine weaved round the columns is very charming.

There are innumerable examples of these staircases in various parts of the country, but I will show you one more only. The staircase at Hatfield, in Herts, the home of the Cecil family, is one of the best known and one of the best executed we have. The newels are carved with strap ornament and terminate with carved figures, and the balustrade is an arcade of small columns and arches. The gates seen here are supposed to have been to prevent the dogs wandering up to the State apartments upstairs. The fretted carving on the soffit of the stairs is very interesting.

This is a very picturesque period in English craftsmanship, but these staircases, lavishly overladen with a riot of carving and moulding, cannot be accounted of greatest artistic value. Invention is at its lowest; in fact, the resources of the master carpenter, so far as design was concerned, had almost come to an end, and as you have seen, he was relying upon repetition of elaborate pattern-book detail to gain effect.

In the early period—the mediæval period—the tradition had grown up by degrees. The English craftsman was sure of himself, sure of his craft. But this was gone. The old tradition was almost lost, and the full understanding of the Palladianism which was coming was beyond the powers of the craftsman designer. It was in the air, but its full comprehension necessitated a scholarship quite outside the powers of one who in all probability could hardly write. The consequence was, that in the latter half of the century the designer was beginning to detach himself from the craftsman. The end of it saw the beginning of a new order, when the responsibility for design, as apart from execution, was transferred from the craftsman to the designer to be known hereafter as the architect, and at the moment England produced a genius of the highest order, and, as Walpole said, England had at last produced one great artist, Inigo Jones.

Not a great deal is known of the first thirty years of his life, except that he travelled and studied in Italy, and thoroughly absorbed the spirit of Palladian design. The double-cube room in Wilton House, which he rebuilt for the Earl of Pembroke, is probably the most beautiful room in the country, and the banquet hall is unquestionably the finest State room.

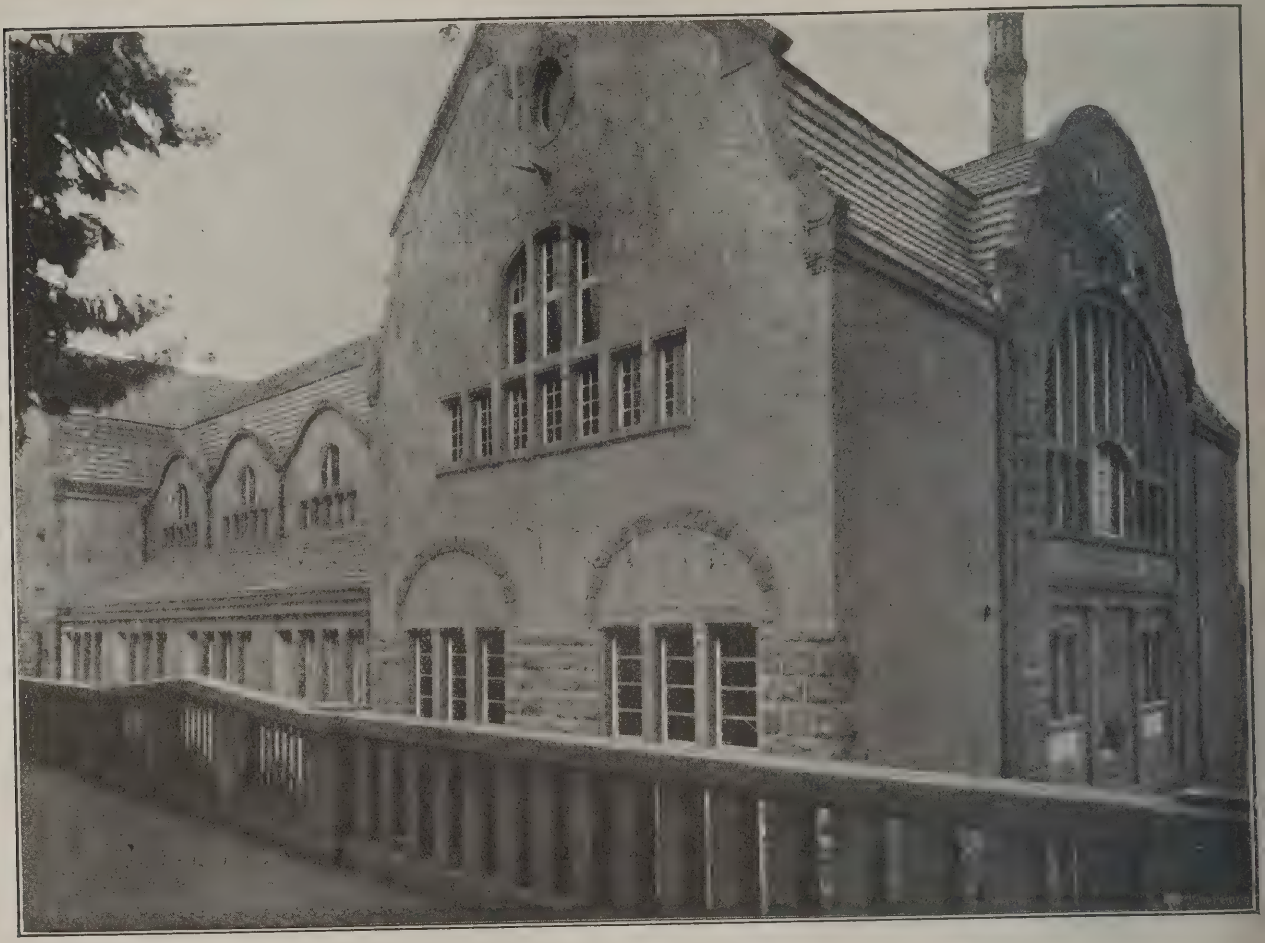
The fireplace in the double-cube room is quite magnificent, and you see at once the purity and dignity of his work.

Ashburnham House, a little house in Dean's Yard, is a delightful example of planning and delicacy of detail. The staircase is quite a masterpiece; in fact, the whole interior is most carefully arranged and designed, and the doorway off the first-floor landing shows great care and refinement.

There is also a screen at Kirby Hall, which is probably

## MODERN EUROPEAN ARCHITECTURE.

### GERMANY.



[From *Der Profanbau.*

MUNICIPAL BATHS AT ISERLOHN.—Herr Stadtbaurat Falkenroth, Architect.

the work of Inigo Jones, and shows the same calm sureness and restraint of his work as Wilton. I wish I could show you more of his work, but I am afraid I should be straying outside my subject.

Inigo Jones's great successor was a man full of scholarship and accomplishment. Sir Christopher Wren, although to begin with was almost an amateur, when the time came it was a case of the hour and the man.

The Fire of London was Wren's great opportunity. The City was a "ruinous heap." The largest and most magnificent cathedral in England, ninety-three parish churches, the Guildhall, Royal Exchange, and fifty City companies' halls, besides 13,000 houses, all swept away.

The organ case of St. Paul's Cathedral is, as you will see, a most beautiful piece of design, and will stand as a monument to the skill of the craftsmen who fashioned it. It is most exquisitely carved, and the big masses impart to the whole a fine sense of grandeur rarely obtained. The caryatides and the central scroll pediment supporting the Royal arms are carved out of solid material and not "built up," as is usual in masses of their size and projection. It will not be apparent to you in this view, but as evidence of the sound construction and the mature state of the wood used it may be observed that scarcely a crack or an opened joint is to be found in the whole case.

Here you have the choir stalls showing the panelling behind with its rich cornice and gallery front. Again, you will notice the great projection of the carving, and it is well to remember that for forty years before this time little heavy construction and no such masses were obtained for carving. In looking at these views one must not, in admiring the carved work, overlook the beauty of the joinery, which is the foundation of the whole conception. The Bishop's throne, which you see at the farther end of the picture, with its enriched pediment and canopy with pierced scrolls and cherub heads, forms a most beautiful termination to the screen.

Leaving the wonderful display of rich carved work shown on these two views, we see the back of the choir stalls, or ambulatory, with Corinthian columns, fluted shafts, a
rich capitals, forming a screen between the stone colum
which support the domed ceiling above.

Before leaving St. Paul's, I wish to show you the beau
ful screen to the north-west chapel.

The pulpit and sounding board of St. Stephen's, W
brook, is amongst the best work of the period, both in desi
and construction. The view shows the pulpit having
panelled sides, the panel and other mouldings being rich
treated. The whole is supported on a square pillar with c
and base. The lines of the cornice of the sounding board
curved and give interest, and impart an appearance of lig
ness to the structure. Carving is freely introduced, and
cherubs, &c., are well placed.

The east view of the chapel at Trinity College, Oxfo
shows the reredos with slender Corinthian columns, wh
support an entablature and curved pediment, breaking b
and continuing on face of tympanum. The cornice is trea
in an original manner, the whole of the lower part be
occupied by a highly enriched leaf moulding. The la
centre panel between the columns has a fine treatment
carving surrounding it, and in the centre is massed up ab
the architrave of the main entablature.

The treatment of the screen here is similar to the east

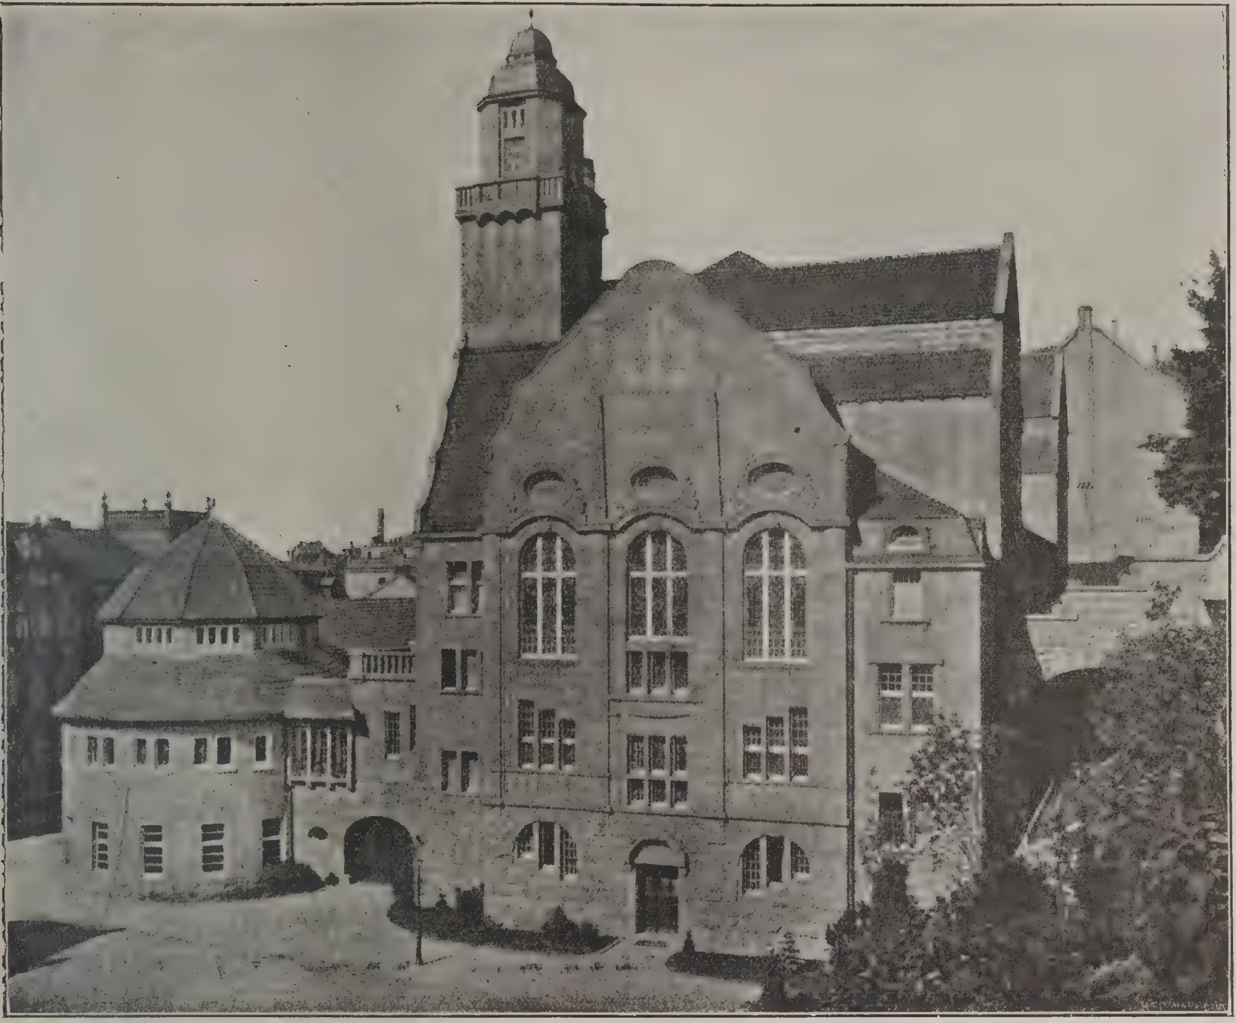
canopies.

## MODERN EUROPEAN ARCHITECTURE.
### GERMANY.



[From *Der Profanbau.*

MUNICIPAL BATHS AT ISERLOHN.—Herr Stadtbaurat Falkenroth, Architect.

Clifford's Inn is a fine example of wall panelling, treated on broad lines. The panels are large, and, except over himney-piece and door, are not enriched. The mounting of he oak is shown quite clearly, and is very effective. The doorway on left is finely carved, and is surmounted by a arved and curved pediment.

The walls of the chapel at Farnham Castle are panelled, nd the spaces between enriched with beautifully carved herubs' heads and drops. Above the panels are placed carved heaves, and at the base charming scrolls are introduced. The pulpit is cleverly arranged in the thickness of the wall, nd is reached through a secret door in the panelling.

In the Court Room of the Brewers' Company, in London, s a fine example of bolection moulded panelling. The doorway and chimney-piece are good, but the carving over the himney-piece cannot be considered satisfactory.

This view shows the screen with column and pediment orming the doorway through the screen. The cartouche over ediment and the figures at side should be noticed.

With all this tradition before you it may interest you to ee how the progress of the past influences modern work, and will now show you some of the joinery of public buildings nd private houses that belong to the twentieth century.

Town house interiors, Mr. John Belcher, R.A.

Town House interiors, Mr. Reginald Blomfield, A.R.A.

Country house interiors, Mr. Voysey.

Country house interiors, Mr. Guy Dawber.

Council Chamber, Cardiff Town Hall, Messrs. Lanchester & Rickards.

Council Chamber, Woolwich, Sir Brumwell Thomas.

Council Chamber, Stockport, Sir Brumwell Thomas.

Furniture, Belfast, Stockport, and Woolwich, Sir Brumwell Thomas.

This brings to an end the traditional forms, and now let us gather up a few of the practical indications of the progress of the craft.

First of all there is the essential difference between Mediæval and Renaissance craftsmanship, that the earlier forms were worked out of the solid wood in the same manner as stonework.

From the sixteenth century onward, in place of the heavy axed, or hewn, oak, the principal characteristic of the construction of the joinery of the period is that of "building up." In the fifteenth century the work was cut out of the solid plank; in the sixteenth the required projection was obtained by placing one piece of wood on another.

In the earlier period the panel moulds were worked on the solid styles and rails, and met at the angles in a mason's joint. Later on they met in a true mitre, but the moulding was still worked on the solid. Later still we have the mitred moulding planted on, and latest of all the bolection moulding.

One of the greatest changes, however, was the invention of sash windows early in the seventeenth century; the introduction of ground and rebated jambs to doors, and, above all, the geometrical staircase, the continuous handrail requiring considerable skill in geometry to find the lines by which it was set out.

And now, in conclusion, what of our original inquiry, Where does the work of the carpenter end and that of the joiner begin? and I think you have already found the answer. In the early days we find simple conditions in which are concentrated in one man—the master craftsman—all the qualities that to-day are distributed over a number of trades and professions. We all claim our share. The modern architect, builder, carpenter, and joiner are the successors of the mediæval master-craftsman, each claiming a share in the rich tradition of woodwork that we have—all too cursorily—examined in the short space of an hour this evening.

## ANCIENT LIGHT CASE.

THE action by Mr. Alexander Murray Smith against the Anglo-American Oil Company, Ltd., to restrain an alleged obstruction of ancient lights from a building now being erected by the defendants on the site of 36 and 38 Queen Anne's Gate, was further mentioned to Mr. Justice Joyce in the Chancery Division on February 4.

Upon the suggestion of his Lordship, when the matter was under consideration on February 1, counsel agreed that it should be referred to Mr. John Slater, B.A., F.R.I.B.A., for report, and the question now raised related to the terms of reference.

Mr. Younger, K.C. (for the defendants), suggested, in the first place, that the respective models prepared by each party should be submitted to Mr. Slater.

Mr. Hughes, K.C., on behalf of the plaintiff, raised no objection to this. Proceeding, he urged the desirability of one gentleman attending before Mr. Slater in representation of each party. The defendants had suggested that two should attend.

Mr. Younger said the reason was this: there were two ways in which the case might be met, viz. from the point of view of the ordinary practical man—that the interference alleged was of no practical importance—and that it was merely a technical interference, if any.

His Lordship: I am not going to make it a "hearing" before Mr. Slater.

Mr. Hughes: There is a provision that he can have what assistance he likes. I would suggest that one from either side should attend him on one occasion and on such other occasions, if any, as he may desire.

Mr. Younger: But these orders are made with a view of getting the best possible report.

His Lordship: They should not attend whenever they please.

Mr. Younger: My friend wishes to tie me down to one occasion.

Mr. Hughes said this was not quite so, as Mr. Slater could invite them to attend on other occasions if he wished. He thought it fair that they should have the right to attend on one occasion and put their views before Mr. Slater.

Eventually the form agreed upon in this connection was similar to that adopted in the Westminster Hospital case, viz. that the representatives of either side should attend "if and when desired." It was also agreed that, apart from the steel construction, the work should not be proceeded with above the cornice on the western boundary of the house formerly known as 38 Queen Anne's Gate, and that the completion of the trial should be expedited as much as possible.

His Lordship then made an order of reference upon the terms discussed and agreed to.

## GUILD OF ARCHITECTS' ASSISTANTS.

THE first annual meeting of the South Wales branch of the above Guild was held in Cardiff on Thursday, January 27. In the unavoidable absence of the hon. secretary, Mr. Harris gave a short résumé of the progress which had been made since the formation of the Guild. He said a lot of uphill work had had to be accomplished, for as always happened in forming new organisations there was a tremendous lot of labour involved in overcoming the lack of enthusiasm which existed amongst those whom the Guild was formed to benefit. Everyone recognised the need of such an organisation among architects' assistants, and yet few seemed willing to put their shoulders to the wheel and help on the work. There was a lot of preliminary, and it might seem to some, thankless labour, before any great measure of success could be attained; and yet he was certain they had every reason to be pleased with their progress. In time he felt sure the Guild would be a real live force in the profession and of inestimable value to the younger generation of architects.

The "constitution" of the Guild was then fully discussed, and the proposed laws and regulations were in general approved. The relation of the local branches to the central body came in for detailed criticism, but it was generally conceded that the proposals submitted to the members (published in the papers the preceding week) were for the most part quite satisfactory, and the hon. secretary was instructed to report to this effect to headquarters.

There is therefore every expectation that if the other branches adopt the proposed "constitution" the Guild will soon be recognised as a firmly organised national body.

## TOWN PLANNING CONFERENCE.

IN view of the recent passing into law of the Housing and Town Planning Act, 1909, it is of the utmost importance that the architectural development of towns should receive the most careful consideration. The Royal Institute of British Architects has therefore decided to organise a Conference to study the architectural problems involved in the improvement and extension of our cities. The co-operation of all our readers is invited in this Conference, which will be held in London from July 11 to 16, at the Royal Institute, 9 Conduit Street, Regent Street, London, W.

His Majesty the King has graciously extended his patronage to the Conference.

The programme of the Conference will include an exhibition of drawings, plans, models, and literature bearing upon the subject, and a large number of town plans and views will be displayed by means of lantern slides.

It is expected that papers will be contributed by leading authorities on the various aspects of town planning, and that there will be a large number of visitors from the Continent and America in addition to those interested in the subject in this country.

Membership of the Conference will be open to architects and all others, including ladies, interested in town planning. Members will be privileged to attend the inaugural meeting and the receptions that will be arranged all the meetings of the Conference; the visits and the banquet (on payment of the necessary charges); and they will receive all the literature issued in connection with the Conference, including a copy of the illustrated volume o transactions to be published subsequently.

The membership fee will be one guinea. If those interested in the Conference will apply to the Secretary the Royal Institute of British Architects, 9 Conduit Street Regent Street, London, W., they will receive furthe particulars of the programme of the Conference, with form of application for membership.

As the number attending the Conference is necessaril limited, an early reply is desirable.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* devotes its illustrations to th work of Messrs. Clinton & Russell, the buildings b whom that are included being the Apthorp Apartments, huge block of flats on an island site bounded by Broadway West End Avenue, 78th and 79th Streets, New York Whitney Central National Bank Building, a sky-scraper i New Orleans; the Mutual Assurance Society Building another tall erection in Richmond, Virginia; the Hudso Terminal Buildings, New York, also a sky-scraper; and tw sumptuous new ball rooms added to the Hotel Astor, Ne York.

*La Construction Moderne* illustrates a château at Neu kirchen, in Lorraine, of which MM. Berninger & Krafft a the architects, and in its series of articles on Old Paris no deals with the Quartier Saint-Benoit.

*Der Architekt* contains a "new art" design for a pictu gallery at Reichenberg, by H. Ried; a simple and successf town house at Brünn, by Professor Maxim Monter, and tw charming examples of old courtyards with fountains.

*Engineering Record* has an interesting article on the com parative cost of plain and reinforced concrete columns, b Mr. Charles W. Hall, showing under what conditions the o is more economical than the other.

## COMPETITIONS.

Herne Bay.—Messrs. Percy J. Waldram and F. C. Mo crop Young have been awarded the first premium twenty-five guineas in the competition for a pavilion to erected on the proposed pier extension at Herne Bay at cost of 4,000*l*. Mr. Edwin T. Hall, F.R.I.B.A., acted assessor for the urban district council.

Peterborough.—The R.I.B.A. competitions committ are in communication with the promoters of the competiti for secondary school at Peterborough with a view to t amendment of the conditions.

## BOILERS AND THEIR FUEL.

IN the valuable series of experiments that the Engineering Experiment Station of the University of Illinois has been carrying out, for the benefit of the United States in particular and the whole constructive world in general, there have been included some fuel tests with house-heating boilers, recently published in the usual bulletin form adopted by the University, which, although they deal principally with fuel in use in Illinois and other parts of the United States nevertheless contain lessons that we think may be useful to ourselves.

The fuels with which the tests were made were anthracite, Pocahontas coal, which corresponds fairly closely to our steam coal from Barnsley, coke and Illinois coal, which seems to resemble the soft coal in general use in English houses.

The purpose of the tests was twofold. First, to obtain the information usually obtained from boiler trials when operating upon house-heating boilers with various types of fuel commonly used for domestic purposes, in order that comparison might readily be made; second, to obtain information that might assist in developing satisfactory methods for conducting house-heating boiler trials, whether the object of the test be to test the fuel, the equipment, or the two combined.

With regard to efficiency and fuel cost the conclusions arrived at were:—The evaporative efficiencies of house-heating boilers vary greatly with changes in other conditions, and extreme care should be used in making comparisons; the efficiencies for the tests under consideration varied from 44 per cent. to 66 per cent., but a still wider range of efficiencies will exist under the variable capacity conditions common to average residence heating work; the range in efficiencies found was due principally to the kinds of fuel tested; fuels high in fixed carbon content, such as anthracite and coke, give relatively high efficiencies as compared with fuels low in fixed carbon content, such as our English domestic coal; present methods of burning and present types of boilers in the United States are particularly well adapted to burning anthracite and other coals high in carbon content—this also applies to the usual methods and types employed in Great Britain. A high fixed carbon content as opposed to a high volatile content is desirable in a fuel for domestic purposes; the low efficiencies with fuel of high volatile content, such as the Illinois coal, indicate the necessity of improvement as to equipment and methods of burning in order that this fuel may be placed more nearly on an equal footing with other fuels in this respect when employed for house-heating purposes; variations in efficiencies, apparently due to slight changes in fire and other conditions indicate the possibility of obtaining higher efficiencies in many cases by careful attention to details relating to fuel, operation and equipment.

Illinois coal may be obtained at from quarter to half of the cost per ton of anthracite, but the cost per British thermal unit will be relatively slightly higher for Illinois coal than when expressed as cost per ton. The cost per ton of 2,000 lb. of the fuels with which the tests were made was for anthracite 8.25 dollars, Pocahontas coal 5.50 dollars, gas-house coke 5 dollars, Solvay coke 6 dollars, Illinois coal from 3.75 dollars to 2.85 dollars. The cost relative to efficiency is shown by the tests to be considerably lower for Illinois coal per British thermal unit, as well as per ton, whether compared with anthracite, Pocahontas coal or coke, for with Illinois coal as fuel water can be evaporated in house-heating boilers at about 50 per cent. of the fuel cost of anthracite and about 75 per cent. of the fuel cost of Pocahontas coal or coke.

The relatively low cost of Illinois or soft coal is considered to ensure its continued use for domestic purposes, and whilst improvements in methods of burning and equipment are needed, these improvements, tending towards a reduction of smoke, dirt, or other disadvantages connected with the burning of the cheaper coal, will doubtless also increase the efficiency with which that fuel may be used, and make the fuel cost differences still more favourable to the cheaper fuel.

In regard of cleanliness, control and attendance, anthracite and Pocahontas coal are particularly well adapted to maintaining uniform pressure and fire conditions over a long period of time with little attention. The quick-burning Illinois coals are much less reliable in this respect.

Satisfactory regulation is more readily accomplished with the Eastern fuels and with coke than with the Illinois coal, whilst the total attendance required may be considerably less when burning anthracite than the other fuels. The same may be said in general as between coke and Pocahontas as compared with the Illinois coal. This condition would be especially noticeable in connection with heating apparatus used in residence work.

Anthracite and coke possess marked advantages over the other fuels, especially over the Illinois or soft coal, with respect to cleanliness. They are in general cleaner in and about the boiler room and do not smoke either from the chimney or in the boiler room. Little trouble is experienced with soot or ash in the flues, and with reasonable care noxious gases should not be given off in the furnace room; also, the ash is small in amount and easily handled.

In considering house-heating boiler tests, a number of important considerations, such as efficiency, fuel cost, attendance, control, cleanliness and equipment must be taken into account. The relative importance of such factors cannot be stated definitely and varies greatly with the nature of the service required of any given installation.

Efficiency and fuel cost may become the items of greatest importance when heating work is upon a comparatively large scale approaching boiler conditions.

Simplicity and the ease with which the heating apparatus can be cared for may be of greater importance than high evaporative efficiency.

The condition which requires the minimum amount of attendance may in other instances be the most satisfactory and economical, and more than compensate for the consumption of some extra fuel.

The ability to get up steam quickly and to maintain uniform pressure and fire conditions over comparatively long periods of time may be of paramount importance rather than questions relating to either fuel or equipment.

Yet again, the desire or necessity for cleanliness with respect to smoke, soot, ash, and dust or dirt in the boiler room, may warrant the use of high-priced fuel.

In the tests that were made some special points ought to be noticed. It was considered that in connection with house-heating boiler work, in order that information relative to capacity might have the greatest usefulness, it should be based upon the evaporation which could be obtained during a period of from six to eight hours without attention, rather than upon the evaporation obtained in one hour with whatever attendance might be required. Hence the conditions of the tests were rather in favour of those fuels that required little attendance.

For all tests a load equivalent to about 65 per cent. of the boiler rating was maintained by means of a suitable sized orifice in the outlet. The evaporation of 0.3 lb. of water from and at 212° F. was assumed as equivalent to serving one square foot of radiation for one hour. A pressure of 5 lb. controlled by the automatic regulators which are a part of the boilers was maintained at the boiler.

The amount of fuel as fired per square foot of grate surface per hour varied somewhat with the boilers used and the fuel consumed, being in one case 5.6 lb. for anthracite, 5.2 lb. for hard coal (Pocahontas), 5.3 lb. for gas coke, and 6.0 lb., 7.1 lb., and 6.2 lb. for three varieties of Illinois or soft coal, and in the other case 4.4 lb. for anthracite, 4.1 lb. for Pocahontas, 4.2 lb. for gas coke, and 5.3 lb., 6.2 lb., and 5.8 lb. for the Illinois coals.

The cost with both boilers per 14,600 British thermal units was with anthracite .47 cents., with Pocahontas coal .27 cents., with gas coke .30 cents, and with Illinois coals .22, .23, and .18 cents, the lowest cost per 14,600 British thermal units being obtained from the cheapest coal, that at 2.85 dollars per ton of 2,000 lb.

These results are thus of considerable interest, but in consideration of them for our own edification the relative prices of anthracite, coke, hard or steam coal, and soft or house coal must be borne in mind. It is not often, for example, that a British heating apparatus can be fired with coal at 2.85 dollars per ton of 2,000 lbs.

## NOTES AND COMMENTS.

It is amusing to hear from the Rev. J. B. Lock, in the paper he read at the Royal Sanitary Institute on the "Ventilation of the Large Examination Hall at Cambridge," an abstract of which we give elsewhere, that Dr. Shaw was the first to point out the advantages of what Mr. Lock calls the two-fan system of ventilation, but which Dr. Shaw in his lectures a few years ago styled the system of "Zero-potential."

This system was introduced by Professor Dr. C. Bohm in the Opera House at Vienna, which was built between the years 1861 and 1868, and has been adopted in many of the great public buildings erected around the Ring as well as in Germany, Italy and France. A description of the manner in which the system has been applied in the public buildings of Vienna was given by Mr. F. R. Farrow in his report to the Royal Institute of British Architects on his tour as holder of the Godwin Bursary in the year 1884.

The "two-fan" or "zero-potential" system is undoubtedly an excellent one, as both inlets and outlets being under complete control it is possible to arrange the course of the air currents in any desired direction. It is only necessary to avoid the causation of local draughts and to provide for an evenly distributed flow of the air currents to ensure a satisfactory result superior to that of the plenum system, and still more of the vacuum system. As regards cost the zero-potential system will usually be somewhat more expensive in its first installation, but little if at all more in working. The exact result in the matter of cost will, however, depend on the precise circumstances of each particular case.

Those of our readers who appreciate the series of articles now appearing in our columns on "Modern Cold Storage and Refrigeration" will be interested to know that an International Congress of Refrigeration will be held at Vienna, from October 6 to 12 next. Receptions will be given by the cities of Vienna and Budapest to the delegates as well as by the Imperial Court, and various subjects relating to cold storage and transport will be discussed. Mr. R. M. Leonard, of 3 Oxford Court, Cannon Street, London, is the Hon. Secretary of the British Committe arranging the representation of the United Kingdom at th Congress.

Mr. H. B. Woodward's little book on "Th Geology of the London District" should be interesting t architects practising in the Metropolis, as affording an in dication of the probable location of the undergroun streams that so often provide unpleasant surprises. Th area now covered with buildings and streets was in day gone by intersected by numerous brooks and streams, th names of some of which, as the Fleet, the Holborn, West bourne, Tyburn, are still preserved in our local nomencla ture. Now it is a mistake to suppose that all of these hav been absorbed by the modern system of sewers, or hav become extinct, although they may have vanished from th surface topography of London. Under St. Paul's Cathe dral, crossing Piccadilly, Burlington Street, Knightsbridg and in many other parts of London at a considerable dis tance from the present channel of the Thames, there a to-day flowing streams which often cause trouble in buil ing, particularly when deep basements and sub-basemen or tube railways are being constructed, and a knowledge the ancient hydrography of the Thames basin would ofte prove useful in assisting an intelligent anticipation of po sible difficulties.

We are pleased to note that in the International Exhib tion of Railways and Land Transport to be held at Buen Aires from May to December of this year, Great Britain h applied for space of 20,000 square mètres, Germany 6,00 Austria 5,000, Belgium 4,000, Italy 5,000, the Unit States of North America 5,000, whilst France will occu about 5,000 square mètres. As the total of imports a exports between the United Kingdom and the Argentine more than double that of any other country it is only fitti that we should be well represented in the Internation Exhibition.

The case of Gibb *v.* Schintz is illustrative of t present severe view that the law takes of an architect w lets a builder get the best of him. Shortly the prese legal position of architect and client is that if the contr is not carried out strictly, the architect is liable for a damage the client may thereby sustain. The cases th come before the Courts and are reported are but a few those that are continually occurring, and we know several instances in which architects have paid up rat than face the practical certainty of an adverse judgme after trial. It is manifestly impossible for an architect completely supervise everything that is done in a buildi unless he acts as his own clerk of works and stays on job the whole time that workmen are there. Therefore is imperatively necessary that in every case an architect should insist on the employment of a qualified clerk of works, and should in writing protect himself against any dereliction of duty by the clerk of works. It is no use trying to be kind to the client because the job is a small one. It is just in the small job, carried out without a clerk of works, that the architect is most likely to be called upon to make good the defects of careless workmen if not of dishonest builders.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held on Monday, Mr. Ernest George, A.R.A., in the chair. A paper was read by Mr. Edward Warren, F.S.A., F.R.I.B.A., on

### The Life and Work of George Frederick Bodley.

The task of writing a paper on George Frederick Bodley was rendered both delicate and difficult by the fact that for over twenty-five years he worked in partnership with Mr. Thomas Garner. It is always difficult, where an estimate of individual character is sought, to deal with the outcome of such collaboration, and to apportion to each his due meed of influence and of creative industry. Mr. Warren said he entered upon the task with the qualification that he had enjoyed a long and close friendship with both partners.

Mr. Bodley's life was best divided into three periods: the youthful initial period of training and of individual work, the middle or collaborative period, and the final one of reversion to single practice. It was no derogation of the high talent, marked ability and extraordinary industry of Mr. Garner to say that if the career of Mr. Bodley had to be considered as single and unassisted his title to distinction would hardly be diminished.

### *The Initial Period.*

George Frederick Bodley, who descended from the family of Sir Thomas Bodley of Oxonian fame, was born at Hull in 1827. His father was a physician of considerable repute, and his mother (to whom he ever attributed the decisive influences of his life) had unusual attainments.

While still a boy they moved to Brighton, and it was there that George met Sir Gilbert Scott, whose pupil he subsequently became, incited to that course by reading Bloxham's "Gothic Architecture."

To Sir Gilbert he served an apprenticeship of five years, living in his master's house in Regent's Park. He found his early studies and employment in the office rather dreary. He did not take kindly to the dry and academic expositions of Classic architecture, and of the "Orders," but his enthusiasm revived with employment upon drawings for Gothic buildings, such as setting out the arcades of St. Michael's Church, Great Peter Street, Westminster.

Unlike many, if not most, work came to this young architect almost at once upon the expiry of his apprenticeship, and his first commission was to add an aisle to a church at Bussage, Gloucestershire, for Thomas, the brother of John Keble. This was followed by a constant flow of work, almost entirely upon churches.

Drilled in a somewhat rigid convention of English Gothic, he, not unnaturally, began his independent career with a revolt. This is very evident in his first complete church, that of St. Michael, at Brighton. Tired of the formalised versions of English thirteenth and fourteenth century styles, he designed this church in an extreme severity of form and detail, and with a character suggesting the Early French rather than the Early English type.

Within the next few years he was constantly and happily busy with new churches—St. Martin's at Scarborough is one of the most interesting, not only for its intrinsic beauty and distinction, but for the fact that the architect found a field in the decorative accessories for the co-operation of his pre-Raphaelite friends and fellow enthusiasts, Rossetti, Madox Brown, Stanhope, and again William Morris.

For the first few years Mr. Bodley's small but steadily maintained practice seems to present almost ideal conditions for a young architect. He lived with his mother in Harley Street, where he worked single-handed, or with occasional assistance only, for several years. Commissions came at comfortable intervals, leaving time for self-culture and the pursuits he liked best. He detested competitions, which were essentially opposed to his quiet reflective nature and abstract idealism.

As work increased he turned to his friend Thomas Garner, who had followed him as a pupil in Scott's office, and who was developing a small practice in Warwickshire. Mr. Garner at first worked as an occasional assistant.

### *The Middle Period.*

As we near the middle or partnership period, we perceive that a marked change has been taking place in Mr. Bodley's handling of Gothic architecture. The French feeling has waned, and the type has become more determinedly national.

The austere simplicity gave way to a more suave severity, and an increasing use of mouldings, always softly curved, of engaged shafts and curvilinear tracery, rapidly led to the fully evolved version of English fourteenth century Gothic which became Mr. Bodley's characteristic manner.

This period is, unhappily, marked by a great physical misfortune. He was stricken with a long and painful illness, arising from blood-poisoning, the result apparently of an inspection of fetid burial vaults at Louth. He had to keep his bed for months, and left it with his black hair turned white, and crippled for life by lameness.

The first long period of illness, however, obliged him to seek and to rely upon the capable assistance of Thomas Garner, and thus led directly to recognised collaboration. A formal partnership was entered into in 1869, and amongst other work which it immediately shared was the church, initiated by Mr. Bodley, of St. John, at Tue Brook, Liverpool, a church of distinctly English fourteenth-century character, not elaborate in structural detail, but very elaborately furnished and decorated. No detail has been overlooked. In the enthusiastic, scholarly and patient completion of every accessory of a church interior Messrs. Bodley & Garner stood in the early 'seventies absolutely alone; and it is to their example that the greatly increased attention now bestowed throughout the country upon such accessories is due.

The Tue Brook church was soon eclipsed by two others, which still remain pre-eminent amongst the many by the same architects. These are the Holy Angels, at Hoar Cross, Staffordshire, 1871, and St. Augustine, at Pendlebury, near Manchester, 1873. Though stamped with a kindred inspiration these buildings are utterly different in form and character.

No indication of their mutual work would be complete without notice of the considerable collegiate work at Oxford and Cambridge. In Oxford they made their beginning and their mark at Christ Church College, with additions to the library, and the great tower at the south-eastern corner of Tom Quad, that rises over the splendid old staircase leading to the hall. It was no easy task to hit the happy mean of height and mass for a tower that should neither do hurt to the fine proportions of the hall, nor lessen in effect the low spire of the cathedral.

St. Swithin's Quadrangle at Magdalen College was entrusted to them, after a competition, in which Messrs. G. E. Street and Basil Champneys of London, and Mr. Wilkinson of Oxford took part. The quadrangle has not yet been completed.

If at Oxford Mr. Garner bore the lion's share of the work, Mr. Bodley redressed the balance at Cambridge. At Cambridge Mr. Bodley added new and distinct buildings to two colleges—"King's" and "Queens'." At the former he has placed, on the river front, facing the "Backs," the incomplete quadrangle known as Bodley's Buildings.

The years between 1870 and 1880 produced many other designs, and amongst them those of two cathedrals—one the unsuccessful competitive design for Truro, and the other that for Hobart Town, Tasmania, which has been carried out, and is a candidly English design in the typical manner of its authors. The period between 1880 and 1885 was a busy one for the partners.

1886 brought Mr. Bodley an opportunity similar to that at Hoar Cross. This was the church designed by him for the Duke of Newcastle at Clumber, near Worksop. It is very similar in style and feeling to its Staffordshire rival; externally, if anything rather plainer, and with less emphasis of vertical line, it conveys an equal sense of easy security and instinctive proportion.

Clumber Church indicates a cessation of the real collaboration of the partners. For several years before the actual severance of the tie, it had become practically nominal, and though intimately friendly and sympathetic, had ceased to have its former significance; each partner worked singly upon a given design with bare consultation of the other.

The actual cessation of partnership came in 1898, by the friendly dissolution of a friendly bond—there had never been any deed or legal document of any kind—and they continued their dissociated labours side by side in the two old sets of chambers on the first floor of No. 7 Gray's Inn Square.

### *The Final Period.*

In the years between 1885 and 1895 many new churches, large and small, in town and country, were begun and completed by Mr. Bodley—Eckenswell, Horbury, Skelmanthorpe, Warrington and Danehill are all small churches, the last of singular beauty and perfect adaptation to its site, on a Sussex hilltop; Epping, Hackney Wick, Norwood, Branksome, Bournemouth, and Cowley, Oxford, all town or suburban churches, are of considerable size.

Mr. Bodley was frequently employed upon the repair and readornment of old churches, or the more or less complete alteration of modern ones. In regard to the former, he hated "restoration" of the fabric, and generally confined himself to mere repairs and to complete furnishing of the interior. He handled old buildings lovingly.

With a modern church—of the early nineteenth century Gothic type—he was scarcely tender, though he respected anything of good architectural character. Some of his conversions, or "transmogrifications," are remarkable.

In ecclesiastical work Mr. Bodley adhered, if possible, to his own version of Gothic; but in civil or domestic work, except in collegiate work, he worked always in equally personal and varied versions of the English Renaissance.

His strong leaning, however, was always towards Gothic. It was a matter of faith, of profound personal conviction, in which to the end he never wavered. His later designs all show its intensity.

One of his last churches, if not the very last upon any considerable scale, is Holy Trinity, Kensington. The thinness of effect in his last works was, at any rate, partly due to the fact that his increasing infirmities made visits to his buildings less frequent, and that he grew to rely more upon drawings and to realise less acutely their realised effect.

Great honours and great opportunities came to him very late in life; one of the greatest opportunities indeed close at the end. In 1906, the year before his death, came the commission to design Washington Cathedral, in conjunction with his old friend and former assistant Henry Vaughan, of Boston. This was quickly followed by the placing of the cathedral of San Francisco in his hands. In 1906 he journeyed to the United States to inspect the sites and to make preliminary arrangements. Upon his return, and while employed upon yet another remote cathedral—in India—he at once began the designs for Washington and San Francisco. He was much hampered by ill-health in the following spring, but managed nevertheless to complete his designs. He was destined never to witness even the actual beginning of the American buildings, but left the drawings in a well-advanced stage of preparation. The United States had done him previous honour by bestowing upon him the gold medal of the American Institute. A similar honour was done him in 1899 by the R.I.B.A. He was elected Associate. In 1907 he received from Oxford the honorary degree of D.C.L. He died suddenly and peacefully on the evening of Sunday, October 21, in the old manor house of Water Eaton, near Oxford.

No just estimate of his character or attainments could be formed without intimate acquaintance, and he was not easy to know. He did not as a rule make friends easily or quickly, but once made he retained them, and their number was not a few. To his many pupils and assistants he was delightfully friendly and inspired admiration and respect in all, and in those who knew him best the warmest affection.

His success owed nothing to business habits, for a worse man of business in the usual sense it would be impossible to find. He detested accounts and kept none; he detested business letters, and frequently delayed answers to important communications—when he answered at all—for weeks or months. Mr. Bodley was not only a master of his art, but excessively masterful. He has been called a copyist. Nothing could be further from the truth. As a pupil he had sketched but little, in spite of constant urging; in his later years not at all. His method of studying an old building was, as regards the exterior, to borrow a chair, which he carried from point to point during the contemplative smoking of a cigar; when the cigar was out, he went inside and continued the contemplation. Yet he would remember the building, even to its details, for the rest of his life. He regarded drawing for an architect as solely a means to the realisation of his design, and to that end his drawing was always adequate. For neat and finished drawings he had small regard, and no patience in his later years for their preparation. His first notes of his various conceptions for a plan, or some large detail, were made anyhow and anywhere. He had an extraordinarily fine sense for curves, and hated a weak or a flabby one. His injunctions to his staff were always in the direction of refinement and restraint. "Learn to leave out. A young architect's india-rubber is more important than his pencil," he once said; and again, of window tracery, "It's not the shapes you make, but the shapes you leave, that matter."

In placing a building in a street, or in contiguity to others, he was always careful to do no hurt to its environment. "You must consider your neighbours," he said; "you've got to be a gentleman in your art."

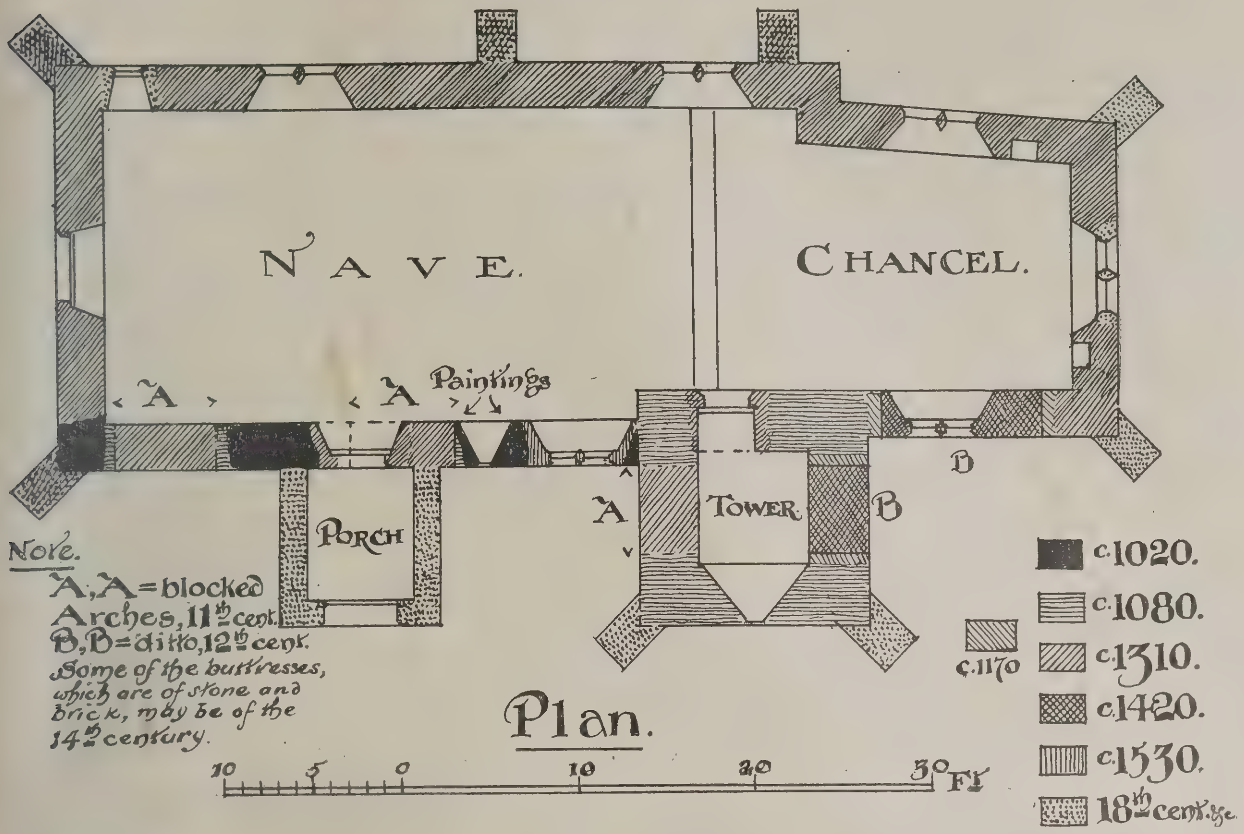
He never faltered from his ideals; he had ever the courage of his opinions; his enthusiasm and his energy endured to the end.

Previous to the opening of the discussion a letter was read from Professor Simpson, one of Mr. Bodley's earliest pupils, who was prevented from attending by an attack of influenza. He said that Mr. Warren's paper was so complete that little was left to be said. Mr. Bodley was, he believed, Sir Gilbert Scott's first pupil at the time that Street was his first assistant. The low but bulky tower at the corner of the Tom Quad, mentioned by Mr. Warren, was to have been covered with a lantern somewhat on the lines, but not a copy, of one on the belfry at Calais. The lantern is shown in some of the measured drawings, and also in a water-colour perspective made by Mr. H. Brewer. This intention accounts for the lofty proportions of the angle turrets which rise above its parapet and appear in consequence too high—or so Mr. Bodley thought. As Mr. Warren remarked Bodley was not business-like. He would keep clients waiting for months. Years ago when Professor Simpson was measuring up a curious chancel arch in Great Bardfield Church, Essex, the clergyman said that he had been waiting for a design for a reredos which he had asked Mr. Bodley to make considerably over a year previous. Professor Simpson mentioned this when he returned; but no design was sent during the six months or more that he remained in Bodley's office.

Mr. G. H. **Fellowes Prynne**, in proposing a vote of thanks to Mr. Warren, said that he rose with the greatest possible diffidence and with the greatest possible pleasure. The paper was distinguished as being the appreciation of a loyal and devoted pupil. Bodley's buildings were marked by an exquisite charm and proportion and delicacy of detail. The gentle loving treatment of his restorations all tended to mark him out as essentially a man who loved his work and studied every detail of it. But first and foremost one must think of him as a man of great courage who broke away from the example of his predecessors, and as one whose work was no slavish following of what had been done before. His genius and sympathy for colour was shown in almost every church. Such details as the decoration of his walls and every detail of his embroidery were marked by the intense care he lavished on them. The phrase "Bodley's colours" is synonymous with all that is quiet and harmonious. Unhappily we seem to have lost our love and power of appreciation of colour, and those who try to use it very often find prejudice and bigotry against them. How very different to the past, when our churches were warm with colour. No individual's efforts to introduce it again were more successful than those made by Bodley. Bodley seems to have been fortunate in many ways; as a young man he mixed with those who were intensely enthusiastic and whose aim was high. He was also fortunate in his clients. The loyalty of his pupils was remarkable. There was one feature that Mr. Warren did not touch upon, and perhaps, rightly, viz., the fact that Mr. Bodley, like all the best ecclesiastical architects, was an ardent churchman. There is hardly one of Bodley's churches which is without spiritual inspiration and that indefinable feeling that church architecture is raised to the highest pedestal of the art of architecture. It enriches the creator and the spectator.

Mr. **Walter Tapper** said that one thing about the paper that struck him was the dominant note of love and reverence that ran through the whole of it, and which was echoed in the hearts of every one of Mr. Bodley's pupils. With reference to the feeling that Mr. Bodley could not draw, it might be said at once that he could not draw in the sense that we understand it nowadays. No elaborate drawings came from his hands. But it was only necessary to look at his sketches to see what a tremendous artist the man was. Bodley once said that it was not what the architect put on paper, but what he put on his brain that mattered. The medium that Mr. Bodley used to express his idea on paper would not appeal to most men, for it was really anything that was at hand. The love and reverence that his pupils felt for him was not to be wondered at, for, said the speaker, the eighteen years that he was with him he had never heard him say an unkind or angry word. The buildings themselves were the justification of this great man's mind.

## Church of St Edmund, King & Martyr, KINGSDOWN, nr Farningham, Kent.



Mr. Maurice B. Adams said that he had known Mr. Bodley for a great many years, and taken the greatest interest in his work. His first church at Brighton was built on a most difficult site. Although it was an extremely sloping one the building had an extraordinary air of massiveness and repose. The west end of this vast breadth of brickwork was somewhat relieved by the streaky bacon style.

A vote of thanks was passed by acclamation to Mr. Warren.

## EARLY WALL-PAINTINGS IN KINGSDOWN CHURCH, KENT.

At a meeting of the Royal Archæological Institute on February 2, Sir Henry Howorth, D.C.L., K.C.S.I., in the chair, a lecture was delivered by Mr. Philip M. Johnston, F.S.A., F.R.I.B.A., on the "Discovery of Early Wall-Paintings in Kingsdown Church, Farningham, Kent." Coloured full-size tracings as well as photographs were placed round the room, and the lecture was extensively illustrated by lantern slides. Mr. Johnston began by dealing with the church generally, which, he said, up to the present time had been known only for its ancient glass. Winston's "Enquiry into the Difference of Style Observable in Ancient Glass Paintings," published in the forties, mentioned it; and Mr. Johnston mentioned that he had himself visited the church ten or twelve years ago for the purpose of seeing these valuable fragments of early fourteenth-century glass. But the immediate object of his paper was not the glass, but the exceptionally ancient paintings brought to light during recent works of repair.

About April or May of last year the present rector, the Rev. F. W. Warland, was carrying out some extensive repairs in the church, and in the course of these the workmen laid bare a curious rude window-opening of small size in the exterior of the south wall. Mr. Warland then made careful search for the splays of this window on the inner face of the wall, and after carefully measuring the two faces he removed the modern plaster and the rubble with which it was blocked up, and brought to light some remarkable paintings.

On plan the church is a curious one. The south wall may with confidence be assigned to the early part of the eleventh century, one proof being the peculiar coursed rubble of which it was constructed. The original church probably extended as far westward as at present, and consisted simply of a small nave and chancel. In the second half of the eleventh century a tower was tacked on at the junction of the nave and chancel on the south side. The church was rebuilt, with the exception of the south wall and the tower, about A.D. 1310, at the expense of the De Lucys, who have left their portraits on the terminals of some of the dripstones. The paintings must have been hidden from about 1080 A.D. They were never subjected to the customary coating of whitewash, and they retain to this day their pristine freshness and vigour. Mr. Warland has taken the proper steps for their preservation. The window is on the outside quite different from the ordinary window formed of Norman stonework, and the arch is typical Saxon stonework (?). The window is only 6 inches in width and was never closed.

The dedication of the church to Saint Edmund, king and martyr, is presumptive evidence of a Saxon origin for the church. He was, of course, very much reverenced in early times in this country as a double champion, first of the Saxons against the invading Danes, and secondly of Christianity against the heathen. From 870—the year of his martyrdom—the memory of Saint Edmund was much treasured, and a large number of churches were built in his honour, one being in the heart of the City of London in Lombard Street. It was a curious coincidence that, while Kingsdown Church stands in the middle of a wood, so many of the legends connected with St. Edmund have to do with a wood, as, for example, that about the gaunt grey wolf which was found guarding the Saint's head. There was no reason to doubt that at the time of its erection this primitive church must have stood in an extensive wood. Then again there was a strong probability from the name "Kingsdown" that the place was Royal property in very early times, and that a Saxon monarch may have built the church.

These may have been some of the reasons for the selection of a martyrdom scene for the paintings upon the splays of the window in the south wall. On the eastern splay are figures of Abel, with his offering of a lamb (a curiously rat-like animal), and of Cain, carrying his sheaf of the fruits of the earth. Between them is a mound of some combustible material bursting into flame, in place of the altar that one would have expected to see. On the western splay we have the straightforward subject of the martyrdom of Abel at the hands of Cain. Cain is represented as an evil-looking man with rolling eyes. He has delivered one knock-down blow, and places his left foot on his brother as he lies on the ground.

When the paintings were first laid bare one of the parishioners hazarded the speculation that the western splay showed Samson killing the Philistines with the jaw-bone of an ass. The object shown is probably intended for an ox's jaw-bone. There was a well-defined tradition that Cain picked up the jaw-bone of some animal with which to kill his brother, perhaps thereby intending to add insult to injury, as his offering of the fruits of the earth was refused, while Abel's offering of the lamb—an animal—was accepted. This tradition was embodied in the mediæval miracle plays with which Shakespeare was perfectly familiar, and it is interesting to note that in the Grave-diggers' scene (Hamlet, Act V., Scene 1) he makes Hamlet say:—

"That skull had a tongue in it, and could sing once: how the knave jowls it to the ground, as if it were Cain's jaw-bone that did the first murder!"

There can be no question that the weapon wielded by Cain is a jaw-bone retaining the teeth. In an illuminated MS. at the British Museum there is an illustration of a similar subject, and at the foot of it there is an inscription to the effect that it is Cain murdering his brother. It also appears as one of the panels in the bronze door at Verona, which was perhaps a century later than these paintings. In the Italian representation Cain is striking his brother with a mattock.

One curious point about the paintings, said Mr. Johnston in conclusion, is the way in which they have been executed. A thin coat of whitewash was first applied; on this the artist outlined his figures in pale tints, and lastly put on his red and yellow ochre. The artist did not complete his work then, but resumed it after a short interval. Presumably he was in a great hurry, for there are splashes of colour all over the surface. It was then that the background was introduced.

Since their discovery last year the paintings have been sprayed with Professor Church's solution, as being the safest system, and they appear to be standing extremely well.

## THE SOCIETY OF ARCHITECTS.

A MEETING of the Society of Architects was held on Thursday, the 10th inst., at their premises in Staple Inn Buildings, W.C. Mr. J. W. Dyson, vice-president, in taking the chair, said that all who were present would regret that Mr. George E. Bond, their President, had been forbidden by his doctor to attend that meeting in consequence of a severe cold. He also had very much regret in announcing the death of Mr. Robert Walker, J.P., of 17 South Mall, Cork. As he was such an old and esteemed member of the Society of Architects a vote of condolence would be sent to Mr. Walker's family

Miss Lorrie G. Dunington then read the following paper on—

### Garden Planning in Relation to the House.

The subject of my paper to-night is so vast that I feel I cannot do more than touch lightly on a few salient points connected with the art of garden planning.

The true beauty of the garden is dependent on three main conditions, all of which are indispensable:—(1) Excellence of design; (2) Suitability of material; (3) Harmonious planting.

I propose taking these points in order, but before doing so, it will not be out of place perhaps to go back a few centuries and trace out the various agencies which have helped to make and mar our gardens of to-day. Let us first consider by what reason does a garden exist? Is its origin to be found in religion, utilitarianism, or mere æstheticism? Is it subservient to, or independent of architecture?

In contemplating the history of the human race and its gradual evolution from primitive man up to that product of sociology and education which marks the progress of our own times, we find that the art of gardening like that of architecture follows closely the wave line of advancing civilisation.

Passing over the somewhat hypothetical records of that allegorical paradise, the "Garden of Eden," and confining ourselves to such meagre historical facts as are at our disposal, we turn instinctively to the East for the birth of gardening. Ancient Egypt supplies the prototype of modern Western architecture, and since gardens have ever been associated with buildings, the question arises, What primeval motives prompted their construction? We read that many of the tombs and temples of Egypt preceded secular buildings This seems to suggest that some simple religious inspiratio or unexpressed idealism was responsible for the first ste towards the awakening of the consciousness of art.

Archaic architecture might almost be regarded as a compilation of local materials arranged conveniently to meet th need for which they were intended. That is to say, the form construction and decoration of the building were the direc outcome of the materials used. Therefore, modifications i style were the result chiefly of the importation of ne materials as well as the evolution of ideas.

The Egyptian temple, though of massive stone construction, probably drew its inspiration from nature. The hi locks of sand rising out of the desert may have suggested it form, and the reed and the lotus its ornamentation Although the stone of which these temples were built wa not always found *in situ*—on the contrary it was frequentl brought from a great distance—still its universal adoptio gave rise to a national and racial style, and a uniformit approaching that of localism.

Surrounding these buildings of severe and rectangula outline were the first gardens of which we have any definit record. Their primary object was probably to serve as barrier to keep at bay the ever encroaching sands of th desert. Further than this, they provided shade from th scorching rays of the sun and seclusion from the eyes of th curious. The fertile and irrigated land which they con prised was used by the priests for the growing of plants f use in religious ceremonies. In design, these gardens we essentially formal, often little more than a mere repetiti of straight lines, yet they were suited to their purpose, ar were at least in harmony with the buildings they encor passed. They were, in fact, veritable oases in the desert wi their tanks of cool water, fresh green turf, and rows slender cypress. Nor were they without their arbours ar trellises. The avenues of sphinxes which lined the ma entrances to the temples were religious symbols and probab had nothing to do with garden design, though they may ha suggested the introduction of statuary into the gardens Greece and Rome.

Thus we see that gardens in their origin were made to co form to the lines of the building, and were entirely s servient to it. Their first object was utility, and the deg of their æstheticism was indicative of the state of civilisati at the time. Abstract beauty is not greater to-day than was then, but by the unfoldment of ideas man has gro more conscious of its presence, and, therefore, is capable giving it greater expression. So true is this that one c form a correct conception of the moral and intellectual c dition of a nation by studying its art and architecture. is not within the scope of my paper to-night to hold a br for the ethics of pagan art, but most thoughtful people m admit that there was a truth and nobility about it wh could only have originated under the influence of div inspiration.

With the further development of art, gardens became necessary adjunct of voluptuous public and domestic arc tecture. Pleasure grounds of considerable extravagance s rounded the palaces as well as the temples, and by the t gardening had spread westward to Greece and Rome, original purpose was obscured by a reckless expenditure wealth and an overwhelming indulgence in sensuous livi Gardens were regarded as a luxury, and were almost enti confined to the rich.

There is every reason to suppose that the villas built England during the Roman invasion possessed garde formal in design, and similar to those of Rome itself, tho less pretentious. Owing to the subsequent invasion of barians, no evidences of these gardens now remain; houses, on the other hand, being of more permanent struction, are still traceable in various parts of the coun With art once again at zero, in as far as Britain was cerned, we were forced to turn to religion for its revi Christianity fostered and spread the garden which was more rigidly utilitarian and less æsthetic than its Egypt ancestor. Treading on the heels of this revival came peace and prosperity which resulted once more in arti extension, and in gardens for pleasure as well as for But it is interesting here to note that the usefulness of garden has never since been lost sight of, and the most suc ful twentieth century garden is the one which displays greatest amount of usefulness combined with beauty, an saying this, I must disagree with the poet who wrote

"Be its beauty
Its sole duty,"

unless I may be permitted to render this as meaning all true beauty is inseparable from utility.

If precedence alone could give superiority to one over another, then the formal design holds an unassailable position. Anywhere between 2000 and 4000 B.C. up to the beginning of the eighteenth century, formality stamped and governed the planning of the gardens of the Aryan race. With the Mongolians it has been different, and it is stated that it is to China we owe the introduction of the so-called "Natural" style which has played such havoc with our traditions and swept away so many of our beautiful English gardens.

The art of garden design in England was at its zenith during the seventeenth and early eighteenth centuries. Never before had there been gardens of such excellence in this country. The peaceful old manor-house garden of the sixteenth century was insufficient to meet the demands of the public which was then feeling the influence of the Italian Renaissance, and the new ideas from the Continent wrought many changes in the English home and court circles. Yet something more than improvement of design was responsible for this sudden uplifting of garden craft. Previous to this, it had been customary for the architect to design both house and garden, and the result was good up to a certain point. There was a general harmony of expression and unity of purpose between house and grounds which could not fail to be reposeful and pleasing in effect. But a change was coming over the public mind. The science of horticulture was advancing with equal rapidity, and owing to the very numerous introductions of exotics, the materials at the disposal of the gardener were greatly enlarged. People began to take a keener interest in flowers, trees, and shrubs, and the garden became something more than a formal enclosure brightened haphazard by a limited number of old-fashioned flora. The garden of the future was to depend not only on architectural design, but also on the plants and trees it was intended to contain. Here was a difficulty to be overcome. The architect's knowledge of horticulture was not sufficient to meet the case, neither was the ordinary gardener competent to undertake the planning in addition to the planting. It was at this point that a French school of garden design came into existence with Le Notre at its head. Here we had the horticulturist sufficiently trained in architectural design to enable him to plan the "lay out" in sympathy with the building. I need not dwell on the causes or effect of the decadence which followed this period of brilliance, and which lasted for over a century. Suffice it to say that we are at this present moment undergoing to a certain extent a revival of that lost splendour. But we are accomplishing more than that. "Times change and we with time." The greatest beauty the seventeenth century had to offer would not satisfy the twentieth century public. This is perhaps a bold statement to make, and the upholders of the "good old times" are possibly ready to dispute it. Humanity cannot for ever be supported by the memories of a past success, but rather should use it as a stepping-stone to higher achievements. The reason why the seventeenth century garden would not meet modern requirements is because we have outgrown it, just as the seventeenth outgrew the sixteenth century work, and to revive it in its entirety would be a retrograde step. The tangled and often empty flower borders of a former age would not be tolerated to-day by those fastidious gardeners who demand leaf and blossom in unbroken succession for nine months in the year, and even the midwinter months are made to produce a modest contribution to the floral feast.

In England, at least, a garden continues to mean to most of us, an enclosed retreat. A place for rest and mental refreshment, where we can enjoy, unobserved, the pure enchantments of nature. Its value does not lie in the intricacy of its design, nor upon the money expended on its construction, for beauty is no more a slave to wealth than is happiness. The modest cottage garden is frequently more soul satisfying than its more pretentious neighbour within the park gates. On the other hand, the designer must bear in mind the extent of his client's purse when preparing his plan, for although, as we have seen, beauty transcends monetary considerations, yet the successful designer is a practical man as well as an artist. It is easier to bury gold unseen in excavations for a garden than in the bricks and mortar for the house, and what appears at first sight to be an inexpensive design may in reality prove a most costly one. Simplicity is seldom cheap in this world.

It is impossible to lay down any hard and fast rules regarding the planning of grounds. Each site suggests its own requirements, and each building its setting and style. But broadly speaking, the skill of the designer lies chiefly in making the most of existing features, in the overcoming of difficulties and in preserving a sense of individuality untainted by affectation.

The most successful lay out is the one which, when finished, looks so obvious and unobtrusive in arrangement that it would be difficult to picture it otherwise. It is in short the one which frequently calls forth the least praise from the uninitiated. There are some who, in their endeavours to produce a faultless design, will at start uproot every tree on the estate, exalt every depression, and lay low every mound, but what they gain by the abolition of a few obstacles does not compensate for loss of character and feeling. Any departure from convention is permissible, providing that the reason behind it is a good one. This is especially true of the remodelling of an existing garden of some maturity. Any who have undertaken such a task will have found innumerable hindrances to the carrying out of preconceived ideas. The size of the forecourt, the length of the paths, the width of the terraces, all may have to be readjusted in order to preserve some fine old timber or rare shrub. The "clean slate" method is undoubtedly the easier, but the inevitable sacrifice which it entails lays it open to just condemnation. Even when dealing with a new site, the designer should weigh carefully in the balance the removal of a single tree.

It is essential to pay considerable attention to the main entrance to the grounds from the road, as it is here that the visitors gain their first impression of house and garden. The drive and forecourt should be quiet and subdued in design, with just sufficient well thought out colour to suggest cheerfulness and good taste. Anything approaching ostentation should be strictly avoided. But when we come to deal with the garden proper, we can allow ourselves a greater licence; colour must abound, and the design, now less restricted, should offer peace and pleasure for every changing mood.

Garden planning does not begin and end at the draftsman's table; indeed, that is the least important part of it. A house may be designed for to-day, and is complete when the last labourer has left it, but we make gardens for a future generation. We only begin the "lay out," others carry it on and the work is never done, and fifty years of neglect will obliterate it from the face of the earth. Half the materials we use are inanimate, and the other half are living, and, therefore, ever changing. Who shall say that Bacon was wrong when he called gardening a more difficult art than building?

The overcrowding of ideas is the commonest fault of the beginner. Most plans from the 'prentice hand contain sufficient special features for half a dozen gardens. Moreover, a garden is not an architectural museum. It can be in perfect harmony with the house and still be devoid of masonry and statuary, and unless the latter be really good, it is better absent. There are few who realise to the fullest extent the value of a well-formed grass bank of geometric design, or who are conscious of the exquisite charm of the shadows it may cast in sunlight.

Gardens, being less permanent than buildings, are more influenced by passing fashions. At the moment no garden is considered complete without a "pergola," and so with a happy disregard of all laws of design and good taste, we see this unfortunate alien from Italy erected in almost every plot of ground large enough to take it. If there be no south slope available for it and its roses and vines, then it is placed on the north and covered with ivy. A sad and useless object leading from nowhere to nowhere. The sun dial is another feature much misused. Savouring of a past age, it suggests itself as a centre piece for an old-fashioned formal garden. Yet, how often do we see it set up in "Suburbia" with nothing to link it to its surroundings. But still more incongruous is it when one meets it in the forecourt of a public building, or in a London soot laden garden.

### *Materials.*

We have already seen that materials produce style. This is true not only of buildings, but also of gardens. All architectural introductions into the garden should be, as far as possible, of similar materials to those used in the construction of the house. This may appear a mere platitude, and yet we not infrequently meet, in otherwise well planned gardens, an absolute dissimilarity of materials.

Wherein lies the charm of a Surrey pine wood garden? It certainly owes a deep debt of gratitude to both Miss Gertrude Jekyll and Mr. Lutyens, but even their joint skill could not have produced so distinct a style had they not had the assistance of local materials. Where would the Munstead gardens be without their Bargate walls and their pine and chestnut copses? With the house built of stone, quarried probably on the site, garden walls to match, paths of sand and flower beds of warm, light earth, what could be more harmonious in its conception? But what is suited to the Surrey pine woods would be out of place on the chalk downs of Kent, or the clay of Middlesex. If the house be of London yellow brick, then let yellow brick form the garden walls and steps. To import stone or other materials of greater refinement would be to accentuate the mediocrity of the building. In these days, however, of easy transit by road and rail, few people care to preserve a local style by the use of materials close at hand. They choose their gardens much as they do their carpets, by consulting a pattern book. Their fancy is caught by a fashion and they succumb. The house is for the time being forgotten, as are also the surrounding conditions. Nor does the folly end here. Affectation creeps in in many subtle ways. At the present moment there is a revival of the gardens of a couple of centuries ago. There is a desire to reproduce ready-made antiquity. What is more delightful than a walk paved with old York flag stones? Age has mellowed and frost and rain broken it asunder. Vegetation has sprung up in the crevices and the whole is sweet with memories. Compare this with the handiwork of the modern man who first lays a discarded London flagstone, and then shatters it to bits with a hammer that it may present a crazy as well as an antique appearance. Will these paths we so construct live to be a joy to future generations? I think not. This is what I mean by retrogression in garden craft. Another idiosyncrasy of the hour is the collecting of dilapidated wrought iron work in the form of gates, railings and screens. Each age has produced its bad art as well as its good, and antiquity alone is no criterion of excellence. Because a gate was wrought a couple of centuries ago it is not necessarily worth looking at.

This last point I will touch upon but briefly, and it shall be more of the nature of a plea for greater attention to this branch of garden craft. Of what avail is a design, however beautiful on paper, if it is unsuited to the successful growing of flowers and trees? Materials control design. How then can anyone design successfully if they have no knowledge of the materials which are necessary to carry out their ideas?

Trees and shrubs used in garden making fall under two headings:—

1. Those used architecturally, when they supplant more permanent materials, but at the same time are made to fulfil the same duties. Here we include the clipped hedge of yew or beech, the trim edging of box, the pleached alley and the topiary tree. To class these as unnatural, and therefore unsuitable features, is scarcely a fair criticism, since they are not intended to replace trees of natural growth, but act as foils to them. Most people will admit that the herbaceous border never looks so well as when backed by a wall of sombre green, and that the terrace gains much by the judicious use of trees of formal outline.

2. Under the second heading we have trees, shrubs and flowers used exclusively for decorative purposes, and these are allowed to grow more or less as nature dictates. At the same time, due attention should be paid to the artistic grouping of colours, the value of light and shade and the planting for bold effect; and it would seem that this is worthy of special study, in order to bring out the fullest possibilities of the garden. With higher ideals before us and an increase of knowledge and experience, we can look forward to achievements greater than those of the seventeenth and eighteenth century masters.

At the conclusion of the paper a series of views of English gardens was thrown upon the screen.

Colonel F. S. Leslie, in proposing a vote of thanks, remarked that it was to the best of his recollection the first occasion on which a lady had lectured to the Society of Architects. They were sometimes told that ladies had not logical minds but this was not correct, one proof being afforded in Miss Dunington's paper, which had been well arranged and logically reasoned out.

Mr. Rogers said that speaking as a stranger and not even as an architect, he had to confess to some ideas which were not usually accepted, although obtained as the fruit of some little experience. With the paper itself he felt in entire sympathy; the subject had been presented in a logical way and most of its principal points dealt with. He took it that Miss Dunington, like himself, was in favour of formal planning up to a certain point. The outlines of a garden should be considered more or less as a receptacle for what was going to be put in it, also the vertical plane had to be taken into account. Few garden designers pay sufficient attention to the question of aspect, though it ought to be one of the controlling features. A great many designs, furthermore, err on the side of being planned on too symmetrical lines. With regard to pergolas, they were delightful things provided they were covered and provided they led somewhere. Paths also should lead somewhere, even if only to a summerhouse.

Mr. Dyson, in concluding the discussion, said that he had been always led to believe that a gardener's year was made up of nine months of very hard work and three months of disappointment. But this latter could hardly be true judging by the very successful results shown to them on the screen.

## ICONOCLASTIC TOWN PLANNING.

We are not altogether in accord with Professo Adshead's views expressed in a paper read befor the Manchester Society of Architects as to the ruthles treatment of mediæval antiquities that he would be pre pared to adopt in carrying out a scheme of town planning "To effect a street widening he would have little scruple after photographing and measuring, in demolishing a half tumbled down erection which had no other plea for preser vation than that it was picturesque and built of goo English oak. He felt that they were inclined to exaggerat the architectural value of much of the mediocre work of tha period and to underestimate the value of work erected sinc the time of Wren and previous to the middle of last cen tury, an age which contained a wealth of traditional form which even the most pronounced progressive movement of to-day could not afford to ignore." This is followin the bad precedent of the Gothic "restorers" of the nine teenth century, with the variation that fashion havin changed with the swing of the pendulum, Profess Adshead would clear away mediæval work and save tha of the eighteenth century. One-sided enthusiasm and mi guided zeal have ever been the causes of iconoclast excesses, and we are not all prepared to be Haussmannise in the "grand manner" because this is the penchant the Liverpool school.

Mr. Adshead, as our first Professor of Town Plannin should at least be aware that there is a school of qui modern town designers in Germany who at least ha decided claims to respect for their views, and who ho that the mediæval manner of town planning is worthy be followed in the twentieth century. Surely a Profess of Town Planning who cannot or will not teach students to make the most of the opportunity that an o building, even though mediæval, gives for a pleasing pie of design has mistaken his mission.

The Eternal City is even now apparently destined to fate to be deplored by all lovers of art from the putting in effect of the views Professor Adshead has expresse Signor Nathan, the Syndic of Rome, and his Council ha triumphed over Commendatore Boni, and the Zona Mon mentale is to be a boulevard and nothing more, instead being an object-lesson of the greatness of Imperial Rome

If civic planning means no more than the driving wide boulevards with occasional squares through existi towns or even slums, anyone with a parallel ruler can come a Professor of Civic Design and remodel our ma Heaven save us from the banality to which our first a only Professor—at present—would appear to conde us. There are, however, we believe, many who love a admire such towns as Nurnberg, Rothenburg and Rege burg, to say nothing of Chester, Coventry and Shrewsbu and we do not fancy that the Professor Adsheads a Signor Nathans will always triumph.

## ILLUSTRATIONS.

### PUBLIC HALL AND BUSINESS PREMISES, LLANELLY, SOUTH WALES.

This building is designed by Mr. H. P. Bu Downing, F.R.I.B.A., for an island site close to Town Hall, at Llanelly, and will be built of red bricks Portland stone, with Delabole slates for roofing.

### CATHEDRAL SERIES, LLANDAFF.—SOUTH NAVE AISLE, FROM EA

This view is in continuation of our series fr Llandaff Cathedral which commenced in our is of January 7.

### THE CHAIN GATE AND GALLERY, WELLS CATHEDRAL, SOMERSE

The plates of large scale details of the mouldi complete our illustrations of the measured drawi by Mr. John Th. Westbye.

# RENAISSANCE CHURCH ARCHITECTURE OF THE SIXTEENTH CENTURY IN FRANCE.*

*(Continued from last week.)*

AFTER my remarks on the conservative tendencies of religious architecture it may appear somewhat contradictory to state that the earliest known Renaissance structure in France is a chapel. This slide shows the chapel of St. Lazarus built in the old cathedral of Marseilles (1479-81) by Francesco Laurana. It is, however, an isolated phenomenon without immediate results in a province far removed from the centre of national life, and not even immediately ruled by the French king. It was designed in the Italian manner by an Italian for a prince connected by blood with an Italian dynasty. Duke René held the semi-independent fief of Provence, together with those of Anjou and Maine. In or close to his dominions alone are monuments of similar character to be found so early, and they are the work to a large extent of the same artist. They include tombs at Le Mans and Tarascon, and a reredos at Avignon. I do not illustrate them, as it is impossible in the limits of this paper to touch on sepulchral design, or except very cursorily on church accessories. This group of works anticipates by from ten to twenty years the date usually assigned as the commencement of the Renaissance in French architecture; 1495 was the year in which Charles the Eighth invaded Italy and thus inaugurated a series of French campaigns in the peninsula, which extended over three reigns, and were one of the principal means of introducing the Italian influence into France. Not till after this date and the subsequent foundation by Charles of a colony of Italian artists at Amboise does the true career of Renaissance architecture begin. The next eight slides will show the designers attempting to amalgamate native and foreign motives by juxtaposition and intermingling rather than to reconcile them. In many cases at this period Italian influence was represented by an Italian carver who was employed to carve the more important ornaments and occasionally to design an entire feature, while his French colleagues either worked in their own style or made clumsy imitations of the new fashion. In addition to such efforts to introduce Italian detail, the means first and most frequently employed with a view to effect a change in the direction of classicism was the substitution of the curved for the pointed form, whether in tracery, in the heads of openings, in arches, or in plan.

In this screen from St. Jacques at Dieppe the tracery, the bases and sections of the mouldings, and the spiral shaft are all in accordance with flamboyant Gothic usage, but the shell panel-heads, the capitals, the entablatures, and the round arch speak of the Renaissance.

Similarly in this door from the cathedral of Aix, in Provence, there is a complete mingling of pilasters and arabesques with crocketed pinnacles. It looks as if the work was done by a Frenchman much more at ease in the contorted naturalism of the contemporary Gothic foliage than in the calmer conventional flowers and fruit of the friezes and panels of the Italian type.

In this pier from the front of St. Michel, at Dijon, the Gothic element in the detail has been reduced, but the niches are still composed of alternately Gothic and Renaissance elements, but the Renaissance elements are more thoroughly assimilated.

This lantern crowns the northern of the two towers at the west end of Tours Cathedral. The upper part of the tower is one of the earliest transitional ecclesiastical structures whose date is known. It was finished in 1507, probably by the brothers Martin and Bastian François. The southern tower finished forty years later, probably by Martin's son Gatien, is virtually a copy of it. The two elements are better blended in this example than in most of the previous ones, but still without definite system.

In this font canopy at Bretagnolles, near Evreux, all the detail except the shaft bases is Renaissance, but the shafts themselves and their caps have a fifteenth century outline. The tendency to turn the cusping of the tracery into foliage is one which was much developed later.

This wooden rood-screen is from Villemaur, a village near Troyes: it seems to have reached exactly the same stage of development as the last example, though not finished till 1521. It belongs to a neighbourhood which was for many years an important centre of Renaissance church work. The churches of Troyes itself are rich in examples.

When we turn from single features to a complete composition we find that the task of amalgamation proved rather more than the architects of the day could cope with. Nothing more awkward can be imagined than the front of the church of St. Calais, near Chateaudun, as a whole. Almost all the features are translated into Renaissance forms; some of them are individually beautiful, as for instance the central doorway with the scrollwork tracery in the fanlight. But in composing the entire elevation the architect floundered hopelessly. He got a certain amount of horizontality into it, but felt bound to keep the traditional vertical division by using clumsy buttresses, and then made a futile attempt to connect them up with the upper window by a flamboyant Gothic label with a pediment on the top of it.

Very different is the front of the castle chapel at Ussé, where the designer has succeeded in fusing the two styles into a harmonious blend. While almost every detail is Renaissance the general effect of the elevation is distinctly mediæval, so completely does it retain the vertical aspiring character, an effect emphasised by the grouping of the door and window into a single feature under a pointed arch and a canopy of Flamboyant outline. The pinnacles have no crockets or gablets, but are represented by a feature of approximately similar silhouette—a tapering candelabrum motive.

Having now reached the stage when the language of Lombard Renaissance detail has been thoroughly assimilated, we may take an example which gives the fullest expression of its application to a church. St. Eustache, in Paris, begun in 1532, is the largest and completest Renaissance church of the century in France. It was designed as a whole from the first as a Renaissance building, and, with the exception of the west end, carried out in accordance with the original design. The architect is not certainly known. The ultra-patriotic writer, M. Léon Palustre, invented a beautiful theory that it was the work of three generations of a family of master masons named Lemercier, and therefore owed nothing to Italian influence. But this theory will not bear investigation. There is nothing to show that either the first or third had any connection with St. Eustache or that they were related, or that the second ever even existed. On the other hand, there is nothing improbable in the suggestion that the design was due at least in a measure to Dominic, of Cortona, known in France as Boccador, who, after living for many years at Blois, where he worked for Louis XII. and Francis I., and was the probable inspirer of much of the work in the Loire valley, removed, at Francis I.'s order, to Paris in 1531, to act as architect to the new Hôtel de Ville. The work was carried on slowly till 1589, and resumed from 1624 to 1654, when it was complete with the exception of the upper part of the west front.

It will be a convenient method of taking a survey of the development of religious architecture if we take St. Eustache as our standard for each aspect of church design, and make excursions to other examples to illustrate each, always returning to it as our headquarters. By completing its lacunæ from other buildings we may obtain an idea of the splendid results which might have been achieved had external circumstances permitted an unfettered development of the school.

In plan St. Eustache is practically identical with Notre Dame, the principal difference being that whereas Notre Dame has five bays in the choir and eight in the nave, St. Eustache has three and five respectively. In other respects the dimensions are nearly equal. The internal width of the transepts is about 148 feet, and the internal length about 280 feet (not counting the Lady chapel). The circular form of the apse is not in this case a Renaissance innovation, but borrowed from the Gothic model.

In section the likeness is less striking. Though the height of the nave (107 feet) is about equal, it is flanked by double aisles, both of great and equal height, instead of the low inner and lower outer aisles at Notre Dame. In consequence the air of spaciousness is greatly increased, and, a much loftier nave arcade being possible, the effect of verticality is also greater though counter-balanced by round instead of pointed arches and vaults, as may be judged from this view of the interior.

We may begin the analysis of the building with the design of the piers. The slide shows a pier between the outer and inner aisles. It is of the compound type with pseudo-orders performing the various functions required. On the angles are members composed of a series of superposed pilasters and engaged shafts taking the relatively thin and unimportant diagonal ribs, their entablatures, which correspond with the springing of the chapel vaults and arches, &c., introducing a welcome horizontal element. On the faces of the piers, on the other hand, are unbroken panelled pilasters carrying the heavier cross vaulting ribs and arches of the arcades. They supply the strongly-marked vertical line, yet further emphasised at the crossing piers, which is the dominant note of the interior.

---

* A paper read at the last meeting of the Architectural Association by Mr. W. H. Ward.

The nave pier from Ennery, near Pontoise, shows a similar system applied to a small country church.

At St. Pierre, at Tonnerre, compound piers with no horizontal element introduced are used at the section with similar responds for the choir arcade, but the remaining choir piers make a return to the single shaft, and are treated as Doric columns, with the cylinder carried above the cap for the arch moulds to die into. The treatment of the latter as a panelled splay is effective, and seems intermediate between the receding mouldings of Gothic tradition and the architraved treatment of the later Renaissance.

St. Etienne du Mont, in Paris, is contemporary with St. Eustache and of similar plan, but it is on a smaller scale, and shows a gradual growth in style from east to west. The choir (1517-37) is almost pure flamboyant Gothic; some Renaissance elements appear in the crossing and transepts, and they become more pronounced in the nave (1538-60). The west end and rood-loft belong to the reign of Henry IV. The balustraded gallery halfway up the piers is a pretty and almost unique feature, whose use is to steady and give an appearance of solidity to the tall plain shafts. It is curious that the tower arches should be of more advanced type of design than the upper. The capitals are unnecessary and unsightly.

Though adorned with clumsy sculpture, this nave-pier from Notre Dame de Bon Secours, at Guingamp, is an interesting one. The heavily-moulded arches die into a cylindrical shaft, which lower down becomes octagonal and stands on a square base. A slender circular vaulting-shaft is carried up the face from the floor.

This slide shows the arches and vaulting carried by the pier in the last. The arches are pointed, but have a keyblock. The triforium is prettily designed, but carried out in the clumsy detail usual in Brittany, and due partly to the distance from more civilised centres and partly to the hardness of the local stone.

This view from the nave of St. Taurin, at Evreux, shows another triforium and one of the most successful treatments of the springing of the vaulting ribs, which are carried by a compound corbel.

I am unfortunately not able to illustrate very fully the interesting subject of the treatment of vaults. The sixteenth century inherited the tendency of the fifteenth to great elaboration either by further complication of the rib system or by the enrichment of the parts. In both cases the sole object was decorative. It goes without saying that the ribs received classical sections usually of the architrave type. Ribs, bosses, and web are each decorated. In this vault, occurring in a cloister running along the side of the castle-chapel at Champigny sur Veude, the boss takes the form of garlanded patera. In this vault from the church of Valmont, it is replaced by a miniature dome, and the webs are carved. Pendants are frequently introduced, especially in star vaults, such as are usual at crossings—for instance, at St. Etienne du Mont. But they are also placed at other intersections of ribs, are richly decorated, hang down to a considerable depth, and are connected up with the roof by flying ribs and volutes, thus giving an air of great elaboration to a vaulting system which is sometimes in itself a simple one.

The multiplication of ribs left such small intervals that it was found they could be filled with a single stone, a discovery which gave rise in Normandy to a series of rib and slab ceilings, of which that at Tillières is one of the less elaborate examples. Those in the chevet of St. Pierre, at Caen, are far more intricate. They consist of a skeleton rib system with no cells, but with spandrils filled with a carved slab as here, or with tracery. This supports another, almost horizontal, rib system with its spaces filled in the same way with enriched slabs.

A number of other devices besides true rib vaults were also used. That in the cloister of St. Martin, Tours, is a segment of a spherical dome with concentric ribs and cells, and crossing at right angles, the former in stone, the latter in brick.

Barrel vaults with false ribs, or coffered, also occur as in the chapel of St. Saturnin at Fontainebleau, and a few small domes, as in the Pendentif at Valence and the Bishop's chapel at Toul.

Outside Brittany, where they were traditional, I only know of one timber roof of the Renaissance in the castle-chapel at Fleurigny. It takes the form of a boarded barrel.

### *Chevets.*

We may now turn to the exterior, beginning at the east end. The chevet of St. Eustache, differing only in detail from that of a Gothic cathedral, requires no detailed description.

The château-chapel at Champigny sur Veude shows another type of translation of Gothic work, each feature being rendered differently from those at St. Eustache. There is no chevet, but a sacristy on either side reached by the cloister.

The church of St. Julien du Sault has chevet chapels built in Gothic times, but by the time the clerestory was reached the Renaissance was in full swing.

Contrariwise, at St. Pierre, at Caen, chevet chapels of Francis I. work are built round an apse which is almost entirely Gothic. The decoration, as frequently in Normandy, is of a more exuberant type and with bolder projections than would be the case round Paris or in the Loire valley. The Lady chapel is carried up an additional storey.

### *South Elevations.*

Though surpassed in the beauty of special features and detail by other examples, St. Eustache gives as fine an example of the side elevation of a Renaissance church as can be found.

The south side of St. Pierre, at Tonnerre, is probably a little later than the last example. The aisle windows contain contemporary glass dated 1541. There is a restraint and refinement about both the design as a whole and its detail, which is in marked contrast to some examples—St. Pierre, of Caen, for instance.

At St. Pierre, at Dreux, the south transept added to a large Gothic church has a façade of good Henry II. work, which in spite of minor awkwardnesses, is of as majestic and monumental a character as could well be expected from a Classic front applied to a largely Gothic plan and section. Unlike any we have yet seen, this façade is composed as a whole on Classic lines. It terminates in a well-designed gable with small central pediment above the cornice shown on the slide

It was probably carried out by one of the Métezeau family who were master masons at Dreux for several generations before being employed at the Louvre, but the design may well owe something to Philibert de l'Orme and Jean Goujon working at the time (about 1540) at the neighbouring château of Anet.

### *West Fronts.*

I cannot show the west front of St. Eustache as it wa originally designed, for it was never finished and no longer exists. What there was of it was removed in the eighteenth century to make room for a façade designed by Jean Mansar de Jouy, a grandson of Jules Hardouin Mansart, the architect of the Invalides, begun in 1754, and afterwards altered by Moreau Desproux, architect of the façade of the Palai Royal, but still lacking the south tower when the work stopped in 1787.

The front of St. Michel, at Dijon, has the same genera arrangement of a nave front flanked by twin towers. But a St. Eustache the vertical lines of the towers were carried to the ground by bold pilastered buttresses. There was a grea central door as at Dijon, but windows at the sides, and th storeys in the towers were more varied.

At St. Michel the great three-arched portal is borrowed from a mediæval cathedral, and the horizontal line above i hardly more strongly marked than at Notre Dame at Par where the junction with the upper part of the towers is muc more skilful. These towers, with their monotonous repetition of similar storeys, are in Henry II. detail, and were no finished till the seventeenth century. They are obviously b an inferior hand to that which designed the bold Transitiona lower storey, with its charming lantern lighting the centra archway.

The three-arched portal motive was repeated in at leas two other churches at Vouziers in Northern Champagne where it appears in fully developed Francis I. work, and a Villeneuve sur Yonne, in Burgundy, in Henry II. detail. Th architect who had fairly mastered the superficial aspects o the style had, however, no conception of the principles o design which accompany it, and only uses the detail as it wer as a veneer, though not without attaining a certain majest due to the great lines of the composition and the comparativel quiet character of the ornament.

The west front of Notre Dame, at Tonnerre, added to Gothic church is perhaps on the whole nearer to the old fron of St. Eustache than either of these three, though it has onl one tower whose stair-turret is visible in the foreground Owing to the narrowness of the street and the bad weatherin of the stone of which it is built the great beauty and delicac of the work can hardly be appreciated from a photograph

The splendid church at Gisors has a complicated histor There was a nucleus of thirteenth century work, largely adde to in the fifteenth, and constantly patched between 1497 an 1579. In the middle of this latter period the fifteenth centur high vaults fell in, causing much other damage, which had be repaired. The present building is, therefore, a museum of styles, and shows specimens of excellent quality of many different periods. The north tower, is Transitional below, with a rich Francis I. lantern. The new front was flamboyant Gothic, and between its buttresses a central portal of exquisitely refined and sober Francis I. work was inserted. Then two and a half storeys of the south tower and the connecting portion were added in Henry II.'s reign, and the loggia over the west door in that of Henry III. Though the general design of the south tower is not specially remarkable, no example of this period in the whole of France surpasses it in beauty and refinement of detail and ornament. A decorative sculptor of a very high order must have been employed upon it, and it has even been suggested that Jean Goujon had a hand in the work.

The church at Pont Ste Marie, near Troyes, shows a three-gable front, with the picturesque overhanging verges common in the district. The nave portal is late Gothic. The north aisle portal is in late Francis I. detail. The designer, however, felt bound to retain the pointed form for the window. In the south aisle he went the whole hog and made it round-headed.

We now come to an example of a towerless front with only one gable. The castle chapel of Champigny sur Veude, whose apse and cloister we have already seen, appears to have been built from the east westwards, so that the narthex porch, a feature of which several examples are found at the time, is of early Henry II. work, and a very refined example. It looks as if a pair of towers may have been intended.

The last two examples of west fronts I shall show you both belong to a period later than 1550. The first one, that of St. Pierre at Auxerre, though probably the later of the two to judge from its florid character, retains much more of the Gothic type of design and a greater admixture of Gothic features than many earlier ones. It is one of the very few church fronts in France with three orders below the gable.

The façade of the church at Le Mesnil-Aubry is far quieter, and designed as a whole on classical lines, and is the nearest approach to the typical seventeenth century church front. It is possible, indeed, that the gable is a seventeenth century addition. It has been suggested that the church may have been designed by Jean Bullant, who worked for many years at the neighbouring château of Ecouen.

### *Towers.*

St. Eustache having no sixteenth century towers, we must take our examples elsewhere. Of the four which I have chosen three show different stages of development, and one a peculiar provincial type.

The noble tower of Bressuire has the bold buttresses with many offsets of the mediæval French towers, and consequently the same tapering silhouette, though in detail, at any rate, in the upper storeys all is Renaissance.

The tower of St. André, at Loches, on the other hand, recalls an Italian campanile with its vertical shaft, only broken by long pilaster strips and shallow panelling.

The unfinished tower of St. Nicolas, at Rethel, is a sturdy example of Henry II. work, with a sober use of the orders in the form of buttress-like pilasters at the angles. The upper storey may be a little later, perhaps about 1600.

The steeple at La Roche-Maurice is typical of the Breton manner. Its date is uncertain. The detail, as in most Breton work for a century after 1550, is a sort of bastard Henry II. type. Brittany was the land of spires, and the spire died there hard, surviving long after it was extinct elsewhere. The strongly marked horizontal features were already prevalent in pre-Renaissance examples.

The next two slides are not exactly of towers, but of tower-like structures. The first is of the well-known Francis I. clock turret which stand beside Chartres Cathedral. The second is the Haute Vieille Tour, Rouen.

This monument, built in 1542, in the old market at Rouen, is known as the Fierte de St. Romain. On the saint's festival his relics were carried in procession through the lower arch and exhibited in the loggia above, and it was the custom to lead a prisoner by the same route and release him.

(*To be concluded.*)

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

On Thursday evening, February 10, before a meeting of the Society, Mr. Raymond Unwin, well known by reason of his connection with such schemes as the Letchworth, Hampstead, and Earswick Garden Suburbs, delivered a lecture on "The Planning of Suburbs." Mr. Unwin illustrated his paper, of which a *résumé* is given below, by an extensive series of views and plans of the Hampstead Garden Suburb and typical examples of town planning abroad.

The successful setting out of such a work as a new city will only be accomplished by the frank acceptance of the natural conditions of the site, and, humbly bowing to these, by the fearless following out of some definite and orderly design based on them. To straighten a river, level a hill, fill up a valley, or even cut down a fine clump of ancient trees, to make the site fit some preconceived design would be presumptous folly. Such natural features should be taken as the keynote of the composition; but beyond this there must be no meandering in a false imitation of so-called natural lines. Let our avenues be straight or boldly curved, not aimlessly crooked, and let our open spaces be not shapeless patches, but squares, circles, or other orderly forms. The glittering path of the river as it winds across the plain, or the slope of the mountain range standing out in silhouette against the sky, delight us indeed; but the inconceivably complex conditions which form these curves have no part in any work of ours, and in attempting to mimic them we but miss that beauty of orderly design for the creation of which alone power has been given to us.

The problem is complicated because it is necessary to consider not only what is desirable, but what is possible, with the building conditions prevalent now. In the Garden City at Letchworth a considerable degree of harmony has been secured by requiring all roofs to be covered with tiles, while the very cheapness of the land at Letchworth and the desire of many of the early settlers for the most countrified sites has led to an appearance somewhat too scattered for the best architectural effect. This, however, will gradually rectify itself, and if in some cases too great freedom has been left, this in its turn will help to foster local public opinion.

In Germany there has been a great change in the style of their town planning. When the modern town-planning movement started the formal and geometrical style typical of Haussmann's work in Paris was adopted, and the work was much in the hands of engineers; but since the time of Camillo Sitte a more irregular and picturesque style of work has become prevalent and is being carried to an extent which tends to destroy dignity and architectural effect.

Taking the Hampstead Garden Suburb by way of illustration, one can see the importance of carefully studying the site, preparing a survey of the trees and other features on the land, together with a contour plan, before attempting to lay it out. The convenience of access to certain points, such as the railway station, drainage facilities, proper gradients for the roads, &c., will indicate generally the lines which the more important ones will take; while the cutting up of the land into the building plots of suitable sizes, with due regard for economy in length of road and proper consideration for the aspects of the buildings, will determine in a general way the lines of many of the building roads. The preservation of the outlook across any open space available should be considered. It is also essential to secure a suitable position to form the centre of the parish, suburb, or estate, where may be grouped the more important buildings.

Having in a general way determined all these factors, the problem becomes essentially very much one of the exact lines and arrangement of the roads, together with the building lines, and the placing of the buildings must be determined primarily on architectural grounds to secure satisfactory street pictures, whether of a picturesque or more dignified and architectonic character. In dealing with areas devoted to cottages economy in roads is the first consideration. At Hampstead, by means of a special Act of Parliament, power was obtained to make roads limited to 500 feet in length of a width of 20 feet, provided the houses on each side were not less than 20 feet apart. As justifying the granting of this privilege the Trust bind themselves not to build more than an average of eight houses to the acre over the whole estate.

The passing of the Town Planning Act affords an opportunity, probably for the first time, for controlling the character of suburban development, and it will be the duty of architects in future to regard their buildings as parts of a total picture rather than as isolated units. At the same time an immense opportunity will be afforded for considering streets and areas as a whole and for producing architectural grouping on a large scale. If wise use is made of the powers given in the Act, and if the citizens, and especially the architects and surveyors, will co-operate, it may be possible to stop the devastation going on round all our large towns, and begin to build up suburbs worthy to be the homes of the people.

At the close a cordial vote of thanks was accorded the lecturer, and a discussion, led by the President, Mr. Percy Robinson, F.R.I.B.A., followed, in which Messrs. Musto, A.R.I.B.A., G. J. Coombes, A.R.C.A., and Councillor Bowman participated.

At the next meeting of the Society, to be held on Thursday, February 24, Mr. J. B. Fulton, A.R.I.B.A., will read a paper on "The Church of Santa Sophia."

## ACTION AGAINST AN ARCHITECT.

MR. POLLOCK, one of the High Court Official Referees, on Feb. 3 heard the action of Gibb *v.* Schintz. The plaintiff, Mr. John George Gibb, an architect, of Newmarket, Cambridge, claimed fees and remuneration alleged to be due to him for work carried out for the defendant, Miss Dora Schintz, of Chuldwall Hall, Liverpool, on her estate at Thickthorne, near Kenilworth, in Warwickshire.

Mr. H. W. Cox, describing himself as Official Receiver for Cambridge and Peterborough, and trustee of the estate of the plaintiff, said that as he had no funds in the estate he was obliged to conduct the proceedings himself. He, however, was not in a position that day to proceed with the plaintiff's claim for various reasons, including Mr. Gibb's absence in the country.

After some discussion, it was agreed that Miss Schintz's counter-claim for damages against Mr. Gibb for alleged breach of duty should be proceeded with.

Mr. F. A. Greer, on behalf of Miss Schintz, pointed out that the main question was the same on claim and counter-claim: had Mr. Gibb really carried out his duty under his engagement, and, if he had not, how much damages he was liable to pay? Mr. Gibb had been employed, said counsel, to overlook drawings and specifications in connection with improvements at Thickthorne, and to supervise the work carried on by the contractors there. Counsel added that Miss Schintz's case was that plaintiff had carried out his duties so badly and negligently and had allowed bad and wrong work to be passed that she had been put to considerable expense and loss. Miss Schintz alleged, amongst other things, that Mr. Gibb had allowed the building contractors to depart from the original drawings, and also to reduce the height of the house stables by 2 feet throughout in the contract drawings. It was also said that the archways were all made too low, with the result that considerable structural alterations, causing much delay, had to be made.

Witnesses on behalf of Miss Schintz included Mr. Henry Hartley, of Liverpool, an architect, who described in detail the several defects of which the lady complained. He pointed out in the course of his evidence that there had been an improper substitution of zinc for lead for flashing gutters, tops and cheeks to dormers. He added that the mortar used had no combining qualities, stating that those portions exposed to the atmosphere would greatly deteriorate, and so leave open joints. He thought that constituted a serious detriment to the building, for if it were known that mortar of that kind were employed an architect would put a substantial discount on its value.

Mr. Hartley considered it was the duty of the architect to have apprised his client of the substantial alterations between the original and the contract drawings. It was usual to notify the employer of any changes that occurred as the work proceeded. Witness also considered it was the duty of an architect to examine or estimate the bills of quantities and prices carefully or correctly.

Other evidence having been given concerning plumbing and woodwork,

Mr. Pollock, addressing Mr. Cox, said that after the evidence he had heard he did not quite see how he could resist this counter-claim to any extent.

Mr. Cox: Unfortunately I have not been able to see the premises.

Mr. Pollock: I have seen the premises and seen quite enough to satisfy me that a great part of this work was executed most disgracefully. Mr. Gibb ought to have been there for the purpose of protecting Miss Schintz, and under these circumstances I do not see how it is possible for Mr. Gibb to prove the right to recover whatever money may be payable to him. It would seem from the evidence that he has acted in such a way as to cause considerable expense to Miss Schintz.

Mr. Cox said that he felt that some of the statements which had been put forward that day on behalf of Miss Schintz might by other evidence have very probably been reduced in a certain way, and that the case on the other side would not have been quite so bad. He, however, felt it was quite possible that he should be doing well in accepting the Official Referee's advice and coming to an agreement with his adversaries. He should like to ask what interest Miss Schintz had in this building? Had she paid any money for these improvements?

The Official Referee: That will not affect her right to decline to pay, but only the question of damages.

Mr. Cox: I am not prepared to go on with the claim for remuneration.

Mr. Greer explained that Miss Schintz was the legal owner of the property and was also the assignee of her brother's rights therein. She had expended her own money in doing the work which had not been done at the outset.

Subsequently, after a consultation, Mr. Greer said:—I think we have agreed. There will be judgment on the claim for the defendant with costs to be added to her claim against the estate, but not costs personally, and judgment also for her on the counter-claim for 500*l.*, and costs proved for in bankruptcy.

## NATIVE CRAFTSMANSHIP IN TIMBER, BRICK AND STONE BEFORE THE EIGHTEENTH CENTURY.*

IT is always inspiring to be reminded of the wealth of native craftsmanship in our own country. Those who are fortunate enough to be able to travel in foreign lands in search of the beautiful, find wondrous buildings and masterpieces of art and decoration which, while the impression is still fresh, perhaps incline one to look upon the work of our own forefathers as often falling short of the marvellous achievements, not only as regards design, but also as regards execution, of those artists of other and sunnier lands. But it is a great mistake to be too easily carried away by the glamour of foreign travel, and the people who are most likely to fall into it are those who have never had the opportunity or have never taken the trouble, to find out what an astonishing amount of beautiful work in many materials there is in our own country. It will be my endeavour to show you this evening how the English craftsmen handled the three building materials with which they were most conversant—timber brick and stone—at a time when the glorious traditions of English craftsmanship were still being handed on, unfettered by the overpowering presence of any particular individual who, by producing a set design, subjected all the workers engaged in its execution to the materialisation of his ideas For that is what has happened ever since the art of building has been led to depend more and more upon the professiona architect. With the Renaissance came this rise of the individual designer, but before that far-reaching movement swept over the land, the building arts were safe in the keeping of the craftsmen and their guilds, and the men who conceived the completed form of the structure as likely as not worked with their own hands in its actual execution. At any rate there is little doubt that such was the case in the building of houses, and it is to house work that I am confining myself this evening. Not that one wishes to attempt to distinguish between church building and house building from the point of view of craftsmanship, for there were no distinctions whatever: the methods of spanning an opening in the church were just the same as those followed in the house the windows were the same—allowing for greater elaboration as was natural in the church—and the details throughou differed in no essentials, whether it were the shaping of a plinth course or the profiling of a coping. But there is no doubt that in the Middle Ages the highest excellence wa achieved in ecclesiastical buildings, and that it was in th fabric and decoration of the church that the craftsmen found their greatest opportunities. When we think of the danger to which the house was subject all through the Middle Ages dangers of attack and pillage by armed foes, it is no wonde that provision for means of defence played so important a part in the disposition of dwellings and tended towards a greater solidity and less display of decorative detail than wa quite admissible in the church fabric, with its comparativ immunity from attack. But the men who were engaged in building the church very often, no doubt, reared the mano house near by, and traditional methods which had been handed down from father to son through generation afte generation, were as applicable in the one case as in the other But it was not until the wonderful enthusiasm for church building which had characterised the Middle Ages had to a certain extent abated, that the whole-hearted attention o ftsmen was directed towards the erection of houses that be considered as dwellings as distinct from strongholds. nsequent upon the further check given to church building the suppression of religious houses under Henry VIII., the confiscation of church revenues, a burst of building ivity found expression in countless houses, great and all, all over the land, which gave opportunity for carrying crafts too well established and too full of vitality to suffer serious rebuff. It has been argued in the not remote st, that the arts of England were becoming effete at the e that this summary check was given to church building the early part of the sixteenth century, that decadence had in, and that nothing short of a wholesale importation of forms and ideas could stop its downward trend; but re is good reason to believe that had not something like a character been given to the building arts as a result of spreading of the Renaissance movement to our shores, sh spirit and renewed energy would have been acquired m internal sources, and that the native craftsmen would ve even exceeded the high pitch of excellence to which they d attained by the time that this influx of foreign ideas and eign craftsmen deterred them from working further on their n lines.

---

* A lecture delivered at Carpenters' Hall on February 9 b Mr. Arthur Stratton, A.R.I.B.A.

However that may be, it seems to me that it is very difficult to detect lack of initiative or lack of skill in execution in domestic work of the English builders, and without keep- to any strict chronological order, I will show some amples which will be more convincing than any theories of own. All through the period when native craftsmanship seen at its best, builders invariably used local materials, d very rarely were materials native to one district carried to another, where they would have very likely looked out place and inharmonious with their surroundings. To this eptance of local materials we owe the great variety in sign and colour of buildings in different parts of England, d to this much of their interest and charm is attributable. hen good building stone could be quarried in abundance, for instance, in the south-west of England, in Derbyshire d Yorkshire, it is rare to come across a homestead which es not present quiet stone-walling, mullioned windows, ne gables, and stone-covered roofs. In the Eastern Coun- s, where little stone was to be had, but a plentiful supply clay, we find beautiful brick houses, with every member rried out in that material, or with the more finished parts ecuted in wrought stone. In Norfolk, Suffolk, and parts Wiltshire flint was turned to good account, while in the ickly wooded counties of Kent, Surrey, Shropshire, Cheshire d parts of Lancashire, from the excellent timber an entirely ferent system of construction resulted in the picturesque lf-timber houses with bright tiled roofs, which are one of e special glories of England. Nowhere can the unlimited sources of house builders be seen to greater advantage than the homesteads built by the native craftsmen in our own ntry; progress never halted, and the same types and difications of types seem to have been arrived at all over e country by workers who were impelled by the one dominat- g desire to build beautifully and well. There can have been direct communication between workers scattered over such wide area, yet allowing for differences of material and local fluences, they seem to have arrived almost simultaneously the same forms and to have expressed themselves in the me language.

Brick was long held in little repute as a building material this country; it does not seem to have been generally re- rded as worthy of careful and delicate handling much fore the period when the extraordinary impetus was given house building of which I have spoken. From that time ilders in the south and east of England relied upon it for any of their largest and most splendid undertakings to ch an extent that the mention of a Tudor house to many inds at once suggests a brick one. Nevertheless, the limita- ns of that material for all purposes, from straightforward lling to decorative details, had to be realised before really od work could be carried out in it, and except in districts ere stone was very scarce indeed, we rarely find brick used clusively.

One of the very best houses built mainly of brick, but with ne dressings to doorways, windows, copings, and other ought members, is Compton Wynyates manor house, and ng in a district where all three materials were available, we d them used side by side, their colours blending in the st delightful manner.

> "Many scarlet bricks there were
> In its walls, and old grey stone"

William Morris wrote of the old castle in "Golden ings." The walling is red brick, not of the dimensions are accustomed to nowadays, but longer and thinner rising five courses to the foot, with wide mortar joints, which are so valuable in giving the texture that one always finds in the walling carried out by these old builders.

The bricks in these houses vary in size considerably, ranging from 12 by 6 by 3 to 9 by 4½ by 1½, which is perhaps the most satisfactory dimension of all.

Whereas a large unbroken surface of stone walling is not without a dignity of its own, a large surface in brick would, as likely as not, prove to be somewhat monotonous, unless interest were imparted to it by bringing forward some parts and recessing others from the general wall face in order to get relief, and with it a play of light and shade. When building exclusively in brick, we find that the use of such a small material very often governed the design to the extent of breaking up surfaces, so as to obtain an effect of lightness; but when, as was often the case, it was not desired to sacrifice the breadth of wall surface it was made more interesting by the very simple expedient of building in patterns in a different coloured brick from that used for the general mass of the walling. This can be seen in the walling of Compton Wynyates. In burning bricks in a clamp, it is impossible that all should come out the same colour, because some are subjected to far greater heat than others, and this, according to the temperature, turns an ordinary red brick into a hard vitrified one of a deep blue or even black hue. These darker-coloured bricks were no doubt at first looked upon as defective, and rejected from prominent positions, until it was realised that by arranging them judiciously in the walling they served to give an added interest; and so growing directly out of the exigencies of the material itself arose one of the most artless and legitimate methods of structural colour decoration that the craftsmen of this country have ever indulged in.

The variety of the patterns evolved is great, but all the earliest and most effective are very simple, consisting for the most part of diagonal lines crossing one another so as to form a diaper ranging anywhere from about ten to thirty courses in height. These are all formed of headers built in, if possible, without upsetting the English bond, which was mainly used, but it was often necessary to interrupt it somewhat. Care was always taken not to overdo this use of patterned walling, and on no account was the same pattern carried uninterruptedly over the whole surface, but the dark lines were allowed to melt away, and the pattern disappears and is picked up again in the middle of a diamond in what appears to be the most unstudied manner, yet it was a nice feeling for texture which prompted the bricklayer to build in another line of dark headers or to leave them out; and he seldom did it wrong. In such a house as Eastbury, near Barking, where rows of mullioned windows cut up the walling on every side, only in a few places are patterns found at all, and when they are introduced they are complete ones in themselves, not calling for repetition. Used with great reserve in this manner, these patterns are most effective and tell all the more by reason of the plain walling all round. The brick chimney-stacks of timber houses afford other good instances, one of the stacks at Moreton Old Hall showing a very good arrangement of three large diamonds in a height of about 14 feet, enclosing three smaller ones, but examples may be multiplied to any extent.

Another and more constructive method of relieving large surfaces and marking horizontal divisions is to be seen in the delicate brick trefoil-headed corbel courses which are introduced with such admirable effect on many gateway towers. These were no doubt in the first place suggested by the overhanging parapets of castellated buildings. They required no little skill to build, but there was no attempt to vie with the elaboration of masonry; on the contrary, although they give an effect of great richness by their constant repetition, they are in reality very simple and differ but slightly in detail in the three counties where they are most prevalent, Norfolk, Suffolk, and Essex.

A difficulty which has beset brick builders in other countries than our own as to how to finish projecting arcading and corbel courses at external angles was obviated in most of these gateways by recessing the face from which the corbel springs the exact amount of the projection of the corbelling, so that a flush face is obtained above it. At Oxburgh, Layer Marney, Little Leighs, Hadleigh and Giffard's Hall, and West Stow Hall, this brings about a panelled treatment to the faces of the octagonal turrets which further enhances the effect of verticality of the design, which is so valuable in a gateway. At Little Leighs the sides of the octagon measure 4 feet 7 inches, the panels are 3 feet 5 inches wide, and are recessed 4 inches.

On the front of the gatehouse at Rye House, on the Hertfordshire border of Essex, is an unusually elaborate example. Additional depth is given by first throwing a pointed brick

arch from corbel to corbel, and in front of this the cusping which consequently looks richer with such depth of shadow behind it.

At Nether Hall, a few miles away from Rye House, this corbelling is used without the recessing, and much more sparingly in consequence. This is another excellent instance of fine craftsmanship in brick, now sadly ruined through the abandonment of the house in 1773. The gatehouse would have been pulled down with the rest of the noble brick structure, but it was found to be so solidly built that it was left standing, albeit mutilated, and even now it commands our admiration. The brickwork is of a very mellow red tint, and the whole structure was built of it, including even the sunk handrails to the newel stairs, which are similar to other b ck handrails found at Tattershall Castle, Lincs., and East ry House, Essex.

In nothing is the skill of the brick builders seen to gre er advantage than in the chimney stacks which rise above he parapets of these gatehouses, and above the roofs of hou s, large and small. The variety of design is only equalled by he skill in manipulating cut brick—no two seem to be quite ke and all are satisfying. They are always of lavish dimensi ns, and are often elaborately enriched with spiral, zig-zag or reticulated patterns, executed in cut brick. The sha is generally circular or octagonal, rising from a well-mou ed base, and finishing with a capital, which in the best exam les

as the octagonal sides slightly hollowed, so that they may eet in a sharp point, the angles being further emphasised y small projecting pieces which fret the sky and give a crispess to the profile, which is very effective.

Yet another use for brick was in the filling or nogging etween the uprights of half-timber work. When these spaces ere not plastered, in the way we have already seen at Eastngton and the lower storey of Grimshaw, the fancy of the uilder seems to have suggested all manner of ways of laying he long thin bricks in these narrow spaces for no other reason han to give interest and to please the eye. The craftsmen f those days never lost an opportunity to obtain good wall exture.

At Great Chalfield is, as far as I know, an unique instance of stone-filling between the oak uprights. This has recently been brought to light by Mr. Harold Breakspear, to whom an extensive rebuilding of the house has been entrusted. Being a stone district, this ingenious system has been suggested by the material most easily obtainable, but the filling has proved more lasting than the framing, being held in position by means of stone keys. The necessity for the use of the materials of a particular district was the foundation of the elementary principles of the building crafts of this country, and rarely does one find an exception to the practice of using the local materials and of making the handiwork subservient to the proper application of those materials.

At Stockton manor-house, Wilts, flint being easily obtainable, it was used in conjunction with stone, the courses alternating with bands formed of two rows of unsquared flint, set out with but little regularity, and not carried round the porch. At Thornbury Castle, Glos., a magnificent stone-built house, curiously enough brick was introduced for the principal chimney-stacks, although it is eminently a stone district, and many of the forms of spiral enrichment were equally applicable to stone. It is no uncommon thing to find red brick stacks to stone houses, especially in Kent and Shropshire, sometimes because the stone was not suitable for use in thin slabs placed on end. It must be allowed, nevertheless, that the houses nearly always gain by the contrast of the rich red beside the grey stone walling. It may have been the desire for colour contrast that prompted the introduction of these small spots of brick in such a house as Thornbury; but it is more likely that we have here an instance of the building owner, who in this case was no less a person than the powerful, but ill-fated, Duke of Buckingham, who was executed in 1521, over-ruling local tradition in his desire to vie with such brick stacks as he had seen in his journeyings to and fro the capital. Such lapses from local custom are rare and generally to be attributed to some such special cause. The use of foreign materials is even more rare; only once have I detected foreign stone in a house of this period. At Brede Place, Sussex, Caen stone was clearly imported for the mullioned windows of the withdrawing room in a house otherwise built entirely of local materials. In the church near by this stone was used about the same time, and there is reason to believe that French masons were also in evidence there.

Stone as the larger material has always suggested greater breadth of treatment, and a simple reliance upon the dignity and repose of plain wall space. Relief may be produced in very simple ways, and one of the most effective found in districts where stones of more than one colour were available was the arrangement of light and dark courses, not necessarily alternating, but often more pleasing if built in haphazard at the whim of the mason. In such a house as the Abbot's dwelling at Muchelney, Somerset, we find the mellow Ham Hill stone, which is still quarried not many miles away, used for the greater part of the structure, with quoins of lighter Pibsbury stone introduced with charming effect. In Northamptonshire, instances of this structural colour relief to plain walling are met with; but, generally speaking, contrast is more often obtained by the disposition of masses and the careful proportioning of solids and voids.

(*To be concluded.*)

## LIVERPOOL UNIVERSITY.

Mr. W. H. Lever has given to the School of Architecture in the University of Liverpool three prizes of 20*l.*, 10*l.*, and 5*l.* annually for the best scheme for laying out the land near the church in the centre of Port Sunlight, to provide sites for a village library, picture gallery, a gymnasium, and a college for higher education. Mr. W. H. Lever further offers, if he carries out any of the schemes submitted, to pay the author of it 100*l.* These prizes are open to students both in the School of Architecture proper and the Department of Civic Design. The former include in their schemes designs for various buildings, the latter contenting themselves with the general plan.

Mr. Ronald Jones, architect, an old student of the School of Architecture, has given to the school a travelling scholarship for this year of 50*l.* to be held at the British School at Rome. To this the British School has added a further 25*l.* With these sums it is hoped that a student will be able to work at the British School for at least six months, and do a piece of restoration work under the Director of the School similar to that done at the French School, but, of course, of smaller scope.

## OUR CONTEMPORARIES FROM OVER-SEAS.

The *American Architect* contains illustrations of a number of new school buildings in various parts of the United States, in none of which is our central hall adopted, and some have no assembly-room or auditorium. There is a further paper by Mr. Wm. H. Goodyear on "The Controversial Aspects of the Architectural Exhibition at the Brooklyn Museum."

*La Construction Moderne* illustrates a design for a synagogue at Tunis by M. Tardu, and details of the façades of the Hôtel Chatham, Rue Volney, Paris, of which M. Decaux is the architect. Our contemporary discusses the situation created by the unwillingness of the Italians to allow the French Government to purchase the Farnese Palace for us as an ambassadorial residence.

The *Architectural Record*, continuing its series of arti es on the architecture of American colleges, now deals v h Princeton University. Other papers are "Building a chu h for a small congregation," by Herbert Wheaton Congd ; "The Architect's Proper Sphere," by Professor W. R. Ware; "Architectural Aberrations," a discourse on c n-position, by John Beverley Robinson; and "Utilita n Architecture at Chicago," by Peter B. Wight.

*Construction* is chiefly occupied with the work of r. F. S. Baker, F.R.I.B.A., of Toronto, executed since 1 2, which comprises a large variety of utilitarian as well as a s-tic work.

The *Engineering Record* has an interesting illustra d article on a new type of reinforced-concrete construction n which the usual girders and beams were eliminated, in -duced by Messrs. Condron & Sinks, of Chicago, used by t m in the Studebaker building of seven storeys above gro d level and described recently in a paper before the West n Society of Engineers.

## COMPETITIONS.

Our contemporary *South Africa* says:—The work of l-judicating upon the designs sent in for the Johan s-burg Town Hall, which is to cost 120,000*l.*, was complete n mail week, and the selection has given general satisfact n. Mr. Leonard Stokes, Vice-President of the Royal Institut f British Architects, who has acted as assessor, made the l-lowing awards:—First premium (500*l.*), Messrs. Hawk & McKinlay, Cape Town; second premium (300*l.*), Mr. W. L. Stucke, Johannesburg; third premium (150*l.*), Mr. Dou s Hoets, Pretoria; fourth premium (100*l.*), Mr. P. Tre y, Johannesburg; fifth premium (100*l.*), Mr. F. G. McInt a, Pretoria. The prize plans are remarkable for ha y utilitarian and ornamental qualities. Compactness of p n has been aimed at, a compactness which permits of no w te of space, and which, at the same time, allows of dignified d imposing elevation. The frontage is topped by a square to r, and is beautified by Ionic columns in relief. The plan of e building is a rectangular oblong, conforming to the shap f the site, and leaving about 100 feet at either end to be d out in gardens as proposed. The municipal offices occupy t portion of the site facing the G.P.O., with its main eleva n fronting the building. The public hall has been place t the rear of the municipal block, with its long axis diagon y across the site. Care has been taken to isolate it comple y from the municipal offices, at the same time so placing e supper-room or small lecture hall as to allow of its being d either in connection with the public hall or the munic al offices. This disposition will admit of the municipal b k and the large public hall being erected at different perio if thought fit. The public hall main entrance is from Presi nt Street, away from the traffic of the tram lines. In the arra e-ment of the municipal offices the main consideration has n compactness and directness of planning, with easy acc i-bility to the various departments from the street, an o er specified in the general conditions. All departments re grouped together on the same floor as far as possible. e position of the Council Chamber and committee rooms ll preclude all possibility of disturbances by street noises at the same time they are readily accessible to the several dep t-ments. The three large courts or areas in the centre of e building will admit of ample light to and the ventilatio of all parts. In the course of an interview Mr. Stokes sai — "On the whole, the competition has, I think, well answ d its purpose. The municipality has certainly done its bes to make it a success. I must add that I had no difficult in coming to a decision for first place, yet the designs as a w le have attained a high level of excellence. South Africa as evidently no lack of competent architects to choose from or important undertakings."

Dundee University College Council have approved p ns for a laboratory of mechanical, hydraulic and civil engi r-ing, estimated to cost 11,000*l.* The plans were prepare y Messrs. Rowand Anderson & Paul, architects, Edinbu h, who were instructed to take estimates for the work.

The election of six members of Council of the Conc te Institute has resulted in the return of three new members d the re-election of three of the old members. The new mem rs are Professor Henry Adams, M.Inst.C.E., M.I.Mech ., M.S.A., &c., Mr. E. Fiander Etchells, and Mr. Willian . Kirkaldy, A.M.Inst.C.E.

*Wednesday, March* 2.

Northern Architectural Association : Paper by Mr. J. Oswald, F.R.I.B.A.

Edinburgh Architectural Association : Paper on "Heraldry as Applied to Architecture," by Mr. J. Horne Stevenson, advocate.

Carpenters' Company : Lecture on "Castles in the Air," by C. F. A. Voysey.

Royal Archæological Institute : General Meeting.

*Friday, March* 4.

Architectural Association : Paper on "The Mediæval House," by Mr. J. Alfred Gotch, F.R.I.B.A.

Leicester and Leicestershire Society of Architects : Paper on "Wood-carving," by Mr. J. Armitage.

*Monday, March* 7.

Royal Society of Arts : Cantor Lecture on "Lead Work," by Mr. Lawrence Weaver, F.S.A.

## ARCHITECTURAL ASSOCIATION SKETCH BOOK, 1909.

THE latest volume of the Architectural Association Sketch Book strikes one as possessing a peculiar value as a work of reference, being notable for the very large proportion that it contains of careful measured drawings of buildings or parts of buildings of high architectural value, and in some cases of wide repute.

There is less of the fragmentary fashion of collecting all sorts of architectural bric-à-brac and more of the system of incorporating valuable and useful records of interesting, if not of important, buildings. The series of careful measured drawings of Ely House, Dover Street, London, by Mr. W. J. Jones, filling nine plates, is an example of this system. Another is the R.I.B.A. prize winning set of drawings by Mr. Ernest W. Wray, of the church of the Madonna di San Biagio, Montepulciano, a characteristic work of Antonio da San Gallo, the elder. Although one would not, perhaps, place either of these buildings quite in the front rank they are nevertheless interesting and well worthy of the permanent record that inclusion in the "A. A. Sketch Book" provides.

Of mediæval buildings, for the editors of the "A. A. Sketch Book" are wisely and properly catholic in their selection of examples, we have a capital series of drawings of the charming and well-known Stokesay Castle, Shropshire, by Mr. D. Robertson, and the magnificent and equally well-known parish church of SS. Peter and Paul, Lavenham, Suffolk, which, if not completely delineated, is sufficiently so, by Mr. Alan G. Brace, to form a valuable record of this remarkable East Anglian church.

In pursuance of the policy of publishing some of the remarkable sets of measured drawings that are continually prepared and exhibited in the annual competitions for the prizes of the Royal Institute of British Architects, the editors of the present volume have included the examples of Robert Adam's work in the Royal Infirmary and David Dale's house, Glasgow, measured and drawn by Mr. E. Douglas Smith.

Valuable amongst the records are Mr. J. L. Berry's drawings of the central or "Bell Harry" tower of Canterbury Cathedral; the beautiful and much drawn sedilia of the church of All Saints, Hawton, Nottinghamshire, measured and drawn on the spot by Mr. Sydney H. Miller, Pugin student; the elevation and section of a bay of the presbytery of Ely Cathedral, also by Mr. Miller; the Loggia dei Lanzi, Florence, measured and drawn by Mr. G. Drysdale; the part of the sacristy in the church of San Lorenzo, Florence, forming the setting for the tomb of Lorenzo dei Medici, for which we have to thank Mr. Alick Horsnell; the west façade of San Petro in Toscanella, one of the most interesting churches of the Late Italian Romanesque period, drawn by Mr. Lionel U. Grace; the lower order of the front elevation of the Grimani Palace, Venice, by Mr. G. Drysdale.

Although in a sense all the drawings in the "Sketch Book" are records, and therefore useful for reference to those who desire to have before them the measurement and delineation of some particular building, some are less to be regarded as occupying this position than as suggestions in design or pleasurable presentments of the picturesque or the beautiful in architecture.

Of both of these classes the present volume gives several instances, although, as we have already premised, record and reference are the main categories to which one would naturally ascribe a major portion of the plates issued.

The main staircase from the Palazzo Balbi at Genoa, drawn by Mr. Alick Horsnell, is useful for its suggestiveness as one of the remarkable series of interiors for which Genoa is famous. Apparently the plate now given is but an instalment, as it is lettered "Sheet I.," and the remaining sheets are to appear subsequently. Another example from Genoa is a doorway from the Via Santa Caterina, a curious piece of Late Italian Renaissance design sketched by Mr. C. Gascoyne. The Palazzo Torugi at Montepulciano, of which two elevations, part plan and details of mouldings are given by Mr. Alick Horsnell, is a good example of one of the less important works of Giacomo Barozzi da Vignola. Mr. Horsnell also gives measured drawings of a loggia in the garden of a more famous work of Vignola's, the Villa di Papa Giulio. A perspective sketch of the staircase and pavilion between the upper and lower courts of the same residence is contributed by Mr. C. Gascoyne, so that altogether Vignola is fairly well represented in the present volume of the "A. A. Sketch Book." Two other examples of Renaissance architecture in Rome also afford useful suggestions, the church of Santa Maria in Campitelli, drawn by Mr. Leslie Wilkinson, and the east front of the church of Santa Maria Maggiore, by Mr. G. Drysdale. An excellent study of one of Palladio's designs is Mr. Leslie Wilkinson's scale elevation of the Loggia del Capitanio, Vicenza.

It is remarkable that the seventy-three plates in the "Sketch Book," not including the frontispiece, are contributed by nineteen draughtsmen only. This is partly accounted for by the several instances of a long series of illustrations of one building each, which go far to establish the character of the present volume as a book of reference and record. Then of the thirty-three plates of Italian work, the great majority have been contributed by four men, G. Drysdale, C. Gascoyne, Alick Horsnell, and Leslie Wilkinson.

The high standard of excellence to which the "A. A. Sketch Book" has attained and which it maintains is no doubt partly attributable to the policy of including the work of a few very able and industrious draughtsmen, but on the other hand this policy does not tend to the encouragement of a numerous band of devotees to sketching and measuring. So that what the "A. A." gains in the value of its "Sketch Book" as an admirable production it loses in the character of an incentive to study. We are by no means disposed to say that the present policy is wrong, but possibly some of the lack of support which has been deplored in annual reports and presidential addresses is due to the fact that as it now exists the "Sketch Book" appeals rather to the purchaser than to the contributor. For the purchaser it is an admirable and wonderfully cheap guinea's worth, and no architect who can afford it should fail to be a subscriber.

It is a curious coincidence that the number of illustrations of English architecture is exactly the same as that of Italian work, thirty-three; thus England and Italy fill sixty-six out of the seventy-three plates in the volume, leaving only seven for the rest of the world, of which three are occupied by Mr. E. Douglas Smith's drawings of Robert Adam's work in Glasgow to which we have already alluded.

From Belgium the solitary example is one of Mr. C. Wontner Smith's masterly drawings, the western tower of the church of St. Martin at Ypres. French architecture is represented solely by two of Mr. A. E. Martin's drawings from Rouen, both details, the one of the internal staircase of the Hôtel de Ville, the other, a doorway and screen in the church of St. Vincent. Spain furnishes but one illustration, a clever drawing by Mr. Leslie Wilkinson of an interior view from the north transept of the cathedral church of Santa Maria, Burgos.

Of English architecture there are not many examples in addition to the drawings we have already mentioned, and of these Mr. E. Garratt contributes four plates, one containing measured drawings of the south porch of the priory church of St. John Baptist, Burford; another of the south porch of the church of SS. Peter and Paul, Northleach, Gloucester; a third, the beautiful and refined fifteenth-century brass lectern in the church of St. Martin, Salisbury; and the fourth a clever perspective of the fan-vaulted nave of the abbey church of St. Mary the Virgin, Sherborne.

Other English examples are The Grange, Broadway, Worcestershire; an eagle lectern from the church of St. Mary the Virgin, Cropredy; and a brass candelabrum from the church of St. Helen, Abingdon, all measured and drawn by Mr. Sydney H. Miller; an interior view with detail sketches of the church of St. Gwinear, Cornwall, by Mr. C. de Gruchy.

The title-page bears a striking sketch of part of the Château de Blois from an unusual point of view drawn by Mr. C. E. Mallows.

## ST. MARGARET, CLEY-NEXT-THE-SEA.

THE south porch here illustrated is part of the church of St. Margaret, Cley-next-the-Sea, Norfolk. The chancel, transepts and nave walls of the church were commenced in the Decorated style, while the remainder, including the south porch, was completed in the Perpendicular style. The spandrels in this porch bear the arms of Richard II., impaling those of Anne of Bohemia. In the jamb moulding are the Agnus Dei, arms of England, the cross keys, and the arms of three famous Norfolk families, the De la Poles, De Warrens and Erpinghams. The doorway in the porch has an ogee arch which encloses a trefoil, which in turn encloses a cinquefoil. The church is in an excellent state of preservation with the exception of the transepts and the north porch, which are in ruins. No dates are available.

## NOTES AND COMMENTS.

The assessors in the competition for the Welsh National Museum have selected for further consideration twelve of the 129 sets of designs sent in, and from these will make their final award, after the consideration of which by the City Council the plans will be exhibited at the old Town Hall, Cardiff, for a fortnight.

Hexham Abbey seems to be following the bad example of some other great churches and revealing its defects piecemeal. Perhaps, though, this may be part of the policy of those concerned with its preservation. But whether policy or carelessness it is equally reprehensible for those in charge of an ancient monument to reveal trouble bit by bit. The first thing that should be done when there is a suspicion that all is not well with a cathedral, abbey church, or other national monument of ancient architecture is to have made a careful and searching examination of the whole fabric and to let the friends of the building have a complete knowledge of everything that is wrong. But to shriek about the danger of a north transept and then when funds have been provided and expended for its preservation to "discover" that the south transept is in imminent danger, is playing the fool and insulting to the generosity of the faithful by the implication that they would not make a worthy response for a great need, but may be egged on to a series of contributions by a succession of frantic appeals.

At the annual general meeting of the Scottish Modern Arts Association held last week at Edinburgh the Chairman, Mr. A. Stodart Walker, gave a clear exposition of the fallacy of super-taxing the rich for the benefit of the poor in its effect on art production and art workers. Mr. Walker said that "What the future held in store for the arts in this and other countries it was difficult to say, but without entering into any political or economic discussion he might be allowed to give it as his opinion that any serious interference with what he might call the super-means of society was bound to react in a marked fashion on the patronage of the arts. The modern book world and the picture world have already suffered to an extent with which few of them were familiar. He thought it could not be disputed that the more difficult it became for the citizen to hold a reserve for things outside his business of keeping himself alive within the limits of comfort, the more would those things which the sociologists might term State luxuries suffer. The arts and crafts of the world flourished chiefly in an age of rich patrons, and it was difficult to see in thei absence how these arts could flourish and yet allow the craftsmen to earn a legitimate wage."

The death of Mr. J. M. Swan, R.A., removes fro amongst us one of the great exponents of the possibilit of artistic achievement in both painting and sculpture and, at the same time, probably the greatest sculptor o animal life of British birth. There was in Mr. Swan' work none of that added human expression that wa imparted by Sir Edwin Landseer and Mr. Brito Riviere, but a frank and truthful portrayal of th animal.

At York the City Council are still hankering afte the destruction of the Castle walls, although the count justices have refused to accede to the Council's reques for their demolition. It seems that the Castle occupie a curiously anomalous position, as it is not included i the city of York nor in any one of the three Riding so that one alderman suggested that it might not be i England at all.

In a case at the Manchester County Court last wee the judge remarked upon the difference that will be mad in the common law relating to the liability of landlor to keep houses in a condition "reasonably fit for occup tion" by the provisions of the Housing, Town Plannin &c., Act. A contract to keep the house in all respec reasonably fit for human habitation is to be implied

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

the part of the landlord for all houses let in the County of London at 40*l*. a year or less, in a borough or urban district with a population of fifty thousand or upwards at 26*l*. a year, and for a house situate elsewhere at 16*l*.

The Dean of Westminster, in proposing a vote of thanks to the Rev. W. Marshall, M.A., F.S.A., for his lecture on "English Mediæval Fonts and Monuments," at Carpenters' Hall last week (which is reported on another page), congratulated him on being able to show in the heart of the City of London views of such an exquisite series of monuments without having recourse to Westminster. In the Abbey there were to be found, he said, by anyone who cared to see them, specimens even more beautiful than any shown. Alluding to one of the slides, which showed a very Early Norman figure slightly in relief on a flat stone on the ground, the Dean said it recalled the earliest Abbey monument. This was of Abbot Gilbert Crispin, who came over with the Conqueror, and who was elected Abbot in 1117, on the recommendation of Lanfranc and Anselm. The slab of that marvellous black Tournai marble was lying in the cloister more or less exposed to the weather, and it had resisted the footsteps of thousands of the Westminster boys. It was practically a flat smooth surface, the eyes, nose, and mouth having entirely disappeared. But, fortunately, at some period, possibly 150 or 250 years ago, somebody must have caught his foot there and fallen heavily, for they had filled up the broken part with Roman cement. The fact was pointed out to him recently by a young Frenchman who had been studying the subject of the monuments of London. The cement was carefully picked out, and beneath they found the ears in perfect preservation. To prevent the possibility of a second accident the Dean had the small hollow filled up again.

Sir Oliver Lodge, in lecturing recently before the Birmingham University Engineering Society on "Protection from Lightning," criticised adversely the idea that most people still possess as to the best method of affording protection. The old idea of protection from lightning was that there was a charge of electricity in the clouds which had to be conducted to earth, and that the best plan was to give it an easy path, so that it would take the path they desired rather than follow a path of its own. It was thought the electricity followed the ordinary laws of electric conduction, and that, if they provided a good copper conductor, that conductor would be chosen in preference to all inferior conductors. The matter, however, was not quite so simple as that. There was a good deal more in it than merely getting the charge to earth. It was not only electricity but energy with which they had to deal; and the problem really consisted in dismissing that energy. It did not follow that to get rid of a certain amount of this energy quickly was to get rid of it as safely as possible. Given a store of energy in the clouds, they could get rid of it suddenly by providing it with a very perfect conductor, say a copper pillar an inch thick. But if they did this they must expect violence. It would be better if they could let it pass through thin iron and take time in the process. It was desirable to provide the buildings with lightning conductors, but it was not necessary that they should be made of thick copper. There were certain advantages in thin iron, inasmuch as thin iron would not carry the charge so quickly, and therefore less violence ensued.

## MODERN COLD STORAGE AND REFRIGERATION.

By W. S. Douglas, B.Sc.

### V.—THE REFRIGERATING MACHINE (*continued*).

*Condensers.*

In the condenser the direction of the heat exchange is exactly opposite to that in the evaporator or in the direct expansion piping. Instead of latent heat being absorbed into the medium for its evaporation (from the brine or air round the coils) it is dissipated as the medium condenses. A certain amount of heat is also given to the vapour as it is compressed, and this, together with the latent heat of condensation, is carried away in the cooling water. To perform this operation economically, with the minimum amount of water, is the function of an efficient condenser.

There are many different designs, which may be classified into three types, as follows:—

1. Submerged condensers.
2. Double-pipe condensers.
3. Atmospheric condensers.

*Submerged.*—This type of condenser has already been briefly described when dealing with the machine as a whole. It consists of either one or several coils, which are immersed in water contained in a suitable tank. When a number of coils is necessary, the upper terminals are united by a common header, which is connected to the delivery side of the compressor. The lower terminals, where the liquid is taken off, are joined in the same way, and the liquid is conveyed in a single pipe to the expansion valve. Water circulation is effected in such a way as to assist the action of convection. That is to say, cold water enters through an inlet in the bottom of the tank, and as it takes up the latent heat of the condensing gas, rises to the outlet, where it overflows. In this way what is known as the "counter current" principle is adopted. The gas and water flow in opposite directions, and the hottest gas, as it arrives from the compressor and enters the top of the coil, meets the water at its maximum temperature—*i.e.*, at the top of the condenser tank, near the outlet. Similarly the temperature of the liquid leaving the condenser coils at their lowest part corresponds to the temperature of the inflowing water. The difference between the two in actual practice is about 10° with the submerged condenser, although much closer exchanges are found with the other types. The temperature of the gas as it liquefies is thus about 10° above that of the water inlet, but had the liquefaction been carried out at the top of the coil, near the hottest water, it would have been even higher. For then the gas would have been 10° above the outlet instead of above the inlet, and as the former is generally hotter than the latter by another 10°, we have 20° in all as the difference in temperature between the inflowing cold water and the condensing gas. This is radically bad, as the higher the temperature at which the gas is liquefied, the more power does the compressor absorb from the engine or motor which drives it.

It is therefore doubly important that we should have cold water and an efficient condenser; less power is then absorbed and the water consumption is reduced.

For two reasons this particular type of condenser is the least efficient of any. Firstly, the circulation of water, unless there is an abundant and cheap supply, is necessarily slow, owing to the large area through which it flows. It is especially so near the coils, just where it is essential that circulation should be rapid, for there surface friction on the metal acts as a brake and keeps the speed of the water even lower than that in the central stream. The effect is that an almost stationary film is formed on the coil surfaces, and the heat transmission is retarded. Air bubbles also gather, owing to the lack of agitation, and assist in preventing the passage of heat. Secondly, only a small portion of the water flowing through actually touches the coils. This is due partly to the construction of the condenser and partly to the bad circulation. The result is wastefulness, as the greater part of the water is doing no cooling. Hence there are big readings on the water meter.

Notwithstanding these two serious defects, most small machines have submerged condensers. Less floor space is taken up, and the plant can be arranged more compactly. The cost is also less, and the condenser may be placed next the machine instead of on the roof, thus saving in pipe work. But where economy of water must be studied, this type of condenser is useless.

*Double Pipe.*—The second type is an attempt to retain the advantages of the submerged condenser, and at the same time to eliminate its defects. In this object it is partially successful, and for small plants is found to be very useful and compact. The construction of one of these condensers, as made by Messrs. L. Sterne & Co., Ltd., is shown in fig. 15. Instead of a tank being made to contain the coils, the piping is bent into a flat grid and surrounded by an outer tube, larger in diameter, which follows the shape of the grid itself. The result is that two continuous passages are formed. One is through the inner pipe, and is the path followed by the circulating water which flows from bottom to top. The other is formed by the annular space, which lies between the outside of the inner pipe and the inside of the concentric tube which surrounds it. Through this flows the gas which is to be liquefied, its direction of flow being, as in the submerged condenser, from top to bottom, or exactly opposite to that of the water. The principle underlying the two types up to now considered is therefore the same, but the great advantage of the double-pipe condenser is that a much smaller area is allowed for the passage of the water. By this means it is kept close to the coil throughout its circuit, and every drop is made to do the maximum amount of cooling. Hence the effect of a given weight passing through the condenser is greater, and a smaller quantity is sufficient to do the work. At the same time the arrangement takes up very little space, and can be placed next to the machine or fixed to any convenient wall.

Another form of condenser which is really an application of the double pipe principle in a minor degree, is that made by Messrs. J. & E. Hall, Ltd. Here the evaporator is placed inside a cast-iron tank, which supports the compressor, and an annular space for water is thus formed between the two. Condensing coils are placed in this space, and, the path of the water being restricted to the immediate neighbourhood, a certain economy is effected in the amount consumed. This arrangement is diagrammatically shown in fig. 16.

Double-pipe condensers, except in some such form as that just cited, are more expensive than submerged, but owing to their compactness and comparatively low water-consumption their popularity in this country is increasing. In the United States, where they originated, they are universally used for the smaller plants, and even in the larger installations are fairly common.

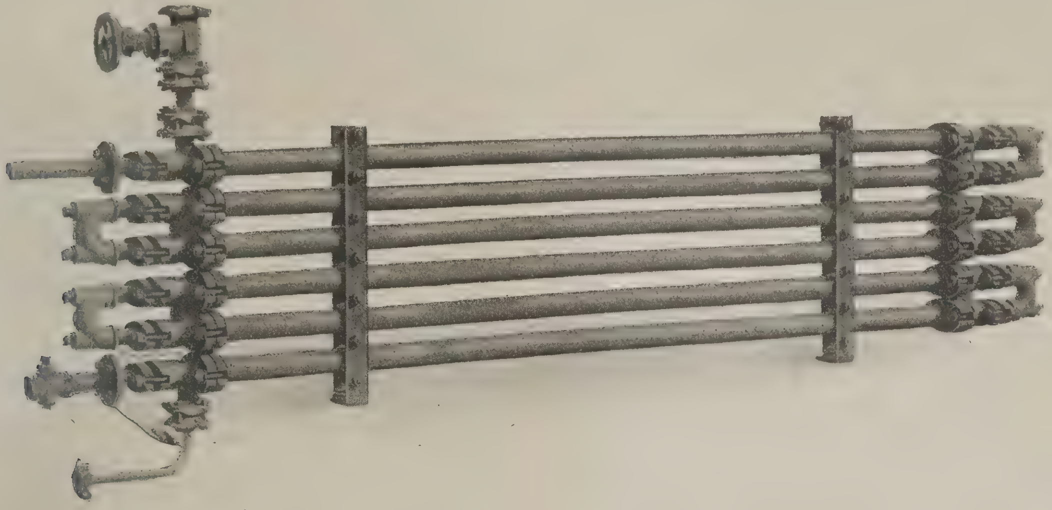

Fig. 15.

*Atmospheric.*—In large installations this form of condenser is used without exception. A typical example, by Messrs. Borsig & Co., of Berlin, is shown in fig. 17. Large flat grids of piping are made, and, as will be seen from the illustration, are built into well-supported stacks.

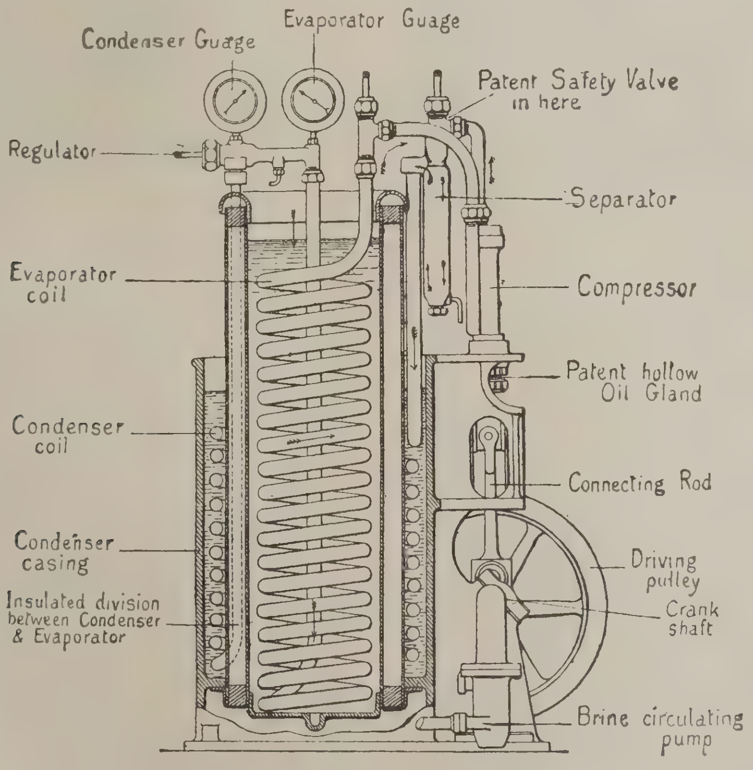

Fig. 16.

The refrigerant (in this case sulphur dioxide) is delivered into the various grids by the long header, or "manifold," seen at the top, and is collected in the liquid form by a similar header at the bottom. The water instead of circulating all round the coils is sprayed over the top by suitable distributing pipes, and allowed to drip from one layer of pipe to another until it reaches the collecting trough at the bottom. In this way small drops are continually impinging on the hot surface of the coils, with the result that a part of the water passing over goes off as steam, and a powerful cooling effect (due to the abstraction of the latent heat necessary to form the steam) is exerted on the refrigerant. From the trough the water is sucked into a pump, hoisted once more to the distributing pipes, and the process is repeated *ad infinitum*. The immense economy effected by this action will be realised by referring to the physical constants already cited for water. Its latent heat of vaporisation at 212° Fahr. is, we find, 966 B.T.U.'s per lb., and the specific heat, of course, is unity. Now in the ordinary submerged condenser the rise of temperature in the water passing through is commonly about 10° Fahr. That is, each pound absorbs 10 B.T.U.'s from the gas inside the coils. But in the atmospheric condenser the water is heated to a much higher degree and then evaporated, and as during the latter operation alone some 900 B.T.U.'s per lb, are absorbed (the exact amount depending on the temperature of evaporation), it will be seen that a very much smaller quantity will perform the same amount of cooling. Unfortunately, however, small losses occur in practice, and the actual economy is not therefore so enormous as it would appear to be from the theory. But, notwithstanding the losses, there is a very real saving, and most atmospheric condensers may be relied upon to take only one-tenth of the water consumed in a corresponding condenser of the submerged variety.

For this reason they are employed in large installations to save running charges, and also in smaller plants where water is scarce. The extra floor space taken up is outbalanced by the water saved, and, as the condenser is generally fixed on the roof, is of no very great importance. About 25 per cent. more piping is used than in the submerged type, and although the circular tank is dispensed with there is the cost of the flat collecting tank, extra stays, supports, water pump, and water distributer to set against it. Hence on the whole the atmospheric condenser is more expensive.

Another form of condenser working on this same principle is sometimes found. It is known as the “ Evaporative ” type, and is used where a confined space is the only location available. The air circulation is then maintained artificially by a fan, and the rest of the construction is very similar to that just described.

*The Refrigerant.*—Vapour compression machines of all types are similar as to general arrangement, and the size of the complete plant does not vary to any extent with the different gases which may be used to fill the system. Each refrigerant, however, demands a certain difference in constructional details, and each has peculiar properties of its own. These are now to be considered.

The three principal refrigerating media are, as already stated, carbon dioxide, ammonia, and sulphur dioxide. All of these are volatile, and under atmospheric pressure exist in the gaseous form. That is to say, if a quantity of one of them were liquefied and then exposed in an open vessel to the air, the liquid would quickly evaporate down to the last drop. Hence to cause liquefaction in the condenser at ordinary temperatures, pressure, varying in amount with each different gas, has to be applied.

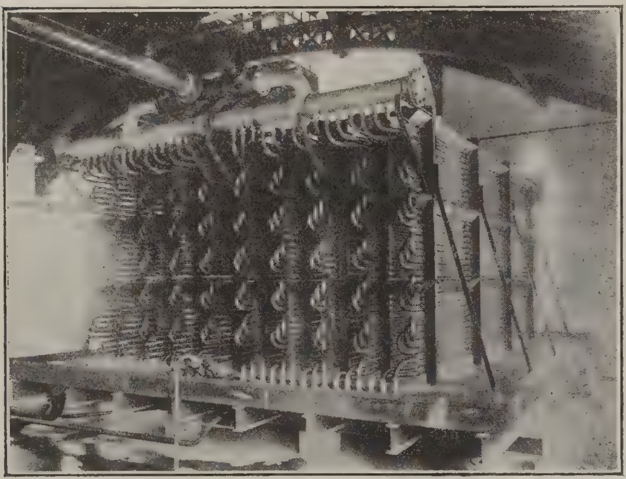

Fig. 17.

*Carbon Dioxide* (*Chemical Symbol, $CO_2$*).—This gas is found almost everywhere, and even forms in small quantities an integral part of the air which we breathe. It is exhaled by all human beings, and, except during the night, inhaled by all plants and vegetables. For commercial purposes it is produced by burning coke, and passing the products of combustion over washing soda, which absorbs the crude $CO_2$ and gives it off under the influence of heat as a purified gas. Large quantities are also formed in breweries during the fermentation of beer, and are now being utilised as a profitable bye-product.

$CO_2$ has no smell, and, except in bulk, is not poisonous. Unfortunately, however, it requires a very high pressure to cause liquefaction, and even in the evaporator, where the pressure is at its lowest, the gauge, if the machine is running on an ordinary store, reads as high as 380 lbs. per square inch. This corresponds to an evaporating temperature of 14° Fahr. In the condenser the pressure is much higher, and, if the gas is condensing at 68° Fahr., must rise to 850 lbs. per square inch before liquefaction is accomplished.

The $CO_2$ machine is therefore somewhat handicapped as high pressures produce high working stresses, and, unless special arrangements are made, cause rapid wear in the moving parts of the compressor. There is also more risk of a leaky joint with $CO_2$, and should a flaw be started in the metal there is just the chance of an explosion. The latter danger, however, is reduced to a minimum by the use of a safety valve, which is set to blow off into the atmospher when the pressure rises to a pre-determined value. This the chief advantage of $CO_2$, as the other gases, while allov ing lower pressures, are penetrating and irritant, with t result that no connection of the system with the atmospher is possible. At the same time, since the relief pressure higher than that attained in ordinary use, there it sti considerable risk.

Needless to say great care is taken in the construction these machines, and at sea, owing to the gas being odourles they are widely employed. But on land, where the smell the gas is comparatively unimportant, they are not popular. This is chiefly due to the high pressure, whic in addition to the disadvantages already mentioned, nece sitates as a compensation for leakages frequent additions the charge of gas originally put into the system. Moreove above a certain temperature known as the “ critical point, no pressure, however high, will cause the gas to liquef Hence where the cooling water available is too hot, C machines are useless.

*Ammonia* (*Chemical Symbol, $NH_3$*).—Ammonia is a we known gas, very volatile and very soluble in water. It prepared by heating various ammoniacal salts in the pr sence of slaked lime.

The pressures necessary are considerably less than tho which must be used with $CO_2$. Taking the conditions specifi before, if the gas is evaporated at 14° Fahr., the pressure the evaporator will be 27 lbs. per square inch, while wi 68° Fahr. as the temperature of liquefaction, 110 lbs. w be sufficient to reduce the gas to a liquid. There is therefo less risk attached to the use of the machine, and leaks are n likely to occur. Further, should any gas escape, it will detected at once by its powerful smell, and the leak will easily located for repairs. No safety valve can be employ owing to the odour (which is exactly that given off by sme ing salts) and irritant qualities of the gas.

The disadvantage of ammonia is that it exerts a corrosi action on all forms of brass, gunmetal, and bronze. No of these metals can therefore be used in the construction the machine if they are likely to come in contact with the g Instead, steel and iron must be exclusively employed, a in certain parts, such as the cocks and valves, this is d tinctly inconvenient.

Ammonia machines have a wide use on land, and America they are employed almost to the exclusion of others. They are also used to a limited extent at sea.

*Sulphur Dioxide* (*Chemical Symbol, $SO_2$*).—This is t gas formed when ordinary sulphur is burnt in air. The p ducts of combustion are passed over lime, and the resulti sulphite of calcium is then decomposed by the action of s phuric acid. $SO_2$ is evolved in a concentrated state, a dried by bringing it into contact with strong vitriol. It i well known preservative, and is also extensively used bleaching.

$SO_2$ permits of lower pressure than either of the two fir named refrigerants, and under the same conditions as th given in the first two cases, the evaporator and conden gauges should read respectively 0 (*i.e.*, atmospheric) a 33 lbs. per square inch. This is a great advantage, a allows of a perfectly safe machine, practically free from danger of blown out joints and leakages. It also relie the wear on the working parts.

Like ammonia, $SO_2$ possesses a penetrating and charact istic odour, and with both there is no difficulty whatsoe in diagnosing a leaky joint. Naturally no safety valve be employed, but at 33 lbs. per square inch this is obviou quite unnecessary. The low pressure also practically obvia altogether the frequent additions to the charge, which so necessary with the high pressure $CO_2$. Another, a indeed the principal, advantage of $SO_2$ is the fact that the liquid form it is an efficient lubricant. The great portance of this lies in the fact that it renders the use of in the compressing cylinder altogether superfluous. For, the cylinder is water-jacketed, drops of liquid dioxide condense on the sides, and will so lubricate the path of piston, which moves in the cylinder, that no oil will be need The mere saving in oil thus effected, although not to be spised, does not count for much, but it is a lasting and s stantial benefit to be free from the trouble of forcing in oil and again extracting it lest it should be forced with gas into the condenser. For the first purpose special lu cators are required, and for the second a large oil separa Neither apparatus is continuously efficient, and seri trouble results, especially with the latter, if there is a bre down. In the $SO_2$ machines both are eliminated.

$SO_2$ has no action on metals, but if water and air allowed to approach it together sulphuric acid may be form

No danger of this, however, exists in practice, as the system is self-contained and perfectly dry.

Machines using $SO_2$ as a refrigerant are widely used in this country and all over the Continent, but, strangely enough, have not yet been adopted in the United States. Their use at sea, for the same reason as that stated when dealing with ammonia, is only limited.

(*To be continued.*)

## RENAISSANCE CHURCH ARCHITECTURE OF THE SIXTEENTH CENTURY IN FRANCE.*

(*Concluded from last week.*)

### *Doors.*

We may now take a few of the individual features of a church, beginning with doorways. The example on the screen is a graceful translation of a Gothic arched door with deeply splayed jambs and many times recessed arch into Renaissance forms. It is the west door of the church at l'Ile-Adam.

The south transept at St. Eustache has a more important doorway with a central pier and with a window above included under the same arch, treated in much the same way as the last. But the growth of Renaissance influence is shown in the desire to enclose this Gothic motive in a square framework.

The west doorway at St. Jean de Losne shows the same desire expressed in more reticent forms.

The west doorway at St. André-lez-Troyes shows a further step. The framework is here treated as more important than the opening. It takes the preponderant place in the composition. This doorway is probably one of the works of Domenico del Barbiere, a Florentine who settled at Troyes and married his daughter to a Frenchman with whom he went into partnership. They collaborated in a number of similar works in the neighbourhood.

The north transept of Ste. Clothilde, at Le Grand Andely, was added about 1540. Its doorway illustrates the translation of a mediæval type into Henry II. detail.

The south portal of St. Nicolas, at Troyes, another work probably of Domenico Fiorentino, illustrates a design made as a whole on advanced Renaissance principles.

The west doorway of St. Nizier, at Lyons, is another fully classical composition of much bolder character. It is perhaps a work of Philibert de l'Orme, and formed part of a scheme for an entire new façade. The use of a great niche as a porch is a conception so majestic that it might well have been more frequently used than has been the case.

The superb doors from the south transept of Beauvais Cathedral are examples of the best Francis I. work at its richest period.

This slide shows one of the celebrated doors of St. Maclou, at Rouen, attributed to Jean Goujon, and extremely characteristic of Henry II. decoration.

The task of translating traceried windows into an appropriate Renaissance equivalent was one of the most difficult which the church designers met with, and led to some interesting solutions. One line they followed was to retain the flowing designs in use in flamboyant Gothic, introducing new forms such as hearts, fleur-de-lys, ovals, into the patterns. This is to be seen in quantity at St. Eustache, where the tracery is one of the weakest points.

### *Windows.*

Another was to return to geometrical patterns while eliminating pointed forms. This may be seen in the choir of the church at Beaumont-le-Roger, in combinations of circles and arches, and in the south transept of St. Eustache in hexagonal reticulated tracery. In the clerestory at Beaumont is rather later tracery, differing from all earlier types by its square, unmoulded section. In one window it is treated as an interlacing ribbon, in another as a monogram.

The rose window in the north transept at Le Grand Andely is perhaps the most successful translation of a free geometrical pattern into Renaissance forms. The tracery is still moulded, and the cusps are composed of foliage.

After about 1530 unmoulded tracery came into fashion, and was largely used in a new type of design which altogether avoids the flowing lines and to some extent the geometrical patterns hitherto in use and simulates slender skeleton edifices. The mullions become shafts and sometimes have capitals; the transomes become entablatures; the tracery takes the form of arches, pediments, circles and scrolls, all of which is sometimes plain, sometimes carved. The left-hand window in this view of Notre Dame des Marais at La Ferté-Bernard shows an example. The same slide shows two types of balustrade, one formed of statuettes in an arcade, the other of an inscription in openwork.

This window from St. Nicolas, at Troyes, illustrates a combination of radiating geometrical tracery with a surface pilaster treatment, while that from St. Jean, at Troyes, shows a skeleton edifice system apparently inserted into a Gothic window opening.

Windows without tracery are almost exclusively used in the advanced Renaissance period, and were found even earlier, as, for instance, at St. Pierre, Caen, till the recent restoration.

The windows on the south face of the south tower at Gisors light the baptistery in its lower storey. The vesica shape above and the two round-headed lights below form a beautiful group and are beautifully detailed.

### *Church Fittings.*

The next group of slides gives examples of church fittings at various periods. This is part of the Francis I. rood screen in the cathedral of Limoges, photographed from the cast in the Trocadéro Museum.

This is an early Henry II. rood-screen from the church of Arques, near Dieppe. The rood-screen by Jean Goujon and Pierre Lescot in St. Germain l'Auxerrois, in Paris, now destroyed, would seem to have somewhat resembled this.

This slide shows a portion of one of the magnificent set of stone screens which extend the whole length of the aisles of the cathedral of Laon, and were put up in the reigns of Henry II. and his sons.

This slide shows a Francis I. font from the church of St. Ouen, at Pont-Audemer, in Normandy.

This is a wooden reredos from St. André-lez-Troyes. Its delicate tracery of foliage and scroll work, its cherubs' head cuspings, and, in fact, the whole of the detail is exquisitely executed. It is gilt with blue backgrounds.

This is another Francis I. reredos in stone from a side chapel in the cathedral at Sens.

The chapel at Ecouen was fitted up by Jean Goujon for the Constable Montmorency. This altar of his design and execution has been removed to Chantilly.

The organ loft, also by Goujon, is still in position at Ecouen.

### *Classic Churches.*

Having run through a number of examples of translations of more or less Gothic motives into Renaissance language and of isolated Renaissance features applied to half or wholly Mediæval churches, we come to those churches of the advanced Renaissance which were designed as a whole in plan and section as well as elevation on Classic lines. I wish it were possible to show you an equally rich series of examples. Unfortunately they do not exist, for the culmination of the advanced Renaissance exactly coincided with the outbreak of the civil wars which brought building to a standstill. No church of any size was designed, still less executed, in this style, and our only examples consist of half a dozen private or mausoleum chapels, of which only the two at Anet are still standing.

The Mausoleum Chapel comes first, though later than the other, because it is the only non-domical one of the group. It was built probably about 1560 for Diane de Poitiers outside the château, to contain her tomb, by an unknown architect.

It does not seem to have been designed by Philibert de l'Orme, but may possibly be the work of Jean Bullant. It is a simple form of basilica, consisting of a rectangular nave with a barrel vault, two square sacristies, and an apse with a semi-dome, and thus forming a rough cross. Its façade is one of the most classical fronts of the century and decidedly monumental in effect. At the Revolution the tombs of Diana and her two children were opened, and the bodies, which were found intact, dragged out. The abundant golden hair of the royal mistress was divided up to make souvenirs for the members of the revolutionary committee who presided over this revolting act.

We turn now to the domical chapels. These all differ from the previous examples of domes in that their plans are entirely conditioned by the dome. One of the earliest was a so-called temple in the park at Villers-Cotterets by Philibert de l'Orme, no longer existing. A circular chamber with hemispherical dome was surrounded by three rather more than semi-circular apses whose domical roofs of corresponding form butted against the walls of the central chamber. The entrance of the fourth side was through a pedimented portico. It was for this portico that de l'Orme invented his so-called French order of banded columns.

---

* A paper read at the meeting of the Architectural Association on February 4 by Mr. W. H. Ward.

This slide gives the plan of the château-chapel at Anet, likewise by de l'Orme, built about 1540, and decorated with sculpture by Goujon. Here again we have a circular central space with hemispherical dome. It has four arms with square turrets between them. One arm forms the entrance opening into the cloister of the court of honour and has an enclosed gallery over it. The other three have curved outer walls concentric with the central space. The interior is full of awkwardness—the four arches in winding, the entablatures broken by the windows, &c. There is no independent façade, and the rear elevations are of no particular interest. On the other hand, the construction of the stone dome is so excellent that it has stood unprotected for nearly 400 years.

On the death of Henry II. (1557) Catherine dei Medici instructed her architect, Primaticcio, to design a mausoleum for her husband, her children and herself. This resulted in one of the purest and completest classical buildings that France ever possessed. It was begun in 1570, but was unfinished when the Valois dynasty came to an end with the murder of Henry III. The Bourbons did little to it and it fell into disrepair, and was destroyed by the Regent Orleans in 1719. It stood on the north side of the abbey church at St. Denis and was entered from the transept. The royal tomb occupied the centre; those of the other princes were to stand in the trefoil chapels which radiate from it.

Over these a gallery ran round the upper part of the central hall, which had a hemispherical stone dome itself covered by an independent timber dome, the first of its type in France. The elevations, treated in a manner recalling those of the Louvre, were excellently proportioned and doubtless beautifully detailed. The interior was enriched with coloured marbles and the work of the great sculptors of the day. The tomb of Henry and Catherine can still be seen in the abbey. The monument as a whole was a worthy resting-place for the ashes of the Valois kings, whose love for art had so large a share in endowing France with the glorious buildings of her Renaissance in its various stages.

In conclusion I would only remark that whatever my hearers may think of the opinions I have expressed, some at least among them may have been convinced by the slides, if they were not so already, that the Renaissance church architecture of France is one which may be studied with profit and with desire to visit its examples.

Mr. J. W. Simpson, who proposed a vote of thanks to Mr. Ward for his lecture, congratulated the Council of the Association on their remarkable success in procuring interesting papers for the fortnightly meetings. He hoped Mr. Ward's lecture would be printed with illustrations, since he was of opinion that it was of the greatest importance to students of architecture that they should study and learn design and history together, and that exercises in the styles of particular periods should be comparative. Continental works should be examined with examples of English architecture at corresponding epochs, for unless some such method was practised the standard of their criticism, which really meant their perception of the beautiful, was certain to become extremely cramped and insular. It was also true that without some knowledge of the history of the people who lived during the different periods, of their customs and costumes, the buildings would never give up to the student their real meaning and interest. Many were disposed to divide the study of architectural design into two parts, on the one hand the architecture of their early practice, dealing with the picturesque possibilities of the pigstye, and on the other hand there was the design which they had to get up for examinations, but for which there was no real use afterwards. For such they must grope in dreary musty volumes containing letterpress in unintelligible tongues, to perhaps recognise some of it with surprise when later on they travelled abroad. The paper they had heard that evening in its logical and historical development of Renaissance church architecture in France was a very good example of a constructional method which might be followed in the study of design, and the speaker therefore commended it as a guide for students of the Association.

Mr. Edward Warren seconded the motion. The study of French Renaissance, he said, had always been one full of charm and interest to him, and the more so because it was interesting to follow a contrast of chronological instances in other countries. The difference between this country, due to our insular position, and France, was very marked. Mr. Ward attached the date 1507 to one of his illustrations, and that was exactly contemporary with the middle period of the building of the great tower of Magdalen College. That building, although it dragged on into the sixteenth century, was pronounced English Gothic without a touch of the Renaissance. There were in England some very striking instances of refined French work—at Christchurch, in Hampshire, the Salisbury tomb; the monument of a warrior dated 1357 in Brede Church, Sussex, Chelsea parish church, and King's College, Cambridge. As to the sequence of the French Renaissance dealt with by Mr. Ward, the most interesting periods were the beginning and the end. A great deal of French Renaissance work of the middle period was foolish and crude. It was certainly not good architecture, because the first quality required in architecture after ordinary structural expression was that of inevitableness—a function performed in a proper way.

Mr. Alan Potter, in supporting the vote of thanks, said while he had great admiration for Mr. Ward's knowledge, he had considerably less admiration for the subject of the lecture. Early Renaissance work in France was a struggle between the Gothic principles of construction and the Italian Renaissance principles of design, by overlaying pseudo Classic detail developed on a different basis of construction. It was a struggle in which the Gothic principles held their own and never entirely disappeared. In all the early work such as that of Francis I. and Henry II. the best examples were clearly those in which the Gothic idea was manifest. The subject, he said, struck him as being of more interest to the student of religious and social history, rather than to the practice of architects of to-day. It seemed to him that the direct lessons were nearly all in the negative of what not to do. He felt that the commencement of the Renaissance was the commencement of a time when people had to be educated up to things—it was a struggle between the self-conscious and the sub-conscious elements.

Mr. H. P. G. Maule supported the suggestion as to printing the paper with illustrations, for in such a form it would be of great use in the school. He agreed also with the importance of making students design in style, taking classical, or whatever periods they might wish, and making the students design more or less on those lines and principles. To do that properly, and obtain the best results it was most desirable that the students should have a clear exposition of the historical development of the style they were studying. Mr. Ward's lecture was admirable, and its value to students could not be overrated.

Mr. Rudolf Dircks supported the vote of thanks, which on the motion of the President was passed by acclamation.

# ILLUSTRATIONS.

### ST. PAUL'S CATHEDRAL, MELBOURNE.

By special permission we reproduce one of the working drawings of the late Mr. William Butterfield that were exhibited at the Architectural Association on the occasion of the lecture by Mr. E. Swinfen Harris, F.R.I.B.A., which is reported in our columns this week.

### THE TOWER, DODFORD.

This house was built from the designs of Mr. Arthur Bartlett, F.R.I.B.A., and was described in our issue of January 28.

### CATHEDRAL SERIES, LLANDAFF.—NORTH SIDE OF CHOIR—INTERIOR.

This view, forming part of our series of Llandaff Cathedral, shows much of the work of Mr. Pritchard.

Many of our readers, to whom he is well known, will regret with us to hear of the serious illness of Sir Thomas Drew, who has undergone an operation for appendicitis.

On Monday evening, February 14, Mr. J. Cruickshank Smith, B.Sc., F.C.S., delivered the first of a short course of three lectures on "Paint," to the students in the Polytechnic architectural classes. There was a good attendance, between forty and fifty students being present. The subject was "Painting grounds in their relation to the suitability and permanence of various paints." The lecturer, after referring to the importance of considering the ground or surface on which paint was to be applied, and the failures that occurred through lack of attention to the subject, dealt in detail with the grounds or surfaces commonly met with in practice, viz., wood, stone, brick, plaster, cement, iron and steel, and galvanised iron. The theories underlying the treatment of these surfaces were explained, and many practical hints were given.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at the premises in Tufton Street, Westminster, Mr. H. TANNER, F.R.I.B.A. (President), in the chair.

The HON. SECRETARY announced the fourth spring visit, fixed for February 26, to the Sir John Cass Institute and School, Jewry Street, Aldgate, by permission of the architect, Mr. A. W. Cooksey. A visit will afterwards be paid to new offices in Austin Friars Square, at 3 P.M., by kind permission of the architect, Mr. M. E. Collins.

At a meeting of the Camera and Sketching Club to be held on March 3, at 7.30 P.M., Mr. John Gaymer will contribute a paper entitled "Mediæval Roofs."

On March 11, at 7 P.M., the Debating Society will hold a joint meeting with the Art Workers' Guild. Mr. A. R. Jemmett will read a paper on "The Study of the Crafts in Relation to the Practice of Architecture."

Messrs. A. S. Bennett and A. T. Edwards were elected members.

Mr. E. SWINFEN HARRIS, F.R.I.B.A., read the following paper entitled—

### The Life and Work of William Butterfield.

As one of your oldest surviving members I feel that it is not only an honour, but a rare pleasure too, to be called upon to say a few words about the life and work of this very remarkable man, and to give you, so far as I can do so justly and impartially, some small contribution towards the still unwritten complete memoir of a great and self-repressing architect, well known, it is true, to most people in the art world, in and through his many buildings, but of so retiring a nature as to be all too little known and remembered by the multitude in any other way; his work is, always has been, and, I fancy, always will be, studied and enjoyed by thoughtful souls.

Let me try to speak of him in a threefold sense: architect, man, friend.

William Butterfield, F.S.A., was born in Gordon Square, London, on September 7, 1814; he departed this life on Friday, February 23, 1900, at his residence, 42 Bedford Square; he was buried on the Friday following, March 2, in the new and added portion of the churchward of the parish church of Tottenham, next and immediately in the rear to the west of the grave of his attached friend, the Rev. Prebendary Arthur Wilson, a prebendary of St. Paul's Cathedral; their tombs are evidently both from Mr. Butterfield's designs, and are very nearly alike both in form and detail.

Some of his best architectural efforts have been already well described, illustrated, and criticised in an admirably written article which appeared in the *Architectural Review* for June and July 1900; an excellent and life-like portrait is given with the letterpress of the memoir over which Mr. Halsey Ricardo has, in his thoughtful critique, in no one particular spared himself; also by other writers in other places.

I suspect that it will never be revealed to us what were the principles at the back of Butterfield's busy brain guiding him so well towards the faculty that produced his many wonderful buildings with their numerous peculiar methods and details; that he had principles and good reasons for all that he did no one knowing him at all would or could have the very smallest doubt.

It has been my great good fortune not only to see and handle very many of his carefully-made drawings, so full of the results of deep thinking as they one and all are, but also to visit and carefully examine the following buildings of his:—

All Saints Church, Clergy House, Choir School, and the Parochial Schools (slantingly opposite to these) in Margaret Street.—Mr. Ricardo has summed up the salient points, but it may be of some interest to you to know that his designs and drawings for this church were on view in the first Great Exhibition of 1851. I was there, too, but being then only ten years of age, and perhaps remembering it all the better because I spent my birthday in it, I could hardly be expected to appreciate them then as I do now, even had I then seen them.

The School Chapel, School Buildings, Gymnasium, Racquet Court and Fives Courts, Rugby School.—All these works are excellent; the way in which the many difficulties as to the chapel in so limited an area were overcome so cleverly are a great sign of his patience, which must have been tried by the insistence of the retention of many of the hallowed if incongruous features; his loyalty to instructions has resulted in the production of a noble structure, lofty and spacious within and full of dignity without.

The Re-building of St. Andrew's Parish Church, Rugby.—Here, too, he was seriously hampered in having to incorporate an old tower with his new work, but the success achieved shows that this difficulty proved in the end a great sign of his power; his own tower and spire rise nobly at the other end of the church. The retention, too, of the old nave as an aisle is a very clever piece of work; the two hagioscopes recall his earlier sympathy with old methods, specially when, as here, they could be made subservient to his needs. This work was done in 1870; the new tower and spire later on, and statically the better in consequence, the foundations belonging to the date mentioned.

The Church and Clergy House of St. Alban the Martyr, Brooke Street, Holborn, 1861-2.—A truly noble, dignified, and well-arranged church; its west end specially reveals the work of a master mind, embodying great height and scale: when for a short time only it was visible to the passer-by it was a revelation little likely to be forgotten by those who enjoyed it. Professor Pite has well recorded that event.

Balliol Chapel, Oxford, which, in spite of the late Lord Grimthorpe's hard words in his "Book on Building," is a fine piece of design; after all, perhaps, had Mr. Butterfield's reasoning been asked for an answer might have been forthcoming for what he did; be that as it may, the persons who paid for it could have objected had they seen good cause for so doing; at St. Albans Cathedral the objectors not being the paymasters were not listened to.

St. Matthias, Stoke Newington, 1851-3, was an early work of his, full of that quiet grace and dignity so needful as aids to true devotion; the ritual arrangements here, as elsewhere, are admirable.

Keble College, Chapel, Dining Hall, &c.—The chapel, built by the lavish generosity of Mr. Gibbs, of Tyntesfield, and containing among its treasures Holman Hunt's "Light of the World," besides its importance as a vaulted structure, shows the aloofness of its architect, his independence of action, and his disregard of precedents, specially in his resistance of old methods in not placing his congregation choirwise, but preferring to treat the matter parochially for the simple reason that Keble was, in a sense, different in so many ways to the older foundations; good proportion as here shown is as necessary to success as is that of mere loftiness; the value of arcading both inside and out is noteworthy; his conviction that the subject from the Apocalypse that he had chosen for the great quatrefoil over the altar was the only one suitable to the iconographical scheme leading up to it, was, after much serious consideration, so logically defended by Mr. Butterfield that the authorities felt bound to adopt it; the supernatural in art is always more or less difficult to handle.

St. Ninian's Cathedral, Perth, N.B. (1851) (since completed by the late J. L. Pearson, R.A.), a very thoughtful and beautiful creation throughout, and set in lovely surroundings.

Fulham Palace Chapel, which most of you probably know very well (1860-67).

Works in the church of Ottery St. Mary, Devon, and the New House of Lord Coleridge, "Heath's Court," hard by it. —This house is full of suggestion, and "racy of the soil."

A Parsonage House in Burleigh Street, Strand, which most of you probably know, at least from the outside; the plan, in a confined area, is very clever.

All Saints, Babbacombe.—A church glowing with the marbles of the beautiful county in which it is placed.

Buildings in Winchester and St. Cross.—These have been carefully described and criticised already.

A New Church at Newbury.—A thoughtful and interesting piece of work; of some of the stained glass noticed when I visited it, perhaps the less said the better.

Chapel for St. John's College, Battersea, and New Parochial Schools there.—These you probably know, so I leave them for others to criticise. The chapel has been recently dealt with by my old friend and pupil, Mr. A. H. Ryan Tenison.

St. Augustine's Church, Queen's Gate (1871).—In this church, as in that of St. Andrew's, Rugby, both works of his later years, he evolved what, for want of a better term, may be called the open stone rood, by cutting off the apex above the chancel arch, and raising the rood on high over and upon its horizontal line; whether it will have an abiding influence remains to be seen.

The Old Home and Chapel of the S.P.G. (1871), since rebuilt on another site hard by from the designs of Sir William Emerson, showed some of his quaint and most original dealing with brick patterning.

I have also been privileged to see many additions to houses for clerics, in one of which as a guest I could but notice that the same pains seem to have been taken as with the works of similar character in his more costly buildings where such survive.

So far as I know they one and all fulfil very completely the object of their existence.

I have also examined the drawings, but, thus far, have not visited the following buildings designed by him:—

Melbourne Cathedral (1884), the drawings of which are on the walls. If you refer to these drawings you cannot fail to note his intense zeal and care over his work there, inasmuch as he sent out as a guide a complete principal from England not merely as a pattern for the production of the other principals, but also to make the masonry of the weathering efficient in keeping out the elements; the wording of the instructions in simple language leaves no possible room for doubt as to his intention and meaning.

St. Augustine's College, Canterbury (for the late Mr. Beresford Hope).

Ascot Priory Church.—This was done about 1865.

Churches at Belfast, at Enfield, Studley (Oxon), Bexhill, Isle of Cumbrae, together with very many others, as well as houses and schools all over the country.

St. Clement's, City Road (1882).

*List of Works from the "Builder."*

Merton College, Oxford, sixteen sets of rooms and restoration of the College chapel; St. John Evangelist, Broad Court, Covent Garden, rearranged; Baldersby Church, near Thirsk; Bookham Church, Surrey; St. Matthew's Parish Church, Ashford (1859); St. John Evangelist, Hammersmith (1859-60), tower, 1881; All Saints, Harrow Weald; St. Edmund, King, Lombard Street, restored and repaired; All Saints, Highgate (1864); Christ Church, Albany Street, N.W., remodelled; St. Michael, Paternoster Royal, E.C., restored; St. Leonard, Shoreditch, restored; St. Thomas, Regent Street, interior refitted; St. James, Shoreditch, repaired and decorated; St. Barnabas, Rotherhithe (1872); St. Clement, Eastcheap, internal rearrangement; St. Paul, Covent Garden, internal rearrangement; St. Mary, Brookfield, Highgate (1875); St. Mary Woolnoth, E.C., interior remodelled; All Hallows, Bruce Grove, Tottenham, restored and enlarged; St. Mary, Rotherhithe, additions and improvements; Christ Church, Endell Street, restored (1877); St. Michael and All Angels, Woolwich, nave (1878-9); Exeter Grammar School and Chapel (1881); St. Philip, Dalston, restoration; St. Paul, Bunhill Row, restoration; St. Mary, Edmonton (1884); Holy Innocents, Kingsbury, Middlesex; St. Mary, Warwick, restored and partly rebuilt (1884-91); St. John, Smith Square, Westminster, altered and repaired; Gordon Boys' Home, Bagshot; St. Paul, Rotherhithe, restored (1892); Parish Church, Hathersage, Derbyshire (the "Morton" of Jane Eyre); Chapel, Guards' Depot Barracks, Caterham; St. Mary Magdalen Church and Vicarage, Enfield; St. Bartholomew, Pinchbeck West, Lincoln; Christ Church, Hoxton, interior rearranged; St. John Baptist Parish Church, Barnet, additions; St. Philip, Clerkenwell, refitted and improved; St. Luke, Sheen, in the Staffordshire Moorlands, completed; Northington Church, Hants, improvements; Theological College and Chapel, The Close, Salisbury; St. Mary, Dover Castle, restoration; Tottenham Parish Church, restoration; St. Michael's Hospital, Axbridge; St. Augustine, Bournemouth; St. Thomas, Leeds; Ardleigh Church, Essex; St. Mary Magdalene, Munster Square.

Winchester.—Buildings and restoration of St. Mary's College Chapel; the County Hospital; St. Cross, restoration of nave (1860), brass lectern, and altar rails.

His churches have been called prayer-books in brick and stone.

If judged merely as drawings they leave little if anything to be desired. I may say this much, that the buildings seen and the drawings examined have given undiluted pleasure to myself.

(*To be concluded.*)

---

The Paisley Town Council are taking steps for the improvement of the surroundings of Paisley Abbey by the demolition of some old property in its immediate proximity.

The Council of the University of Liverpool have appointed the following External Examiners for the year 1909-1910:—Architecture: Reginald Blomfield, A.R.A., F.S.A., Honorary Fellow of Exeter College, Oxford, and Professor of Architecture at the Royal Academy. Civic Design: H. V. Lanchester, F.R.I.B.A., Secretary to the Town Planning Committee of the Royal Institute of British Architects.

## ROYAL ACADEMY LECTURES ON ARCHITECTURE.

In his course of lectures last year at the Royal Academy, Mr. Reginald Blomfield, A.R.A., dealt with "Early French Renaissance Architecture," tracing its development from the time of advent of the Italian craftsmen until the death of Francis I. In his course for 1910, Mr. Blomfield resumed his subject at this point. The first was delivered on Monday, February 14, and dealt with—

### Philibert de l'Orme.

Francis I. died in 1547. His death closed a definite period of history and released forces which had lain in abeyance. A man of restless energy, considerable capacity, and the instincts of an artist he took the control of the arts into his own hands and, as far as possible, designed his own houses. Trained and competent artists were thereby reduced to being little more than servants of the Royal whim; and the exotic Renaissance was dependent on his patronage and the caprice of the Court. No first-rate Italian artist would stay long in France. The result was a series of false starts; and, when he died, architecture had advanced but little in thirty years, unless it was in a widely diffused interest in the art and possibly a growing consciousness that architecture meant something more than a series of futile variations in detail.

His son and successor, Henry II., was on the other hand a morose and melancholy man whose absorbing passions were hunting, violent exercise and, greatest of all, Diane de Poitiers. Caring little for the arts he handed over their direction to deputies; and thus came the opportunity of the younger generation.

There had been growing up at this time a class of men, who, different to the somewhat unscrupulous master-builders, had deliberately devoted themselves to architecture. They had qualified themselves by a study on the spot of the antiquities of Rome, and they applied the new enthusiastic learning to research in ancient monuments.

Such a man was Philibert de l'Orme, the most brilliant of all the artists who rose up after the death of Francis I. The son of an unimportant contractor, he was born at Lyons about 1515. He found his way to Rome and joined the host of other artists occupied in studying its antiquities. One day while busily engaged on the Triumphal Arch of Santa Maria Nova, he was accosted by some of the papal court who had noticed his industry in measuring with great minuteness the ancient buildings. The young man was introduced to Pope Paul III., who put him in charge of a church in Calabria. This he threw up in 1536, and returned to Lyons under the patronage of the powerful family of the Du Bellays.

His first important commission was for the Château de Saint Maur des Fossés, near Vincennes. The site was a filled-in quarry, and De l'Orme sunk shafts about 4 to 5 feet square and 12 feet apart, down to the firm ground 40 feet below, and built up piers of masonry, and arches from pier to pier to carry the works above. This marked an important advance towards scientific construction, and makes one of De l'Orme's strongest claims to be regarded as an architect. The constructor in him was always stronger than the artist. The design itself in its quiet treatment and good proportion shows traces of his Italian study. Indeed, it is doubtful if he ever got back to its fine austerity. The building, however, was never completed by Du Bellay.

One of the first acts of Henry II. on his accession was to displace Serlio and appoint De l'Orme, then holding another Government post, architect to the King and inspector of all the Royal buildings. His commission to inquire how Francis I. had been served was plenary, and he set about its discharge in that drastic spirit which rendered him ultimately one of the most unpopular men in the country. In his uprooting of corruption he seems to have felt an exultant delight in the reckless exercise of power.

Throughout the reign of Henry II. he enjoyed unbroken prosperity. The statement of his enemies that he had been in receipt of 20,000 livres was indignantly denied by De l'Orme, who declared his expenses were enormous. His refusal to contribute to the rebuilding of one of three abbeys of which he was abbé brought him into the courts, where he lost his case.

At the chapel at Villars he first used his invention of the French order, i.e., a column with bands of ornament at intervals up the shaft so as to conceal the joints of the stone. It is one of those wrong-headed inventions a finer taste would have rejected.

De l'Orme was employed by Diane de Poitiers to design the great house of Anet on the Dure. He was given a free hand and practically carte blanche, and the half of it that remains is typical of his manner. There is much that is admirable in it: the general conception of the quadrangular plan is fine and even masterly, and for the first time one can trace a real attempt at rhythmical composition. Meanwhile he was engaged on the important monument of Francis I. in the church of St. Denis. This much admired design seems "too architectural," i.e., there is too much reliance on mouldings and details.

The death of Henry II. by a thrust in the eye at a Court tournament, in 1559, brought an immediate and disastrous change to De l'Orme's fortunes. Even before the King's burial he was replaced by Primaticcio. After an impetuous but futile protest he commenced to write his curiously personal "Nouvelles Inventions"—that immense and first really practical treatise on architecture to which he owes his most enduring reputation. He did not live to complete this encyclopædia of architecture, in which he was to state the result of his own studies and long experience.

De l'Orme was, however, allowed at least one more great chance. Catherine dei Medici employed him first to complete his gallery 180 feet long across the Cher at Chenonceaux, and then in 1564 to design a vast pleasure house on the outskirts of Paris—the Palace of the Tuileries. His ill-fortune followed him. The works at the Tuileries proceeded fitfully from lack of funds. All that he lived to complete was the centre part of the east façade with its great staircase, and Catherine's interference hampered him throughout. When the poet Rosnard, who had always looked down on De l'Orme as a successful upstart, insulted him in the Tuileries, the unpopular architect was severely snubbed by the Queen Mother.

De l'Orme died on January 8, 1570. He had revolutionised building methods in France. As an engineer he was in the front rank of his time; but as an architect he was entangled with details, and lacked a clear conception of architecture as an art. His work was never spontaneous, never the result of a full and living imagination. Yet the Tuileries was the first of the great palaces of Europe, and when fifty years later Inigo Jones was called upon to design Whitehall, he did not hesitate to follow De l'Orme's plan in its general lines, though not the Frenchman's elevations. But, after all, it is not intellect only or even imagination that always wins the day. By force of character De l'Orme fought his way to the front, and has maintained a place among the great Frenchmen of the sixteenth century.

The second lecture was on

### Jean Bullant.

Jean Bullant was the most original thinker in architecture that France produced in the sixteenth century. He is believed to have been born at Ecouen about 1515. Practically nothing is known about his early training except that he got to Italy. He was possibly sent there by Anne de Montmorenci, Constable of France and Lord of Ecouen, who employed Bullant, among a galaxy of artists, on his castle at Ecouen. It was in the company of men like Jean Goujon, Palissy, Abaquesne, and the Lescots, that Bullant learnt his art and absorbed the best of their influence.

The arrogant Montmorenci was content with nothing less than the best and newest thing that wealth and a great position could obtain for his surroundings. The main block of the castle, including the chapel (for which Goujon made the famous altar, now at Chantilly), was begun by Charles Billard, and probably completed before 1540-2. Bullant's work is certainly subsequent to that date. There are indications that it was not consecutive, and probably Bullant journeyed to Italy in the intervals of his employment.

Bullant's work is unequal and uncertain. He had an exceedingly arbitrary master; and this may perhaps account for the manner in which he pitchforked his neo-Classic into the middle of a Francis I. design. The south façade shows signs of most violent changes. It almost looks as if the Constable had made experiments on it, and allowed them to stand, for no architect left to his own devices would have tolerated the jumble. His most satisfactory work is the frontispiece on the inside of the court through which passes the corridor to the terrace front. It is in two storeys, with a curious triple-storey dormer. Regard has been paid to the earlier work, as Bullant kept his string cornice lineable with the earlier strings. But his constant search for fresh motives in design is shown throughout the whole composition, especially in the broad handling, the treatment of the piers, the deep shadows of the continuous entablature, and the play of light and shade by other means than the familiar open gallery given in the columns at the end and the central pier. The actual masonry itself is notable. The space between the columns and the central pier was much too wide for a lintel, and Bullant, probably for the first time in France, treated his lintel as a straight arch, running his voussoirs through both architrave and frieze. Bullant was the first French architect to let his mind play freely on his design as a whole, to think of it not in detail, but as a matter of planes and masses. He was also the first of the new Classical men to handle architecture as an art, complete in itself, with its own technical conditions, and its own peculiar ideals. He was fortunate in having an employer who saw large, a man of a certain magnificence of temperament, as well as of prodigious wealth.

The Constable possessed at Fère en Tardenois a fine thirteenth-century castle. Between 1550 and 1560 he employed Bullant to throw an immense viaduct across a deep gorge separating this house from a plateau admirably adapted for the housing and drilling of troops. The whole scale of the bridge is heroic, very simple and very grand; it has more of the Roman quality than any other building of the time. Five semi-circular arches with piers 22 feet thick carry a two-storeyed gallery some 200 feet long at a height of over 100 feet above the bottom of the gorge. The building is now ruinous, having been broken up in 1779 by Philippe Egalité in order to pay his creditors and win favour with the populace. It is still, however, one of the most impressive fragments of French neo-Classic; and its stark masculine and unaffected architecture is the fit expression of two remarkable personalities.

In 1557 Bullant obtained his first official promotion, being appointed controller of building operations, with a salary of 1,200 livres a year, "Comme personnage grandement expérimenté en fait d'architecture." The duties were to control the workmen, measure their work, and see if they had complied with the terms of their contracts. Philibert de l'Orme, architect to the King, and then all powerful in the arts, grudged Bullant this one ewe lamb, and secured half the salary for his own brother Jean. When the King died eighteen months later, Bullant was swept out of Court, and retired with Montmorenci, who was also in disgrace, to Chantilly. Here he designed the châtelet which stands on a small island to the south-west of the Constable's château, and is in communication with it by bridges on both floors. Bullant was allowed here a perfectly free hand, and the châtelet summarises all the peculiarities of his manner. It is the only complete building by him that has survived.

Nothing is known of Bullant's work between the completion of this châtelet and 1570, when he succeeded De l'Orme at the Tuileries. In his enforced leisure he took to writing. His first book, on sundials, appeared in 1561; it was followed in 1562 by a second part dealing with geometry. Both were dedicated to the "high and mighty Lord, My Lord the Duke of Montmorency." Then followed a treatise on the Five Orders, according to the rules of Vitruvius, which ran into four editions.

His appointment on the death of De l'Orme brought a salary of 500 livres a year, a notable decline from the 1,200 livres drawn by De l'Orme and Primaticcio. It is probable, however, that he was paid independently for other work, and he is supposed to have succeeded Primaticcio as controller of the Royal buildings.

Bullant was at once engaged on continuing the great scheme for the Tuileries inaugurated by De l'Orme. He was not content with following the original design, but introduced some of his own devices, though the transition from De l'Orme's lower building to the higher façade, which Bullant designed, is managed skilfully and harmoniously enough. In 1572 Catherine dei Medici stopped the building there in consequence of a prediction that she would perish under the ruins of a house near St. Germain, and it was in that parish the Tuileries stood. He was finally employed to rebuild the Hôtel de Soissons, now destroyed. Bullant died in 1578, a month after the death of Lescot.

Of the famous trio De l'Orme, Bullant and Lescot, Bullant was the finest artist. Starting with less advantages, his natural genius carried him to a point of attainment never reached by the other two. Lescot's buildings are dull and only saved by Goujon's sculpture. De l'Orme mistook knowledge for imagination and fell into the snare of archæology and of an over-rigorous science. Whereas in Bullant's works it is possible to trace a definite idea, a serious attempt to realise a great architectural conception, he alone realised the true fascination of architecture as the art of great forms and rhythmical proportions, and allowed his imagination to move in large spaces. He was, moreover, feeling his way back to the national austere restraint.

It is not so much on his actual attainment as for his brave endeavour and respect for his art that Jean Bullant ranks with Goujon, the sculptor, as one of the bright particular stars of French art in the sixteenth century.

## NATIVE CRAFTSMANSHIP IN TIMBER, BRICK AND STONE BEFORE THE EIGHTEENTH CENTURY.*

*(Concluded from last week.)*

CRAFTSMEN should possess in no small degree the power of invention and knowledge of form and light and shade, which are essential to the painter, with this important difference, that the one produces his effects from the palette while the other creates his out of solid materials. Mullions well placed in relation to the wall face, string courses at the right levels, and label mouldings over windows, when carefully introduced, give brilliance to a plain surface which otherwise might be dull and uninteresting.

The walling may be—and often is—comparatively rough, built of unsquared stones, or—as at Great Chalfield, Wilts—of small stones brought to irregular courses; but the wrought work needs to be carried out with all the more thought and care, and well-defined mouldings and carving show up as precious beside a comparatively rough setting. There are few more thoroughly English and more completely satisfying stone houses than this old manor-house with its stone roofs and sculptured finials, full of spirit and redolent of the best days of native craftsmanship.

In no one particular feature is the free and romantic spirit of this late mediæval work more clearly seen than in the sculptured finials perched high at the apex of a gable or crowning a pinnacle as at Mapperton. These have not been touched since they were set up nearly 400 years ago, and they are as full of fire as the day they came from carver's chisel, heraldic in motif as most of the carving and ornament is at this date. But wherever Ham Hill stone could be obtained we find ashlar walling in large blocks with fine joints, instead of unwrought walling, and nobody knew better than the craftsmen of old that so beautiful a material could be relied upon to tell its own story with very little, if any, help from the carver. A single spot of carving on a plain wall, such as a crest projecting slightly or a panel sunk ever so little, and containing a shield or coat-of-arms, was more often than not depended upon to give a character which is much more expressive than results, as a rule, from a lavish display of decorative detail.

On one of the noblest houses of all, Barrington Court, one seeks in vain for a single piece of sculptured ornament, and yet there is beauty and dignity beyond words to express, resulting from the straightforward, honest use of the material. This is a house which, as regards disposition of plan, shaping of masses and execution of detail, is as natural as the Ham Hill stone of which it is built.

On a far smaller scale, but equally eloquent of this principle of reliance upon good building, rather than upon display of detail is Eason House, near by. This unbroken front might well be taken as a model by the builders of to-day who are so apt to lose themselves in pretentious design. It is about 74 feet long, and shows what can be done with good proportion and simple detail; projecting labels, which are continuous over the two groups of windows, with ends turned down over the lintels, being the only relief. It is not quite symmetrical, the doorway being out of centre. The thatched roof fortunately survives, and there is no doubt that the roofs to many old houses which are now covered with machine-made tiles or thin slates were covered originally with thatch or with thick stone slates.

In these quiet stone houses much depends upon the section of the stone mullions and their position in relation to the external wall face. Thin mullions, or what comes to the same thing, lights too wide, are sure to produce a meagre and wiry effect, and the old masons seldom erred in this respect, and it is very interesting to notice the different sections and the changes in the form of the head of the light.

Although mediæval buildings owe so much to the wealth of stone traceries, the difficulties of glazing and of providing shutters or casements to fit lights with intricate heads, in due course resulted in the abandonment of traceried heads except in the upper parts of oriel or bay windows, for the simpler flat-arched type, which the native builders loved so well, or for the still simpler square head, which persisted until it was eventually ousted by the introduction from abroad of the wooden sash window. With tracery or the flat arch, the section of the mullion invariably shows the hollow chamfer, but with the square head the convex form was general, while in the best work in districts where good free stone was available, an additional member was often worked. These mullions are set back seldom less than $2\frac{1}{2}$ inches or more than 6 inches, the larger mullions alone being brought out to the wall face. The example from Sandford Orcas is quite typical of the Ham Hill district; in the North of England a plain splay is much more commonly met with, seeing that the hard sandstone would have necessitated such an expenditure of labour to mould. It is not nearly so effective and gives a hard feeling to many a fine house. At Skipton Castle is a remarkable example of the influence of local material and of the work of craftsmen who brought their methods from the South.

The courtyard front of ruined Cowdray shows all these types of window head side by side. There is no more inspiring ruin in England, and it is to be sincerely hoped that nothing will be done to it to rob it of its beauty.

Between the two bay windows of the courtyard at Skipton, Yorks, is one of those panels of heraldic sculpture which native carvers carried out with so much spirit. There is no doubt that the Italian carvers, who were present in this country in numbers long before the Renaissance came to maturity, were able to teach much by their more delicate modelling, by their wider range of decorative detail, and, above all, by their knowledge of the human figure, which the native carvers seldom attempted; but whenever straightforward heraldic carving was needed to fill a panel, a spandrel, or to shape a finial, there was no lack of creative power.

The bay window and the oriel were in particular singled out for elaboration in these native-built houses, and they gave opportunities for the display of skill in many materials. As may be supposed, the finest examples are executed in stone, and in brick districts stone is used for the wrought work almost exclusively.

At Rye House are two projecting windows, carried on brick corbelling well designed, on quite different lines from the stone corbelling, as it should be.

At Kirtling Tower, Cambs., is a particularly fine oriel carried out in stone upon a brick structure, with fine moulded and enriched corbelling. The whole of this is circular work, the lights being 12 inches wide. It is more usual to find straight-sided oriels, with the corbelling carefully profiled so as not to give a weak line of intersection with the wall.

A very favourite position for these oriel windows was over the principal entrance archway, whether in gateway or porch, and at Cerne Abbas and Forde Abbey, in Dorset, magnificent ones are to be seen with traceried heads to the lights and carvings in the hollows of the mouldings.

At Holcombe Court there is a very bold one, three storeys in height, starting as usual above the archway of the principal entrance and carried right up to the parapet. Being later in date than the last one, we find the lights have no tracery, but the plain arched head. Local stone for walling, with finer grained and lighter-coloured limestone for dressings. Relieving arch over windows.

The detail of these corbels shows that, however elaborate they may appear, they are generally made up of a series of shallow mouldings, designed with regard to the jointing of the stones, which are always let into the wall square, to give an appearance of strength and to avoid scribing.

The mouldings, when there are many of them, generally fall within one plane. A string course as often as not forms the topmost member and serves to tie the oriel to the wall, as well as to give protection from the weather and prevent rainwater running down and disfiguring the mouldings.

At Hengrave is a particularly rich one, and although the oriel itself, the doorway below, and even the boldly-carved heraldic panels were doubtless conceived and carried out by the native craftsmen, there is little doubt that we have in the figures in the corbelling one of the many instances of the combined handiwork of Italian and native carvers which are found in the first half of the sixteenth century in the South of England.

An even more striking example of this combined handiwork of native and foreign artists is seen in the entrance front of Montacute House, where, set in the midst of a wealth of native workmanship is some sculpture in low relief, in which the hand of the Italian carver is clearly seen in the little figures supporting the diamond panel, set up here in 1786. Ends stop abruptly against return walls instead of terminating with strong angles. It would be easy to multiply examples of fine craftsmanship from houses built in the fifteenth and sixteenth centuries all over England. Many have been pulled down, many have been disfigured by rebuildings and additions, but almost the deadliest foe they have had to contend against has been the ignorant "restorer," who, as often as not, has thrust himself to the fore, and in so doing has dealt a blow at the subtle qualities of the old work from which it can never recover. For this native craftsmanship is elusive in its charm. Seek not to master it by the ponderous study of fancied principles of design, for there is no conscious design in the latter-day sense of the word. Purpose is expressed with sincerity, often with naïvety; there is no sacrifice to the dictates of ymmetry, which have at times been so monumental in their destruction of truthful, unaffected building. If a wing was needed on one side of a house rather than on another it was thrown out; if a bay window was wanted to give importance and better light to a principal apartment, it was fearlessly built without any thought as to the necessity of another one o balance it. No one knew better than the builders of that time how to let it tell its own story and strike its own note in the composition.

---

* A lecture delivered at Carpenters' Hall on February 9 by Mr. Arthur Stratton, A.R.I.B.A.

Whether the material used was timber, brick, or stone, each was handled with thought for its peculiar properties, and never was effort made to force it beyond its natural expression. Genuine materials, however homely, were considered preferable under all circumstances to imitative ones, and seldom did it happen that their appearance was not improved by the right methods of working them. In these English homes, large and small, we have conclusive proof that native craftsmanship was equal to the calls made upon it, and only in detail, which formed no essential part of the structure, do we find the Flemish or Italian artist giving evidence of his greater grasp of decorative motifs, and carving in wood or stone, or modelling in terra-cotta heads, arabesques, and even figures such as they were familiar with in their own countries, but for which they found no precedent in this. Never was there a period of building activity in England which owed its vital qualities to restraint, to the right use of material, and to insistence upon simple, straightforward methods of execution more surely than that during which the beautiful houses were erected of which I have been speaking this evening. They were built by men about whom we know practically nothing, whose names even have not been handed down to us except in those few instances where that of a master mason or a master carpenter has been recorded in a building account. The full flood of the Renaissance swept over the land while they were still masters of their own crafts, yet the carrying out of new-fangled ideas and the strange contortions of Classic profiles, for which they were called upon to reject their own unobtrusive art, was destined to rob them of the opportunity to keep alive their own traditions, and even in later years to stand in the way of their receiving the recognition which ought long ago to have been meted out to them. They always worked within their strength; they gave us craftsman's architecture at its best, suited to the climate and to the needs of the people, and if we would throw off many of the trammels which fetter us to-day and express ourselves once more in that healthy, unaffected manner of building which it is our common aim to promote, we cannot do better than look to their handiwork for guidance and inspiration, for in it we shall find made clear many of the secrets of beautiful building.

## ENGLISH MEDIÆVAL FONTS AND MONUMENTS.*

THE variety of design in fonts is most remarkable, and it is almost impossible to do more than roughly classify them according to their architectural periods. It is a subject of very great interest, whether looked at from the architectural or ritual point of view. It is strange, therefore, that it has not, speaking generally, received the attention from antiquaries that it deserves. A remarkable exception to this neglect is afforded by Mr. Bond's recent and very interesting volume on fonts.

As to the existence of fonts of a date previous to the Norman period it is impossible to say much. At times absolutely plain blocks of stone, without any ornament or distinctive carving will be met with, and such examples people are anxious to assign to this early period. There is, however, nothing but the plainness to support this theory, if, indeed, such a characteristic can be considered a sign of antiquity. Fonts there must have been of this early date; what then has become of them? Bede says they were not made of stone. This fact, taken together with the love of the Norman architects for a profusion of surface ornament, and, therefore, their desire to introduce elaborately carved fonts, may account for the almost complete absence of the pre-Norman examples. It may be positively asserted that Norman fonts are very numerous, while earlier examples are but seldom found. The best pre-Norman font, perhaps, is at Potterne, in Wiltshire; it bears an inscription from the 42nd Psalm.

There is a surprising number of Norman fonts to be found in our country churches in very good preservation, notwithstanding their antiquity. These fonts, we must remember, are the work of masons who had to put out their fires at 8 P.M., and remain in darkness until daybreak, who had no surnames, and no means of going from place to place but on foot, or at most on horseback. They are large and massive and reflect, so far, the sombreness of the lives of those who made them. Their cumbersomeness made them not so easy to displace as some of those wrought in succeeding centuries, such as we occasionally find disregarded in out-of-the way places, in gardens or farm-yards, on account of having been supplanted by modern work. They were also richly carved, which may have been another reason why they were preserved through the successive reparations in the churches to which they belong. There was also in many cases some idea of sanctity attaching to a special font, which led to its preservation even when the whole of the church was rebuilt.

As to the position of fonts, there is no doubt that it varied, but within certain limits. They are to be found at the west end of the church, near the west or south-west doorway: and if they are not now there it is pretty good evidence that they have at some time been moved. Of course, such a position near the entrance to the church was to be typical of the fact that Baptism is the sacrament which gives entrance into the Church. From the time of the Reformation onwards, until, say, the beginning of the Anglican Revival there was a strong propensity to tamper with the position of the font, and to use in its stead a common basin. In 1564 it was directed "That the fonte be not removed, nor the curate to baptize in any basons in the parish churches, nor in anye other forme then is alredie prescribed." The eighty-first Canon of 1603 also refers to this matter in the same way; and yet, notwithstanding these efforts, in many cases they were of no avail. An especially interesting extract from the Parish Accounts of St. Martin's, Leicester, bears on the point:—

1645.—"For a basin to be used at baptism—5*s*. For a handard to bear the same—15*s*. For laying the same in marble colour—5*s*."

1651.—"Received of George Smith, for a stone belonging to the font—7*s*."

1661.—"Agreed that the font of stone formerly belonging to the church shall be set up in the ancient place, and that the other now standing near the desk be taken down."

1662.—"Paid Widow Smith, for the font stone, being the price her husband paid for it—7*s*."

But, alas! this ancient font has again been replaced by a modern one.

*Norman Fonts.*—Whatever form these fonts take, whether square or round, they are always of a more or less heavy type. The simplest design is the tub-shaped plain or sculptured either with figures or some form of ornament. The circular form is also seen raised on a shaft, when it loses much of its heavy appearance, as at Coleshill, Warwick. Square fonts without a stem are certainly rare, but the square form mounted on a central shaft with a supporting shaft at each angle is quite characteristic of the time. A remarkable example is at Winchester. It is sculptured with scenes from the life of St. Nicholas of Myra, the patron saint of boys, virgins and sailors. This font has generally been considered a Saxon example; but this is improbable, judging by the bishop's mitre shown. In very early times bishops had no special head-dress; in Anglo-Saxon days the dress of the clergy differed but little from that of the laity. There was, therefore, no particular form of mitre till about the end of the eleventh century, when a crescent-shaped mitre, represented and known as the *corniculata*, was used. The dresses woven are of a Norman character, as also is the building, which is intended, no doubt, to represent the bishop's cathedral. The date probably would be c. 1150. It is one of a series, of which there are about seven or eight, constructed of black marble, and which almost certainly came from Tournai, in Belgium. The others are at East Meon; St. Mary Bourne; St. Michael's, Southampton; Lincoln Cathedral; Thornton Curtis; and St. Mary's, Ipswich. Another type is the cup-shaped font, with or without a stem. Sometimes in our buildings you will find some particular peculiarity in design or arrangement turning up again and again, in certain localities. Perhaps this peculiarity is in nothing more noticeable than in the fonts. To take one instance; in the neighbourhood of Aylesbury fonts of a special type are to be seen, not only at Aylesbury itself, but also at Monks Risborough, Bledlow, Haddenham, and Great Kimble. They are all of the cup form; but the treatment of the base, which we may call of an inverted form, is certainly unusual.

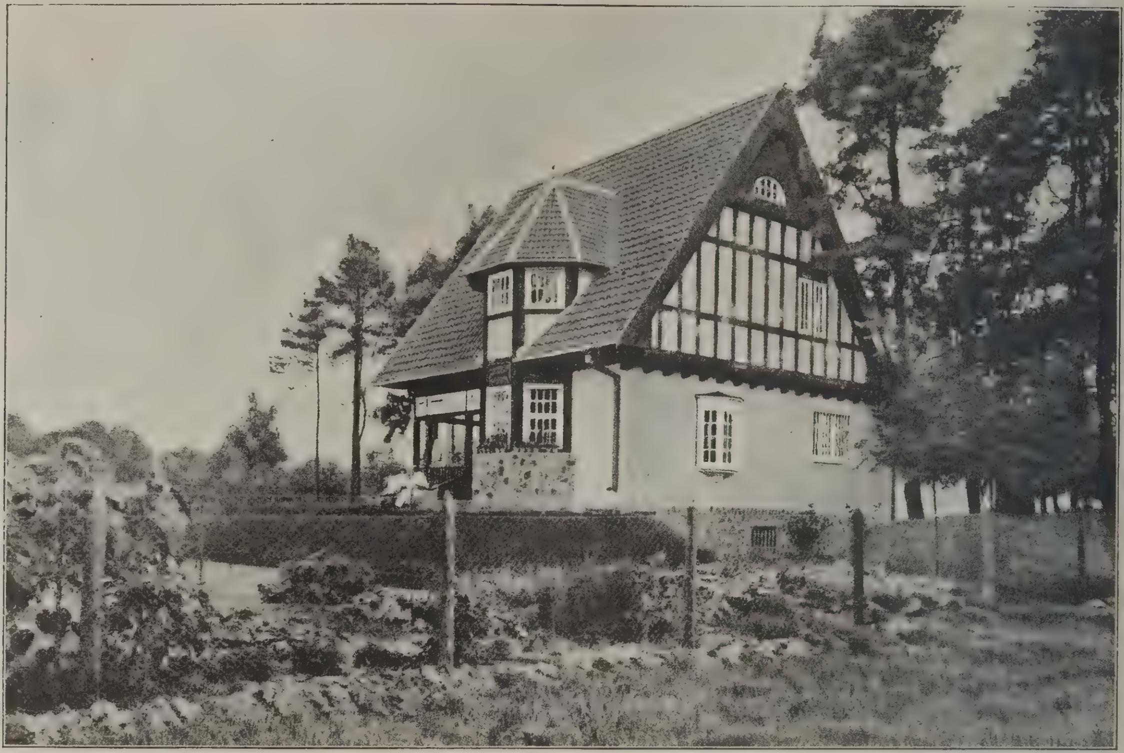
* Abstract of a paper on "English and Mediæval Fonts and Monuments," by the Rev. W. Marshall, M.A., F.S.A., delivered at Carpenters' Hall on Feb. 17.

## MODERN EUROPEAN ARCHITECTURE.

### GERMANY.



[From *Moderne Bauformen*.

SMALL COUNTRY HOUSE AT KUMMERSDORF IN THE MARK.—Ernst Schneckenberg, Architect.

Although the octagonal form was introduced before the end of the Norman style, yet the circular shape was much more frequently used in the Lancet fonts, and they were frequently supported by the central column and surrounding shafts. But the examples are not so very numerous, and it is seldom that any decorative treatment, other than the architectural ornament of the period, is to be seen. Occasionally, as at Barnack, we find the bowl supported upon pierced arches, the effect produced by such arrangement being admirable.

Probably fewer fonts of the Decorated style exist than of any other. We now find for the first time the richly crocketted canopy, the panelled flowing tracery, the ball flower and the diaper background. Examples are at Claypole and Swaton, in Lincolnshire. There is an exuberance of niches and sculptured foliage, and the octagonal stem with slender engaged shafts, the latter now serving only as ornament and not as a support. The octagonal form became all but universal. This is perhaps to be accounted for to some extent by its symbolic meaning; for eight symbolises regeneration. As the number seven is typical of the seven days' creation, so eight symbolises the new creation in Christ, who rose the eighth day from the dead. In this series the seven Sacraments are each given a side, and the Passion is represented on the eighth side.

The practice of raising the fonts on several steps is now frequently seen, although this plan was used before the Perpendicular period. At Walsoken we get a very fine example, and the risers of the steps are richly panelled; sometimes they take the form of a cross, as at Stoke-by-Nayland and Walsingham. This example at Walsingham is the finest font we have in the country; it unites the simple but effective arrangement of risers and the cross form.

Another type was known as the Lion fonts on account of that animal acting as supporters. An example is at Raveningham, in Norfolk. The one at Stafford also has lions, but treated in a different way; it would be hard to surpass the hideousness of this font, its bowl is the shape of four fonts joined together. The one at Fakenham shows heraldry, which is rather uncommon, and the symbols of the Passion. The symbolism was, of course, that the devil goes about like a roaring lion.

Fonts are, almost in all cases, made of stone; there are a few of marble, and also of lead. The example at Dorchester is a fine one of lead, and there are at least two others in its immediate neighbourhood—viz., Wittenham and Warborough. A genuine wooden font scarcely exists. There is one at Dinas Mowddwy, in Wales, and there is also one at Ash, near Aldershot, probably of the fifteenth century. There is an unmistakable fifteenth century example at Marks Tey and another at Stanford-in-the-Vale, Berks.

By a constitution of Edmund, Archbishop of Canterbury, in 1236, it was ordered that the font be decently covered. Hence arose the custom of placing covers on fonts, some of which, like the one at Sudbury, are very magnificent. It is unlikely that there is any cover so old as the constitution of Edmund; the early examples were probably a flat lid. There are beautiful spire-like erections of the fifteenth century at Worstead and Ufford. A very fine example of the best type of Perpendicular is at Sall, in Norfolk; the cover is suspended from a wooden arm coming out of the gallery. Though the ancient fonts do not appear to have been destroyed by the Puritan party, these covers were in many cases demolished. In the churchwardens' accounts at St. Martin's, Leicester, in 1501, appears this entry:—

"Payd unto Wylyame Symsome and Robert Craftes for takynge downe ye thynge over the funt XIId."

It is surprising how many of our font-covers are Jacobean—fully more than half of those remaining; nothing more strikingly shows the temporary revival of Church principles during that era. At Walpole St. Peter the cover is fixed on to the font and access is gained to the water by means of two doors. It is in a state of marvellous preservation.

The baldaquin or cover at Trunch, in Norfolk, is a unique feature. It is of very Late Perpendicular and hexagonal, as is also the font, which is inlaid with flint, c. 1350. The supports of the cover are beautifully carved with foliage of a distinctively Renaissance character. The panels were originally painted, and faint traces even now remain of the Crucifixion on one of them. The whole of the work was at one time coloured. The somewhat similar example at St. Peter Mancroft, Norwich, is supported on four pillars, but is almost entirely new work. However, there is another piece of work, something similar on these lines, at Luton; this, of course, is of stone and of the Decorated period. It is a very imposing feature, but more satisfactory in design perhaps than in execution. The roof is a fine groined vault of stone. The height is about 19 feet. At Beckley, near Oxford, there is a bracket placed just near the font, so that when the priest took the child in his hands his book would not topple over the edge of the font into the water.

Of the numerous monumental relics that are preserved in our churches but very few indeed can, with any degree of certainty, be ascribed to a period prior to the Norman Con-

SMALL COUNTRY HOUSE AT KUMMERSDORF IN THE MARK.—Ernst Schneckenberg, Architect.

quest. Even from thence to the reign of Henry III., *i.e.*, to the end of the twelfth century, the number is comparatively small, notwithstanding the vast increase of monastic buildings.

The origin of monuments is to be found in the fact that they were constructed either to contain the remains of the dead, or to mark the exact spot of their interment. In the primitive age of Christianity, when the presence of a dead body was considered defiling to the House of God, such memorials were necessarily excluded from churches. Burial within the walls of the church arose out of the doctrine of prayer for the dead, because it was thought that worshippers would be better incited to offer such prayers if they were perpetually reminded of the departed by the presence of their tombs. At first intra-mural burial was only granted to distinguished ecclesiastics, to founders and other liberal benefactors of churches. The first recorded instance in England of such burial is that of the great Roman missionary to the Anglo-Saxons, Augustine, who was buried in the church founded by himself just without the walls of Canterbury. He was first interred outside the church, and then, at its completion, his body was removed to the porch in the seventh century. The practice thus begun gradually increased, and from the porch only another step was required for the interment to take place inside the church, where such burials seem at first to have been confined to recesses in the walls of the lower part of the church. Another step was taken when, as a special privilege, tombs were admitted into the choir or chancel; and in 1075 Lanfranc introduced vaults into his cathedral at Canterbury, and even permitted sepulture under the high altar.

After a time additional space was required, and to meet this requirement distinct aisles and chapels were added to churches, being exclusively devoted to this purpose. Not infrequently the altars in such chapels were endowed in perpetuity—or for a limited period—with an annual stipend to ensure the daily services of a priest to chant requiems for the souls of those buried therein. But we must be careful not to call every side-altar in a church a chantry altar, for the reason that many of them were not chantry altars—*i.e.*, altars endowed. A chantry means an endowment and not an altar or a chapel.

In the course of time, therefore, our churches became crowded with tombs; very many of these memorials have perished, but, happily, there are still left to us numerous examples of each successive era, from the Conquest onwards. And not only are these to be looked for in our cathedrals, but frequently some of the most beautiful and most rare types are to be found in some obscure and remote village church, the humble appearance of which would lead the stranger to expect nothing worthy of notice.

Monuments constitute a valuable connecting link between the past and the present; their effigies impart a more correct and vivid idea than the most elaborate description can convey of the various costumes and general appearance of ecclesiastics, military characters, of civilians and ladies, and of children also, in successive generations. The accuracy of detail in these monuments is marvellous; it was the business of the sculptor to make a simple and accurate presentment of the man—to show him to us as he was when alive, and not (as was the case at a later date) to show him in clothes which he never wore. Truth in a tomb was considered imperative. But monuments are especially valuable as contemporaneous records; they not only in many cases confirm the evidence of parish registers, but, what is much more important, they carry back their evidence for centuries before parish registers commenced, in accordance with a mandate issued by Cromwell, as Vicar-General, in 1538, just a year before his death.

*Stone Coffins* (c. 1070-1400).—The earliest monuments in the Norman period consisted merely of the stone coffins in which the bodies were deposited. Sometimes the coffin was sunk into the ground and the lid, forming part of the pavement and ornamented with a cross, or other emblematic devices, was the only part that appeared. Also, the whole coffin may be seen placed above ground, either on the floor of the church or in an arched recess in the wall. The lids to the coffins were generally formed to the size and tapering shape of the coffin itself, and were at times coped or raised to a ridge in the middle, sometimes with the ends treated in the same manner. About the end of the thirteenth century their general form became rectangular.

Stone coffins of the earliest date are without inscription. When inscriptions began to be used they were variously arranged, sometimes on each side of the cross, sometimes above its head and below its base, and sometimes forming a border legend around the verge of the coffin-lid. The cross does not appear to have been generally adopted on monuments till towards the end of the twelfth century; but from this period till towards the age of monumental debasement in this country some modification of the cross was almost invariably placed upon all sepulchral monuments, except when this symbol of the faith was superseded by an effigy of the individual commemorated. From a very early period this cross was floriated and otherwise enriched with various monumental devices. In many examples of this class of monument the cross was accompanied by some emblem of the rank or vocation of the deceased: as a pastoral staff for a bishop, or a sword for a knight. Shields of arms also were occasionally introduced.

The earliest attempt at monumental effigies appears to have been made about the beginning of the twelfth century by representing the person commemorated recumbent on the covering slabs of stone coffins. The figure was rudely sculptured in low relief, the background being sunk in the stone, and the effigy rising no higher than the surrounding margin. But soon a bolder and more elaborate style was acquired, and the effigy executed in higher relief seemed to rise out of the stone till it became a perfect and distinct figure. An example of this type is Bishop Wulfstan's monument at Worcester.

Towards the close of the twelfth century effigies in armour first made their appearance on tombs—*i.e.*, in the reign of Richard I.; and in its main characteristics but little difference is to be found in the two succeeding reigns.

During the earlier part of the thirteenth century the monumental tombs were low, and the sides plain and unornamented; some tombs of this description with effigies appear beneath low arches obtusely pointed and formed within the substance of the church wall, as at Sparsholt and Raveningham. Such tombs have generally been assigned either to the founder of the church or to some early benefactor, or, if the effigy be that of an ecclesiastic, to the first rector or incumbent.

Some remaining specimens of partial effigies are exceedingly curious and evince the fanciful taste of the sculptor or his employer. The sculpture is so contrived as to make it appear as if the head and bust, and sometimes the feet, were disclosed through apertures in the coffin-lid. They first occurred at the end of the thirteenth century. It has been thought that the full length figure was derived from them, but that could not have been so, for the full-length effigy made its appearance years before the existence of these semi-effigial monuments. In the top of a slab at Heckington a quatrefoil is carved framing the head and shoulders of the person represented. At Howell, also in Lincolnshire, there is the same kind of thing, with a second quatrefoil lower down showing a child's head.

It is often found that these semi-figures are combined with the cross, and it may be that this type originated in the desire to effect such a very desirable combination as the cross and the figure of the one commemorated. The brass of Richard de Hakebourne (1310), at Merton College, Oxford, shows this arrangement.

*Altar Tombs* (c. 1200-1600).—In the earlier part of the thirteenth century a new type of monument was introduced, called an altar, or table tomb, which was but an easy transition from the improved character of the stone coffin. These tombs were of oblong shape and stood from two to four feet high. The sides and ends were formed of Gothic panels, ornamented with shields of arms, or other decorations. Before the close of the century niches were added containing representations of saints or angels, or the effigies of the children of the deceased. This form of monument did not by any means always have the effigy. It might be observed in passing that where a dog is introduced at the feet of a female figure it almost always wears a little collar with bells.

Monuments were not invariably made of stone or marble; sometimes we find bronze figures, as in the magnificent example at Warwick of Thomas Beauchamp, Earl of Warwick, who died in 1370. Or, again, they are made of wood, as at Little Horksley. A metallic composition, called latten, was often used about tombs, for inscriptions, instead of being cut in the slab, were generally engraved on narrow plates of this metal sunk into the chamfered edge of the slab, or other parts of the tomb. Garter angels, or other small figures called "weepers," placed around the sides, were also made of this metal.

Soon after the introduction of altar tombs they became strikingly embellished by the addition of canopies; these frequently display the finest architectural taste and most exquisite workmanship, and afford an admirable opportunity for the display of heraldry. They were in three forms:—(*a*) Recessed in the wall; (*b*) placed between piers with their own canopy; and (*c*) placed between piers with the arch of the arcade above used as a canopy. Another type represented in the upper division the deceased in life, full of health, and in the lower an emaciated body or a skeleton. On the tomb in Lincoln Cathedral of Bishop Fleming, who died in 1430, appears his effigy as in life, arrayed in episcopal vestments; whilst in a recess beneath his body is represented in a shroud in a state of decay. Another instance is the fine monument of Alice, Duchess of Suffolk, in Ewelme Church.

In the same fifteenth century another variety of monument makes its appearance; it is made of some hard stone of the Purbeck marble character, but not so liable to crumble; and on account of its hard nature the details of carving are always lacking in depth. It is generally of a somewhat debased character, and evidences are often present of the influence Italian architecture was beginning to have over our national character. Such monuments never have the recumbent effigy; but very frequently brasses are fixed to the back of the monument.

*As to Brasses.*—About the beginning of the thirteenth century incised stone slabs began to be used as memorials, and were laid in the floor, and formed, indeed, part of the pavement. Soon after their introduction they were considerably improved by the devices being engraved on metal plates sunk in the slab, instead of being figured on the stone itself. These brasses exhibit great variety in the character and number of their devices. Some are simple and consist merely of a chalice, a cross, or a host. Others are elaborately executed and profusely ornamented.

The word "Hearse," or "Herse," in the minds of most people, pre-supposes a funeral car with its trappings, in which the bodies of the dead are borne to burial. But its derivation is probably from *hirpex*,* a harrow, as used in agricultural operations. We do not know the exact form of this Roman harrow; but heraldry helps in this matter, for an old English family of the name of Harrow has for its arms three harrows of triangular form. This is the form of a harrow when used in an ecclesiastical sense, when it signifies a triangular frame of wood, suspended from the roof of the church, and at the points where the bars crossed were sockets for candles. These hearses soon gave way to metal candelabra. The next step in the etymology of this interesting word is in connection with the burial ceremonies. The body was placed near the altar, and over the body, which was generally without a coffin, except in cases of persons of distinction, was placed a light framework of wood, on which the pall was placed. At the corners and on the ridge were places for candles. Not a single example of these wooden hearses is known to exist. But occasionally they were copied in metal. A beautiful example is at Tanfield, near Ripon, for one of the Marmions. Another is the tomb at Warwick of Thomas, Earl of Warwick, who died in 1439. This is made of latten, and the contract for its erection, which still exists, speaks of it as a hearse.

The funeral car to which we now give the name of hearse to the exclusion of the older meaning originally differed but little from these stationary hearses, except that they were on wheels and the necessities of locomotion required them to be smaller.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* shows two picturesque rubble-stone small country houses by Messrs. Mellor & Meigs, one of which is curious as an alteration of a stable building to a residence. The series of articles on "The House and its Environment," by Arthur G. Bein, is continued.

*La Construction Moderne* illustrates the model Alsatian house which was one of the features of last year's exhibition at Nancy, and the new premises of the journal *Le Nord Maritime*, at Dunkirk, of which M. Morel is the architect. Our contemporary gives views of the effect of the Seine floods at the Ecole des Beaux-Arts, and apologises for the delay in illustrating the winning design for the Labarre prize at the Ecole, which is now given, on account of the flooding of their photo-engraver's workshops.

*Moderne Bauformen* this month includes some of the work of two English architects, Mr. Charles Wade and Mr. Tom Merry. Most of the remaining illustrations are given up to the work of Messrs. Pfeifer & Grossmann, of Carlsruhe, and Leopold Bauer, of Vienna, all of which is redolent of German national feeling without being too effusively modern.

*Het Huis* has an interesting illustrated article on the layout of a small suburban garden, which, though no scale is given, shows what might be done on a villa site of about 40 feet by 150 feet. An illustrated account is given of the picturesque old buildings of Oudewater, and another of the churches of Warmond, old and new.

*Stone* has a good photograph of the doorway of the Palazzo Pessagno, in the Via Catarina, at Genoa, of which, as noted in our leading article, a measured drawing by Mr. C. Gascoyne appears in the Architectural Association Sketch Book for 1909. There is also in our contemporary a continuation of a good series of articles on cylindrical vaulting.

Society of Architects : Paper to be read.

Royal Institution : Paper on "Turner," by Mr. A. J. Finberg.

Carpenters' Hall : Paper on "Japanese Decorative Art," by Mr. W. Harding Smith, R.B.A.

## CONDITIONS OF ARCHITECTURAL COMPETITIONS.

There can be no doubt that at present the conditions under which the profession of architects is expected by promoters to compete for the privilege of carrying out buildings are decidedly unsatisfactory.

Although great progress in the direction of securing freedom from grossly unfair decisions has been made through the employment of professional assessors, a method now generally recognised as essential in public or open competitions, there yet remains considerable room for improvement even in this direction.

Much dissatisfaction and friction have been occasioned in competitions in the recent as well as in the more remote past by a disposition on the part of assessors to disregard some or other of the conditions or instructions issued to competitors. Technically, assessors appointed by the President of the Royal Institute may be considered bound to exclude designs only if they come within the scope of the grounds of disqualification stated in the regulations approved by the Royal Institute. In these the disqualification by reason of excessive cost is very elastically defined, and the assessor is only presumed to disqualify if the outlay stated in the instructions is adequate. That is, in nine cases out of ten, the assessor is, by the Institute regulations, free to disregard the limit of outlay so long as he takes the question of cost to "be a material element in the consideration of the award," which, of course, means anything or nothing.

That a design should be excluded from a competition "if any of the other instructions are violated" is a so-called "regulation" which has too often by assessors been regarded as a "recommendation" or "suggestion," with the result, as we all remember, of much bitterness and exasperation.

There is a very general feeling, and, we think, rightly, that the particulars supplied by promoters to competitors should differentiate between "conditions" with which compliance is essential and "suggestions" as to which competitors are free to use their own judgment. The category in which the amount of the outlay is to be included in each instance ought to be quite clearly and emphatically stated.

We think that assessors have been very much to blame for the growth of the burden that architects who take part in competitions have now come to feel is intolerable—the excessive costliness and wastefulness of our present system. Over and over again the deplorable result has been seen that the value, nay, even the out-of-pocket cost, of the competition drawings has exceeded the gross amount of the successful architect's remuneration. Take the still undecided competition for the National Museum of Wales. How many of the competitors would, in the ordinary way of business, have been satisfied to prepare their designs for a fee of 100*l.*? Yet even at this low figure the value of the 129 designs is 12,900*l.*, and the gross amount of the winner's commission will be 12,500*l.*, for which he will have to wait years and years, as the promoters only propose to build one-third of the whole building for a start and seem to be very dubious as to where the remaining two-thirds of the cost is to come from.

It appears to us that the most costly competitions in which an architect can take part are those in which an assessor has assisted to draw up the instructions and conditions. Complete plans, sections, and elevations to one-eighth scale are not sufficient for these officials. They must have block plans showing the drains, &c., generally to so small a scale that it is impossible to draw all the pipes and manholes; they must have half-inch scale details "of a portion of the principal front," because they cannot, or will not try to tell from an eighth-scale drawing whether an architect knows the grammar of his art; they must have perspectives, because they cannot, or will not try to grasp the composition of a building from plans, section, and elevations; they must have the shadows correctly projected according to the rules of sciography, because they cannot, or will not try to read plan and elevation together. All these recently-added requirements are pure fads which, to our mind, seem to indicate that assessors are prone to save themselves trouble at the cost of considerable unnecessary expense to the competitors.

No wonder there is a revolt against such a state of affairs, for the remedy of which the best suggestions that have been made are, we consider, those of Messrs. Leeming and Mr. E. M. Gibbs.

In our opinion, any assessor who is worth his salt ought to be able to select from a hundred or a thousand schemes the dozen or half-dozen that give the best promise of a successful design, with no further drawings than might be included on three sheets of quarter-imperial paper and comprising sketch plans of the two principal floors and a freehand drawing of an outline perspective. As Messrs. Leeming have pointed out, a large number of competitors in every competition go wrong at the start, and every hour spent in the elaboration of a wrong idea is absolutely wasted. The Cardiff competition is an illustration in point. It took the assessors quite a comparatively short time to discard all the designs but twelve. Numbers of designs were at once out of the running because their authors had placed the reserve collections in the wrong position or committed some other equally hopeless error of judgment in their original conception. The simplest of sketches would have been equally lucid in revealing such errors to the assessors as the costly sets of drawings that have been the fruit of completely abortive effort.

When the assessors have selected the half-dozen, dozen, or score, as the occasion may determine, of likely schemes, then the authors of these should be invited to work out their schemes and should be paid for their out-of-pocket expenses on some such scale as Mr. Gibbs has proposed.

Another improvement that might well be pressed is an approximation to an enhanced scale of premiums as is now the usual custom in Germany. It is no uncommon thing for a sum of from 2½ to 5 per cent. on the proposed cost of the building to be placed at the disposal of the jury for the reward of meritorious designs in addition to the usual first, second, and third premiums. We believe the British public would follow the same course if they were told by the Royal Institute that they ought to do so.

A class of competition that is very much on the increase is the private limited competition. Private individuals, but more often firms or directors of public companies, committees of chapels and churches, &c., invite a limited number of architects to compete. Not infrequently the competition is a bogus one and is meant only to cover nepotism on the part of those who are in a fiduciary position.

It seems very desirable therefore that the Royal Institute, whilst engaged in the revision of its Regulations for Architectural Competitions, should take this matter into account and insist that for its members such competitions should connote the appointment of an assessor and the adequate payment of all the competitors. It is all very well to say that private individuals or the heads of a firm of manufacturers know what they want. There would be no objection to a representative of the promoters being associated with a professional assessor, but some steps ought to be taken to prevent, as now happens, members of the Institute being virtually forced, at the risk of offending friends or clients, to take part in competitions which are simply window-dressing to cover the appointment of the son or nephew of the chairman or managing director. We understand that there have recently been one or two flagrant instances in Manchester where members of the Institute have been forced to send in competition drawings with the full knowledge, or at least expectation, that they would not receive fair play. Such an experience might be avoided if members of the Institute could say that under the Regulations they must decline to compete unless an assessor was appointed and competitors were paid for their labour.

Such a provision in the Regulations would also tend to prevent the application to architects of a system that is not infrequent in commercial circles. Tenders are invited from a number of firms, and then these are put before others in order to obtain a better quotation. So, on commercial lines, designs are invited from a limited number of architects, and then others are asked to submit something better and more in accord with the fancy of the promoters.

We are confident that the Royal Institute, in the revision of its Regulations, has only to tell the public what are considered by architects to be fair terms, and these will be accepted.

## NOTES AND COMMENTS.

In selecting Mr. Thomas Graham Jackson, R.A., as the nominee of the Royal Institute of British Architects for the Royal Gold Medal this year by reason of his works as an architect the Council have certainly sufficient justification for their recommendation. Mr. Jackson has carried out a large number of interesting works as an architect, works expressing individuality and, within reasonable limits, originality. As a general rule, Mr. Jackson may be said to have founded his designs almost exclusively upon English architecture prior to the eighteenth century, and there is, in our opinion, no living English architect who has so thoroughly imbibed the spirit of the best work of our national art of the sixteenth and seventeenth centuries. If we were Buddhist, we should regard Mr. Jackson as the re-incarnation of the man who designed the west front of Winchester Cathedral, and to no one could its restoration or repair be in our time more happily entrusted. The characteristics of Mr. Jackson's work as an architect appear to us to be those of the prototypes on which it is founded. It is picturesque and piquant, but lacking in a fine perception of proportion.

---

Mr. Thackeray Turner, secretary of the Society for the Protection of Ancient Buildings, has been writing to the *Times* anent two south-country buildings of interest. He informs the public that Cowdray House, or rather its ruins, having become the property of Sir Weetman Pearson, the new owner has taken steps, approved by Mr. Turner, for the preservation of the ruins. The other building about which Mr. Turner writes is Puddletown Church, Dorset. Here the Society is acting more in accordance with its traditional character, and protests against the extension eastward of the chancel and north aisle, notwithstanding that it is admitted that the chancel was at one time longer. The church seems to have been "elaborately refitted about the middle of the seventeenth century." The objection of the Society is that "if the proposed enlargement were carried out there would be an ugly scar of new work both inside and outside the building." We are not told by Mr. Turner who were the vandals that reduced the chancel to its present length, or when it was done, but we might be pardoned for presuming that it was "about the middle of the seventeenth century," when the elaborate refitment was carried out, and possibly the vandalism was the result of a desire to remove the sedilia, piscina, and other traces of the devotion of the original builders, or to lessen the cost of the elaborate seventeenth century work, either of which, in our opinion, was an unworthy motive, and in no way deserving of respect. If the seventeenth century men committed outrages to please themselves, why should we of the twentieth century refrain from undoing their iniquities and restoring the chancel of a church to the dimensions that we, as well as the original builders, consider more fit for the due performance of Divine worship? Of course, this is rank heresy to the Anti-Scrape Society, whose principles and tenets are opposed to the practice of artists of all ages prior to the latter part of the nineteenth century.

---

The lesson that Mr. John Nisbet sought to teach in a recent lecture on "Picturesque Streets" to the Philosophical Society of Glasgow, that modern streets might be, and are, picturesque, is one of which ample illustration is to be found in Glasgow, as the lecturer pointed out in his reference to George Street, St. Vincent Place and St. Vincent Street looking west, Sauchiehall Street looking east from Charing Cross, Trongate looking east from a point near Glassford Street, Great Western Road and Kelvin Bridge from a point in Rosebery Terrace, and Buchanan Street looking southwards from a line above West George Street. Mr. Nisbet, in the course of his lecture, showed that although the traditional acceptance of what was picturesque adhered largely to the ancient town with the irregular thoroughfare, overhanging gable, warping roof, and the quaint construction probably enhanced by the infirmities of time, full sympathy with the traditional was not to be despised, but an extension of our admiration to include the modern was profitable, as the ancient was not always available. Most frequently the picturesque street owed its beauty to buildings of quality in design, but it was evident that few streets were wholly good in architecture, and the faults of detail might be softened by atmosphere or distance. The principles regulating a picturesque street were a good sky line occasioned by the varying heights of ridges, chimneys, and such features as dome, tower, and spire, the variation of tone due to colour of material, and minor details such as projections, recesses and openings.

Drawn by Leslie Wilkinson, A.R.I.B.A.

Bristol is exercised over the future of the three paintings by Hogarth which were purchased of the artist in 1756 by the Vestry of St. Mary Redcliff, and for which he was paid 525*l.* "in full of all demands." The pictures remained in the church for a century, and were then purchased for the Fine Arts Academy, where they now are. But the Academy wants to get rid of them and proposes selling. Why not restore them again to their original home?

The severity of unemployment at present existing in the building trade is illustrated by a request received by the Edinburgh and District Trades Council from the Edinburgh and Leith District Joiners' United Trades Committee. The committee propose a reduction of working hours in the building trades from fifty-one to forty-four per week, as the most effective palliative for unemployment. This, of course, is one way, but a more effective, failing for the present Tariff Reform, would be a general reduction of wages, so that Great Britain may be able to compete on more equal terms with those competing countries in which Protection obtains. Reduction of output may be a palliative for unemployment in the building trade, but it is not a remedy for the loss of business that the nation sustains through the operation of more favourable conditions under which foreign countries produce. The reason why we are being beaten under the existing conditions of Free Trade is that foreigners can find a market here for their surplus production, and as increase of production lessens its cost in manufacturing industries, the foreigner can produce more cheaply than ourselves because we are kind enough to take his surplus.

Recent allusion in the Press to the repair of the Hampton Court clock recalls the fact that the maker of it was Nicholas Oursian, appointed clockmaker to Queen Mary and Elizabeth, whose initials, "N. O.," are visible inside the dial. Nicholas Oursian was one of the many skilled craftsmen who came from France and the Netherlands, to whom grants of "denization" were made to enable them to exercise their calling. We can trace in many English homes the influence of foreign artisans who were much employed here during the Tudor period of building and decorative design. On this subject a valuable paper by the late Sir Digby Wyatt was contributed to the *Journal of the Royal Institute of British Architects* in 1869. The Hampton Court clock consists of three revolving discs, with a long pointer which tells the hour of the day, the day of the month, the month of the year, the phase of the moon, and the time of high water at London Bridge. The "Clock Court" at Hampton Palace was so called from the position of this astronomical clock in that quadrangle. This old clock was taken down in William IV.'s reign, but was replaced, and now, according to the daily Press, has been thoroughly repaired. Other examples of foreign workmanship in this royal Palace are Tijou's beautiful iron screens, which have been restored to their original position in the Privy Gardens. The Palace is indeed famous, and still continues to maintain its world-wide interest in history and architecture.

In connection with the question of the exemption of the London County Council's school buildings from the provisions of Parts VI. and VII. of the London Building Act, 1894, a summons was recently issued by the district surveyor against Messrs. Galbraith Bros., the contractors for the erection of the "John Ruskin" school for physically and mentally defective children (Newington), to enforce payment of fees under the Act in respect of that school. As a result, the magistrate decided that school buildings were exempt from the provisions of Parts VI. and VII. of the Act, but that, notwithstanding this, the district surveyor was entitled to his full fees in respect of such buildings. As the district surveyors propose to continue to treat the Council's school buildings as not exempt from the provisions of Parts VI. and VII., the Education Committee are of opinion that an endeavour should be made to obtain an express decision on this question. They therefore suggest that the solicitor should proceed with the application which has been served on the magistrate to state a case for the opinion of the High Court, and in the event of the case not being stated in a form likely to lead to a decision on the point, the committee will report further.

## CONCOURS INTERNATIONAL D'ARCHITECTURE, PARIS, 1910.

I.—Le concours a pour objet d'élaborer les plans d'une

*OLYMPIE MODERNE*

comprenant :

1° Les édifices, portiques, arènes, pistes, etc. . . . propres aux épreuves de sport et d'art inscrites au programme des Jeux Olympiques modernes ;[1]

2° Les aménagements servant aux spectateurs ;

3° Les édifices ou espaces nécessaires pour les cérémonies connexes aux Jeux ;

4° Les installations affectées à l'administration, aux athlètes, etc.

Les concurrents auront aussi à déterminer les particularités topographiques du site choisi ou imaginé par eux.

II.—Les concurrents devront envoyer au minimum *quatre*, au maximum *six* cartons susceptibles d'occuper un espace d'ensemble de *deux mètres cinquante de long sur quatre mètres de haut*. L'un de ces cartons devra figurer un plan général de la Cité. Les concurrents pourront y joindre un mémoire explicatif qui ne devra pas excéder quatre mille mots.

III.—Tous les concurrents recevront un *Diplôme commémoratif* ; leurs envois seront exposés au public et feront l'objet d'un *Rapport général* sur les résultats du Congrès ; ce rapport contiendra la liste des concurrents. La *médaille olympique*, qui n'a été décernée que 17 fois depuis 1894, sera en outre attribuée au vainqueur du concours. Le jugement sera rendu par un jury composé de compétences internationales au nombre de cinq et représentant les différents points de vue : art, technique et sport.

IV.—Les concurrents sont priés de se faire inscrire autant que possible avant le 1er Mai 1910. La liste des concurrents sera close le *1er Octobre* et leurs envois devront parvenir *avant le 15 Novembre 1910* à M. Gaston Trélat, Directeur de l'Ecole spéciale d'Architecture, Commissaire général du Concours, 254, boulevard Raspail, *Paris*, à qui on est prié d'adresser toutes les communications relatives au concours.

## COMPETITION FOR OFFICES FOR RENFREW PARISH COUNCIL.

The conditions of this competition are, in our opinion, decidedly unsatisfactory. A deposit of ten shillings is required for them, which is only returnable to competitors who submit a *bona-fide* design.

No assessor is mentioned, save that "the estimates submitted by the competitors will be reported on by the measurers appointed by the Council."

Architects competing are required to state distinctly the rate of commission they are "prepared to accept for the complete job."

Designs submitted are not returnable to the competitors.

The accommodation required includes board-room for Parish Council, to accommodate twenty-three and reporters, committee-room, offices for inspector, registrar, collector, and sanitary inspector, waiting-room for poor, strong rooms and stationery stores, lavatories, and cloakrooms, outbuilding for lamplighting stock, covered shed for scavenging barrows, &c. No indication of sizes is given except for board-room.

The site plan gives no information as to levels, sewers, water, or gas supply.

"Such plans, elevations, and sections as are necessary" are to be supplied to one-eighth scale and details "may be also submitted" to one-quarter scale.

The cost is limited to 1,400*l*. inclusive of architect's and measurer's fees, and plans have to be sent in on or before March 21.

## THE WORKMEN'S COMPENSATION ACT AND THE EMPLOYMENT OF INFANT LABOURERS.

By W. S. Holdsworth, D.C.L.

The case of Evans *v.* Vickers, Sons & Maxim, Ltd., decided by the Court of Appeal on the 8th of last month and reported in a recent number of the *Times Law Reports*, would seem to show that it is dangerous to employ infants, who are out of work, as ordinary labourers if, in fact, the infant has been apprenticed to a specific trade. In this case the facts were as follows. The applicant, aged about twenty, applied in July 1907 to the respondents for work as a labourer, and was taken on by them in that capacity at 22*s*. a week. By trade he was a stove-grate fitter. He intended to return to this trade when the prospects of work improved. While in the employ of the respondents he met with an accident, and was awarded compensation at the rate of 11*s.* 4*d.* a week. Subsequently he partially recovered, and light work was found for him at his original wage. The compensation was thereupon reduced by agreement to 1*d.* per week. In August 1909, after he attained twenty-one, he applied to the Court under the proviso to Section 16 of Schedule 1 of the Act, for a review of this agreement. The words of the proviso on which he relied run as follows:—"When the workman was at the date of the accident under twenty-one years of age, and the review takes place more than twelve months after the accident, the amount of the weekly payment may be increased to any amount not exceeding fifty per cent. of the weekly sum which the workman would probably have been earning at the date of the review if he had remained uninjured, but not in any case exceeding one pound." His contention was that if he had not been injured by the accident he would have returned to his trade of stove-grate fitter, and that in that case he would have been earning some 30*s.* a week. It followed, therefore, that the employers were liable to pay compensation on this basis, and not on the basis of 22*s.* a week. The County Court and the Court of Appeal (Cozens-Hardy, M.R., and Fletcher Moulton, L.J.) have upheld this contention. Buckley, L.J., on the other hand, dissented. In his opinion the words of the proviso must be taken to refer to the money which the workman would have been earning if he had continued uninjured in the service of the same employer. It appears to us that there is much to be said in favour of Lord Justice Buckley's view. If the other view is adopted it introduces a highly speculative element into the principle upon which compensation is assessed. Taking this case as an instance, how do we know that this person would have got employment at his trade of a stove-grate fitter? Have we any right to assume that he would succeed in getting such a job when he had failed to do so two years before? In fact, we might say that his chances of a job were possibly less, because he had ceased to practise his trade, and for that reason had become less efficient during his employment as a labourer. It would seem very odd that the Legislature should have intended the Court to embark upon these hazardous conjectures as to a man's chances of employment in a particular trade in order to see what he "would probably have been earning." If, however, Lord Justice Buckley's view be adopted, no such speculative element is introduced. If an infant is taken on in any given capacity, *e.g.* as a labourer, or a fitter of some kind, it is perfectly easy to say what wages he would probably be earning with that master and in that capacity if he had remained uninjured. We think, therefore, that the proviso to this section of the Schedule should be limited in two ways if it is to work with any degree of certainty. In the first place it must be taken to refer to earnings with the same master. In the second place it must be taken to refer to earnings in the same capacity as that in which the workman was employed by that master. The interpretation adopted by the Court of Appeal appears to us to require the Court to make a series of conjectures as to probable future events which could only be made with any approach to certainty by a first-class major prophet. Moreover, it is more than likely that it may inflict considerable hardship upon youthful mechanics out of a job. Masters will naturally be rather chary of giving a job as labourer to one of these persons if they are to be landed with the obligation of paying to such a person compensation at the rate, not of an unskilled but of a skilled workman, because the Court thinks it likely that, but for the accident, the person would have got employment as a skilled workman. The obligations of masters to their employés under this Act are already sufficiently onerous. They will be rendered still more onerous in the case of employés who are infants if this decision stands, because they will be entirely uncertain in amount. They will depend upon the Court's view of what might have been the history and prospects of the infant in a trade he was not actively pursuing if the accident had not happened. It is almost inconceivable that the Legislature should have required any set of human beings to embark upon such an inquiry.

## TOWN PLANNING CONFERENCE.

Under the auspices of the National Housing and Town Planning Council a conference was held on Friday of last week to consider various technical points in the administration of the town-planning powers of the Housing and Town Planning Act. The members attending consisted chiefly of municipal councillors and borough officials, together with a few architects.

Mr. Harold Shawcross, C.C., J.P. (Rochdale), the chairman, in opening the proceedings explained that this conference of borough engineers and surveyors, together with the chairmen of committees, had been called because it was thought that as they would have most to do with the Act it would be best if they could thrash out their difficulties. The Council had expected to have been able to consider the regulations to be issued by the Local Government Board, but these were not ready yet for publication. It was becoming every day more clear that the question of town planning was bristling with difficulties and that the Act would have to be considered very carefully. If the regulations were framed hastily, and proved unworkable, it would cause a great deal of trouble and would set back town-planning schemes in the near future. Judging by the difficulties that had already befallen those who had attempted to prepare town-planning schemes, it would seem that the question would be largely one of making roads for convenience and better access from one place to another. It would, he believed, be found very often impossible and unfair to make landowners bear the cost of roads they did not want. Consequently the cost of making such roads would have to be very carefully gone into. There would undoubtedly be a difficulty in getting a scheme through which was objected to on that score. Then there was the question of the respective contributions to be paid by two authorities for a road made through their areas at widely differing costs.

Mr. Henry R. Aldridge, secretary, then read a letter from the Local Government Board, in which it was said that the President could not yet state what the procedure regulations of the Board would be under Section 56 of the Housing, Town Planning, &c., Act, 1909, as they were still in course of preparation. Mr. Aldridge thought that this unreadiness was not altogether surprising in view of the many difficulties that had been placed before the Board as a result of their conference in December last. The Secretary then proceeded to deal with his memorandum on the cost to local authorities of (*a*) preparing a town plan; (*b*) the carrying of a town-planning scheme into effect. This memorandum has just been prepared by Mr. Aldridge as the fruit of his last visit to Germany, where he was in consultation with the leading town-planning experts, and it thus represents the result of actual experience. The memorandum was as follows:—

### (A) The Technical Cost of Preparing a Town Plan.

### 1. *The Scale Necessary for the Survey Maps.*

The estimate of the scale necessary varies from that of 1 to 500 to 1 to 2,000. City Surveyor Geusen is of the opinion that for very difficult areas the scale of 1 to 500 should be used. For general purposes 1 to 1,000 will suffice, whilst in some cases 1 to 2,000 will be sufficient.

Note.—Ordnance survey maps of the scale of 1 to 500 are already in existence for most of the towns of Great Britain. A list of owners and the areas of the land in their ownership will of course be necessary for the later stage of town-planning work.

### 2. *The Value and Cost of Contour Models.*

There is much divergence of opinion as to the value of contour models. On the one hand it is pointed out that these models have no real value to the skilled men entrusted with technical work in the preparation of the plan, for the maps recording the survey give all that they need. On the other hand it is urged that, although such models are not essential to the technical work of town officials and skilled advisers, yet they are of great service to town councillors in enabling them to form a good judgment both as to the character of the town-planning problem of their town, and the merits of the plans submitted to them.

*Cost.*—The range of cost of a good contour model is from 50*l.* to 200*l.* (1,000 to 4,000 marks). The price, of course, varies with the extent of the area to be modelled and the scale.

### 3. *The Cost of Equipping a Municipal Town-planning Department.*

City Surveyor Geusen, of Düsseldorf, estimates that to produce a town plan within a period of a year would require the following staff in addition to the town official, who would give part of his time to the work, and overlook it:—Expert adviser, three draughtsmen, and two outdoor men.

This estimate is for a town of the size of Düsseldorf (280,000 population), and applies to the land likely to be used for building purposes during the next thirty years, and to town extension work only, and not the replanning of the existing town.

### 4. *The Cost of a Town Plan when an Outside Professional Expert is Entrusted with the Whole Work.*

Professor Goecke (editor of *Der Stadtsbau*, Berlin, and one of the best authorities in Germany) states that a fair standard of remuneration for an outside professional expert undertaking the complete work, from first to last, of preparing a town plan is twenty marks per hectare of land dealt with in the plan. As a hectare is 2.471 acres, this means a cost of about 8*s.* per acre.

### 5. *The Cost of a "General Idea" Plan.*

There is a strong opinion in Germany in favour of limiting the help given by professional town planners and experts to the preparation of a "general idea" plan, leaving the task of completing the plan in detail to the municipal officials. Professor Goecke is strongly of opinion that this is the best course to adopt. Such a "general idea" plan gives the main lines of development, but does not plan every street.

The fair standard of remuneration in Germany for the preparation of a "general idea" plan is five to six marks (5*s.* to 6*s.*) per hectare dealt with in the town extension plan, say from 2*s.* to 2*s.* 6*d.* per acre. In any case the stage of preparing a "general idea" plan must be passed through, and Professor Goecke points out that once a good general idea plan has been adopted the detailed work of more closely planning special areas can be accomplished without the aid of outside experts.

Note.—The statements of cost given above apply to Germany only. No attempt has been made to compare the scale of remuneration for professional services in Germany with the scale in this country for similar services.

## (B) The Cost of Carrying a Town-planning Scheme into Effect.

### 1. *The Distinction between a Town Extension Plan and a Town Plan Dealing with both the Existing Town and the Future Extensions of the Town.*

It is essential that a clear distinction should be made between the scope of town-planning legislation in Great Britain and Germany respectively. In Germany a town plan can be made to secure both the replanning of areas already built upon, and the planning of all new extensions of the town. In Great Britain the power to replan areas already built upon is not given in the Housing and Town Planning Act, and therefore the action which our local authorities may take is limited to the work of town extension planning.

In considering questions of cost of town planning administration this fact is of vital importance. It will at once be recognised that the heavy burdens of cost involved in the purchase of existing buildings and land for replanning at congested centres will form by far the greater part of the cost of German town planning work.

### 2. *The Conditions Governing the Cost of Carrying Schemes into Effect as relating to (a) land for roads; (b) cost of road making.*

The success of the work of town planning in Germany may be said to be due to the provisions relating to the width of street which by law the municipality can require. Under the Prussian Town Planning Act, 1875 (clause 15), a town council may require the owners of sites bordering the streets outlined in a town extension plan to give, without payment, the land for constructing a street 26 metres in width (85 feet 3 inches), and to bear the whole cost of constructing the street.

The successful administration of town planning in Prussia has been due to this clause, for under it town extension has not involved a burden of cost except in those cases where specially wide roads have been made, and even here the town councils of Prussia by negotiations have been generally able to induce the owners of sites to bear the cost.

The point is of such fundamental importance that it will be well to state it in yet another way to make it absolutely clear. So long as the roads outlined in a Prussian town plan do not exceed in width 85 feet, the owners of sites are bound under the Act of 1875 to give the land for the roads free and pay all the costs of road-making. The cost to Prussian municipalities of town extension planning is—as far as normal roads are concerned—therefore absolutely nothing. The principle embodied in the 1875 Act is practically that of most of our by-laws, viz., that the owners of sites shall give the land and pay all the cost of street-making.

There is, however, one vital difference between the Prussian standard and our standard. With us 40 feet (in some cases 36 feet, and in a few cases 50 feet) is a standard which at one and the same time prescribes a minimum of width permitted and maximum of width for which the owner can be required to give land and bear cost of road construction. Moreover, under the Prussian Act the municipality can, if it so desires, permit a road to be less than 85 feet in width, whereas under our by-laws every owner is compelled to make 40 feet roads (or 36 feet under some by-laws).

There is, therefore, a great need for clearly defining in the new town planning provisions the maximum width which town councils may require in regard to both width of roads and road construction.

It is obviously out of the question that the present standard of 40 feet should hold good for town extension work under the new Town Planning Act. No town council would ever consent to the payment by the municipal authorities of public money for the purchase of land and for extra cost of road-making when the 40 feet existing standard is exceeded.

Any payments thus made must be rigidly confined to special cases such as the construction of great lines of communication, the provision of specially broad promenades, boulevards, &c. The cost of making all normal roads must be borne by the owners and not by the ratepayers.

Happily the Local Government Board have power under the Act (clause 55 and schedules 4 and 5) to make provisions governing this question, and the Board will, without doubt, properly conserve the interest of the ratepayers by prescribing in these provisions that the grading of widths of roads for (*a*) main arteries, (*b*) secondary roads, and (*c*) residential streets, shall in a town planning scheme be secured without cost to the community.

## (C) The Cost of Wide Boulevards, Open Spaces, &c.

In Germany many of the wide boulevards have been constructed on the sites of abandoned fortifications. These sites have generally been sold to the municipal authorities by the Government, and after land has been allotted for the purposes of parks, open spaces and boulevard construction, sites for public buildings, &c., the remaining sites have been sold at prices which have often paid, or nearly paid the total cost of land purchase. The cost of boulevard construction in such cases has been paid by the municipality.

In other cases of specially wide new streets leading out of a town the municipalities have negotiated with the owners, and in most cases have been able to induce them to give the land, and pay all the cost of street making.

Where such roads are planned from the first to be used by tramway companies these companies bear a part of the cost. The owners of sites in specially broad streets, however, find that it is to their interest to have the streets of special width—for their heavier expenditure on road making is more than compensated by the increase in the value of their sites.

The land for open spaces and squares is also often given by the owners on the ground that their property adjoining is increased in value. In regard to these open spaces, &c., it is quite consistent for the municipal authority to pay a part of the cost of road-making.

## (D) The Distribution of Cost of Planning Between a Number of Owners of Small Plots of Land.

The difficulty of dealing with land in Germany is much more complicated than in Great Britain for there are in Germany a greater number of small owners and land speculating societies. The difficulty of dealing with the various owners has produced the Lex Adickes at Frankfort, and it is probable that before long this law will apply to most of the German cities. This law provides that where there are a number of small owners with interests in land to be dealt with in a town planning scheme the area can be treated in bulk and the cost of street-making consolidated. After the roads have been made, and deductions made for cost of road-making a redistribution of sites or values takes place. The process is, however, an intricate one, and as the matter is provided for in clause 58 of our new Act the actual procedure for dealing with such cases as these will, without doubt, be carefully framed by the Local Government Board.

## Summary.

In summarising these notes it may be stated that the first and last technical cost of preparing a German town-planning scheme, apart from the work of survey, is about 8*s.* per acre of land dealt with in the town extension plan.

The cost of the "general idea" plan is in Germany from 2*s*. to 2*s*. 6*d*. per acre.

The cost of carrying a scheme into effect is, as far as normal roads are concerned, nothing, beyond the cost of municipal oversight.

German town councils are safeguarded by the Act of 1875 against claims for compensation for land and cost of road-making so long as the road does not exceed 85 feet in width. All cases in which this width is exceeded are dealt with on their merits, and in most cases the municipal authorities are successful in inducing the owners to give the additional land and to pay the cost of extra road making.

It is a matter of most urgent importance that our town councils should be similarly safeguarded. If they are not thus safeguarded it will not be too much to say that hundreds of thousands of pounds of the money of ratepayers will be expended without proper justification.

### Additional Notes.

1. The Prussian law of 1875 referred to in the above notes has its equivalent in laws passed at later dates by other States in the German Empire. The standard as to width of road varies a little, but not much. In the adjoining kingdom of Saxony it is, for example, 24 metres as against 26 metres in Prussia.

2. In order to keep the issue quite clear, the fact that German councils in most cases make the streets has not been mentioned above, as the councils collect from the owners of sites this cost of road making as soon as the sites are covered. The fact however remains that the owners give the land free and pay all the cost of road making.

---

The first resolution to be proposed and carried was as follows:—

"That in the opinion of this Conference it is advisable that the general course to be adopted in making a town plan should be left to the various local authorities, and that as far as practicable the $\frac{1}{2500}$th Ordnance maps be utilised for schemes with a view to minimising the cost of preparing the same."

Considerable discussion was aroused by the reference in the memorandum to the necessity for obtaining outside expert advice on the preparation of a town plan. Mr. G. T. Jackson, J.P. (Salford), emphasised the danger of making any general recommendation in the matter whereby it might appear as if they thought that their Corporations were not intelligent enough to know if they needed extra help. If the Act was to be made a success it was important that the autonomy of local bodies should not be interfered with.

Mr. T. C. Horsfall, J.P. (Manchester), said that the authorities of this country had not had intelligence enough to ask for town-planning powers until the evil had gone so far that the minimum of good would come from them. The unanimous experience of other countries was that an expert was of the utmost assistance. In Prussia, when they obtained a town-planning Act in 1875, they started without expert advice; but it was soon realised that mistakes were being made, and outside assistance was at once called in. The present local officials are doing extremely useful work, but the general health of the community is being ruined.

Mr. W. Harpur, M.I.C.E. (Cardiff), speaking as a city engineer, said that up to the present local authorities have had no voice whatever in town planning, and consequently officials could not be regarded as having been failures. The people responsible for town planning in the past were the landowner and his architect, whose chief aim had been to put his houses as close as possible. Now that the authorities had at last some controlling powers, they would see to it that such abuses did not occur again. To do this there was no necessity for expert advice.

Mr. P. Wright (Newport) contended that although the expert adviser might have proved a success in Germany, it should be remembered that the constitutional standpoint is different. In Germany the burgomaster was practically king, whereas in this country we are ruled on democratic principles. Borough surveyors understood the local conditions and requirements far better than any outside expert, whose first work always was to get all the information out of the local authorities and then to write a report at a substantial fee on it. The greatest evils of the past had been created by landlords and their architects, and it behoved those present to watch carefully that the new Act contained no loopholes which would allow a repetition of those faults.

Mr. Lasker (York Housing Association) regretted that there appeared to be such a dislike to the word "expert." Probably the number of people in this country who could be considered experts in town planning was not more than a dozen. It was only suggested that they should prepare a "general idea" plan; they would not go into the complete details. It was hard to see what harm would be done if the Local Government Board recommended the employment of one or other of these experts. The cost of so doing would be infinitesimal compared with the benefits that would arise.

Mr. Alex. R. Stenning (President of the Surveyors' Institution) said that the architects who are advising the big landowners do understand thoroughly what they are about, and that the owners were only too willing and anxious to make proper housing schemes. Overcrowding was caused not by them, but by the small landowner, who wanted to put as many houses as possible to the acre.

Mr. R. M. Cameron (Edinburgh) expressed a hope that it would not become a battle between the local authority and the expert. The intention of the Act was that each authority should do the best it could with its own problem. As there were no two towns in which the conditions were precisely the same, it would be well if each were left to attend to its own business.

The second resolution put before the meeting was as follows:—

"That this Conference is of opinion that in the future the land for all normal roads authorised in town-planning schemes should be provided and the cost of road-making borne by the owners of adjoining land, and not by the ratepayers, and that local authorities should have the power to require land to be given up to a maximum width of 80 feet for main arterial roads, and further to require the carrying out by the owners of road works to a width of 50 feet."

Mr. W. H. Hickson (town clerk, Rochdale) complained that the Act was not sufficiently definite as to who should bear the main or entire responsibility. It was desirable that general regulations should be so framed as to prevent any undue burden falling upon the local authorities. Under the present law the cost of laying out roads as required by the by-laws sometimes ultimately fell upon the local authority. Some towns already possessed exceptional powers of their own as to the width of roads, and it was desirable that they should not be surrendered for those in the Act.

Alderman E. Purcell (Liverpool) took exception to the statement that town planning had only been thought of in this country during the past year or two. They in Liverpool had been studying it for years. So far as their municipal powers would allow they had always insisted on new roads being made as wide as they possibly could; and where the owner would not do so they did it at their own cost, their total outlay on road widening during the past twelve years being one and a quarter millions. Under their own Act, which was passed last year, all new main roads are made 80 feet wide without the payment of any compensation to the landowners. If still more land be needed, it is paid for at the average price before development. In practice, landowners proved very willing to co-operate with the Corporation. Some with property on the outskirts approached the Council and asked that the new 80-feet roads should be joined up with their own as they found it enhanced the value of their property. Alderman Purcell proposed the following addition to the above resolution:—

"That in the event of more land being required for the purpose of further widening of the road, the owner shall receive payment at a price equal to the average price of the land before development."

This was seconded by Mr. Brodie (city engineer, Liverpool), and carried.

Mr. G. W. Bailey (town clerk, Bournemouth) also proposed that to the second resolution, requiring owners to carry out road works to 50 feet, as given above, the following words should be added:—"Or such other minimum width not less than 50 feet as local authorities are entitled to require under the local Acts or by-laws, or may in practice have obtained." By this addition those councils who already possessed greater powers than those outlined in the resolution would not have them taken away. The proposal was adopted. Finally the following resolution was agreed to without discussion:—

"That in the opinion of this Conference provision should be made in town-planning schemes for the building line to be defined (as in the Hampstead Act), and sufficient land dedicated in order that for future widening land may be taken by the local authority without compensation for constructing a road not exceeding 80 feet in width."

The short session of the Conference in the afternoon was mainly devoted to the discussion of three additional resolutions which had been sent in by representatives. The first was as follows:—"That in the opinion of this Conference provision should be made in town planning schemes for secondary or non-traffic streets or by-roads to be made of less width than that allowed under the by-laws, provided that the building lines on the opposite sides of such streets or roads be not less than 50 feet apart."

Mr. Shawcross, the chairman, said that the object of the above resolution was to minimise the cost of constructing those roads where it was not intended that heavy traffic should pass. Under present conditions there was a quite unnecessary expenditure of a large amount of money in making many roads capable of resisting the heaviest kinds of traffic, which would only have vehicles of the lightest kind. The money saved by removing this anomaly would be devoted to an improvement in the quality and comfort of the houses.

Mr. J. S. Birkett, solicitor to the Hampstead Garden Suburb Trust, said that when they came to lay out the suburb they found that all their intentions would be frustrated by the restrictions of the by-laws which prevented the arrangement of squares, &c., and rendered compulsory the making of even subsidiary roads to a width of 50 feet. As it was proposed that the majority of the roads in the suburb should be subsidiary ones, the outlay involved was very great. So the Trust got a special Act of Parliament, under which they are allowed to make roads, limited to 500 feet in length, of a width of 20 feet, provided that the houses on each side are not less than 50 feet apart. In this way they had been saved thousands of pounds, and in consequence the houses were able to be built better and let cheaper. Such a provision was of very great importance in the drawing up of town planning schemes, for it enables the architect or owner to lay out his sites to the best advantage for the occupants, and also with a finer artistic effect. Where a road was only wanted for access to the houses on that road, it was quite unnecessary to have wide macadam thoroughfares 40 or 50 feet in width, with their heavy initial outlay and heavy cost of upkeep. Of course, where wide roads are desirable, they were able to have them at the Hampstead Garden Suburb.

Councillor H. B. Bates (St. Helens) said that he knew from experience of instances where a great many small houses had had to be crowded together on a small area owing to the expenses of street construction having been so heavy.

Mr. J. A. Brodie (City Engineer, Liverpool) considered that if the reduction in the width of street works were accompanied by a proportionate increase in the open areas there would be no great objection to the resolution. In the Liverpool Act of 1908 the Corporation had power to deal with streets in that way.

Mr. T. C. Horsfall (Manchester) suggested that in a great many cases the open space insisted on by the Act could be given with much greater advantage in the form of playing grounds than in the form of streets of a quite unnecessary width so far as the traffic was concerned. The success of this arrangement had been already demonstrated at Sheffield, where there was an admirable grouping of cottages round an oval playground. If such an open space is provided, there was no objection to allowing quite a narrow space between the houses. It was of enormous importance that playgrounds should be brought near to the dwellings of the mass of the people. The children's health would be far more improved thereby than by insisting on wide streets.

Alderman E. Purcell (Liverpool) mentioned that in Liverpool they were now empowered to ask any builder or owner developing an estate for one acre in ten. Such open spaces are not paid for, but the owner is let off the payment of street works for a certain amount. The Corporation take the land over, and are responsible for the upkeep. There have been, so far, two instances where this power has been put into force. In Liverpool the minimum width between the houses was 36 feet.

Mr. Raymond Unwin expressed his conviction that it would be a great mistake to lay down any hard and fast regulation as to the exact width necessary for a street. In Hampstead a width of 50 feet has worked very well; but there might very easily be circumstances under which a lesser width would be desirable. If the reduction in the number of houses to the acre was insisted upon to the extent that they knew to be desirable, it was essential that the owner of the land should be spared the present exorbitant expense of the road construction. It was very necessary that the laws wielded by the authorities, that the legal requirements should be flexible and permit of the laying out of narrow as well as broad roads. It might be desirable in some places to have roads 80 or 100 feet wide, and equally desirable to permit of narrow ones. In the present day there was a great need for a law by which houses could be set back in by-roads or groves, so as to escape the noise of traffic. The interests of the public would, of course, have to be safeguarded by preventing any such facility in the case of roads which might be later used for heavy or main traffic. He therefore moved as an amendment that the resolution should be framed so as to include such a phrase as "Or such width as may be adequate."

Mr. W. H. S. Dawson (City Engineer, Bradford) thought that it was far better to have the open space all round the houses than in the form of occasional public playgrounds, which became in time a sort of no man's land. There would not, perhaps, be such an objection to these latter if they could be supported and maintained out of the rates. But even if they were upheld in this way, he was still of opinion that it was better for children to play in their own backyard than in any playground.

Mr. Horsfall said that if good was to be effected by this Act they would have to leave something to the discretion of the local authorities. He was perfectly certain that there would be no difficulty in getting an adequate amount of open space in a given area if the scheme is first drawn up by the local authority and then submitted for approval to the Local Government Board.

Dr. S. C. Lawrence (Medical Officer, Edmonton) said that as a medical officer of health he could not support the amendment. To introduce the word "adequate" was to use a word that was best barred. Moreover, the amendment was inconsistent with the spirit of their morning's proceedings, when much was heard of 80-feet roads. No official or councillor could be so wise that when he labelled a street as secondary he could be certain that it would not in 30 years become a primary road. His experience of common playgrounds did not lead him to be charmed by them. They shared the character of public schools in being hotbeds of disease.

It was eventually decided that the first resolution should be referred back for the consideration of the advisory committee.

The following resolution was accepted without discussion:—"That the Local Government Board be asked whether a local authority, under a town planning scheme, has the power to make any of the roads shown upon the plan when it wishes to do so, and whether in such cases the cost of such roads could be collected from the owners of the frontages either at the time the roads are made, or at the time that the adjacent land is built upon."

The third and last resolution, which, it was mentioned, came from Mr. H. V. Lanchester, was as follows:—

"That with a view to limiting the number of buildings to be placed on the land, it would be advisable to define these by the number of cubic feet of room space that can be placed on an acre of land, rather than by defining this in any other way."

Some discussion took place before it was decided to refer it to the advisory committee. Mr. E. T. Hall, F.R.I.B.A., insisted on the absurdity of strictly limiting the number of buildings to the acre and making the same number applicable to every class of structure, whether houses, chapels, warehouses, schools, and so on. He was also strongly in favour of being allowed to group houses together so as to leave large open spaces at intervals, as opposed to each house having its own little piece of ground. The proper way of dealing with a big scheme was to provide for playing fields as distinct from ordinary open space. The Dulwich College Estates governors, of which Mr. Hall is chairman, had set apart 160 acres of land out of two square miles for playing fields. The aim should be to provide a number of oases.

## ILLUSTRATIONS.

### LIVING ARCHITECTS.—NO. 30, SIR ROBERT ROWAND ANDERSON, LL.D., F.R.S.E.

### NO. 31, SIR THOMAS DREW, P.R.H.A., LL.D.

SIR ROWAND ANDERSON and Sir Thomas Drew are at the head of the profession in Scotland and Ireland respectively, and hence we have considered it fitting that their counterfeit presentments should appear together in our pages. We are able to inform our readers, amongst whom Sir Thomas Drew has many friends, that he is progressing slowly towards recovery after his recent operation.

### RUSHTON HALL, NORTHANTS.

WE illustrate some characteristic interiors by Mr. T. Graham Jackson, R.A., the nominee this year of the Royal Institute of British Architects for the Royal Gold Medal.

### DODFORD CHURCH—INTERIOR VIEW.

THIS illustration completes our series of views of Mr. Arthur Bartlett's very successful church, an account of which appeared in our issue of January 28.

## THE LIFE AND WORK OF WILLIAM BUTTERFIELD.*

(*Concluded from last week.*)

ONE somewhat curious fact connected with them was that, though signed by paymaster and contractor, his own name and address were both conspicuous by their absence from each and all of them—an embodiment of the adage "not the workman but the work"—a striking contrast to the habit of many grave-masons, the name of one of them in a recorded incident being so largely and so conspicuously sculptured on the gravestone that a wag, who, till then, had supposed it to be that of another man well known to him in life, asked the mason with seeming innocence if it was intended as a tomb for himself.

As has been well said, "Those who differed from him for the moment nevertheless greatly respected his character, because they saw, added to his high professional knowledge, a depth of religious feeling and conviction which could not fail to attract admiration."

His masterly care in the design and arrangement of tile pavements, and specially as to the right place for a peculiarly beautiful blue-grey tile of his, greatly exercised him; not content with this, his formulæ for their laying, and retention in a cleanly state when laid, appears in a somewhat lengthy document well worth perusing; it shows his great thoroughness.

It would ill become such as I am to venture to criticise the abandonment of the tile in church and other floors for the prevailing method at present of the marble chequers or the plain stone floor; all I would say is that the tiled floors of such men as Pugin, Butterfield, Street, Pearson, and others, and of a great amateur, the late Lord Alwyn Compton, Bishop of Ely, are too much things of beauty to be ignored or unprized; that they, one and all, should be the embodiment of much thoughtful attention is what I think all of you will agree about without much argument either way; that none of these methods fall into the rut of a mere passing fashion or craze might not perhaps be an unnecessary warning; any way, let us steer clear of the old French nursery jingle:—

"Dans la gendarmerie, quand un gendarme rit,
Tous les gendarmes rirent, dans la gendarmerie."

His mouldings usually are simple in section, but very telling in effect, and show his great gift of self-restraint and an entire freedom from fussiness; perhaps some of us might think the charm of a little more variety might have been better, but that was not his way.

His loyalty to, and love of, the English square end once led him, when at Norwich, to playfully describe the great apse of its cathedral as "a piece of Norman extravagance." Rugby Chapel, a case of necessity, is the only apsidal end of his of which I am aware. His reverence for St. Mark's at Venice, and his study of its motives, were very great. The patterns of his niello ornament were rich, varied, and marked the great value he set on subordinate matters. His love of the blue known as "cerulean" was often gratified in the decoration of his woodwork. His beautiful ridge-crestings which, after all that has recently been said in favour of the half-round ridge, were but a survival or revival of old methods; poor manufacture of unworthy and oftentimes vulgar models have, I fancy, had something to do with this change of procedure. Possessed as he was of the "single eye," there was nothing trivial, flighty, evanescent, or fashionable about his work; his natural reverence of mind and high sense of responsibility and duty, as he understood it, prevented this.

A slight discrepancy having occurred to a feature in a church of his, discovered some short time after its completion, its builder had little peace given him till it had been rectified; it was no case of "extras and omissions," but of simple obedience.

He objected to the term "organ chamber," preferring "organ room," and he preferred "nimbuses" to the more usual "nimbi."

That there was a certain lack of repose in some of his later works, many of his staunch admirers will be unable to deny. Generosity in his patrons may have contributed to it, proving that "the lean hound hunts the best."

His many designs in "Instrumenta Ecclesiastica" show great refinement, restraint, and originality. His great love of constructional colour only wants "the kindly hand of Time" to sober it into perfect beauty; may at least some of his works be left intact to receive it.

Possibly owing to my failure to understand the reason why, I may be pardoned for thinking that, unless it was unavoidable, his lozenge-wise diapers would have been less restless and disturbing in effect had they been made parallel (as they almost invariably are not) with the lines of the gables themselves.

His dealings with old work, though on the same lines as of the men of the Middle Ages, were scarcely perhaps at all times quite sympathetic; he built what he liked, and as he liked, sometimes a little perhaps to the detriment of the character and complexion of the old work adjacent; even in this he at any rate showed as much regard for it as have those who have already dealt with some of his own work. His numerous village churches, quaint and beautiful though they are, sometimes show some of this want of sympathy with ancient methods, both as to construction and design.

Those of you who know Caudebec, where one Guillaume le Telier, the architect, spent all his days and efforts on one church, and was finally buried in it, will marvel that Mr. Butterfield could have done so many, and so well, separated as they were both by time and distance, and each receiving so much of his personal attention. The failures in much of our work of to-day may in some measure be pardoned when we think of this great difference in modern methods which has caused the favoured few of us to be almost ubiquitous. Personally, I think better work, or at least brighter times, might come with a trifle more spreading of it.

### *The Man.*

So little that is known of his character as a man as I have, after some effort, been able to get together must be the sole apology I can offer for writing a comparatively brief paper, when I had fully hoped to be able to prepare a much longer one with which to test your forbearance.

His familiar figure was fairly well known when walking out for a visit to his club, the Athenæum, to get his "dish of tea," and perhaps to hold conversation with those persons there whose privilege it was to know him, or to write occasional letters on various Church matters, in which his trenchant and caustic humour found a congenial outlet; or, maybe, on architectural or antiquarian subjects to the journals most concerned with them.

We must not forget, too, his forceful methods as an admirable and voluminous correspondent; he not only wrote long and very scholarly letters, but every sentence and every word of them had its due place, weight, and measure most exactly apportioned. In courteous terms few could hit harder, or in more knightly fashion, those delinquents, be they who they might, whose faults and failings he deemed it to be his duty to hit; that word "duty" was to him in all ways and at all times a masterful monitor who would put up with no shuffling and tolerate no form of weakness that could be cured or averted.

Excellent letters of his on theological subjects have appeared from time to time in the Church papers signed "A Churchman"—they all teem with interest and originality and show clearly the bent of his powerful mental equipment. He was, as a Church dignitary once said of him, "no ordinary theologian," adding that "architecture is his least quality"; this, of course, in illustration of his value as a master of the first-named attribute.

He objected somewhat to "firms" of architects, being quite unable to understand how each, having a mind of his own, could manage to work comfortably with that of any other. This is, of course, a matter of temperament.

It may perhaps seem somewhat out of place here to say much as to his deeply religious life, and yet how still more feeble than they are would be my remarks, or indeed those of anyone else, were all mention of it to be omitted; it did not prevent, nor do I see any reason why it should, his occasional indulgence in a quiet humour quite his own, free though it necessarily was from all insane frivolity; such would have been opposed to his natural thoughtfulness.

That he came so little out of his shell was a distinct loss to his professional brethren, but he could not change his nature, and probably never attempted to do so. No better illustration of his hermit-like life and his retiring habits can perhaps be recalled than the fact of his non-appearance to receive in person the Gold Medal given by the late Queen Victoria, to the nominee, as he was, of the Royal Institute of British Architects (for the reception of which many of us would cheerfully walk a long way barefoot), on the plea that it would be "contrary to the habit of his whole life"; indeed, it is said that he went so far as to remark that he would rather relinquish it altogether than accept it, if the conditions compelled him to attend personally in order to receive it.

---

* A paper read at the last meeting of the Architectural Association by Mr. E. Swinfen Harris, F.R.I.B.A.

No one could do otherwise with truth than recognise his amazing industry, which never once slackened during his long career till failing eyesight compelled him to desist.

Very few of the so-called practical men (so well put to rebuke by the late Mr. Micklethwaite) ever took more pains than did Mr. Butterfield to prevent chimneys from the chance of smoking. He would doubtless have been well abused had they done so (and, no doubt, some practical man sent for, as solely able to cure them). How few among those concerned are ever grateful to our friend in keeping them clear of the nuisance. His chimney-pieces at 4 Adam Street, seemed like a reflection of himself as in a mirror.

He united the Christian gentleman with the architect in a way which we may all strive to emulate, and, if we can, to copy.

Though perhaps hardly to be described as a "broad-minded man," he was most certainly a high-minded one, aiming at excellence rather than the dictates of any mere passing fashion; he never sought nor cared for popularity. He was opposed to the new cult of letting the workman think and act for himself, specially till found fit to do so. As a rule it is thus far at any rate to be feared that, in the abstract, he is not.

His loyalty towards good builders when found worthy after experience of them showed his keen sense of justice; his firmness in rejecting bad material soon revealed him to the slippery ones who had made experiments with him, as a man who would in no way allow himself to be trifled with. One of the former kind who built a house for me was so loyal to all his ways and habits that, though I was delighted to find such a rare form of virtue, I confess it became at times somewhat of a trial of patience to myself.

As I have said before, loyalty in others he could, and did respect: to wit, in speaking of his man-servant, of whose devotion to himself he always spoke with dry, but very sincere and deep personal regard. He possessed little, if any tenderness towards disloyal workers.

A frequent remark of his was, "Are you quite sure of your measurements?" and yet another, "People will abuse me because I will use brick." This latter was certainly made by one who well knew how to use it; his strong sense of the value of "texture" was very real years before it became a popular word with us of to-day; there was little sympathy shown by him in the use of any art cant, his method being rather to be art, than to talk about it.

A frequent reply to questions in conversation was "With a view to what?" as was another, used during his works towards adverse criticism, oftentimes as unreasonable as illogical, "Mr. ——, I have a conscience." We can say with Tennyson, he "reverenced his conscience as his King." Every line that he drew or caused to be drawn was the outcome of fervent and personal thought and devotion to his work, as he saw and believed it to be right, and he was never content or satisfied till the very best that could be contrived had been arrived at. The old saying that "the gods see everywhere" was quite unnecessary to him; he made it his business to do that, too, neither sparing his assistants nor himself over any small, or seemingly small, requirement; with him nothing was thought to be so. One great point in his favour was his feeling that all the parts in his work were necessary to the whole, not being, as is too frequently the case, studied merely as separate items, often quite "out of key" with the mass; in this his thoroughness in his work is generally apparent at once.

With the advertising spirit of his later days he had no patience.

His remarks on "Church Seats and Kneeling Boards," excellent in many ways, are somewhat marred by a too dogmatic spirit, avoiding deliberately, as they do, all elasticity or compromise to suit them to the possibility of adaptation to varying positions or circumstances. It is, however, only just to say that for some forty years he fought nobly for his system; as a friend of his has said, "A church was nothing to him if it did not lead to worship."

It speaks volumes that works so many, so various, so original and remarkable in many ways, should have fallen at all into the hands of so able and yet so reserved a man; this in itself is a comforting proof that reticence is little, if any, real barrier to those who have an opportunity afforded them of showing their knowledge and love of "The Mistress Art." His great seriousness in every phase of his long life was so different to the usual tone of life around him; this characteristic possibly grows less as time runs on.

In his later years he drew but little with his own hand (though few of his brethren had probably drawn in their time more than he); he spent very much thought and care in criticising and amending the work of his staff, his then idea being that it was a "waste of effort" to do otherwise.

It is perhaps to be regretted greatly, even from an archæological point of view, that the countless measured drawings of old work made by him (very much of which it is to be feared is now no longer in existence) have not descended to us for careful preservation, or, better, for opportunities of study and perhaps of fruitful inspiration. Probably his fear of mere soulless coypism of them may have led to other methods of dealing with them, but that, like many points of interest to us about him, will probably remain unknown. He was no mere imitator. Imitation may be "a sincere form of flattery"; with many nowadays it is frequently, I fear, an insincere form of robbery also. The only deliberate copying of any ancient work by him that I am aware of (and that, no doubt, with very full knowledge of its entire suitability to his needs) was when the mouldings of the caps and bases of the nave arcade in St. Albans, Holborn, being similar in section to those in similar positions in Tintern Abbey, were repeated with excellent results, thus proving the wisdom of his choice of them.

He ruled his own lines; they were those of none other. He "decorated his constructions, but never constructed his decorations."

I was, as a pretty constant attendant in the sixties at All Saints Church, Margaret Street, acquainted with nearly every line of it, and considered it then, as I still do, a masterpiece of planning and suitability to a most difficult site, besides being full of most interesting and original detail, all admirably put together, and in every sense well built.

We architects are sorely tempted to admire a fine church when we might perhaps be better employed, and even when worshipping in an ugly one we are still unsafe, being then tempted to reflect how much, were we but given the opportunity, we could improve it, therefore the works of Mr. Butterfield have not, and cannot be expected to escape our criticism.

### *The Friend.*

Grave and unsympathetic as he was supposed to have been to and by many, he was by nature one of the kindliest and most hospitable of men to those few who had the good fortune to possess his friendship; such always prized it.

My personal introduction to him was in 1867 at my old office in Duke Street, Adelphi (long since pulled down), and a most interesting memory it remains. The kind old friend who brought us together, still happily living, has given me much aid in preparing this short record, and specially in lending me the drawings on the walls of Melbourne Cathedral, Rugby parish church, and Ascot Priory, and thus showing you specimens of a cathedral, a parish church, and a community chapel. How I wish he were here to-night to describe that interview. His racy account of it would add much more to your edification and enjoyment than I can ever pretend to give you; few, if any, can be found to reverence the memory of Mr. Butterfield more than he. When criticising a window sent round for Mr. Butterfield's approval, he flipped at so many of the portions of it with his forefinger while objecting to form or colour, in order that these unsatisfactory parts might be taken out and substituted with something more to his taste, that the few surviving portions might well have reminded the glass-painter of the story about the model of Wallenstein's horse—"The head, neck, legs, body and tail are new, all the rest is the real horse."

Some few old friends may perchance be living who yet remember his familiar figure, Sunday after Sunday, in the church of St. Mary Magdalene, Munster Square, in days now long passed.

What a source of comfort is the feeling of the reality still attached to loyal work and service by the knowledge that one so forgotten to the world at large, as he seems to be, should be still so well remembered and honoured in his own profession, in and through the many works he has left us. "When I am forgotten, as I shall be, and sleep in dull, cold marble," is no more applicable to William Butterfield (so far as we are concerned) than it is to Cardinal Wolsey. We architects cannot look upon any of his buildings (whether known as his work, or not) without wishing to know more about them. We, at any rate, should always be thankful for the possession of these many remembrances of him kept green as it must be in and through his work.

Among the architects of the Victorian age alone what a wide field for study and observation might be evolved by any earnest young student among us as to their varied and various methods of producing their effective characteristics in their several works. For instance, if we compare those of William

Butterfield and William Burges we shall find in those of the former a simple directness of aim produced by the use of ordinary materials trained and used for a definite effect, while the other puts up huge stones for the sculptor to do his bidding by liberating from them, as it were, the racy figures full of humour, of forms, both human and animal, sacred and profane, hidden within them, full as they are of exhaustive (and possibly exhausting) studies from Greek and mediæval lore. So varied are the motives at work in various brains. As restorers or preservers of old work we shall do well to act on the wording on the tomb of another great architect of the same era (J. L. Pearson), "Sustinuit et Abstinuit."

Let us (when we can do so with a clear conscience) try and speak kindly of one another's work.

It is a good and hopeful sign that we are now so keen in our wish to know more of the ways, characters and personalities of the men themselves, as well as of their works, far more than has hitherto been cared about; like the pleasant reunions of the Royal Institute of British Architects, unknown in old days, this cannot but be helpful to us. The more we know of each other the better for the progressive influence of our art, nor is it at all inimical to that friendly rivalry which should lead us on to greater excellence. This has already been done here, at least once before, when George Devey and his works (many of which I know and greatly admire) were brought before you in an admirable address by Mr. James Williams, which, though I could not hear, I could and did read and think about with much enjoyment. Of a type differing from William Butterfield, he at any rate resembled him in one way, being in every sense a true English gentleman; like him too, in being brought in contact with many great and remarkable men, he could always hold his own with them, and receive, as he merited, their appreciation, both of himself and of his gifts.

We architects are not a wealthy body, and the exception does not prove the rule. May be, our epitaphs will resemble the last words of a divine, "I die, as a Bishop should, without money." May we also resemble that Bishop as to the latter half of the sentence too—"and without debts."

William Butterfield has gone to his rest, and well earned it. I can wish nothing better for the younger members of the Architectural Association than that they may live to meet with the same success he did, and may also be led to imitate him in deserving it, as he did; even after all a far better condition of things than being busy over undeserved work.

His funeral, in the churchyard at Tottenham, like his life, was, by his own wish, of a quiet and unostentatious character. He lies in the spot selected by himself adjoining his close and intimate friend Prebendary Wilson: so "in their death they are not divided."

In conclusion, I think I may venture in the name of those present to thank my friend on your behalf (as I certainly shall on my own) for the loan of those drawings by Mr. Butterfield, which he lent and sent me specially for your edification and pleasure this evening.

Mr. G. H. Fellowes-Prynne said it was with the greatest possible pleasure that he proposed a vote of thanks to the author of the paper, a friend of old standing, and he was sure a more enthusiastic lover of art and architecture did not exist. The paper really made them think of the past leaders of their profession, and he believed it would therefore be of great use to students. The architecture of Butterfield showed originality, strong feeling, and an intense love of colour, and although in the study of his work, as in the study of all artist's work, they must sometimes be disappointed, yet they must admit the disappointment came from their own standpoint, and they should remember that since they were apt to learn more by their own failures than by their successes, the failures of past leaders could be helpful in the same way. It was well to speak kindly of one another's work, and yet, if there was one profession in which unnecessary bitterness was often shown it was in that of architecture. Disparaging remarks were often made about a professional brother's work, and one wondered to what purpose, and in no case was that better exemplified than in the work of Butterfield. The men who generally criticised with bitterness were the least worthy to do so. Butterfield was one of the men over whom a battle of criticism had raged. The speaker could remember his being described as the Fra Angelico of the age, and though that was an extreme view —for it must be admitted he was sometimes placed on too high a pedestal—at the same time, there was that much truth in the title as befitted the originator of constructional decoration. They must not lose sight of the fact that he was religious from beginning to end. At the Institute on Monday last they had had a paper on Bodley, another Victorian architect with Butterfield. In the two men, however, they had two different characters, one unsympathetic and the other loving, and yet the two men absolutely akin in art, one constructional and the other a master in applied decoration. All the great artists of church architecture in the last century, especially Pugin, Street and Bodley, were men who had studied deeply the ancient work, and though influenced by it they all showed strong individuality, and it was certainly only the basis of their own architecture.

Mr. H. H. Statham, in seconding the motion, said the illustrations hung round the walls represented Butterfield's conservative attitude. They were interesting to him, and they would be to those who remembered the Gothic revival. The time of that passion for Gothic had now passed, but he had the feeling aroused by some of Butterfield's churches that they embodied that sort of originality which kept it alive still in spite of new movements.

Mr. F. R. Farrow said he hoped they would not forget to include in the vote of thanks their expression of gratitude to the friend of Mr. Harris who was good enough to allow the beautiful drawings by Butterfield to be exhibited that evening. Although Mr. Butterfield was a man of retiring nature, it would be of interest to members of the Association to know that he took a keen interest in their work, a fact which appealed to the speaker in a simple and unexpected manner. At one time, said Mr. Farrow, when he was giving a series of lectures at the Association on "Construction," Mr. Butterfield wrote him a long letter carefully pointing out the best method of laying tiles upon a roof and desiring him to impress upon the students the results of his experience. The letter was beautifully written, clearly argued, not merely as to the diction, but as to the proper method and the logical reasons for the method. That letter showed that Mr. Butterfield must have read and studied the A.A. Brown Book; it showed, too, that he had a keen interest in the instruction which was being given to the younger members of the profession. It showed also how jealous he was in his endeavour that the best should always be done in everything in connection with architecture. Mr. Farrow said he was perfectly unknown to Mr. Butterfield, a stranger to him, but because of his interest in the Association Mr. Butterfield had undertaken to write such a letter to one of the lecturers. Mr. Prynne had remarked on the coincidence that there were lectures on two great Victorian architects as Bodley and Butterfield in one week. They must all admire the work of those great men and recognise it expressed their individuality. It was the fashion to say nowadays that Gothic work was archæological, but those men of the nineteenth century were ardent students of all the old work ever done in mediæval times, and they expressed in every building that they did their individuality, and that was the charm of Butterfield's work. They did not imagine he was the same kind of man as Bodley or Street; they recognised that his was a different personality, and if for no other reason than that his work must always be worthy of study to students of the present day.

Mr. W. Millard said he had only seen, like many other students, Butterfield's work from outside, and that evening was the first time he had seen drawings of it. In referring to the criticism of another's work, he urged that it could not be fair until those who would pass judgment were acquainted with all the conditions and had examined the work from top to bottom, back to front, internally and externally.

Mr. Arthur Keen said he thought Butterfield was not only an artist, but that he was just as great as a constructor pure and simple. A letter from Mr. Halsey Ricardo had been handed to him that evening, and he wished to quote from it. Mr. Ricardo wrote:—"I have reverenced Butterfield's work since I was a schoolboy at Rugby, and my amazement at his power and the intensity of his romantic poetry of feeling increases as the years pass by, and I learn sadly the terrible difficulties of expressing oneself in building. The astounding majesty of the narthex at St. Albans, High Holborn, and the inexplicable beauty of the nave arcades of All Saints, Margaret Street, to take two handy London instances, compel one to shout and to cry at the same moment. How the conviction of the man burns through all he did."

Mr. Theodore Fyffe supported the vote of thanks, in which the President joined. Mr. Swinfen Harris briefly replied and the meeting terminated.

[In the list of works by Mr. Butterfield included in our last issue the church of St. Mary Magdalene, Munster Square, was inserted in error.—Ed.]

## PLANNING OF ELEMENTARY SCHOOL BUILDINGS.

Mr. H. D. SEARLES-WOOD, F.R.I.B.A., presided over a provincial meeting of the Royal Sanitary Institute at Derby on Friday, when the subject of school planning was discussed.

The subject was introduced by Mr. G. H. Widdows, A.R.I.B.A., the architect to the Derbyshire education committee, who has designed a number of schools since 1903, differing essentially from the central hall type. Speaking generally, the Derbyshire education committee had decided that the schools should be built to accommodate from 250 to 350 children (which is the best number for a teacher to supervise), and that the number of classrooms in a school should as a rule be six. Having dealt with a number of reasons in favour of a six-room school, Mr. Widdows called attention to the plans of his first attempt at cross-lighting and cross-ventilation, and said it was amusing now to read the correspondence of the Board of Education on the subject of this plan. It was trying to one's patience, but by sticking to their guns they got the plan through at last unaltered, for they then received the grandmotherly information that they were not to build more than five schools on those principles. For his part he would rather see the Board leading the way and providing provincial architects with good ideas, instead of which they had a Board which not only did not lead the day, but hindered those who were trying to get out of the rut. Some day the Board would find out that light and air were two of heaven's greatest blessings. Describing the plan, the author pointed out that the central part of the building can, by the use of screens, be turned into what is practically a central hall. In the case of infants the central part and the two corridors adjoining form playing places for the children in wet weather. It is a help to the teachers to be able to have the children divided into three groups at recreation time, instead of having them all together in a central hall. The corridors are 13 feet wide, and he fixed on this width because it enables two boys side by side to perform extended drill without knocking the walls or one another's knuckles. The corridors are provided on each side with double doors opening into verandahs. In wet weather no rain enters, and drill takes place in what is practically the open air. The verandahs, moreover, in wet weather provide shelters before the opening of school, and the cost of covered sheds is avoided. The windows in the end gables of the classrooms are swing lights and are 9 feet 6 inches from the floor, so that the light does not fall direct into the teacher's eyes. The side windows are provided with hoppers at the bottom and swing lights above, the hoppers being air inlets and the swing lights outlets. The hoppers open not more than four inches, and are formed with a deep rebate at the top, and thus compel the incoming air to travel in an upward direction. If hoppers are made to open more than four inches the air comes in horizontally, catching the teacher's head. To further assist the ventilation, more particularly in inclement weather, a fireplace is provided in each room, together with two 14 inch by 9 inch air flues, one on each side of the fireplace. These air flues are continued down to the floor, and have regulating grates at floor and ceiling level. It is essential that these should be continued to the floor, as there is more dead air below the level of the window-sill than above. The heating of our schools is, as a rule, by means of low-pressure hot water, with ventilating radiators in each room. No room has less than 14 square feet of heating surface per 1,000 cubic feet of contents, and if the rooms are at the end of a circuit this is increased to 18 square feet. In all cases ventilating radiators are reckoned at half the efficiency given in the catalogues to compensate for the extra quick circulation of air brought from the outside and warmed by these radiators. In the matter of lighting the net glass area is one-fifth of the floor area of each room. For artificial lighting electric light is used wherever available, but in most cases gas is the only illuminant to be had. In such cases they used single inverted incandescent lights arranged to spread the light equally, the bottom of the globes being 8 feet 3 inches from the floor. To obtain satisfactory lighting the ratio of candle power to square feet of floor area should not be less than 3 to 5. The classrooms are 11 feet in height to the wall-plate and 14 feet to the ceiling. Greater height produces an unnecessary strain on the teacher's voice. What we aim at is not a large body of dead air, but a smaller body of air frequently changed. When it is realised that each child ought to have 1,500 cubic feet of air per hour, it will be seen how necessary it is to change the air frequently and how little help is an extra 2 or 3 feet in height. It is, of course, desirable that as much sunshine as possible should be obtained in each room; and in a building with cross lighting it does not matter materially how the building is placed on the site, as sunshine is sure to reach each room some time during the day. The floors are usually of maple nailed to coke-breeze concrete, or are of wood blocks on concrete. He had tried two small jointless mastic floors, but neither has proved a success. He had also tried asphalt, but it is cold to the feet. There is a fortune awaiting the man who can bring out a suitable jointless floor which shall be both warm and durable. The walls and ceilings are plastered. In infant schools a height of 4 feet from the floor, and for older children 5 feet 6 inches, is made of hard plaster coated with green composition for free-arm drawing. This is cheaper than glazed bricks and serves a double purpose. Where possible cupboards are worked in as part of the structure, and cumbersome pieces of ugly furniture are avoided thereby. As regards painting, they rely on white and green externally. Internally the woodwork is usually a light green, and the walls above the dark green dado are treated a light warm buff. To show that cross lighting and cross ventilation does not tie one down to one type of plan, Mr. Widdows exhibited plans of other schools he had designed, and proceeded to touch on the arrangements made for sanitation. In conclusion, he said that the tendency among architects is to regard doctors as cranks and faddists. Unfortunately some are, but certainly not all. Architects will do themselves no good by ignoring the doctors. There are very few architects who understand ventilation, or who take the trouble to try to understand it. They swallow some firm's patent nostrums, and that is as far as they go. The doctors have come to stay, and architects must rise to the occasion so as to be able to debate the questions with the doctors. For his part, he hoped the Royal Institute of British Architects will go more into it, and make their examinations more drastic in the matter of ventilation, lighting, and heating. He hoped, too, that the day is not far distant when architecture will be made a close profession, just in the same way as law and medicine, and when the time comes for a Bill to be presented in Parliament, he appealed to medical men to give their support, and help in getting that Bill through. It is time something was done. In Derbyshire he had seen a window-blind on which the advertiser describes himself as "architect and undertaker." Let them hope that this will soon be no longer possible, and that the Local Government Board will guarantee official architects their position, just as they have done in the case of the medical officers of health. It is to be regretted that education architects have not a society among themselves, so that they could meet and discuss the various difficulties that arise. Such a society would be of inestimable value; but we are all so busy that it has been, so far, impossible to find anyone able to spare the time to start such a society. A difficulty would be met at the commencement as to who should be admitted. In some counties the schools have been placed in the hands of the county surveyors. Can it be said that in all cases such are architects? Have they had the proper training? He could not understand anyone satisfactorily performing both duties. In all but the smallest counties there is sufficient work in each department to keep an official going. How, then, can a county surveyor give the proper time and attention to schools? Be that as it may, official architects lose much by not having a society. From the Board of Education they get practically no help; merely criticisms, and these anyone can make. On a committee, too, there are sometimes members whose actions do not conduce to efficient and smooth working. A society would be of great value and assistance in dealing with such men.

Mr. R. G. Kirkby, A.R.I.B.A. (Bradford), said there was no doubt that in a few counties reform has taken place in regard to school planning, but it was much to be regretted that perhaps 70 or 80 per cent. of the schools being erected in the country were totally unsuitable for the present requirements of education. He had lately visited a number of schools in Birmingham, Staffordshire, and Derbyshire, and certainly considered Mr. Widdows's schools were much superior to many of the types they saw exhibited on the walls. Mr. Widdows had been successful in obtaining good light and efficient ventilation in every classroom. He had been much struck with the great marching halls in the German schools, and thought there should be more provision made in English schools for physical culture. The conditions of Staffordshire and Derbyshire differed from those of Bradford, as they had in those counties flat sites and positions which were not exposed, and he felt that the schools being erected in Bradford were more suitable for that city. At Bradford he was planning a school with verandahs facing the south in order that in summer time the side of the classroom could be thrown open and the children would be practically in the open air. He was very much impressed with the adaptability of Mr. Widdows's schools, and their general artistic appearance both inside and out.

Dr. Reid, medical officer of health for Staffordshire, referred to his astonishment when after the Education Act he received a plan for a new school of the central hall type. He refused to pass it, and as a result of consultation with the architect they came to the conclusion that the only way to build schools was to build them as they did hospitals. Dr. Reid described the salient features of the now well-known Staffordshire pavilion schools, and strongly urged that all schools should have cross window ventilation. He would go further, and would not pass a school which opened into a corridor. It had been said that the pavilion type of schools occupied a large site and were costly to build, but that was not so. There was no reason why they should not have two or three storeys each with verandahs, and as a matter of fact at Bangor they were building a three-storeyed University on that plan. In Staffordshire they allowed 40 inches of ventilation per child, and the air was changed six times an hour, and they allowed 26 to 28 feet of heating area per 1,000 cubic feet.

Mr. Owen, His Majesty's inspector of schools, thought the differences with the Board of Education had been exaggerated. He admired Mr. Widdows's work, but at the same time he was one of the most daring school architects of the country, and he would not condemn many of the schools which had been built under the regulations of the Board of Education. Mr. Widdows himself admitted that architects did not understand ventilation, and surely architects must have been asleep, for they were called on to design schools before the passing of the Education Act.

Mr. Edwards, city architect, Sheffield, pointed out that the primary consideration in the planning of schools in the past was to secure proper supervision by the head teacher, and now he thought they were inclined to rush to the other extreme, and they might make a mistake in treating schools purely as seminaries. A great many of the mistakes in school planning were undoubtedly due to the competition system, because an architect knew he would stand no chance of winning a competition if he went far outside the usual lines. He considered it an advantage to have an official architect who could consult with various other officials.

The Chairman said the central hall system was introduced from the point of view of supervision. He deprecated the idea of forming another architects' society, and pointed out that if school architects wished to meet and discuss matters, the Royal Sanitary Institute would afford them facilities.

Others who took part in the discussion were Dr. Berwise, the Mayor of Derby, Mr. E. W. Small, and several head teachers, one of whom, Mr. Cley, of Long Eaton, said that since being in a school built by Mr. Widdows his staff had not suffered at all from teachers' sore throat.

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE great church of Santa Sophia at Constantinople formed the subject of a paper read by Mr. J. B. Fulton, A.R.I.B.A., before the Society at a meeting held on Thursday evening, February 24.

Mr. Fulton, who has made an extensive study of this building, dealt in detail with the historical circumstances surrounding its erection. Built in the sixth century A.D., by order of Justinian, to replace the old church which had been destroyed by fire—the cause of which may have been a suggestion from the Emperor himself—it occupied five years ten months from commencement to dedication.

The work of Anthemius of Tralles, the greatest architect the world has ever known, Santa Sophia ranked with the temples of Karnak and the Athenian Parthenon as one of the great pinnacles of architecture.

Spanned by a great dome vieing in beauty with the blue dome of heaven over the Sea of Marmora, the cliffs, flowers and forests of his beloved land of Asia Minor, Anthemius's masterpiece surpassed all previous works, and stands to-day —to quote Mr. James Fergusson—"the most perfect and the most beautiful church which has been erected by any Christian people."

It was the culminating point of ancient art at which for once in the history of art east and west joined hands, a lasting monument to the genius of Anthemius.

Structurally, Santa Sophia, on the authority of M. Auguste Choisy, astonished its contemporaries by its wonderful lightness; to them it appeared, to use their thoroughly Oriental form of admiration, that its dome was suspended in space by an invisible power, so slender were the supports that upheld it. Yet so sound and logical was the construction that with the exception of the four corners which were evidently the weakest points of the building, and had been thrust about 18 inches back from their original positions, the vast system of arches stood to-day apparently sound. Everywhere, both within and without, great piers had been built, and after the Turkish occupation, the four minarets were built in the sixteenth century.

Internally, the acoustics were perfect, and the original arrangements were such as to give appropriate emphasis to the altar. In the words of Professor Aitchison, "As the interior of the Pantheon strikes one as the most sublime building, the exterior of the Parthenon as the most perfect, the exteriors of some of the French cathedrals the most wonderful, the interior of St. Mark's as the most gorgeous, so the interior of St. Sophia strikes one as the vastest building one has seen."

The great beauty and charm of the interior lay, not only in the constructive features, but also in the power and beauty of great horizontal cornices placed at the correct relation to heights and broken only on plan. To the speaker this was the secret of Byzantine design, and nowhere had it been used to greater advantage than in this vast pendentived hall.

Standing at any point in the nave, the eye moved from one vista to another in endless variety. The golden vaulting of the aisles and galleries gave colour and distance, while all the nearer features carried the eye to the great dome crowning all.

The views of the nave from the aisles and galleries were unsurpassed, the columned low-vaulted richness of the aisles contrasting with the seemingly infinite height of the nave.

Analysing the details of the plan, Mr. Fulton explained that the four great stone piers or buttresses measured 67 feet 6 inches by 25 feet 2 inches by 101 feet 8 inches apart from north to south, and not only did they carry the weight of the cross arches, but were also designed to take the thrust of pendentives, supporting dome, and cross connecting arches supporting dome.

The necessary depth of the buttresses allowed for openings to be left forming the north and south aisles; while the thrust of the dome necessitated the buttresses being carried to the height of the base of the dome far above the roofs of aisles, forming features in the elevation which are so charming and logical.

The dome, supported upon forty piers, rose 46 feet 9 inches above the cornice, and internally ribbed ascended to a great circle 37½ feet in diameter. The length of the church exclusive of apse, was 244 feet 6 inches, while its breadth, including aisles, was 228 feet 10½ inches.

Mr. Fulton illustrated his paper by a number of photographs of the building, and a beautiful and interesting series of measured drawings and sketches.

A vote of thanks was accorded Mr. Fulton for his lecture, and a discussion led by the president, Mr. Percy Robinson, F.R.I.B.A., followed.

## SEVENTEENTH CENTURY HOUSES IN NORTHAMPTONSHIRE.[*]

THE early part of the seventeenth century witnessed in England a great change in architectural style. No set of architectural forms has remained unaltered for any great length of time. There has always been a tendency towards change. But during the Gothic period—*i.e.* from about 1100 to 1500—there was a strong family likeness between all the successive forms. The sixteenth century saw the introduction of a fresh strain of blood—the Italian—and the seventeenth century saw the complete domination of architectural treatment by Italian detail. It was in the early years of that century that the foreign forms began to gain the mastery over those handed down by the ancient Gothic traditions: traditions, however, which died hard, and, like the remnants of a conquered race, maintained a precarious existence in remote districts.

Northamptonshire is famous for its spires and its squires; it is, therefore, a matter for no surprise if the churches connected with the former and the houses connected with the latter are worthy of particular attention. As a matter of fact it is a county extremely rich in architectural treasures, and a general history of architecture, both ecclesiastical and domestic, could quite well be illustrated by examples taken only from within its borders. It has many villages. Horace Walpole called it "a clay pudding, stuck full of villages," and there are few of its roads that would not take you in an hour's drive, by the almost obsolete method of horse-drawn vehicles, through four or five of them.

PUBLIC ELEMENTARY SCHOOL AT KONIGSBERG.—Herr Stadtbauinspector PAPENDIECK, Architect.

The county, therefore, is an admirable district in which to study old houses; and it possesses, among others, some fine examples of those of the seventeenth century; and the conditions are rendered all the more favourable by the fact that the native building material is a very excellent stone.

About the period under consideration a number of men, famous in history, had houses within the shire. John Norden, the surveyor, writing in the closing years of the sixteenth century, and finishing his work in 1610, said, "The fertility, salutary air, pleasant prospects, and conveniency of this shire in all things to a generous and noble mind have so allured nobility to plant themselves within the same, that no shire within this realm can answer the like number of noblemen as are seated in those parts." He then goes on to give lists of over fifty men who lived in fine houses. Among them may be mentioned Lord Burghley, at Burghley House; Sir Christopher Hatton, at Kirby and Holdenby; the Lord Mordaunt, at Drayton; Sir Anthony Mildmay, at Apethorpe; the Lord Compton, at Castle Ashby; Sir Edward Montagu, at Boughton; Sir Thomas Tresham, at Rushton; Sir John Spencer, at Althorp; John Brudenell, at Deene; and Edward Cope, at Canons Ashby, whose daughter married a Dryden. But in addition to men with well known names were many others (one in almost every village), squires who housed themselves comfortably and left tangible evidence of the prosperity of the time in the shape of handsome houses.

A great number of these houses have disappeared; some have perished along with the families who built them, others have been replaced by more modern structures. But there are enough remaining, either wholly or in part, to give us a very good idea of the kind of house that was in vogue when James I. occupied the English throne.

There is, for instance, the manor house at Great Addington, typical of many manor houses of the county, simple but picturesque in outline, depending on its gables, its large chimney-stacks and its mullioned windows for its interest; or Pilton manor house, the home of one branch of the Tresham family, placed, as most manor houses were, next to the church and grouping happily with it. The church itself has more than local interest, for here in the year 1630, when the manor house was still comparatively new, were married the parents of John Dryden. Again, there is an old house at Chacombe, in the south-west of the county, called the Priory, which was rebuilt in the eighteenth century, but retains its quaint porch of the seventeenth.

So far there has been little or no evidence of Italian feeling, nothing, indeed, beyond the symmetrical treatment which the study of Italian models fostered. Here we get a touch of Classic detail in the balusters just below the roof of the porch, and in the little obelisks which adorn the busy gable; the gable itself derives its ancestry probably from Dutch sources, either directly through the imitating of Dutch masons, or else indirectly through the study of Dutch books of design. This is a strong probability, but by no means a certainty; for a great deal of the foreign-looking work of this period was designed and wrought by English craftsmen.

Among the smaller houses may also be mentioned one at Hardwyck, built by a Sir Francis Nicholls, whose descendants have long disappeared from their home, but who has left as his memorials the remains of his house, a tomb in the church and a charity. The house has suffered much since it was built as a manor house; it is now a farm-house, whose windows the cocks and hens may approach without presumption, but it retains a quaint circular bay-window, adorned, after the fashion of the times, with the coat of arms of Sir Francis, the builder.

Hardly distinguishable from these houses in point of style, although built nearly fifty years later, is a house at Brockhall, which bears the date 1677. When we remember that at this time Sir Christopher Wren was rebuilding the City churches, and that St. Paul's Cathedral was already designed, and, indeed, begun to be built; when we compare the fully-developed Classic treatment of these buildings with this little farm-house, we can realise how long the old traditions lingered in remote places. The same moral is pointed by the Grammar School at Clipston, partly school, partly master's house, and partly almshouse, built in 1672. The only touch of the later manner is in the central turret, which may be a later addition.

So far the houses we have seen have been the simple efforts of village workmen, the unpretentious vernacular of the country-side. We will now look at some houses of more importance, where design was more consciously studied. The first of these belongs to a very curious group, the outcome of the quaint pedantry which marked the closing years of the

PLANS OF PUBLIC ELEMENTARY SCHOOL AT KONIGSBERG.—Herr Stadtbauinspector Papendieck, Architect.

sixteenth century and the opening of the seventeenth. It was built by Sir Thomas Tresham, of Rushton, a leader of the Catholic party in Elizabeth's reign, and a man who suffered much for his religion. He passed many years in confinement, but emerged from time to time into a restricted freedom, and being a great builder, he seized these opportunities to carry out curious schemes which he had evolved in the weary hours of his imprisonment. One was a triangular lodge in the grounds of his home at Rushton; this embodied the idea of the Trinity, everything being in threes or multiples of three. Another was a small house which he built near another seat of his at Lyveden. This sets forth the Passion of Christ. The building is in the form of a Greek cross, with a great bay at the end of each arm; each side of each arm is of the same length, the body of the plan thus consisting of five equal squares (four arms and the centre). In the frieze of the top cornice is a series of Latin legends, appropriate in their reference to the object of the building. In the frieze of the lower cornice is a series of seven devices emblematic of the Passion, duly recurring. They comprise the cross, the crown of thorns, the ladder, the lantern, swords, spears, the seamless garment and the dice, the money-bag and thirty pieces of silver. Round the base of the building is placed a row of shields which have never been carved, but which, like those on another building of Sir Thomas's, the Market House at Rothwell, may have been intended to contain the arms of his friends. The detail of the windows is in the ordinary manner of the time and district. The cornices are of the most refined Italian profile; there is no building of the period which has their equal in this respect. The front door is "correct." The internal detail is more mixed, but before briefly examining it a sight of the plan will bring the quaintness of the building more vividly before you.

In the interior the subsidiary doors are, many of them, flat pointed, and where they are treated in the more fashionable Classic manner, there is a certain freedom of handling which relieves them of insipidity.

Lyveden was not the chief seat of the Treshams, that was at Rushton; but it was an important place, and the grounds were laid out in a manner almost lordly. Not much of this work is distinguishable at the present day. This building, which you have seen, was not the principal house at Lyveden; it was in the nature of a toy, and lay at some distance from the actual manor house, beyond the ornamental gardens. Behind the chief house, a considerable portion of which still exists, stretches a large grass field, where may be dimly discerned the curved banks and gentle slopes which formed part of the lay-out, now almost obliterated by "Time's fell hand." But at the top of the field there is a long terrace of earth with a prospect mount at each end, and along one side of it runs a narrow sheet of water, part of a large canal or lake. Nearly three centuries of neglect have overwhelmed the design, but this fine terrace, and the straight lengths of water, now black with overhanging bushes, stir the imagination to reconstruct what must once have been a magnificent piece of garden planning.

Lyveden new building was still unfinished when Sir Thomas Tresham died in 1605, and it was never completed, for his eldest son Francis was deeply implicated in Gunpowder Treason, and a few months after his father he too died, in prison, and so cheated the headsman.

The estates were confiscated and the chief seat of the family, Rushton Hall, was involved in the ruin. Lyveden eventually came back to the family, but Rushton passed away for ever, and was purchased by the Cokaynes, Viscounts Cullen, who established themselves there for two centuries. This transference had important architectural consequences, for after a few years the new owners began some very considerable building operations which gave the house its distinctive character. In approaching it, the whole of what is seen (except the south front, which was rebuilt after a fire in the middle of the last century) is Cokayne work. It is only after entering the court-yard that the earlier work is visible. The original house of the Treshams had been built about the beginning of the sixteenth century, and Sir Thomas had done something in the way of alteration and embellishment. It had been built round a court-yard; the Cokaynes lengthened two wings of the court and connected them with a one-storey arcade, or corridor. They also added an attic storey with a balustraded parapet broken at intervals with large dormers. The whole effect is singularly happy, combining stateliness with a pleasant play of fancy. The Cokaynes followed the lines laid down by their predecessors, and whereas Sir Thomas had ornamented his gables with the trefoils of Tresham and the date 1595, they made use of the same detail, but adorned it with the cocks of Cokayne and the dates 1626, 1627, and 1630. And so, standing in the court-yard at Rushton, as the eye wanders from gable to gable, you are reminded of one of the most picturesque events in English history and of the downfall of a once powerful family.

Inside the house there is very little original work left; the only features of our period are the ceiling of the principal staircase and a doorway on the same, the stonework of which is a good example of the Classic manner of the early seventeenth century. It surrounds an oak door which follows the traditional treatment of the preceding hundred years.

One of the daughters of Sir Thomas Tresham had married Sir Thomas Brudenell of Deene, afterwards created Lord Brudenell and Earl of Cardigan, an ancestor of the Lord Cardigan of Balaclava fame. Into her new home she carried from the wreckage of her family possessions at least one interesting relic, a portrait of her father in a gorgeous suit of armour. Her husband lived in a fine house which had been built in the reign of Edward VI. His uncle had done something in the way of embellishment, but he himself did not only this, but a large amount of substantial building. The old house lay in the customary way round a court-yard, entered through a plain, low-browed archway.

Sir Thomas Brudenell built a tower at one end of the front, he added a wing here, rooms there, and gablets in many places. The effect is very picturesque, and the whole house, with its work of different periods, of Edward VI., Elizabeth, and James, of the eighteenth century, and again of the nineteenth, is extremely interesting. That with which we are now concerned, however, is that done by Sir Thomas in the first quarter of the seventeenth century. It is characteristic of its period. It is more substantial, less full of delicate fancy than the earlier work. Heraldry then played an important part in the decoration of houses; it had done so in Elizabeth's time, it did so even more in James's. Sir Thomas Tresham had employed it in all his buildings, and, doubtless, his daughter fostered her husband's taste in the same direction. Sir Thomas Brudenell placed shields of his ancestors' arms round his new tower; his own and his wife's he placed by way of ventilators in a little projecting chamber which he added on one of the fronts. He placed them again on chimney-pieces, and more particularly in his new plaster ceilings, where he endeavoured, within the space at his command, to set forth the principal facts of his ancestry and that of his wife.

Pride of family was a common foible in those days (it is not wholly extinguished in the present), and not a few notable men of the time were declared by their detractors to have invented ancestors, and in one case even to have filled windows with ancestral arms to which they had no shadow of a claim. Fortunately, the respectable people with whom we are now concerned had no such detractors, and the interest which Sir Thomas Brudenell rightly took in heraldry was shared by his brother magnates. Sir Francis Fane, for instance, who married the daughter of Sir Anthony Mildmay, of Apethorpe, filled his ceilings with the alliances of his ancestors when he enlarged his house on coming into possession in right of his wife. The ceilings at Apethorpe are finer than those at Deene, and are, indeed, among the best of that period. One room is largely devoted to Neville heraldry, Sir Francis's mother having been a Neville; another is chiefly concerned with Fane alliances. In both cases the net-work of panels, with their delicately moulded ribs, are thoroughly characteristic of Jacobean work.

*(To be concluded.)*

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* devotes the major portion of its illustrations to the "palace" of Charles Beyerle, Esq., at Cairo, Egypt, a swagger house with plenty of marble and elaborate Italian Renaissance detail, of which Mr. Carlo Prampolini is the architect. The remainder of the illustrations are given to students' work of the Society of Beaux-Arts Architects.

*La Construction Moderne* illustrates an Italian country house, the Villa Rosa, at Collanzone, by M. Alfredo Melani, a not too exuberant "Art Nouveau" design, and the principal buildings of the exhibition at Seattle, Alaska. In the series of articles on Old Paris, the abbey of St. Germain-des-Prés is now described and illustrated.

*Arquitectura y Construccion* gives views of a costly mausoleum in the cemetery at Barcelona for the Rocamora family, by D. Julio Fossas, and the new station at Bilbao of the Bilbao-Santander Railway, of which the architect is D. Severino Achucarro. From France our contemporary illustrates a block of residential flats in the Rue de Labiche, Paris, designed by M. Alex. Fournier.

The *Architectural Review* (Boston, U.S.A.) gives a description with many views of the Hotel Meurice, Paris, of which M. Nenot is the architect, and geometrical drawings and details of St. Paul's Church, Butler, Pa., by Mr. John T. Comes, and the Illinois State monument, in the National Military Park, Vicksburg, Mass., designed by Messrs. Jenney & Mundie.

## Correspondence

*[The Editor will not be responsible for the opinions expressed by Correspondents.]*

### Llandaff Cathedral.

SIR,—I notice the continuation of the interesting article on Llandaff Cathedral by S. Bowen Williams, M.S.A., has been omitted from the last few issues, and I should be glad to know if it is your intention to insert the remainder.—Yours faithfully, G. LL. REES.

Birmingham: Feb. 24, 1910.

[The completion of Mr. Bowen Williams's article will appear as soon as space permits, together with further illustrations of Llandaff Cathedral.—ED.]

### Fonts and Monuments.

SIR,—Your most interesting abstract of a paper on "Fonts and Monuments" is marred by two slips on page 136. (*a*) In first column, last par but one. The bronze figure is not on the tomb of Thomas Beauchamp, Earl of Warwick, who died in 1370 (should be 1369), whose tomb is in the choir of St. Mary's, Warwick, but on that of Richard Beauchamp, Earl of Warwick, who died 1439, whose tomb is in the Beauchamp Chapel. (*b*) In second column, close to end of article. For Thomas Beauchamp read Richard Beauchamp. I hope you are going on with those pictures of Oxford and to follow them with those of Cambridge.—Yours faithfully,

Ilminster: Feb. 27, 1910. R. J. W. DAVISON.

## GENERAL.

THE Bolton Corporation are about to undertake the erection of two new police stations, one in Green Lane and the other in Lever Edge Lane.

THE restoration committee of St. William's College, York, have given instructions to Mr. Temple Moore, the architect, to proceed at once with that part of the building which is to be the Maclagan Memorial Hall for the use of the Lower House of Convocation.

THE Bangor and Beaumaris Board of Guardians have decided unanimously to adopt the report and recommendation of the architect to the Local Government Board as to building a new workhouse infirmary at a cost ranging from 10,000*l*. to 12,000*l*. A committee was appointed to secure a site and select an architect at once.

## THE PROTECTION OF ANCIENT MONUMENTS.

HIS MAJESTY'S Commissioners of Works are empowered by the Ancient Monuments Protection Act, 1882, to accept the guardianship of "any ancient monument to which this Act applies" when constituted guardians by deed under the hand of the owner.

This power of guardianship remains with the Commissioners under the Act of 1882 until revoked by a succeeding owner not bound by the original deed, but the guardianship does not necessarily debar the owner or his successors in title from exercising any of his or their rights in the property of the ancient monument, which they can accordingly sell or otherwise alienate, save that the owner as well as the general public is prohibited from committing any injury or defacement of the monument.

The Act of 1882 also provides that an owner of an ancient monument may by deed or will give, devise, or bequeath to the Commissioners his property in any ancient monument to which the Act applies, and the Commissioners may, if they think fit, accept the property.

The Act of 1882 also permits the Commissioners to purchase for the nation any ancient monument on terms mutually agreed between the owner and themselves. The Commissioners may thus become either guardians only or both owners and guardians of any ancient monument "to which this Act applies."

By this Act, therefore, we have a recognition of the principle that the preservation and protection of ancient monuments is a national affair, and that the nation at large should be prepared to relieve from the cost of maintenance those who for the moment may happen to be the private owners of monuments in which the whole nation has an interest.

At the time that this Act of 1882 was passed it was not, however, recognised that any monument was worthy of national regard that was not so ancient as to be pre-historic, and a schedule of such monuments was appended to the Act as those "to which this Act applies." This schedule gives a list of twenty-nine ancient monuments in England and Wales, twenty-one in Scotland, and eighteen in Ireland, all of which are of the nature of tumuli, barrows, forts, and camps, or early stone monuments of pre-historic date.

The Act provides for an extension of the schedule by giving power to the Crown by an Order in Council to declare that other monuments shall be deemed to be ancient monuments "to which this Act applies," but unfortunately limits the selection to monuments "of a like character" to those in the schedule.

The limitation of the Act of 1882 has, therefore, with the growth of interest in national monuments, led to amendments, the latest of which is expressed in a short Bill, introduced into the present Parliament by Mr. L. Harcourt, the First Commissioner of Works, and read for the second time on Friday last.

An explanatory memorandum is attached to the Bill, which reads:—"Power is given by Section 4 of the Ancient Monuments Protection Act, 1882, for any person to bequeath to the Commissioners of Works any ancient monument to which that Act applies, and to the Commissioners of Works to accept any such bequest, if they think it expedient to do so. The ancient monuments to which the Act of 1882 applies are the monuments described in the schedule to that Act, and any other monuments of a like character indicated from time to time by Order in Council. The monuments described in the schedule to the Act are such that it is impossible to include as monuments to which the Act applies any ruined buildings of historical or architectural interest. Inconvenience has arisen in practice as a consequence of this limitation, and, to remedy this, the Bill extends the provisions of Section 4 of the Act of 1882 to all monuments within the meaning of the Ancient Monuments Protection Act, 1900, that is to say, to any structures, erections, or monuments of historic or architectural interest or any remains thereof."

The Ancient Monuments Protection Act, 1900, to which reference is made in this memorandum, established a further important principle, that ancient monuments worthy of national concern embrace not only prehistoric remains, but any monument that "is a matter of public interest by reason of the historic, traditional, or artistic interest attaching thereto."

The Act of 1900, therefore, makes the great advance that the historic or artistic interest of works of architecture entitles them to the protection afforded to ancient monuments as much as mere archæological or antiquarian interest.

The amending Act of 1900 also extends to the Council of any county some of the powers given to the Commissioners of Works, so that a County Council may also become either guardian or, by purchase, owner of any ancient monument. The ownership or guardianship may also be transferred from a County Council to the Commissioners, or *vice versa* from the Commissioners to a County Council.

It is not necessary under the widened scope of the Act of 1900 that an ancient monument shall be in ruins and even uninhabitable so long as it is not "occupied as a dwelling place by any person other than a person employed as a caretaker thereof, and his family."

The Bill now before Parliament is intended to remedy an oversight in the Act of 1900, which though extending the category of ancient monuments, omitted to give the Commissioners of Works or a County Council power to accept as a bequest by will any monument within the extended category. This, the First Commissioner of Works explained in moving the second reading, placed him in a difficulty with regard to the desire of an owner, nameless for the present, to bequeath to the nation what Mr. Harcourt described as "one of the finest historical monuments in the country."

Curiosity has naturally been aroused by the mystery that at present it is obviously undesirable to remove, and Richmond Castle, Yorkshire, Stonehenge, and Battle Abbey have all been suggested as the monument to which Mr. Harcourt alluded. The list of surmises might easily be enlarged to quite formidable dimensions.

It is gratifying to know that the importance to the nation of a careful preservation of ancient monuments is receiving due consideration, and that there are at present three separate Royal Commissions engaged in inquiry into the question, one Commission being appointed for England, another for Scotland, and the third for Wales. When the labours of these Commissions are completed, we shall expect to be in possession of a complete inventory of those monuments, both prehistoric and historic, that are worthy of being included as ancient monuments for the protection of which the nation should be prepared to undertake the guardianship.

It appears to us that Mr. Harcourt's Bill is capable of a still further improvement.

As the law stands at present the Commissioners of Works may, under the Act of 1882, become owners of a pre-historic monument by gift or purchase from an owner during his lifetime or by bequest at his death.

The Act of 1900 empowers the Commissioners to become owners of a monument not pre-historic either by gift or purchase from an owner during his lifetime, but not by bequest, whilst a County Council may become owner by purchase.

Mr. Harcourt's Bill proposes to allow the Commissioners to accept the bequest of ancient monuments not pre-historic, and they will thus be in a position to become owners by gift, purchase, or bequest of "any structure, erection, or monument of historic or architectural interest or any remains thereof," as well as of pre-historic monuments.

But the County Councils will still remain under the disability that at present fetters the Commissioners of Works, and we would suggest that they also may be empowered to accept bequests or gifts instead of being limited as at present by the Act of 1900 to acquisition by purchase.

Pride in and affection for one's own county are sentiments that are deeply rooted in many Britons of the present day, and there are numerous influences in our modern life that tend to strengthen and develope this spirit of clan. The principle having been adopted that it is desirable that ancient monuments should be protected at the public expense, it seems to us that owners of such monuments should be permitted to give or bequeath them to the representatives of their county as well as to the representatives of the nation.

## NOTES AND COMMENTS.

Although the number of workers in the Students' Sketching and Measuring Club has not been quite so large in February as in January, we are glad to have received fifteen sets of measured drawings, the quality of which is of a very high grade. We hope to give a criticism of the drawings and announce the winner of the monthly prize next week.

Mr. W. H. Lever has made a handsome gift to Liverpool University out of the sum of 91,000*l.* received in damages as the result of the successful libel actions of Messrs. Lever Brothers against various newspapers. The sum of 24,000*l.* is offered by Mr. Lever should the University care to exercise the option they have acquirec of purchasing the old Bluecoat School. If the building is not found suitable, then Mr. Lever will give the money for the erection of a building adjoining the University fo the accommodation of the School of Architecture and its subsidiary, the School of Civic Design. Mr. Lever alsc gives to the University 60,000*l.* worth of shares in the Bromboro' Port Estate Company for the benefit of the School of Civic Design, the School of Tropical Medicine and the School of Russian Studies. As these shares although ultimately expected to become very valuable do not at present pay a dividend, Mr. Lever in the meantime guarantees to pay 3 per cent. on the 60,000*l* for the benefit of these Schools of the University.

The discontent which is felt by many for the proposed plans of the new abattoirs at Belfast has founc expression in a trenchant letter from Mr. Jas. J. Phillips to the *Belfast News-Letter* as a final protest against the scheme that the Belfast Corporation seem bent on carrying into execution. The main objections seem sufficiently serious, first, that the cooling chamber is placec over a brick-built main sewer, 5 feet 3 inches diameter which for some part of its length, if not on the actua site of the abattoirs, has been found defective; second that the meat hall is to be surrounded by the lairages and so continually exposed to the risk of taint anc infection.

At Darlington the architects of the town feel aggrievec because a Mr. Pallister, an official of the Rural Distric Council, has been appointed as architect for an extension of the workhouse for the Board of Guardians, anc a letter of protest has been received and discussed at recent meeting of the Guardians. Although a large minority were in sympathy with the protest, the lette was ordered to lie on the table. We have before repeatedly expressed our opinion on the manner in whicl architectural work is given by local bodies to officials often appointed for quite other duties to which thei whole time is supposed to be devoted. The plea o cheapness which is generally advanced for this procedur is quite fallacious nine times out of ten, and the fees o a properly qualified and independent architect would b covered many times over by the greater economy of th work and the better value for money that would b obtained.

Truro Cathedral has received the peal of ten bells which are now being hung in the Queen Alexandra o north-western tower. Each of the bells bears a Latii inscription quoting the first words of some one of th Canticles, the name of the saint or saints to whom th bell is dedicated, the name of the donor and the date The weight of the bells, together with the names of th donors and price, is as follows:—

No. 1.—6 cwt. 2 qr., children of the diocese, 40*l.* 19*s.*
No. 2.—7 cwt., Mr. J. C. Daubuz, 44*l.* 2*s.*
No. 3.—7 cwt. 3 qr., the late Major Parkyn, 48*l.* 16*s.* 6*d*
No. 4.—8 cwt. 1 qr., Mr. A. P. Nix, 51*l.* 19*s.* 6*d.*
No. 5.—9 cwt. 2 qr., anonymous, 56*l.* 14*s.*
No. 6.—11 cwt. 2 qr., Mrs. Moor (St. Clement's), 72*l.* 9*s*
No. 7.—16 cwt., Mr. and Mrs. John James, 100*l.* 16*s.*
No. 8.—19 cwt., Mr. S. M. Robins, 119*l.* 14*s.*
No. 9.—25 cwt., the Bolitho family, 157*l.* 10*s.*
No. 10.—35 cwt., Mrs. Hawkins, 220*l.* 10*s.*

Sheffield, notorious for its murk and grime, is i hopes of being able by the adoption of the Town Plannin Act to receive a belt of suburbs healthful and health giving, and the members of its Town Council appear t be carefully studying the best means by which thi desideratum can be obtained.

Mr. W. H. Bidlake, M.A., F.R.I.B.A., in a lectur delivered to the Workers' Educational League at Birmingham, on "Birmingham as it Might Be," well expresse what we consider to be the primary considerations of town-planning scheme when he explained that there wer two main systems on which a town might be laid out

There was, first, the "chessboard" system, in which all the streets were set out at right angles each to the other; and, secondly, the "spider's web" system, in which the streets were either radial or concentric. The "chessboard" system had been practised at all times from the earliest ages. The system had one merit, the square blocks suited the natural shape of the buildings. That was all that could be advanced in favour of it; it was mechanical and soulless in the extreme. The "spider's web" system was more in harmony with the natural growth of the town. Moreover, it allowed of a focus which the former system did not. Birmingham itself had developed very much on these lines. But the setting out of a town on rigid radial or concentric lines, with the public buildings in the centre, was only a little less objectionable than the rectangular system. Both were alike artificial, and wanted individual expression. Further, the radial system, if strictly carried out, as some had advocated, gave awkward triangular sites ill-adapted to buildings, and while the straight radial streets gave monotonous and interminable perspective, the perspective of the circular ones was for ever opening out, and yet for ever closed. The ideal, said Mr. Bidlake, was to be found neither in the one system nor the other, but, as was so often the case, in the middle way, for while the principal public buildings and their surrounding squares and places would certainly form the principal focus, the railway station, harbour, and river bridge would assuredly form other foci, and from each radial roads would lead. If, therefore, the main thoroughfares were mostly radial, the filling in of secondary roads should be approximately rectangular to suit the buildings, and, in addition to these, one or more main concentric roads should bind the whole together, while judiciously disposed diagonal roads should here and there unite points of special importance, but above all and beyond all the lay-out should adapt itself to the natural topographical conditions, its roads gently curving here round contour lines or river bend, or there striking out straight across to the plain. Only thus by frankly accepting the bent of the site would the town acquire a natural and individual character. Almost all mediæval towns had developed thus, and it was to this fact that much of their charm was due. Following his enunciation of general principles, Mr. Bidlake dealt in detail with the modifications of Birmingham's plan in a quite reasonable and admirable scheme. This is what we call the practical and sensible exposition of town planning, which is far more valuable in the education of the public than any amount of resolutions and vague generalities.

## CHURCHES AND CLOISTERS IN PORTUGAL.*

In the autumn of last year I paid a visit to Portugal. My tour was rapid and cursory, yet it opened my eyes to the fact that Portugal possesses architectural remains of which we in England know little or nothing.

This is rather surprising when we consider that nationally Portugal is our oldest ally, that the country is comparatively near to our shores, that English trade with it was reciprocal as far back as six centuries ago, and that 100 years ago its armies fought side by side with ours in the Peninsular War. A century and a half ago Henry Fielding the novelist voyaged to Lisbon in search of health, too late to find it, and died there. Between 1792 and 1795 James Murphy published a folio volume with plates illustrating Batalha Abbey. William Beckford, the author of "Vathek," visited the abbeys of Alcobaca and Batalha in 1794 and published an account of his visit, but somehow or other during recent generations Portugal has been more or less overlooked by Englishmen so far as its architecture is concerned.

In 1865 the Hon. Secretary for Foreign Correspondence of the R.I.B.A. communicated to a general meeting some notes in which he said:—"Anything respecting Portuguese architecture must, I think, be acceptable. With the exception of a monograph or so our stock of information is but scant. Gwilt in his Encyclopædia gives a chapter on Spanish and Portuguese architecture, in which the latter is conspicuous as one of our statesmen once expressed himself, by reason of its absence."

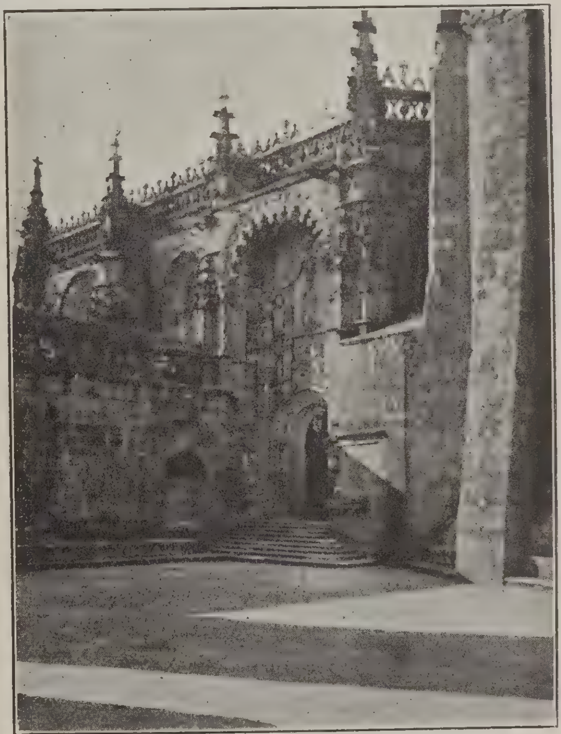
The Secretary had overlooked Gwilt's chapter on "Pointed Architecture," at the end of which he refers to and illustrates the abbey church of Batalha, giving some quite inaccurate information about it.

A later edition by Papworth mentions a few other Portuguese buildings.

Fletcher passes Portugal over without a word, except in connection with Rosslyn Chapel, near Edinburgh, where he says, "Portuguese influence is apparent, for it is very similar in detail to the church of Belem." The latter is however fifty years later.

Fergusson devotes three or four pages to Portugal, and illustrates the south door of Belem as a frontispiece to one of his volumes, and apparently provides Fletcher with the Rosslyn-Belem theory of common origin for both.

I have never seen Rosslyn, although I have made several attempts to do so, but judging from illustrations I can see no analogy between it and Portuguese work except in the overcrowded ornamentation. My impression is that the work at Rosslyn is coarse, whereas Portuguese work is not so. MacGibbon and Ross describe much of the detail at Rosslyn as "rude and debased," and say "no parallel to Rosslyn has, so far as we know, been discovered abroad." I find, however, that Mr. H. W. Brewer, in a paper read before the R.I.B.A. on April 21, 1873, on "The Churches of Brittany (North Coast)" says:—"At Plougasnou there is a church with a small transeptal chapel opening out of the south aisle, which bears so remarkable a resemblance to some portions of Rosslyn Chapel that I am led to believe that it must be by the same architect . . . in fact so great is the similarity that I feel convinced they had some common origin." However, all this is obiter, and let us return to our subject.



SOUTH PORTAL, THOMAR.

As far as my knowledge extends the only English book upon Portuguese architecture is but two years old, by Mr. Walter Crum Watson, architect, of Edinburgh, to which I am indebted for much of the information I am able to lay before you. He also read a paper before the Edinburgh Architectural Association on January 16, 1904, afterwards published in the R.I.B.A. *Journal* for that year.

Mr. Watson in the list of authorities he had consulted mentions only one English book on the subject, namely, Murphy's book already referred to. Murphy's drawings with all their poverty of execution and inaccuracies are wonderfully good for their date. The story of his book is rather interesting. James Murphy was a Dublin architect (born 1760, died 1814). The "Dictionary of National Biography" says he was originally a bricklayer, but his book is written in the language of a well educated man. In the year 1789, at the age of twenty-nine, he was commissioned by the Right Hon. Wm. Conyngham to go to Batalha (which that gentleman had visited in 1783), and to make measured drawings of the abbey. Murphy says he spent thirteen weeks there, and the result was his book, containing twenty-seven large plates, published, he states, at the expense of Conyngham, at a cost of upwards of 1,000*l.*; not a bad record, I think, for a private gentleman of antiquarian tastes 120 years ago, in what we are apt to consider the unenlightened reign of George III.

---

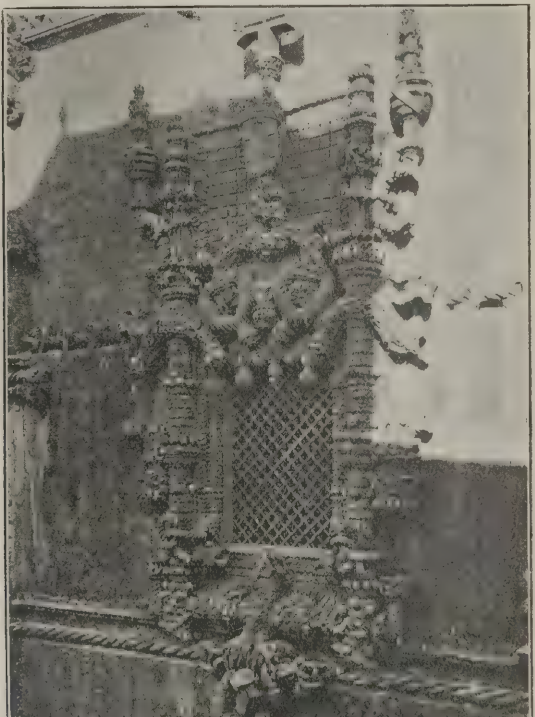
* A paper read before the Northern Architectural Association on March 2, by Mr. Joseph Oswald, F.R.I.B.A.

I am not going to hold up Portuguese architecture to you as an example to be followed, but, however unimportant it may be in the history of our art, to ignore it would be to seal up a chapter in that history, and so I make no apology for asking you to give some attention to it to-night.

We shall find it (when compared with English, French or Italian work) generally clumsy in bulk and outline, and to our eyes impure and unduly florid in details; but on the whole delicate and dexterous in the manipulation of such details. Whether the over-elaboration of detail is due to Moorish tradition or Indian influence has been much discussed. Dr. Carotti in his "History of Art" says:—"In Portugal the development of art was parallel to, though more modest than in Spain. But when, towards the end of the fourteenth century, Portugal made itself politically independent of Spain, a new style of decoration began to arise similar in character, but even richer and more inventive, a true national style. It was in this magnificent style, compact of Gothic and Moorish (the latter element prevailing even more than in Spain) and elements of Italian Renaissance, that was fashioned the fantastic and marvellous monastery of Belem."

We cannot study the architecture of any country or district properly unless we know something of its history. A brief glance at so much of this as leads up to, and is contemporaneous with, our architectural survey will therefore help us on our way. But to begin with we must not forget that Portugal is quite a small country, about 340 miles long and 100 miles wide, its area being about 34,600 square miles, or about two-thirds of the area of England (without Wales or Scotland).

The ubiquitous Romans occupied the country (Lusitania) from 139 B.C. to about 400 A.D. On their withdrawal, Goths and Visigoths from the north overran the peninsula, which was conquered by the Moors in 711, and they were not completely driven out for many centuries after, although revolts against them took place frequently after 997, at which date they ceased to hold the north of the country but retained more or less authority over the extreme south for 300 years afterwards.

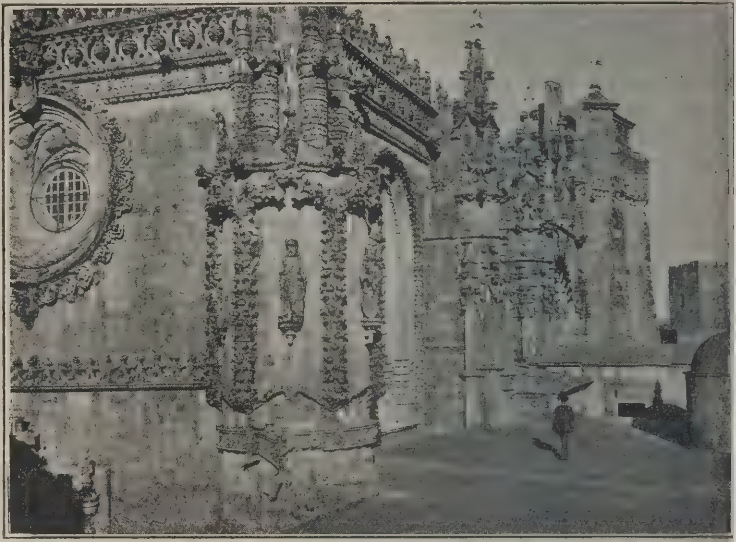


CHAPTER-HOUSE WINDOW, THOMAR.

In 1140 Alfonso Henriques, by the aid of English and other Crusaders, founded the first real kingdom of Portugal, and fighting went on between it and the Moors on one hand, and the adjoining kingdom of Castile on the other, until in 1273 under Alfonso III. (being the fifth king), practically the whole of the present territory was acquired.

This king was succeeded by Diniz in 1279, who contracted in 1294 a commercial treaty with England, then ruled by Edward I. This treaty was reaffirmed in 1353 by our Edward II. Pedro I. (the Great) whose tomb and effigy we shall see at Alcobaca, reigned from 1357 to 1369.

His successor (Ferdinand the Handsome) became involved in war with Castile, which our English John of Gaunt claimed for his wife, who was a daughter of the King of Castile (Pedro the Cruel). Ferdinand's widow assumed the Regency, but her conduct caused a revolution, and John I. (the Great) became king, and assisted by John of Gaunt gained the great victory of Aljubarotto over Castile on August 14, 1385, to the commemoration of which Batalha Abbey owes its existence.



THOMAR, FROM SOUTH-WEST.

The following year (1386) witnessed the marriage of John of Gaunt's daughter, Philippa, to King John I., and of another daughter (the father seems to have been a diplomatic old match maker) to the heir to the throne of Castile. These relationships stopped for the time the rivalry between the two countries. The same year was signed the treaty of Windsor declaring that England and Portugal were united in friendship, and our then King Richard II. created John I. Knight of the Garter, and this distinction has been conferred upon most of the kings of Portugal ever since. The intimate connection between England and Portugal at this time may account for some of the features in Batalha Abbey.

The third son of John I. and Philippa was Henry, called "the Navigator," on account of the encouragement he gave to maritime enterprise by his countrymen, which culminated a century later, during the reign of John II. and Manuel the Fortunate, when Bartholomew Diaz first rounded the Cape in 1486, and Vasco de Gama reached India in 1498, and Brazil was discovered in 1501; Sumatra and China were afterwards reached, and Madagascar and Mauritius explored, bringing untold wealth to Portugal in the reign of Manuel, which lasted from 1495 to 1521, and whose taste for the florid in architecture we shall see exemplified later on in the so-called Manueline style, which appears to be the most distinctively characteristic phase of Portuguese work.

The enormous accession of wealth just referred to unfortunately resulted in corruption in high places, and national decay set in during the reign of John III. between 1521 and 1557.

In the early part of the reign of his successor Sebastian was erected the latest of the examples we shall see to-night (the Renaissance cloister at Thomar), and therefore we will not pursue the historical side of our subject further in detail. Suffice it to say that in 1580, at this very place Thomar, King Philip II. of Spain was crowned King of Portugal, and then followed sixty years of Spanish rule under which Portugal was in subjection to her neighbour, and nearly all her vast possessions in the east were wrested from her, although she retained Brazil. After sixty years she revolted against Spain, but did not recover her independence until 1668, just before which (in 1662) King Charles II. of England married to her sorrow a Portuguese princess, Catherine of Braganza. After her miserable married life and long widowhood she lies at rest in the church of Belem.

Subsequently Portugal was again at war with Spain between 1706 and 1715. This brings us to the eighteenth century, marked by the terrible earthquake at Lisbon in 1755. The early years of the nineteenth century brought the struggle against France, which we call the Peninsular War, after which there were internal dissensions and civil war until 1834.

To a casual visitor like myself the country now seems settled and prosperous, and the population contented.

Although I visited other buildings interesting to architects, I am going to confine myself to-night almost exclusively to the monasteries or convents of Thomar, Alcobaça, Batalha and Belem. The first three all lie within about twenty-five miles of each other, sixty miles north of Lisbon, and 100 miles south of Oporto. The last, Belem, is close to Lisbon.

In 1834 the monasteries in Portugal were suppressed by the Government, but their churches were not desecrated, and are retained as so-called national monuments, well cared for and kept in good condition. The domestic buildings are devoted to secular purposes; at Thomar and Alcobaca they are used as barracks for soldiers, at Belem as a boys' orphanage.

*Thomar.*

Above the plain on which now stands the pleasant little town of Thomar rises a steep hill, on the summit of which and in close contiguity to their fortress the Knights Templars in 1162 began to build their "round" church, consisting of a polygon of sixteen sides, encasing an octagon. This octagon has two tiers of slightly pointed arches, and is surrounded by a barrel vaulted ambulatory. The interior is dimly lit by round-headed windows high up in the external wall of the polygon, which has massive battering buttresses.

In 1319 the Knights Templars had ceased to exist under that name, but were transformed, so to speak, into a new military order, the "Order of Christ." Prince Henry the Navigator was in his time the Grand Master of the Order (1417-60), and he threw out the small eastern chapels and built two cloisters to the north-east of the round church. The eastern cloister is now ruined, but the other "the Cemetery cloister," is in excellent preservation. It has a dado of beautiful glazed tiles, and contains a gruesome sight in a stone tomb in a recess of the southern walk, having a coped top in which is a glass panel, through which you can look down into the tomb and see the mummified corpse of Balthasar de Faria, a great courtier of Philip II. of Spain, instrumental in forcing the Inquisition upon Portugal, and so bitterly detested that, it was said, the earth itself refused to receive or cover his remains.

CLOISTER OF THE PHILIPS, THOMAR.

The Order of Christ increasing in power and wealth, it was decided in 1492, when King Manuel was its Grand Master, to build a larger church.

Instead of tacking this on to the east end of the old round church as was done in England at the Temple Church in London, and at the round churches at Northampton and Cambridge, they here joined their new building on to the west side of the polygon, so that it forms what we would call the nave, but is in fact called the "coro." It is 85 feet long by 30 feet wide inside. The two western sides of the polygon were taken out, and a large pointed arch inserted to open out the polygon towards the new coro, which is of three bays. Of these the two western bays are as to the lower part occupied by the chapter-house, above which is the raised choir, similar to that which we will see later at Belem. At this time also the simplicity of the old round church was considerably interfered with, to suit the taste of the time, by the introduction of crocketted canopy work for statues, also by painting, gilding and pictures, some of which still remain. The fine choir stalls and fittings were unfortunately burnt by the French during the Peninsular War, so that the present aspect of the western limb is bare.

CHURCH OF ST. JOHN BAPTIST, THOMAR.

The general view from the south-west exemplifies the clumsiness of form to which I have referred and shows the extraordinary treatment of the buttresses, especially at the angles of the west front.

The south portal, which occupies the new bay immediately west of the old round church, is a good deal later in date than 1492, when the decision to enlarge the church was come to. It may be that like many architectural schemes we wot of, the execution was long delayed, or it may be that the carving was left till nearly the last, for it is said to be dated 1515, and may be later still by ten years or so. Be that as it may it cannot be denied that the portal is a very fine example of the Manueline style, exhibiting a mixture of Renaissance and Gothic details, but less exuberant than the portals of Belem, which we will come to later. A charming effect is due to the deep shadow cast by the foliated curtain arch thrown across the bay from buttress to buttress. Above the door we see the armillary sphere used by King Manuel as a sort of badge emblematic of the almost world-wide discoveries made in his reign. It appears in every building with which he had to do.

The other great feature of the church is the chapter-house window at the west end. Of this the Portuguese are very proud, but I fear we can only regard it as an extravaganza. The theory has been advanced that the Portuguese architects and sculptors were at that time influenced by the discovery of India having revealed to them the intricacies and elaboration of Indian design and workmanship. Be that as it may, we have here coral branches, ropes, leaves, pinnacles and armillary spheres, carved with wonderful manual dexterity, surmounted by the Cross of the Order, below which is the Royal coat of arms. At the bottom of the composition is the carved head of a man, traditionally that of the sculptor.

The buttresses at the angles of the west front are also elaborately treated in similar fashion to the window; that at the south-west corner has a strap and buckle, said to be that of the English Order of the Garter, of which King Manuel was a Knight. High up in the gable is a round window lighting into the coro above the chapter-house with curious ornamentation, said to represent the sails of ships bound by ropes, indicative of the sea power and prowess of Portugal at that time. A redeeming feature of the design is the plain wall surface in which the windows are set. The whole is built of a warm yellow limestone of charming colour.

In 1524 King John III. changed the Order of Christ from a military order into one of monks, and built for them to the north, south and west of the church a set of five cloisters, with cells, dormitories, and refectory.

In 1557 the south-eastern one (now called the Cloister of the Philips), if ever it had been finished, was pulled down and rebuilt during the next five years in a pure Renaissance style. It is about 115 feet square, with a fine central fountain. It is a very successful composition, well balanced with good details. Unlike our English cloisters it is two storeys in height, and its combination of round and square-headed openings is very happy.

The cloister walks are as dignified, quiet and refined internally as externally.

The other cloisters are more or less ruined, and with the domestic buildings surrounding them are occupied as barracks. Their architecture is not equal to that of the other two cloisters. We have thus traced the history of this remarkable block of buildings for nearly four centuries. Afterwards little change appears to have taken place, except that the bell tower and gable now existing at the east end of the church look as if they were seventeenth-century work.

FOUNTAIN IN CLOISTER, ALCOBACA.

There are two other churches in Thomar. First, St. Mary of the Olives, a little way out of the town. It occupies the site of a church built by the Knights Templars before they built their church on the hill. The architecture looks as if it were of the early part of the thirteenth century, but may be later. The tower is quite detached to the west of the church. Second, St. John Baptist in the town. This is early Manueline work, 1494, with a fine west door, an interesting tower and spire, and a square topped west end.

*(To be concluded.)*

## SEVENTEENTH CENTURY HOUSES IN NORTHAMPTONSHIRE.*

*(Concluded from last week.)*

APETHORPE was already a large house when Sir Francis Fane came into possession. He either enlarged it or remodelled a considerable portion, and his work followed the prevalent style of the district, substantial and simple in its detail, yet withal picturesque. Bay windows help to gi the latter quality, so do stepped and curved gables ar quaint finials outlined against the sky. On the ground flo of his main wing, in which was the new entrance, introduced an open loggia, a feature which he copied fro Italy, as did many of his contemporaries. It is true th the same idea had prevailed in old times in the cloisters monasteries, but it was not suited to our English climat and later owners of these great houses, not being so we adapted to the simple life as were the monks, found the long open arcades chilly, and in most instances, as here Apethorpe, they have been enclosed and converted in dwelling-rooms. In addition to his new buildings, S Francis added parapets and curved gables to the existi walls, thus bringing the whole into harmony and bestowi piquant touches on the old Tudor work, such as may seen in the picturesque corner where the doorway to t original hall stands.

On the upper floor of his new wing, over the open loggi he contrived his long gallery, that characteristic feature every mansion of the time. The length of these galleri was extraordinary in proportion to their width, sometim being over 200 feet to a width of 20 or 25 feet. Here it 108 feet by 20 feet. The question has often been asked, what use were these rooms put? An answer is given at Ap thorpe in the inscription over the fireplace: it was intend for music. But from other sources we gather that lo galleries were often intended for exercise.

The pedantry which marks much of the literature of t period found expression in its architecture also, and S Francis indulged in the prevalent taste for allegories some of his chimney-pieces, which were the ordinary vehic for such fancies. In one room is set forth the union of i compatibles. War with her sword is about to kiss Pea with her olive branch; the lion and the lamb lie in o corner, while in another a child plays with a cockatri This room, as well as others, has a fine ceiling; the mid part is domed, and in the centre of the dome is a handso piece of modelled heraldry, the arms of James I. It w quite customary to place the royal arms, whether of Eliz beth in her time, or of James in his, in some conspicuo place; but here there was a special reason, inasmuch James had stayed in the old house on his way from Scotla in 1603; and during a later visit he had first met Geor Villiers, afterwards to become Duke of Buckingham.

Apethorpe is situated a few miles from Stamford, cl to which is the great house of Burghley, but Burghley its is outside the scope of our present inquiry, having be finished some years before the opening of the seventeen century. It had, however, a notable *dépendance* a mile so away called Wothorpe, a house built by the first E of Exeter, son of the great Lord Burghley. According old Thomas Fuller, he said he built it in order to be o of the dust while his great house of Burghley was a-sweepi but it may more correctly be regarded as the dower-hou the house to which the widow of a dead lord went when son came into possession. There is not much left of t original building, not much beyond the ruins of the centr block with its four towers. The detail here is not so quai and fanciful as in buildings of the former generation. shows a tendency towards the rather harder treatment whi an increasing acquaintance with "correct" architectu brought with it. But it still retains some of the atmosph of romance which envelopes the houses of the early part the century. When complete it must have been a nota building, although a pigmy in comparison with its par house, and it had what most of its contemporaries possessed a fine lay-out with terraces, terraced walls and alcoves. this splendour but little remains, the only substant remnant being a gateway, rather heavy in design, flanked either side by a pair of niches. Still the imagination ne not be very vivid to reconstruct, even if somewhat vague the gay parterres, the straight walks, the quaint statu the arcaded walls and the broad steps leading from o bright garden to another, which once existed.

If Wothorpe fails to create the picture, help may be h at Kirby, the most romantic of all the great houses of th time. The house as a whole must, for the same reas which affect Burghley, be excluded from consideration night; but its north court has two claims upon our atte tion. One is the arcaded wall enclosing it, which supp ments the glimpse of fine garden architecture which we at Wothorpe, and shows us other great archways with th niches. The other is the north front of the house itse An examination of this front reveals a noteworthy change architectural treatment. It is more formal, m "regular"—to use an epithet of the period—and windows are of an entirely new type. They are no longer divided into comparatively small oblongs by stone mullions, but consist of one large opening in which the glass is held by a wood frame. It was only a short step from such wood frames to sliding sashes, and the introduction of the sash window marks the definite change from the old traditions in design, which mingled Gothic ideas and Classic in a fascinating jumble, to the more correct and severe methods which a continuous study of Italian models had at length produced. The reason of the change at Kirby is that the owner, being anxious to bring his house up to date, employed Inigo Jones to impart a more fashionable air to it. Jones did this by introducing a few new windows in the walls of the main court, by refacing and remodelling this north front, and by various embellishments within the house, among which was a new ceiling to the porch, which follows lines entirely different from those adopted at Deene and Apethorpe some fifteen years earlier.

---

* A lecture delivered by Mr. J. Alfred Gotch, F.S.A., F.R.I.B.A., on February 24 at Carpenters' Hall.

There is another house in the county to which Inigo Jones imparted a new character, and that is Castle Ashby, where he added a charming screen, quite Classic in its detail, and contrasting strongly with the somewhat earlier example which we saw at Rushton.

But Inigo Jones opened a new chapter in English architecture, of which we can only read these few lines to-night; however, they serve to show the end towards which all design had been drifting or, if you will, progressing during the early years of the century. This new chapter is a long one and no less interesting than its predecessors, but we must leave it and return for a moment, in conclusion, to the older manner, and to the matter from which Inigo Jones has caused a digression—the surroundings of great houses. Bacon in his essay on gardens shows us how lordly were some of the lay-outs of the time. His verbal description is borne out by such plans and surveys as have come down to us, notably by a plan of Wimbledon House, made in the year 1609, a house of which barely the memory even is locally preserved. It is, of course, impossible to show by photographs how gardens looked in the seventeenth century, but some idea of the spirit which inspired them may be gathered from an old house in the west of the county, Canons Ashby, the home of the Dryden family, of which the poet was a cadet. One of the adjuncts to nearly every house of the time was a courtyard, and this was entered either through a gatehouse, where the porter lived and perhaps the falconer and other outdoor servants, or else through a gateway. Small houses had such charming little entrances as that which still remains in the principal street of Oundle, giving access to some almshouses; and manor houses of intermediate size, such as Winwick, which is given in Norden's list as the home of Thomas Andrews, had gateways of more elaborate design, adorned, as might be expected, with the arms of the owner.

Looking back from the strenuous life which we now live, the early seventeenth century seems full of peaceful years—years when men could fleet the time carelessly, as they did in the golden age. But even to them there was a vast difference between the fever of the town and the repose of the country. Beaumont and Fletcher's "Noble Gentleman," when weary and harassed, yearned for his country home, where "quietly," as he said,

"Free from the clamour of the troubled court
We may enjoy our own green-shadow'd walks."

It was to such green shadow'd walks that such gateways as these gave access, and over them might fitly be written that line of Ovid's which surmounts the doorway of an ancient Northamptonshire hospital:—

"Time flows by, and we grow old with the silent years."

## LLANDAFF CATHEDRAL.*

By S. Bowen Williams, M.S.A.

*(Concluded.)*

THE tower on the north side has replaced an Early English structure, portions of the wall still existing being Early English. The present tower was erected by Jasper Tudor and is Perpendicular in style. The tower is not particularly beautiful, but presents many features worth notice. The buttresses do not reach the top of the tower, and the angle pinnacles of the parapet are therefore not supported by the buttresses as is usually the case. The elaborate parapet immediately catches the eye and strikes one as being too rich for the tower. Yet though this parapet is new it is practically a copy of the original parapet, and so Mr. Pritchard must not be blamed for it. There is a remarkable similarity between this parapet and that on St. John's Church, Cardiff.

One most pleasing feature of this tower is the manner in which the belfry windows are filled with ornamental pierced stonework instead of louvre boards as is usually the case. It is a great pity this practice has not been more frequently followed, for it is a great improvement.

The south-west tower and spire are entirely new and the work of Mr. Pritchard. The original Early English tower fell into ruins and had to be taken down. It is therefore by no means a restoration, and some critics have found fault with it on that score. But any such objection is easily silenced by the striking beauty and appositeness of the new erection. It is the first feature to strike the eye on approaching the cathedral, and nothing more exquisitely *à propos* could be imagined. The tower itself rises to about the same height as the north tower, and then the spire soars to a height of 195 feet. The whole composition is rather French in design, bearing a great resemblance to some spires in Normandy; and yet it harmonises well with the other work, and gives a charming finish to this part of the cathedral. The lower part of the tower is buttressed, and these buttresses terminate in canopies containing images of St. Peter, St. Paul, and Bishop Ollivant. One buttress has a bas-relief of the cathedral cut on one side. Over the roof of the south aisle are seated figures of the four Evangelists, and immediately above the tower changes from the oblong to the square shape. The spire itself, octagonal in form, rises gracefully from a machicolated cornice in a typically French manner. The angles of the spire are crocketted, but in general the work is not over-rich. It is very well proportioned and graceful, and reflects great credit on Mr. Pritchard.

Taken as a whole the composition of the west front balances exceedingly well, and though small is yet one of the most successful and picturesque in the country; and the addition of the spire adds a dignity and beauty which must have been lacking in the original building.

The next feature to be noticed is the chapter-house. It is much altered in appearance from the original. Mr. Pritchard took the liberty of ingeniously transforming the upper storey from a square to an octagon and surmounting it with a pyramidal roof. The effect is certainly striking, and the general appearance of this side of the cathedral is greatly improved by this arrangement, though its legitimacy may be questioned.

There remain the two Norman doorways in the north and south aisles. They are later work than the Norman arch over the presbytery, though they undoubtedly belong to Urban's church. The aisle walls were rebuilt during the Decorated period, and it is most probable that their position was altered. Both doors are richly moulded, and that on the south side has a Greek or Etruscan moulding as a label, very unusual in this style of work.

We have now finished most of the more noticeable features. A visitor might give a glance at the pierced parapet of the aisle walls, which is good work, and at the corbels beneath same, which are of interest as they are sculptured images of the Sovereigns of England from early times down to the present.

In conclusion we may refer to a few of the monuments.

In the Lady chapel there are the tombs of Bishops Coplestone, 1828-49, and William de Braose, who is supposed to have built this chapel.

On the south side of the presbytery is the supposed resting-place of St. Teilo, one of the founders; St. Dubricius is supposed to have been buried on the north side of the presbytery. His effigy is now in the north aisle.

The tomb of Sir David Mathew, standard-bearer of King Edward IV. at Towton, is at the east end of the north aisle.

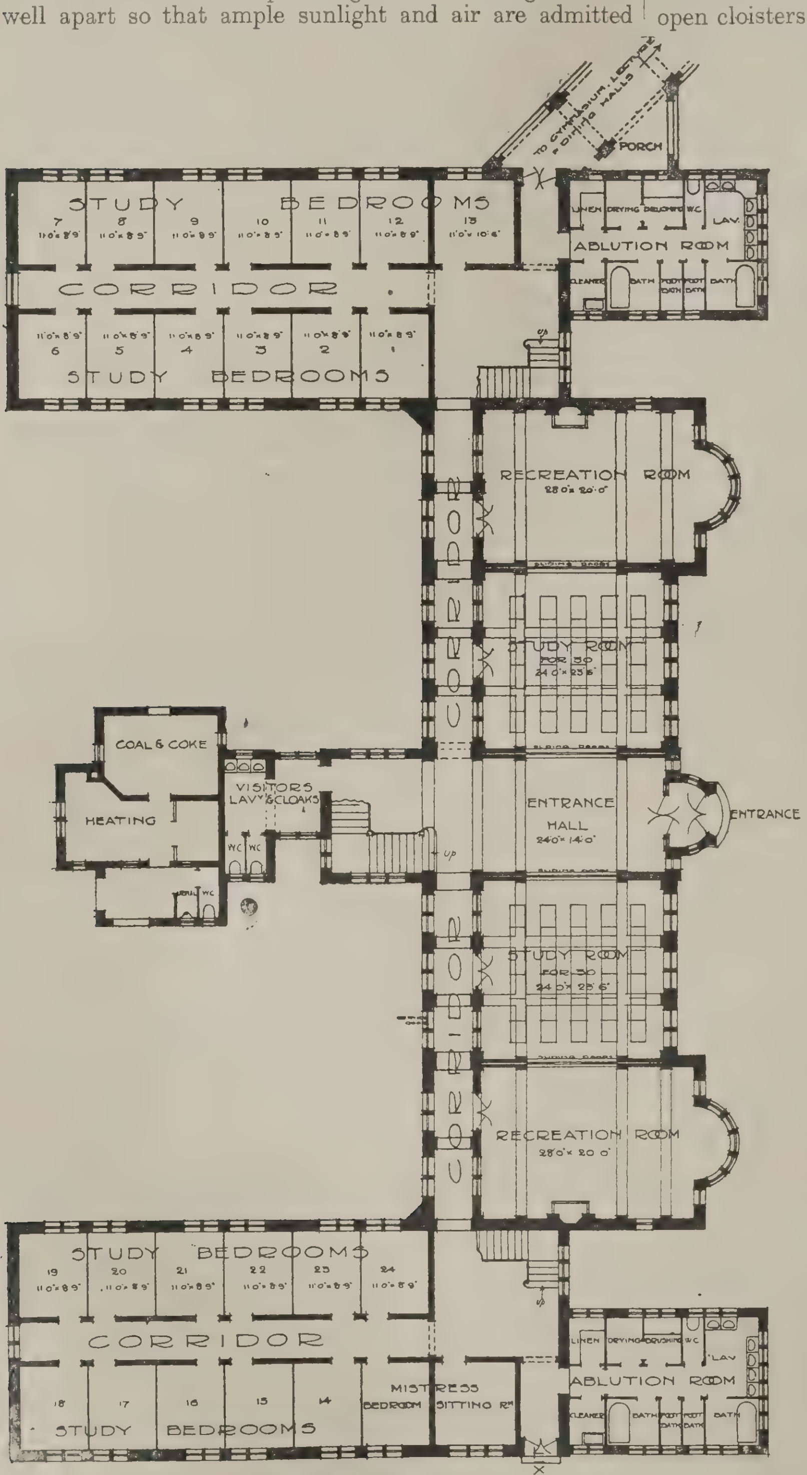
# ILLUSTRATIONS.

### DESIGN FOR TRAINING COLLEGE, HULL.

THE accompanying drawings illustrate the design submitted in competition by Mr. E. STANLEY HALL, M.A., of 54 Bedford Square, W.C., which was one of those commended in our issue of November 5, 1909, for its picturesque grouping of buildings. The design is based upon the tradition of an old university college, varied to suit the general and special requirements of more modern planning. The buildings are set well apart so that ample sunlight and air are admitted on every side; at the same time every block is interconnected by short covered ways. The buildings are grouped round the north, east and west sides of a quadrangle, which measures 250 feet east and west between the buildings. The only entrance to the grounds is through the main gates, which are on the north and south axis of the quadrangle and almost central in the road frontage. The porter's lodge is immediately inside the gates on the left, and his living room is in the angle of the lodge facing them. Immediately beyond the lodge a road runs off to the right to the kitchen block, and is continued round the entire group of buildings back to the porter's lodge. This is the road for all tradesmen's carts, and by it coal carts can deliver directly to the coal stores in each unit. The approach to the quadrangle is by an avenue 200 feet long running directly from the gates along the north and south axis and branching east and west into a circular road to the entrances of the men's hostel on the east, the women's hostel on the west, and the hall and lecture-rooms block on the north. The two hostels are connected with the lecture block by open cloisters running diagonally across the two northern angles of the quadrangle. The refectory and kitchens block and the gymnasium open off these diagonal cloisters, so that there is a sheltered means of communication between all buildings. As was suggested in the instructions, the whole of the northern half of the site has been left open for playing fields. They are shown laid out for three full-size hockey or football grounds, while ample space is left in the middle for the cricket pitch, which would not be played over in the winter months. Four tennis courts are shown on the lawns of the quadrangle, and four more along the north-east boundary of the site. All these courts lie north and south. One fives court is placed against the north-east wall of the gymnasium. The Principal's house is placed in the south-east corner of the site, with its own private garden. His private carriage-drive branches off the outer circular road. From his study window he commands a view of the whole of the college, while the desirable amount of privacy for his household is secured. The buildings were designed to be faced with red hand-made bricks and stone dressings, the roofs covered with brown tiles, and the windows were to be iron casements with leaded lights. The total estimated cost was 39,947*l.* 15*s.*



GROUND PLAN

### HOUSE AT RIPON.

THE site, facing as it does a small natural lake, has to a large extent determined the design, and so an endeavour has been made to design a house which would in no way detract from the surroundings. Between the front and the lake is to be laid out a sunken garden with lily pond connected to the lake. The walls are built of brindle bricks with cherry-red facings; roofs of Broseley tiles. The entrance gates are of wrought iron surmounted, as shown, with the owner's coat of arms. Internally, the design has been treated in a free Georgian manner, the joinery being of English oak. Some small amount of carving has been designed *à la* GRINLING GIBBONS, but this is restricted mainly to the mantels and the staircase newels. The ceilings of the principal ground-floor rooms are in plaster, with ornament in high relief. The architect for the house is Mr. H. STANTON WEBBER, F.S.I., Maidenhead.

### WINDOW IN CHRIST CHURCH, WIMBLEDON.

THIS window, by Mr. HUGH ARNOLD, has recently been placed in Christ Church, Wimbledon. It is a small window in the north aisle, the two outer lights being about three feet high, and the subjects which have been chosen so as to form part of a series illustrating the Life of CHRIST are the Flight into Egypt, CHRIST among the Doctors, and the Baptism in Jordan. The prevailing colour is blue, the use of red being limited to small jewel-like pieces here and there. A coloured full-sized cartoon of the window was shown in the recent exhibition of the Arts and Crafts Society.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, in the premises at Tufton Street, Westminster, Mr. H. Tanner, F.R.I.B.A., president, in the chair.

The Hon. Secretary made the following announcements:—The fifth Spring visit would take place on March 12, to the new King's College Hospital, Denmark Hill, by permission of the architect, Mr. W. A. Pite, members to meet at the building at 3 P.M.

The next meeting of the Camera and Sketching Club was fixed for March 17, when Mr. Alan L. Snow would read a paper entitled "Architectural Books," and a joint meeting with the Art Workers' Guild and the Debating Society on March 11, to discuss a paper by Mr. A. R. Jemmett, entitled "The Study of the Crafts in Relation to the Practice of Architecture."

On Monday and Tuesday, April 18 and 19, the A.A. Play "Arctia" would be performed at the Court Theatre.

Messrs. G. McLean and F. S. Mumford were elected members.

On the motion of the President a hearty vote of thanks was passed to the Royal Institute of British Architects for the nineteenth annual grant of 100*l.* towards the educational work of the Association.

### House List, Session 1910-11.

The President said the following names were put forward by the Council as officers for the next session:—President, Arthur Keen*; vice-presidents, Sir A. Brumwell Thomas,* Gerald C. Horsley*; ordinary members, C. C. Brewer, W. D. Cathcart, F. Dare Clapham,* F. C. Eden, Horace Field,* W. Curtis Green, Herbert A. Hall,* P. W. Lovell, Percy May,* F. Winton Newman,* H. Passmore, C. Wontner Smith,* J. H. Squire, W. J. Tupper, S. J. Tatchell, Stanley Towse; hon. treasurer, Henry Tanner*; hon. secretaries, Edwin Gunn,* G. Leonard Elkington*; hon. librarian, T. W. Watkins; hon. editor *A.A. Journal*, Allen Foxley.

Mr. J. Alfred Gotch, F.R.I.B.A., read a paper, illustrated by lantern views, entitled—

### The Mediæval House.

Young Gamelyn stood at the door of a mediæval house. The house was his brother's, where he had been brought up. Brought up, it is true, but in no manner suitable to his parentage; for his brother withheld from him his heritage, left to him by the knight his father on his death-bed sixteen years before. At that time Gamelyn was too young to take care of himself. He was what would now be called the residuary legatee of his father, and his share was the largest, comprising lands, parks, woods, and two houses, besides all the old knight's horses. All these were kept from him by his brother. He himself was ill-fed and ill-clothed; his property was allowed to go to rack and ruin. His parks were broken, his deer taken away, his houses unroofed, his horses denied him. With the lapse of time, however, Gamelyn began to realise that he was being defrauded of his rights. He had now grown up to be a youth of uncommon strength, and standing one day in the courtyard of the house he pulled his beard thoughtfully and resolved to have matters righted. Just then his brother came near and began to taunt the simple, good-humoured Gamelyn, who hitherto had taken his ill-treatment with the meekness of inexperienced youth. But now Gamelyn fired up and gave back word for word, until the enraged brother ordered his men to fetch staves and beat him. Then Gamelyn gave them a taste of his quality; seizing a pestle that lay near he drove them all "of a heap," while the brother flew into a loft for safety and shut the door fast. A parley ensued, and Gamelyn, whose wrath was soon appeased, explained that he wanted no more than his inheritance, but that he was determined to have. The false brother, on his part, explained that he had intended no harm to Gamelyn in ordering him to be beaten—he merely wished to try his strength; and as for his inheritance, he should certainly have it. The reconciliation was then sealed with a kiss, genuine on the part of the youth, traitorous on that of the brother.

Presently Gamelyn heard of a great wrestling match in which a celebrated champion was taking part. Of course, he went there, vanquished the champion, bore off the prize—the ram and the ring—and, followed by an admiring party of young men, he went home with much joy in the morning. And so young Gamelyn stood before the door of a mediæval house.

Except perhaps for a little postern, the mediæval house had but one door, which gave entrance to a courtyard, on the further side of which lay the hall. The outer wall was high, windowless, inaccessible; Gamelyn must enter through this door or not at all. But his false brother had ordered it to be shut and locked, for he had seen the party approaching, and he was vastly better pleased that Gamelyn should be without than within. The porter in charge of the door, who stood in dread of his lord, had locked the great gate and secured the wicket with a pin.

"Porter, undo the gate," cried Gamelyn, "for many a good man's son stands here!"

"By God's beard," replied the porter, "thou shalt never come into this courtyard, Gamelyn!"

"Thou liest!" answered the vanquisher of the champion; and with that he kicked the wicket so furiously that the pin broke and it flew open.

Then the porter, seeing no help for it, fled across the courtyard. But Gamelyn cried, "Thy labour's lost, for I am as light-footed as thou!" And lost his labour was, and his life too, for Gamelyn overtook him, broke his neck with a single blow, took him by an arm and flung him down the well, seven fathoms deep, of which the open walled mouth, with its windlass and bucket, stood in the courtyard.

The other men in the court were too much in dread of his prowess to interfere; they "drew themselves away," and Gamelyn, returning to the entrance, flung the great gate wide open for all to come in who could walk or ride. An interesting touch this limitation to pedestrians and equestrians, for the gates of nearly all mediæval houses are narrow; there was no occasion to provide for wheeled traffic.

So the crowd of young men came through the gateway into the courtyard. Gamelyn welcomed them heartily. "Yesterday," said he, "I left five tuns of wine in my brother's cellar; not a drop will we leave undrunk. If my brother grumble he shall have St. Mary's curse. He is a niggard, but we will spend what he has spared, and if anyone objects to our being here he shall follow the porter into the draw-well."

Such a threat from so doughty a hero had its effect, and for seven days and seven nights the company made merry, while the false brother lay hid in a little turret—one of those turrets which add so much to the picturesqueness of a mediæval house—and watched the wasting of his substance in cowardly rage.

But on the eighth day the guests departed, in spite of their host's remonstrances, and Gamelyn stood there, friendless and alone. Then came his brother forth from his solar—the parlour of a mediæval house—whither he must have gone from the turret when he saw the coast clear. Finding Gamelyn alone, he plucked up his courage. "Who made you so bold," said he, "as to destroy my store?"

"Brother," replied Gamelyn, "for sixteen years you have enjoyed my inheritance; that will pay for what we have now eaten and drunk."

"Look here," said the wily brother; "I have no heir, brother Gamelyn. By St. John, you shall be my heir!"

"By my faith," replied the other, "if you think as you say, God requite you!"

"But, Gamelyn, one thing I must mention; when you threw the porter down the well I swore in my wrath that you should be bound hand and foot. Do not let me be forsworn. Let me bind you, just to fulfil my vow."

"Brother," said the guileless youth, "you shall not be forsworn for love of me." And so he innocently suffered himself to be bound, and they fastened him to a post in the hall—probably to the framework of the wood screen, which in a mediæval house divided the entrance passage from the hall itself. All who came in saw him, and his brother explained to them that he was mad. For two days and two nights he stood there without meat or drink, and it was borne in upon him that his brother was a villain. At length he found a chance to speak to Adam, the spencer—the butler as we should call him.

"Adam, spencer, I have fasted too long. By the love my father bore you contrive to get the keys and set me free, and I will give you some of my land." But Adam answered, "I have served your brother these sixteen years, and if I let you go out of this bower he will say I am a traitor." "Adam, you will find him a traitor; therefore, brother Adam, set me free and I will give you some of my land." Thereupon Adam consented, and when his lord had gone to bed he found the keys and set Gamelyn free, in good hope of his reward. Then said Gamelyn, "Thank God, now I am free. Could I but eat and drink aright there is none in this house who should bind me again." So Adam the spencer took him quietly into the spence—which was the storeroom or cellar of a mediæval house—and gave him food and wine. When he had eaten his fill, "What do you advise, Adam? Shall I go to my brother and strike his head off?" "Not so," said Adam. "I can show you a trick worth two of that. We are to have a great feast on Sunday, when many abbots and priors and men of holy church will be here. You shall stand as though still bound, and when they have eaten and washed their hands [for they ate with their fingers in a mediæval house] you shall beg them to set you free, which if they do, all will be well and I shall be blameless; but if not, then you shall have a staff and I another—and cursed be he that fails the other!"

---

* Members of present Council.

So it was arranged that should things come to this pass Adam was to give the signal and they both were to fall to.

The Sunday came and the guests with it, and as they came in at the hall door they saw Gamelyn bound. As they sat at meat the false brother told all the harm and shame of Gamelyn that he could invent. At length the youth begged to be given food—it was not well that he should fast while others made merry. The false brother explained to his guests that the man was mad. After a while Gamelyn appealed once more to the great lords that sat in the hall.

"Help to set me free from my bonds!" cried he. But the abbots and the priors only mocked and reviled him. Then Adam gave the signal; Gamelyn slipped off his bonds, and the two of them started cudgelling the whole company. Adam thought no more of his pantry, but stood guard at the hall door, while Gamelyn raged among the men of holy church. The laymen stood by in benevolent neutrality. At Adam's urgent entreaty Gamelyn spared the heads of his enemies, and did no more than break their legs and arms, so that whereas they had ridden to the feast blithely on horseback, they were led from it miserably in carts and wains. The false brother got his share of the cudgelling, and was bound in the cast-off fetters of Gamelyn. Then the two assailants called for water and washed.

Meanwhile the sheriff, who was in the near neighbourhood, heard of the fray and cast about to take the assailants. To him came four-and-twenty young men with offers to bring them prisoners to him; and they hastened to the gate of the house, which they found fast closed and under the care of a new porter. In vain they knocked and demanded admission. The porter carried their message to Gamelyn, who took counsel with Adam upon their desperate plight, with many foemen without and no friends within. Their resolution was soon taken—to have a final fling and then betake themselves to the woods. Armed each with a fresh staff, Gamelyn slipped out through the postern and Adam through the wicket of the great gate. Suddenly attacking the four-and-twenty young men, Gamelyn felled three and Adam two, while the rest fled, followed by the sarcasms of the spencer. But the sheriff was at hand, and, seeing the uselessness of further fighting, they betook themselves to the wood, and left the mediæval house behind them.

With their further adventures, which have to do with the forest and not with the house, we need not concern ourselves. If anyone wishes to follow Gamelyn and Adam into the woods to learn how they fell in with outlaws; how Gamelyn eventually became their king; how a price was set on his head; how his trial was held; how, with his customary masterfulness, he attended the trial; violently ousted the judge from the judgment seat and took it himself; how he finally caused his false brother, the partisan judge, and the twelve complaisant jurymen to be all hanged; how he made his peace with the real King, and was made Chief Justice of the Forest—if anyone wishes to do this he can do it in the pages of Chaucer.

The interest of the tale to us lies in the picture which it incidentally portrays of a mediæval house; how the house had to be planned to resist violent attacks, and how jealously its narrow entrance had to be guarded. We see the courtyard with its well, and wonder perhaps how far the body of the porter with his broken neck rendered its water unpalatable. We see the hall and its screen, with the pantry close at hand; the cellar where Gamelyn replenished his wasted strength; the turret to which his brother fled, the solar from which he emerged to upbraid the headstrong young man. Having thus, with the aid of Chaucer's lively pen, formed a mental image of a mediæval house, let us see how far we can substantiate it from some of the mutilated houses that have come down to us.

The accommodation in a mediæval house was not extensive. We must not take Haddon, for instance, as typical in this respect; it was the home of a very considerable personage, and much above the average in point of size. But imagine Haddon smaller and you get a good idea of a mediæval house. There is the main gatehouse, inaccessible to all but people on foot or horseback; there is the courtyard, and beyond it the hall; there are turrets and towers; there are the screens of the hall giving access to the pantry, the buttery, and the kitchen passage; there are several rooms which might stand for the spence; and the solar, or principal room of the lord, is represented by the quaint panelled parlour.

Stokesay Castle is perhaps nearer to Chaucer's description. The gatehouse, it is true, was rebuilt in Elizabeth's time; but restore the walls which abut against it to their ancient height and you get just such a courtyard—well and all—as that across which Gamelyn chased the porter. The hall, too, is such an one as might have been filled with the abbots and priors and men of holy church, who, full of meat and wine, mocked Gamelyn in his distress, and were so handsomely cudgelled in return. At Stokesay the fire was placed upon a hearth in the middle of the room, as it was likewise at Penshurst; at Haddon, on the other hand, the equally frequent alternative was adopted of placing it in a recessed fireplace with a proper smoke-flue.

Stokesay has no little turrets, but it has a large strong tower, where the false brother might have felt safe. It has, too, an outside staircase, up which he might well have fled to a loft; it has a solar with windows looking into the hall; and at each end of the hall is a room which might have been the spence.

The solar was originally the small private room of the lord—probably, in quite early houses, the only private room of the house; the hall itself being the day-room and night-room of the whole household. It was the germ of the long series of private apartments—bedrooms, dressing-rooms, parlours, drawing-rooms, smoke-rooms—which are now indispensable to a comfortable, well-ordered mansion. In Chaucer's time it had grown into a short series of similar rooms, but they were still few in number. It is clear from his narrative that the false brother slept in some kind of a bedroom, and also that the hall was no longer used as a sleeping-place by the household, inasmuch as Adam was able to liberate Gamelyn, who stood bound in the hall, and to take him secretly to give him food in the spence. But notwithstanding this implied increase in privacy and comfort the house of Chaucer's time would be intolerable to the hardiest of us now, even to the most enthusiastic advocates of the "simple life."

One important room which Chaucer had no occasion to mention, but which was to be found in every mediæval house, was the kitchen. In early times it was second in importance only to the hall; it was connected to the lower end of that apartment, while the solar was usually attached to the upper end. The kitchen was not infrequently built of wood, or of wood and plaster, a mode of construction which was adopted in the majority of houses, and which accounts for their disappearance. It is only a certain proportion of those which were built in stone that have survived.

*(To be concluded.)*

## THE SITE OF THE SAXON CATHEDRAL CHURCH OF WELLS.*

SO many attempts have been made to unravel the architectural history of the cathedral church of Wells, and such conflicting views have been put forth to explain it, that it may seem hopeless now for anyone to get a hearing for an entirely new theory as to its beginnings. Yet I am going to be so bold as to put forth such a theory, and I crave your patience while I unfold it.

In Vol. xix. of the "Proceedings of the Somerset Archæological and Natural History Society" there is printed a paper by Mr. J. T. Irvine, entitled "An attempt to separate and describe in the proper order of their erection the various portions of the fabric of the cathedral church of Wells." In the ground plan which illustrates this paper, Mr. Irvine shows to the south of the transept the outlines of two buildings, the one rectangular, the other octagonal, as projecting from the east side of the cloister into the vicars' old burying ground. The former he elsewhere calls "Stillington's chapel" and states that "the valuable information on the plan respecting" it was "obtained by the kindness of Prebendary D. M. Clerk, from his measurements obtained when he had excavations made in 1850."

The evidence as to the existence of the octagonal building, which was apparently discovered during the same excavations, had always seemed to me so slight, that in 1894, at my representation, the site was again examined through the kindness of the Dean and Chapter. The results are embodied in a paper "On the Lady-chapel by the Cloister of Wells, and the adjacent buildings," by Mr. Edmund Buckle, printed in Vol. xl. of the "Proceedings of the Somerset Archæological and Natural History Society."

---

* A paper read on March 2 by Mr. W. H. St. John Hope, M.A., before the Royal Archæological Institute.

The fragmentary foundations disclosed by the excavations have been ingeniously shown by Mr. Buckle to have belonged to two distinct buildings. One of these was a large cruciform structure, the west wall of which still remains to a considerable height, and formed the Lady-chapel built by Bishop Robert Stillington during the later years of the reign of King Edward IV.

The other building was of a totally different character and of more than one period. The oldest fragment apparently belonged, not to one of octagonal plan, but to the eastern portion of a square-ended structure 15 feet wide and of early date. To this aisles had been added in the thirteenth century. But the most curious feature of these foundations is, that while those of Bishop Stillington's chapel were exactly square with the cloister and cathedral church, the earlier fragments belong to a building which makes with the cloister an angle of twelve degrees.

This obliquely placed building has been conclusively shown by Canon Church to have been identical with the "chapel of the Blessed Mary which is situated on the south side of the greater church of Wells" mentioned in a charter of 1250, and which was apparently enlarged, probably by the addition of the aisles, by members of the Bitton family about 1275, when an altar of St. Nicholas was constructed in it. A chapel of St. Katharine within it is also mentioned in a will of 1392, and her altar was afterwards transferred to the new chapel (see will of 1486). The fragments of the older building showed that the aisles extended as far eastward as the chapel itself, and that it was of three bays, with arches opening into the aisles in the two western bays. The western respond of the south arcade still remains embedded in the cloister wall which formed in later days the west end of the chapel. This wall is believed by Mr. Buckle, and I have no reason for dissenting from his view, to be contemporary with the north porch of the cathedral church, which he assigns to a date circa 1185. The wall contains a large doorway (now blocked) that led into the earlier Lady-chapel, but this doorway is an insertion by Bishop Joscelin after 1220. South of it is a smaller doorway, also now blocked, that led westwards from the cemetery, but this is contemporary with the wall. Mr. Buckle also pertinently argues that since the chapel stands so obliquely with regard to the wall, it must be older than the wall, and that possibly it occupies the site of a chapel of Our Lady which was endowed in the eleventh century by Bishop Giso with a virgate of land in Wootton. "If this is so," Mr. Buckle continues, "the difficulty caused by the oblique position of the chapel vanishes at once; for in that case the chapel is of higher antiquity than the present cathedral, and nothing is known of the direction or even of the exact site of the earlier Saxon church."

Mr. Buckle thinks also that the obliquity of the direction of the chapel is to be accounted for by the existence, parallel with it, of the stone conduit that carries off the overflow from the smaller of the two St. Andrew's wells to the east. Here I must leave Mr. Buckle and revert to my theory of the beginnings of the cathedral church of Wells.

And first let me direct your attention to the Ordnance Survey plan of the city of Wells.

It will at once be seen from this that while the general axis of the city and the trend of its roads and streets is generally some twelve degrees north of east, the cathedral church and the contemporary portions of the cloister and bishop's palace alone stand nearly due east and west. Why church and palace should have been so set is at present immaterial, but it is all important to notice that the general direction of the town and its streets coincides nearly, if not exactly with the obliquity of the older Lady-chapel.

In explanation of this I must revert to the early history of the church of Wells.

A church is believed to have been founded here by Aldhelm, bishop of Sherborne, between 705 and 709. This church, which was collegiate (that is to say, it was served by a college of priests) was made cathedral in 909, when Athelm was consecrated first bishop of Wells.

No mention of the structure of the church occurs until the days of Giso, the fifteenth bishop, consecrated in 1061, who himself says that on taking possession of his new see:—"Seeing that the church of my see was but a middling one and also that four or five clerks were there without a cloister and a frater, I devoted myself of my own free will to the building of them."

Giso accordingly obtained from King Edward the grant of Wedmore, and from Queen Edith lands in Merken and Modesley. He also recovered the vill of Wynesham which had been alienated from the church, and bought other property for the augmentation of the canons and their support. The bishop goes on to say that having compelled his canons to live according to rule:—"I prepared for them a cloister, a frater, and a dorter; and everything which I knew was necessary and fitting for them, according to the manner of my own country (Lorraine) I laudably added."

Giso died in 1088 after ruling the see for twenty-eight years, and was buried in the church which he had ruled, in a recess made in the wall on the north side near the altar, as Dudoc, his predecessor, was buried on the south beside the altar.

It is clear from this that Giso did not rebuild the cathedral church, despite its being "middling"—*mediocrem.*

Giso was succeeded by John of Tours, who in 1090 removed his bishopstool from Wells to Bath as being the more important town, and deprived the canons of part of their revenues.

"The houses also of the canons which the venerable Gyso had built, namely, the frater and the dorter, also a cellar and other necessary offices, with the cloister, having been destroyed, the canons whom Gyso had taught to live by rule and religiously were turned out of doors and driven to live a common life with the people."

So says the "Historiola," but the Canon of Wells adds, apparently without any authority:—"And the site on which they first dwelt he usurped for himself and his successors, and built his episcopal palace there. And although when broken by age he repented of it, he neither repaired the destroyed buildings of the canons nor restored to them the site unjustly taken away."

Of the German Bishop Godfrey, who succeeded John in 1123, nothing particular is recorded, but a charter of Bishop Robert incidentally mentions his having hallowed the church of St. Cuthbert, and endowed the rectory with half a hide of land in North Wootton.

Bishop Robert succeeded Godfrey in 1136, and as Canon Church has pointed out, "set himself at once to the recovery of Wells from the humiliation under which it had been left by the rule of Bishop John of Tours." He removed the provost who had hitherto governed and oppressed the church, and instituted in his stead a dean with a subdean, a precentor and subchanter, a treasurer and a chancellor. The manor of Biddisham was set apart "to repair the church of the blessed Andrew and to buy ornaments for it" ("ad reparandam ecclesiam beati Andreae et ornamenta emenda"). The same charter also tells us of the half-hide in Wootton which Bishop Giso gave with a virgate of land to the chapel of St. Mary.

The "Historiola" contains a very important statement with regard to Bishop Robert. After describing his new building of the church of the blessed Peter at Bath, together with the chapter-house and cloister, the dorter, the frater and the farmery, it continues:—"Moreover it must not be forgotten that the church of Wells was built by his counsel and aid. And so it was, that when the church of Wells was finished by the same lord of Wells, having associated with him three bishops, famous and of good memory, Goscelin of Sarum, Dan Simon of Worcester, and Dan Robert of Hereford, he hallowed and dedicated the same church."

From the dates of the assisting bishops this consecration must have taken place between 1142 and 1148.

What is precisely meant by the statement of the chronicler is a little difficult to understand. In describing Bishop Robert's work on the Bath church he says "cum magnis expensis construi fecit," that is, "he caused it to be built;" but of the Wells church that "suo consilio et auxilio fabricata est."

A fifteenth-century writer on Wells states that Bishop Robert "finished the fabric of the church of Bath begun by John of Tours; dedicated the church of Wells in the presence of Bishop Gocelin of Sarum, Simon of Worcester, and Robert of Hereford; and admirably repaired many ruinous portions of the same church (which were) threatening its destruction in divers places."

In attempting to reconcile these statements (1) that Bishop Robert helped to build anew the church of Wells, and (2) that he only repaired it, we are met with the difficulty that practically no remains of any Norman church have hitherto been met with at Wells, while there is ample proof that the new abbey church of Bath was of quite imposing dimensions. That too escaped rebuilding until the close of the fifteenth century, while Robert's church at Wells, if ever it existed, must have been swept away within fifty years of its building.

The hallowing of it, on the other hand, which is so explicitly recorded, certainly points to some rebuilding or enlargement, and the question is, what was the nature of it?

I should like to suggest that Bishop Robert first repaired the old Saxon church, and at the same time, to make more room for his newly founded chapter, enlarged the church by extending it eastwards. And I should like to feel that the early square end among the fragments excavated east of the present cloister was a remnant of this enlargement. In that case the addition to the old church may have included a new Lady-chapel, and this may be the reason why it alone was kept when the rest of the church was destroyed. But I have no documentary proof of this, and merely submit it as a suggestion.

You will please note, however, that it presupposes one important fact, that the site of the Saxon church is not to be looked for within the area of the present cathedral church, but in the cloister known of old as Palm churchyard, to the west of the obliquely placed foundations laid bare in 1894.

Excavations here are unfortunately impossible owing to the number of graves, in the making of which any foundations were probably destroyed, but a church in this position, somewhat on the original lines of that at Brixworth, which was built in 680, and therefore a little before the first church at Wells, would have sufficed for all the spiritual needs of the place for quite a long time.

I regard the conduit that runs parallel with its line as having been made rather as a drain to carry off storm water from the roofs of a considerable church, than as a means of supplying water to it.

In connection with the position of the Saxon church I should like to call your attention to another fact. In a charter which, though undated, must be earlier than 1160, since it is witnessed inter alios by Ivo the first dean, Bishop Robert recites how "it is well known to the experience of some, that the tumult of the fairs which have hitherto been wont to be held in the same church and in its forecourt (atrium) brings dishonour and injury to the same church, and is particularly burdensome to those ministering in it, by reason of its hindering their devotion and disturbing the quiet of their prayers." "Nevertheless," continues the Bishop, "lest we suffer contrary to the Lord's word the house of prayer to become a den of merchandise, we appoint and firmly ordain that whosoever assembles thither on the three feasts of the Invention of the Holy Cross, the feast of St. Calixtus, and the celebration of St. Andrew to do business, shall perform their business in the broad places of the town . . . and that they in no wise presume to violate the church or the forecourt of the church."

Now it will be noticed that on the west side of the existing cloister, between it and the market place, there is still an irregular shaped area, entirely out of square with the cloister, but with north and south walls having the same general direction as the market place and High Street and almost exactly parallel with the axis of the foundations in the vicars' cemetery. And I submit that we probably have here the site of the very atrium or forecourt referred to in Bishop Robert's charter, and so are able approximately to fix the place of the Saxon church. The forecourt would be conveniently at the head of the market place, and this led quite naturally to the chief church of the city. It is also possible that until Bishop Beckington absorbed the northern half of it, by building there the existing row of shops that formed his nova opera, the market place was as wide as the forecourt east of it; and it is quite easy to suppose that the fairs which were at first held in the market place would overflow in time into the convenient court between it and the church whence they were removed by Bishop Robert.

If this theory as to the position of the Saxon cathedral church be accepted, it clears up some other difficulties.

To mention one, it has always been a puzzle why the present church, if built upon the site of a former one, should be so singularly free from older influences in its plan and from all traces of older materials in its construction.

But if the old church continued standing in the cloister while the new one was rising on another site both these difficulties vanish. There was also nothing to hinder the new church from being laid out with a different axis from the older, as it certainly was, though I am unable to offer any tangible reason for it.

That Bishop Robert had nothing to do with the building of the new church is sufficiently evident on architectural grounds, and Canon Church has demonstrated beyond doubt that it must have been begun by Bishop Reginald FitzJoscelin, who succeeded Robert, after a vacancy of nearly nine years, in 1174.

To Bishop Reginald is certainly due, not only the ground plan, but a very considerable section of the existing building. After his death in 1192 the work probably proceeded, but slowly, under Bishop Savaric, who was largely an absentee. He instituted however the daily mass of Our Lady, and possibly completed the Lady-chapel at the east end of the church, the altar of which is mentioned in 1206-7.

Savaric was succeeded in the bishopric in 1206 by Joscelin. He was in exile from 1206 to 1213, and this fact, as well as a great struggle with Glastonbury as to the independence of the Abbey, which lasted until a final concord in 1219, must practically have stopped all work upon the new church.

The resumption of extensive building operations is perhaps marked by the royal grant in 1220 of sixty great oaks from the Cheddar woods "to make a certain limekiln for the work of the church of Wells."

The new church was hallowed by Bishop Joscelin in 1239, and in a charter of 1242 the bishop speaks of it in terms which show that it was then finished.

That it was so, except probably as regards the upper works, is proved by an act in chapter of July 9, 1243, a year after Joscelin's death, as to the arrangement of the burial-grounds.

To the canons residentiary was assigned the area of the cloister south of the church, beginning at the south door and then southwards, and back again.

No layman or vicar was to be buried among the canons, but the vicars were to be buried "in the cemetery towards the east behind the chapel of the Blessed Mary." That is, in the already existing burial-ground around the Lady-chapel on the east of the cloister.

The lay folk were to be buried "in the cemetery towards the west" and their burials were to begin "beside the elms there planted alongside the place where the jousting ground was wont to be, and so extend themselves towards the west," but no layman was to be buried before the west doors of the church.

The dignitaries might be buried in the nave (which was therefore now finished), if they or their friends so willed it.

This interesting award brings us back again to the question of the site of the earlier church.

It is clear that the lay folks' cemetery before Bishop Joscelin's new west front was also new, since it is directed where burials shall begin, and the site is expressly stated to have adjoined the jousting ground. It cannot therefore be the same as the atrium or forecourt of the old church from which fairs were excluded.

The area of the cloister is also assigned for the first time as a burying-ground, perhaps because it had lately been cleared through the taking down of the old church and any adjoining buildings.

The cemetery behind the Lady-chapel was apparently an old one, which was henceforth to be reserved for the burial of the vicars only.

Concerning the entrances into the present cathedral church Canon Church has reminded me of the important bearing which they have upon the points raised in my paper. The doorways in the west front are not the chief entrances at all, but merely the means of communication with the cemetery. The great north doorway, with its protecting porch, was the entrance for the canons and other officers, all of whom lived on the north side of the church. The main entrance from the city was under the south-west tower, through part of the western alley of the cloister, which in turn was entered through a regular gatehouse from the site of the very atrium referred to above.

Here I think I may end my paper, and it is for the Institute to say whether it is satisfied now that the Saxon church must have stood obliquely across the present cloister, westward of the Lady chapel uncovered in 1894; and also that the existing cathedral church knows no other beginning than that by Bishop Reginald, on a new site, in the third quarter of the twelfth century.

## GLASGOW INSTITUTE OF ARCHITECTS.

THE annual general meeting of the Glasgow Institute of Architects was held last week in the rooms, 39 Elmbank Crescent, Mr. George Bell, F.R.I.B.A., president, in the chair. The secretary submitted the forty-second annual report, from which it appeared that the membership of the Institute now stands: 104 Fellows, 64 Associates, 40 lay and 27 student members, a total of 235. During the past year the Council had frequently under consideration the conditions of competitions, promoted in the Institute's province, which had been found to be unsatisfactory. In these cases representations were made to the promoters for amendment of the conditions, and in several instances the Council was successful in effecting this. The Society of Engineers, London, called the attention of the Council to cases in which architects have employed engineering manufacturers and contractors to do professional work, which they felt to be detrimental to both professions. On the other hand, the Society of Engineers was aware that engineers frequently employed builders and contractors, and they had asked their members to employ properly qualified architects in connection with engineering work in which architectural work is involved. The Council, while approving of the desire to bring about a better understanding between the two professions, pointed out that it was not the practice in this district to employ other than qualified engineers when the nature of the work requires it. A memorial was received from the Stone Carvers' Trade Association, London, pointing out the evils of allowing carving to get into the hands of those who subcontracted it to carvers who tendered lowest, irrespective of the quality of the work, this practice causing scamped work, and making it more difficult for architects to obtain good work than if they dealt with the carver direct. The Council concurred in the views stated in the memorial, and replied expressing sympathy with it. A resolution by the Glasgow Master Brickmakers' Association that it was desirable to have a uniform thickness of brick in the trade was considered, and the standard thickness of three inches suggested by the Association was approved of. The Council for the ensuing year was elected as follows:—Messrs. George Bell, Alex. Skirving, Robert Miller, John B. Wilson, J. J. Burnet, James A. Morris, Henry Mitchell, John Watson, R. D. Sandilands, Neil C. Duff, J. K. Hunter, A. N. Paterson, W. G. Rowan, John Fairweather, Charles R. Mackintosh, Robert Wemyss, Alexander Wingate, and W. J. Blain. A meeting of the newly-elected Council followed, at which the following office bearers for the year were appointed, viz., President, Mr. John B. Wilson, F.R.I.B.A.; vice-presidents, Mr. Alexander Skirving, F.R.I.B.A., and Mr. Alexander N. Paterson, F.R.I.B.A.; auditor, Mr. James M. Monro, F.R.I.B.A.; secretary and treasurer, Mr. C. J. MacLean, writer, 115 St. Vincent Street. The various committees for the year were also appointed.

## "CASTLES IN THE AIR."*

MANY times in this place has been urged the necessity of a thorough knowledge of the possibilities and limitations of the materials to be dealt with by the craftsman. And we should keep this principle before us to-night, in dealing with the craftsman and his "Castles in the Air."

The possibilities and limitations of our nature, both physical and spiritual, must be as interesting as those of lead and timber, and certainly must underlie and affect our understanding of everything else whatsoever. Thus we find that technical qualities will carry us nowhere without thought and feeling.

As Carlyle has said, "The spiritual is the parent and first cause of the practical." The artist must be the high priest, and preach the gospel of beauty through the ritual of material creation, ceaselessly pouring into his work that spiritual grace which shall increase interest in moral qualities, and win us by love of beauty to love one another.

Moral beauty is first manifested in man, and by him to be recorded in matter.

To all who believe in accident or chance, and who deny that all things are subject to inexorable law and order, and are working together for ultimate good, I can only say—fare you well! for to you I must appear a poor, wild visionary, and only arouse your smiles.

Belief in law and order imposes the duty of searching for the good purpose in all phenomena.

Has it not been man's love of beauty and fitness, that is to say, the best that he is capable of seeing, conceiving, and understanding, which has ever acted as his lodestar, to guide him onward and upward? First appealing to his physical nature and leading him to attribute to the gods the noblest bodily functions, then through thought and feeling to still higher conceptions of Deity and beauty.

Often the feeling for beauty is only a sensation devoid of mental activity—drawing us magnetically to follow and investigate its source.

Hence we feel that all we can say or do that will stimulate the thirst for beauty helps towards the development and advancement of mankind.

Continuity, and advance through antagonism, characterise the æsthetic world, as they do the physical.

Life is one perpetual torrent of tears, and looking into the sins of others only adds to the flood.

Shall we then bewail our social conditions? shall we blame governments, or, as some would have us, anathematise the wicked machine, and the still more wicked duke? and repeat the old falsehood that no artist can do good work unless he is happy, and therefore fix our attention on the importance of environment?

Shall we rouse ourselves into passionate antagonism against the many evil influences we see around, and abuse the public (of which we are a part) for their materialism and lack of taste? Countless are the themes we might adopt to excite our resentment. There is nothing easier than to stir up hatred. But be it remembered that the hotter our anger boils, the more incapable we become of seeing and speaking truly. As Marcus Aurelius has said, our anger and impatience often prove much more mischievous than the things about which we are angry or impatient.

The evil monsters grow, as we warm them in our passions; and we think that the world would become a Paradise in a night if only our particular monster were beheaded, or our particular despot crowned. And we go grey by planning social revolutionary schemes. And the material with which we strive to build our temple of perfection is grey; all is grey and gloomy, and all colour is hidden by our tears.

If we would build "Castles in the Air," of such is not our material. Nor will we go to the extreme of the Christian Scientist and argue the non-existence of matter and evil.

For most men the existence of matter and evil is a practical reality, like light and darkness. And we want no metaphysical jugglery to confuse our perception of either.

Law and order, and clear understanding, will alone help us to classify our perceptions, according to their value. It is a mercy that men can never be induced to think alike on great social questions. Progress would be impossible if they could.

It is conflict of opinion that helps us to discover the truth, and makes us tenacious of it when discovered; and, better still, it drives us to examine our foundations, and temper our zeal. So our castles in the air are not to be built out of "isms." Nor will man-made by-laws help us.

Do we then want freedom? In the realms of moral thought and feeling we can only be free in proportion to our obedience to reason, conscience and love. We often hear artists bemoan their lack of freedom; they cry out for liberty, they regard liberty as essential to their full development, and so it is, if what is meant by full development is the expression of their lower nature.

Liberty is needed for vice and mundane things; restraint, control and law for all that is highest and best.

All artists must feel that the grand purpose of their vocation is to increase sensibility. If we were not sensitive, we could not aspire. The insensitive, if such there are, cannot feel their lack of refinement, or conceive their future possibilities. Sensibility makes us smart when we disobey law and order. It is the intensity of feeling that drives us onwards and upwards. The condition of painless luxuriance and ease weakens and debilitates. So it is clearly the artist's function to help men to see, and to feel that suffering is the parent of all virtue.

We are moved by compassion, pained by our own sympathy, and immediately forced to loving help by it. We suffer through lies and deception, and so are we driven to seek truth. We suffer through ignorance, and labour to know. Out of sorrow and sighing we must build, until we reach a higher plane where we can follow all virtue for love alone.

Belief in the good purpose of suffering is ennobling, as it leads us to search for law and harmony, and strengthens our optimism. Whereas the denial of good purpose behind our pain allows our resentment to kindle into blinding anger. And while resentful we cannot be producing beauty of any kind. Countless petty annoyances, if we will look into them, remind us that it is our attitude of mind towards what we regard as evil that makes it a blessing or a curse to ourselves.

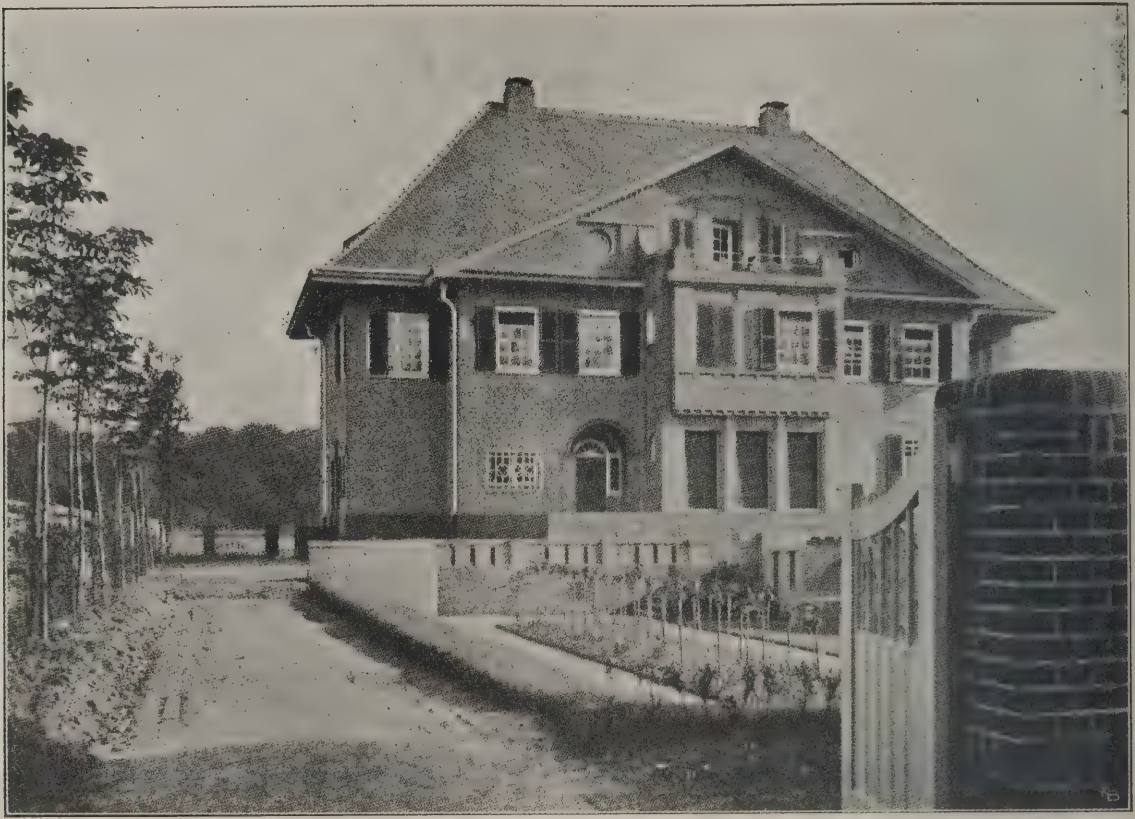
The more fearlessly we peer into things and search out their moral purpose, the more we shall be convinced that all pain is a blessing in disguise, that we cannot spare a moment of our suffering. Remember we are speaking of our troubles as they affect ourselves, not at all of other people's sufferings. It is very necessary to keep this distinction clear in our minds, lest we undermine our compassion and our desire to help our brother workers. This anxiety to seek for good possibilities will help us to adapt ourselves to new and strange conditions and inventions, and to impress the idea that æsthetic qualities can be, and must be, given to all we do, even though our medium is as unkind as the machine or as forbidding as ferro-concrete.

---

* A lecture delivered by Mr. C. F. A. Voysey on March 2 at Carpenters' Hall, London Wall, E.C.

## MODERN EUROPEAN ARCHITECTURE.

### GERMANY.



[From *Dekorative Kunst.*

A BRICK HOUSE FOR HERR WALTHER von SCHEVEN, AT CREFELD.—Herr August Biebricher, Architect.

Has ever any craftsman derived pleasure from any piece of his work without having done battle with difficulty of some sort? And is it not that very battle which has heightened his joy in the final triumph, and is his consolation in the hour of defeat? Do not all healthy minds welcome a difficulty, and are not difficulties members of the same family as those we call troubles?

We climb from strength to strength through battling with obstacles of every sort, by trying to see the beauty and benefit to be derived from them, and not by dwelling on the ugliness and pain alone. It is more helpful to be led to see a good purpose in pain than to be assisted in running away from it.

The craftsman feels he has to exercise his mind and moral sense until he has completely mastered his lower nature. He begins by training his hand. Do we not say of any fine work, we can see the master's hand in it? And do we not mean by that that we feel the mind of the artist has completely mastered, controlled and directed his hand? And that state of mastery, we all know, is mental law and order, imposing itself on the lower physical powers. In one word, obedience makes us free. Freedom of hand is the direct outcome of obedience and resignation—when hand says to mind, "Thy will be done."

Towards the building of our castle in the air, have we not, at last, got one stone—or call it one condition—the subjection of the physical to the mental, the elevation of mind over matter?

We are so dominated by matter, our bodies are so hard to get away from, that the building of our castles does not seem to flourish, and we are fearful that being of the spirit, they can have no practical use at all. Sometimes we are so contented and happy, our struggling is being done for us by countless societies and political parties; we really ought to be smiling all day long, so many wrongs are being set right for us. But we are a discontented lot. We still feel the lawlessness within, and our castle in the air will not get built. The party I am working for wants the wrong sort of service. My ideas are not understood nor appreciated, and how can I create any palace, hampered and hemmed in by the wicked wills of other men? So we may go on, counting up our excuses, and explaining the delay in our building. And no one is satisfied therewith. Then we remember we are the high priests of beauty, and beauty must be sought and found. If our material is mundane and sordid, we must not throw up our birthright; as castle builders we must not lose heart because our task is difficult. Have we not just acknowledged that the difficulties of our work are the measure of our successes? I deny that there is any work needed to be done in this world which necessitates the silencing of the moral sense or the stoppage of thought, the two universal, everlasting faculties, fidelity to which gives power, and which power is often called genius.

Thought and feeling, then, must be the mortar with which we bed and bond-in every stone of our castles in the air.

The province of art workers is not so much to symbolise what is lovely for the entertainment and enjoyment of man, as to win his heart to seek what is lovable.

The study of history teaches us that there is no finality in the culture of the human mind. So the ploughmen of to-day may be the dukes of to-morrow. Thus all mankind, from the least unto the greatest, are equally charged with the duty of self-culture and castle building; and we need to be ever mindful that the moral aspect of art is for our own culture and an example to others, rather than as a weapon wherewith to drive them. Beauty is to be held up for admiration and never forced down our throats.

In forming your judgment of the value of any work, you instinctively inquire into its moral worth. Does it appeal to your higher or lower nature? Does it appeal to your spirit, or to your flesh? And to what extent does it awaken your kindly and benevolent feelings? In making or creating anything, your first impulse is spiritual, that is, mental and moral; whether your impulse be benevolent or otherwise will determine your work's worth. You build your castle out of pure crystal thought, and colour it with love. And so may you foster and cherish your love of beauty.

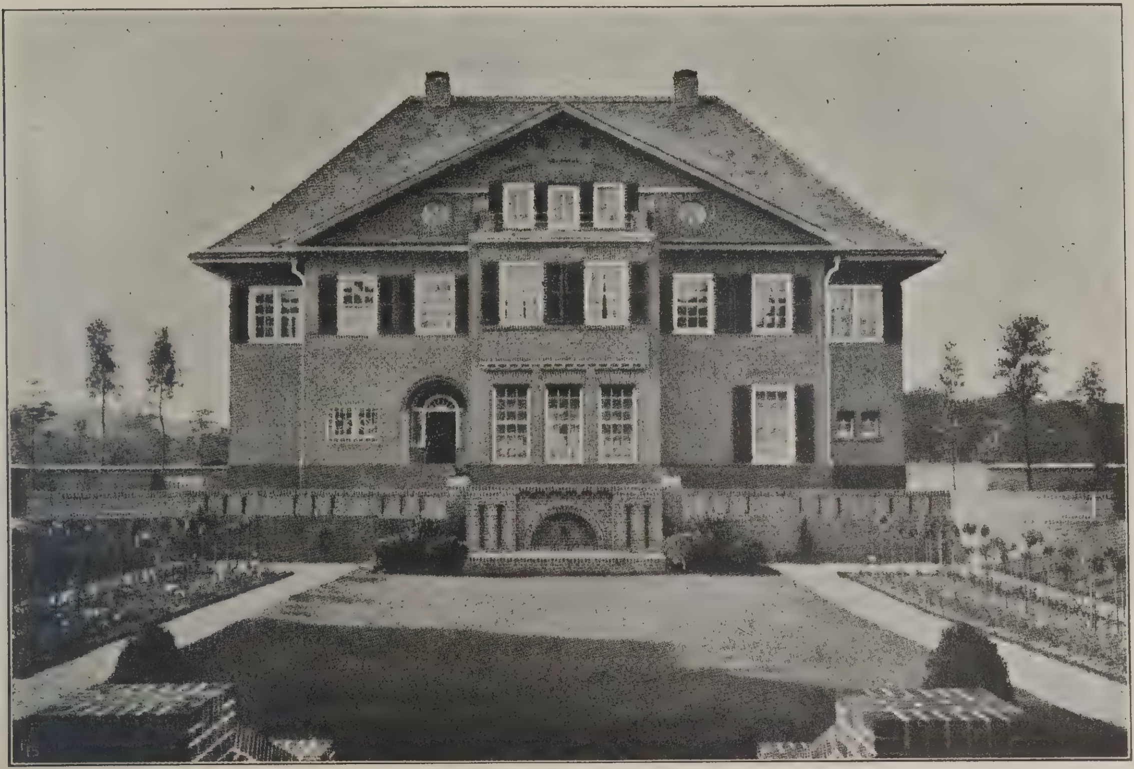
And this purely spiritual love of beauty may be as surely transmitted as the love of drink.

One man will express it in poetry, one in prose, one in music, one in crafts, and so on through all industry. Whatever be your tools matters little.

Carlyle said, "Rightly viewed, no meanest object is insignificant; all objects are as windows through which the philosophic eye looks into infinitude itself." And again,

## MODERN EUROPEAN ARCHITECTURE.

### GERMANY.



[From *Dekorative Kunst.*

A BRICK HOUSE FOR HERR WALTHER von SCHEVEN, AT CREFELD.—Herr August Biebricher, Architect.

"All visible things are emblems; what thou seest is not there on its own account; strictly taken, is not there at all: matter exists only spiritually and to represent some idea and body it forth." In less ornamental language we may say, matter is merely the vehicle of thought and feeling, and only that particular part of things is worth fighting for. The most perfect material in the world is useless to us without the force of human will. We cannot, any one of us, make a beautiful world. But each one may build himself a beautiful castle, and in so doing cultivate that love of beauty that shall colour all his conduct, and in the course of ages make the world more beautiful.

We must keep up the longing for beauty, in all its forms, that is the best the human mind can imagine.

The desire must precede the acquisition; so let us build on, adding little by little to our castles in the air.

Being of the spirit, they occupy no space, and cannot be in anyone's way. We can blame no man for their defects; we can pull down, and rebuild, as improved ideas suggest themselves to us. We feel like creators, dealing with the infinite. We need no money for such building, for as Carlyle says, "Thus from poverty does the strong educe nobler wealth." We may use our work to refine and quicken our faculties, to purify character, not to please. Pleasure is only a consequence of right action and goodness. When pleasure is sought as an end in itself, it is poison. Emerson has said that "as soon as beauty is sought not for religion and love, but for pleasure, it degrades the seeker."

One of the most perplexing of questions is that one often asked by young craftsmen, "Ought we to do what is asked for, what is said to give pleasure, although we know it is bad?" And we may interpret the difficulty of the question to mean that we cannot be the guide of other men's conscience. Each must answer the question for himself. He who will make the biggest sacrifice for conscience sake proves, at least, the honesty of his belief, and sets a good example. What we can do, and ought to do, is to encourage each other to be strong.

Never appeal to each other's fear as a motive for action. Fear is a cruel taskmaster, and a destroyer of our sense of beauty.

If to please were the sole aim of all art, and happiness the aim of life, we should not feel any necessity for greater sensibility, because greater sensibility certainly involves greater pain and suffering. So it would seem we are not sent here to be happy, but to learn in what real happiness consists, and what it involves, and to be a blessing to each other.

We find that when people are bent on amusement and thoroughly abandoned to sensuous pleasure, their sense of beauty becomes dulled and materialistic, and they ask for nothing beyond fitness to material ends. Fitness we believe to be the true basis of all beauty. But the card-player, among others, stops there, and does not mind how ugly the card-backs are as long as they fulfil all practical requirements.

The pursuit of pleasure and the craving for ease are closely allied and lead to a materialistic state of mind that is not stimulating to a sense of beauty.

The fear of the ballot-box makes the councillor satisfied with the safe, hall-marked architecture, although vermiculated, that is, pitted all over to imitate worm casts, as if man's highest aspirations were to find expression in the imitation of the lowest orders of creation. This "ornamentosity" of architecture is like verbosity in literature, a poisonous excrescence.

But this is a digression. What I wished to do was not to denounce and scold, but to praise and encourage those forces we all have in common—those moral qualities which are as old as the hills, and more permanent, more stable than any matter. Matter for ever is changing; but the moral qualities are the materials with which the mind of man is for ever building, and beautifying his character and the world. And these qualities bring forth good fruit, under every conceivable condition, and in every country.

The most inspiring instances of the noblest powers of man have been seen in backwoods and amid squalor.

These same moral qualities are the most precious building materials, and the only ones of any use for our castles in the air. I think I hear the practical man ejaculate, "But they will not boil the pot!" Friend, if you think so, tell me what pot will boil without them. It is a grand world that is peopled with minds possessed of so many points of view. We help to keep each other from going to extremes.

My innings, to-night, is but a passing moment; time is behind me, preparing to cut down all folly and falsehood. Only what is true, and therefore beautiful, can survive its action.

But we are so impatient, we want to clear away all falsehood at once, to set everybody in order, according to our own ideas. And that is why we commend castle building. It is an antidote to impatience, and to the undue interference with others; its influence is gentle and persuasive, not violent or angry. We have to be looking everywhere for the beautiful and true materials. Every particle of our castle must be of the best. And in course of time we shall go to that storehouse of precious stones for the building of our earthly homes. Then "not a hut we build but will be the visible embodiment of a thought, and will bear visible record of invisible things. And in a transcendental sense, symbolical as well as real."

If we believe in the supremacy of law and order, then we have a bed-rock to build upon. It is the artist's business to discover what makes for law and order; what harmony means, and what are the possibilities and limitations of our materials and conditions, and to respect those possibilities and limitations as parts of the Divine plan.

We grow in strength as we recognise and obey Nature's law and order, and endeavour to harmonise our work with it.

And, on the other hand, the more lawless we become, the faster human laws accumulate, so much anarchy, so much grandmotherly legislation, and so many tyrannical schools of art.

Many will say we are trespassing; that the province of the artist is with material appearances; that he had better stick to his tools. But is this not carrying specialisation too far? Do you not, in so doing, make man into a machine, and rob him of the only source of heavenly light possible to mortals?

(*To be concluded.*)

## ARCHITECTS' BENEVOLENT SOCIETY.

THE annual general meeting of the subscribers and donors to the above Society was held on Tuesday, the 8th inst., in the rooms of the Royal Institute of British Architects. Mr. Ernest George, A.R.A. (the President) was in the chair.

The Council, in submitting their sixtieth annual report, have to express regret that during the year under review, while the list of subscribers has suffered severely from the death of old members, only two new names have become enrolled among the members, viz., Mr. H. C. Corlette and Mr. Percy W. Lovell, while Mr. William Glover has doubled his annual subscription.

In the relief of cases 1,136*l.* 18*s.* 6*d.* has been disbursed, including 270*l.* paid to pensioners. The number of applications in which help was given amounted to ninety.

The income account shows excess of expenditure over income of 54*l.* 0*s.* 2*d.* The demands on this account were largely relieved by a special grant of 25*l.* from the Royal Institute of British Architects, by a special subscription of 20*l.* from Mr. H. Beswick (in addition to his usual subscription of 2*l.* 2*s.*), and by the sum of 47*l.* 2*s.* 8*d.* recovered from the income-tax authorities, being the rebate on two years' income.

The capital account has been increased by three bequests: Mr. J. W. Penfold, 100*l.*; Mr. Joseph Parkinson, 50*l.*; and Mr. N. S. Joseph, 25*l.* In addition to these sums the following donations have been received: Mr. John T. Christopher, 105*l.*; Mr. J. Macvicar Anderson, 10*l.* 10*s.*; Mr. Arthur Ashbridge, 10*l.* 10*s.*; Mr. J. Borrowman, 10*l.* 10*s.*; Mr. John Belcher, 10*l.*; Mr. Ernest George, 5*l.* 5*s.*; Mr. W. Hilton Nash, 5*l.* 5*s.*; Sir Lawrence Alma-Tadema, 5*l.* 5*s.*; Mr. W. H. Lever, 5*l.*; and some smaller amounts. Most of the above donors have from time to time made handsome contributions to the capital as well as being liberal annual subscribers.

In consequence of this addition to the capital the Council were enabled to increase the Society's investments by the purchase of 200*l.* Queensland 3 per Cent. Inscribed stock at a cost of 171*l.* 16*s.*, and 200*l.* New Zealand 3 per Cent. Inscribed stock at a cost of 175*l.* 16*s.*

Instead of meeting on undefined dates as hitherto, the Council have decided to meet on the second Tuesday in the months of February, May, July, October, and December, as well as before the annual general meeting in the second week in March, when applications will be considered and other business transacted.

In view of the diminution in the number of subscribers the Council would urge upon members to use their influence, on behalf of the Society, with all architects in active practice. As the aims and objects of the Society are, by advertisement and other means, brought prominently before the architectural profession repeatedly during the year, it is felt that the expense incurred in seeking further publicity would not be justified by the results. But it is essential, if the necessitous cases which come before the Council are to be adequately dealt with, that an effort should be made to secure the practical support of all architects who are in a position to contribute to the needs of their poorer brethren or to those whom they have left insufficiently provided for.

The following, being the five senior members, retire by rotation from the Council: Mr. Lacy W. Ridge, Mr. J. T. Christopher, Mr. J. Douglass Mathews, Mr. William Dunn, and Mr. Henry T. Hare. To fill the vacancies caused by these retirements the Council have the pleasure to nominate Sir Brumwell Thomas, Mr. Walter Cave, Mr. F. W. Hunt, Mr. Reginald St. A. Roumieu, and Mr. Lewis Solomon.

The thanks of the Society are due to the proprietors of the *Builder*, the *Architect*, and the *British Architect* for granting space for free advertisements in their respective journals.

The Council also desire to thank the Royal Institute of British Architects, both for generous contributions and for office accommodation, as well as the staff of the Institute for their willing assistance in all matters connected with the Society.

A vote of thanks to the retiring members of Council was proposed by Mr. H. L. Florence and seconded by Mr. C. H. Brodie.

In proposing the election of Council for 1910-11, Mr. J. Macvicar Anderson said that if each member of the Council would do his best to impress on his architectural friends the importance of the Benevolent Society much good must result. In the past this obligation and pleasure to further the interests of the Society had not been carried out properly. The motion was seconded, and the following were elected on the Council: President, the President of the R.I.B.A.; Vice-Presidents, Messrs. William Glover and Thomas M. Rickman; Council, Messrs. Benjamin Ingelow, Henry Lovegrove, Rowland Plumbe, William Woodward, the President of the Society of Architects, G. E. Bond, Arthur Ashbridge, Charles J. Blomfield, John Borrowman, C. R. Baker King, Sir Charles A. Nicholson, Bart., Sir Brumwell Thomas, Walter Cave, F. W. Hunt, Reginald St. A. Roumieu, and Lewis Solomon.

Mr. E. T. Hall moved a vote of thanks to Mr. W. Hilton Nash (the Hon. Treasurer) and proposed his re-election. Mr. Henry T. Hare moved a vote of thanks to Mr. Percivall Currey (the Hon. Secretary) and proposed his re-election. This was carried in both cases.

Votes of thanks were passed to Mr. H. P. Burke Downing and Mr. A. Saxon Snell for their services as the retiring auditors. Mr. A. Saxon Snell and Mr. C. H. Brodie were elected auditors.

In conclusion, a vote of thanks was passed to the R.I.B.A. for the use of the rooms, and to Mr. Ernest George, A.R.A., the Chairman.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* (New York) devotes itself to the illustration of the Shelby County Court House, Memphis, Tennessee, a fine pure Classic building designed by Messrs. Hall & Rogers.

*La Construction Moderne* (Paris) gives several views and a block plan of the Drouhet hospital at Cholon, Cochin-China, of which M. Josse is the architect.

*Der Architekt* (Vienna) illustrates a competition design for the town theatre at Brüx, by Herr Marcell Kammerer; a "new-art" project for a block of business offices at Brünn, by Herr Heinrich Ried; another for the Laibach Credit Bank at Laibach, by Herr Franz Krasny; a study for a water tower by Herr Rudolf Perco; a charming old interior courtyard at Linz, and two of Mr. Baillie Scott's designs.

*Berliner Architekturvelt* (Berlin) makes its current number practically a monograph on a remarkable venture of Messrs. Keller & Reimer, who have changed a flat dwelling in the Potsdamer Strasse into a show house of the latest things in German "new art," as applied to internal decoration and furnishing. Professor Bruno Schmitz has designed and carried out the entrance, vestibule and grand reception room on the ground floor, and numerous artists, architects, painters and sculptors have co-operated in the design of internal architecture and furniture for the various rooms. Thus we have here collected the work of the representative most modern German artists in the sphere of internal domestic architecture.

*Engineering Record* (New York) contains an interesting and useful account of a series of tests of concrete columns made under building conditions, the columns being of three types, plain concrete, longitudinally reinforced, without and with spiral hooping in addition. These tests were made by H. C. Berry, Assistant Professor of Materials of Construction in the University of Pennsylvania.

THE Newport Corporation are considering the expenditure of 17,255*l.* on alterations, &c., at their electricity works, and of 14,000*l.* on the extension of mains.

## FORTHCOMING EVENTS.

*Friday, March* 18.

Architectural Association : Paper on "Filippo Brunelleschi and the Renaissance," by Professor Beresford Pite (Nomination of Officers).

Leicester and Leicestershire Society of Architects : Paper on "Influence of Classic Revival in Leicester," by Mr. A. Herbert, A.R.I.B.A.

*Monday, March* 21.

Institute of Sanitary Engineers : Discussion on The Housing and Town Planning Act, to be opened by Mr. P. M. Fraser, A.R.I.B.A.

*Wednesday, March* 23.

Edinburgh Architectural Association : Paper on "Plaster Decoration—principally Handwork," by Mr. Thomas Beattie, sculptor.

Carpenters' Company : Paper on "Coloured Reliefs and Mosaic," by Mr. R. Anning Bell, R.W.S.

*Thursday, March* 24.

Architectural Association : Camera and Sketching Club Excursion to Warwick till March 28.

## "THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

ALTHOUGH the number of those joining in the work of the club for February is not quite so large as for January, we are very pleased to recognise that a general high standard of excellence is reached and we have had some difficulty in deciding upon the best work contributed. As a guide to our members in the future, we may define the principal points that weigh with us in the consideration of the merits of the several sets of measured drawings that we receive. These are: judgment in selection of subject, importance and magnitude of the work measured, thoroughness of the study, and finally draughtsmanship.

Judgment in selection is shown by preference for work that is good and excellent in design, for old work varied in this quite as much as modern work. Doubtless much of the bad design of the past has vanished because it was allied with jerry-building, or at least poor construction, for these faults are by no means confined to modern times. Although the present existence of buildings erected centuries ago usually connotes good construction, sufficient evidence has remained to our own day to prove that in the Middle Ages men did not always build well.

On the other hand, good construction then, as now, has not infrequently been accompanied by poor design, and students must be careful to remember that because a building is old it is not necessarily excellent architecture or worthy of study. Naturally a student in his early days is not to be expected to possess an unerring judgment, but as one side of his training he should endeavour to improve his critical faculty and ask himself before starting to measure any old building or piece of detail whether it is good in design. In this way he will form the habit of recognising and appreciating excellence and of detecting and condemning inferiority. One golden rule should be observed by every student whilst his judgment and taste are in process of development—never to devote valuable time to the study of that which is merely odd and eccentric.

Although, as we have said, we take into consideration the importance and magnitude of the work measured by our students, we give more credit to thoroughness. It is far better to make a thorough and careful study of a door or a window than an incomplete measurement of a cathedral. One very general omission in the drawings sent in for our first measured subject is that of diagonal measurements. It should never be assumed that an old building is rectangular either as a whole or in parts. There may be, and often are, irregularities due either to accident, or intention. Nothing, therefore, should be taken for granted. The same care should be given to determining the centres of circular curves. Mediæval arches often have their centres above or below the apparent springing. Centres of circles, whether in the arches or in tracery, can always be found by measuring two or more chords and the rise of the curve on a perpendicular from the centre point of the chords.

Another important point in the measuring of old work is the careful and complete study of the mouldings. These should always be measured and plotted full size on the spot, so that they may be recorded with the utmost accuracy of which the student is capable. When finished drawings are made, if full sizes are for any reason of space considered undesirable, mouldings should not be drawn larger than one-third full size, and often one-quarter is preferable. Half full size should be rigorously avoided as it tends to create wrong impressions. When mouldings of any piece of detail are drawn out they should all be to the same scale, otherwise it is almost impossible to judge of their correlation, which it is most important to understand. In any satisfying piece of architecture there must be harmony between the mouldings of its several parts. Arch-moulds, caps and bases must not be considered as separate and distinct entities, but as closely related parts of one organic whole. Only thus can harmony of feeling be preserved in design.

As regards draughtsmanship it must be remembered that a measured drawing is a diagram of architectural work as it is, not a picture of it as it looks. Accuracy and clearness of expression with completeness of record are, therefore, far more important than effectiveness of representation. A sketch is a memorandum of a thing either as it is or as it looks; a measured drawing should be a working drawing and the record of the means by which the effect of a particular piece of architectural design is obtained. Precision and completeness are therefore essential.

Whilst we are pleased to welcome amongst our February students several new workers, we regret that some of those who sent drawings in January have not again contributed, and particularly we miss the names of some of those who did excellent work at the first essay.

It is with the object of encouraging continuity and perseverance that we offer a studentship, as well as a monthly prize, and the winning of the studentship may be the reward of an aggregate of good work, although this may not necessarily be fortunate enough to win a single monthly prize.

Following our former procedure, we give our criticisms on the drawings submitted in a sequence that does not imply the order of merit.

"Kingdom" sends an interesting set of drawings, well executed, of the chancel and apse of the church at

Leuchars, Fifeshire, a rich example of Late Norman work, the character of which would agree with the date that the author gives us of the time, 1187 A.D., at which a record remains of the existence of a church. This, however, is not the thirteenth century. The seventeenth century tower which now exists is not shown by the draughtsman, who instead has "restored" the old roof. The plans are not figured, although it is advisable on measured drawings that the dimensions should be given. The mouldings are sensibly drawn one-quarter full size.

Mr. Harry Collings contributes a measured drawing of the south door at the church of St. Peter, Thurgarton, Notts, a well-chosen and well-drawn example, with the joints, as they should be, carefully shown. Figured dimensions also are given, so that Mr. Collings has in several respects done the right thing. He has, however, made a mistake in drawing some of the mouldings half full size and some full size on the same sheet. In the design the composition of the arch mouldings with a counterchange in the orders is worthy of note. The treatment of the caps is peculiar and inferior to the more usual method of grouping each order of the arch with its individual support.

Mr. Kenneth A. Cockrill has measured the two middle bays of the east walk of the cloisters at Norwich Cathedral and has made a commendably careful study of the vaulting and its construction. The bosses, however, should not be indicated in such work by simple circles, but by the form of the stones of which they are constructed, failing the accurate representation of their carving. Mr. Cockrill's delineation of mouldings is not sufficiently careful and accurate, whilst his drawing of the tracery is also somewhat wanting in precision.

Mr. Bernard J. Mendham has drawn the east window of the church of St. Giles, Sheldon, Warwickshire, built in 1291. The window is in five lights and is a good example of the Decorated period as it had developed at the end of the thirteenth century. Mr. Mendham has erred in drawing some mouldings one-quarter and some one-half full size, whilst his section of the arch moulding does not appear to us to be quite accurate.

Mr. Stanley E. Minns contributes two sheets of well-executed drawings of the doorway in the south transept of Beverley Minster, Yorks., but he has not fully shown the jointing.

"Nelson" illustrates one bay of the north aisle of the parish church of Mold, North Wales; but as this is Perpendicular work it can hardly be considered of thirteenth century date. The author should avoid back lining in measured drawings and must aim at accuracy and precision in draughtsmanship rather than the false effectiveness that back lining produces.

Mr. Charles T. Whiteley has measured the doorway in the north aisle of Bolton Priory, Yorkshire, and his drawings have the merit of figured dimensions and careful measurement of jointing with good drawing, except in the mouldings, which to one-quarter full size are not sufficiently accurate.

"Sans Peur" has drawn the south porch of the church of the Holy Cross, Ryton-on-Tyne, a somewhat peculiar example of Early English work. The drawing is well executed and the jointing fully shown, but no dimensions are figured.

Mr. Reginald Pywell sends good drawings of the retro-choir at St. Saviour's Cathedral, Southwark, commendably figured, save that no diagonals are given, and with the mouldings full size.

"Esek" gives us an excellent drawing of the lower part of the west front of Bolton Abbey, Yorkshire, with some full-size mouldings, but not a sufficiently complete series.

Mr. H. A. Welch has measured and drawn the west doorway of the church of St. John, Kirkburton, Yorkshire, a not very remarkable subject and scarcely worth the trouble of study. Mr. Welch makes the mistake of drawing mouldings half full size.

Mr. F. D. Browne and "Ambo" have improved upon the work they sent in January, but "Tyke" and "Precentor" have yet to learn that carefulness and cleanliness are amongst the first essentials of an architectural draughtsman.

We have awarded the prize for February to Mr. Reginald Pywell, and consider that in point of excellence his work is very closely approached by that of Messrs. K. A. Cockrill, H. Collings, F. M. Craik, B. J. Mendham, S. E. Minns, C. T. Whiteley, "Esek," and "Sans Peur."

With the purpose of giving our students an opportunity for work during the Easter holidays, we have extended the date for sending in their drawings for the March subject to Thursday, March 31.

We also make the preliminary announcement that the subject for June will be an example of woodwork, executed during the fourteenth or fifteenth century, in an ecclesiastical building erected in Great Britain or Ireland.

## NOTES AND COMMENTS.

The Building Committee of the Welsh National Museum met the assessors at the office of Mr. E. T. Hall on Thursday in last week, when the unanimous decision of the assessors was presented in their report to the Building Committee, who in turn unanimously adopted it for recommendation to the Council at the meeting which we understand is to be held to-day.

The long-delayed application of the gift of the late Mr. Usher of 100,000*l.* "to provide a hall that should be a centre of attraction to musical artists and performers and to the citizens of Edinburgh and others who may desire to hear good music," and for the purpose of "promoting and extending the cultivation of and taste for music," appears now to be on the point of fruition, for at a meeting of the Lord Provost's Committee of Edinburgh Town Council on Wednesday in last week it was resolved—

> That the magistrates and council proceed forthwith with the erection of a new hall under the late Mr. Usher's gift, to contain seating accommodation for 3,500 persons, including the orchestra, on the site belonging to the corporation between Castle Terrace and Lothian Road, extended to include the site of the Lothian Road School and the tenement properties between the corporation property and the Lyceum Theatre.
>
> Remit to the committee to negotiate for and acquire the school from the School Board, and the remaining tenement property, and to apply for powers of acquisition in the Provisional Order about to be promoted by the corporation.
>
> That, in consideration of the redemption price being applied wholly in or towards the execution of the corporation statutory powers in connection with the hall and site, the magistrates and council resolve and agree to redeem the 102,900*l.* of Edinburgh Corporation 2½ per cent. stock (redeemable at par after 1927) held by them on behalf of the account for Mr. Usher's donation, at a total price of 101,613*l.* 15*s.*, being the price originally paid to the corporation for the same; and upon such redemption, to cancel and extinguish the amount of stock so redeemed.
>
> That the total sum to be expended on the acquisition of the site (exclusive of the existing Synod Hall) shall not exceed 40,000*l.*; and that the estimated cost of the erection and completion of the new hall and its adjuncts shall not exceed 70,000*l.*, but the contractors' offers, when obtained, to be submitted to the magistrates and council for approval and acceptance.
>
> That the plans of the new hall and offices shall be obtained by open competition; and that Sir Aston Webb, R.A., London, shall be the assessor to adjudicate upon the plans submitted, with Mr. James A. Williamson, city superintendent of works, associated with him. Remit to the committee to adjust the conditions of competition, and the premiums to be paid.

The Departmental Committee appointed to consider the question of materials and construction of school buildings has led to sundry questions in Parliament suggestive of an enlarged scope of the reference to the committee.

Mr. Charles Bathurst inquired of the President of the Board of Education whether the terms of reference to the recently appointed Departmental Committee on school buildings were intended to include the consideration of what was the best type of building for an elementary school and what was the best internal arrangement of classrooms, cloak-rooms, and offices, bearing in mind not merely present convenience, but also the possibility of future extension; and, if not, whether, in view of the differences of opinion amongst school architects and their occasional lack of foresight in these matters, resulting in increased expenditure on the part of local education authorities, he would specifically widen the terms of reference so as to include this consideration?

---

The President of the Board of Education replied:—"I purposely restricted the reference to the Departmental Committee to materials and methods of construction in order that this small committee might be able to deal with the matter expeditiously. I think it would not be at all in the interests of local education authorities that I should extend the reference so as to include the whole question of school planning, which is very complicated. As regards school architects, I am disposed rather to welcome than to discourage differences of opinion, and in the interests of progress, which involves a certain amount of experiment, I should be very reluctant to prescribe any type or types of school building as the best."

---

Sir John Rolleston asked whether, in regard to the Departmental Committee lately appointed to inquire into the cost of public buildings for schools, &c., he will consider the advisability of adding to the Committee the names of one member each of the Councils of the Royal Institute of British Architects, the Surveyors' Institution, and the Institution of Civil Engineers?

---

Mr. Runciman replied that he purposely restricted the membership of the Committee in order that it might be able to report quickly. It is not intended to be a committee of experts who could authoritatively recommend particular materials or methods of construction for adoption by local education authorities. The practical question which lies behind their reference is whether the Board of Education can properly modify their building regulations and entertain or encourage proposals from the local education authorities who are primarily responsible for school buildings for the adoption of new materials and methods, and if that question is decided in the affirmative, what further arrangements are necessary to give effect to the decision? He thinks a small committee of administrative officers collecting the best expert opinion on the subject, which he hopes will be placed at their disposal by the great bodies named in the question, is the best body to deal with the matter from the point of view which he had indicated.

---

Lord Claud Hamilton asked the First Commissioner of Works last week whether he would consider the expediency of removing the painted wood boarding which had for so many years disfigured the stone screen facing the entrance to the Admiralty in Whitehall; and whether he could hold out any hopes of the completion of the towers of the Home Office in Whitehall in accordance with the design of the architect?

---

Mr. Harcourt replied that he would consider the first matter, but the cost would be considerable, and he was not prepared at the moment to incur it. He much regrets that financial exigencies will not permit him to undertake the completion of the towers at present.

---

The awakening interest of the public in town planning no doubt led Mr. Ponsonby to inquire of the Lord Advocate whether any scheme of developing the residential quarter of the naval base at Rosyth on garden city lines is to be undertaken by the Scottish Local Government Board.

---

Mr. Ure, in reply, stated that he understands the Admiralty are proposing that a certain area of their property at Rosyth should be developed on garden city lines. A conference has been held between the representatives of the Admiralty and the Scottish Local Government Board in order that the Admiralty may be advised as to the best means by which the scheme can be carried out.

## CHURCHES AND CLOISTERS IN PORTUGAL.*

*(Continued from last week.)*

### *Alcobaça.*

Between 1150 and 1160 was commenced the erection of the church and monastery of Alcobaça by the first real King Alfonso Henriques, in fulfilment of a vow that he would found such an establishment if successful in an attack upon Santarem, a city held by the Moors, about twenty-five miles away. The church is distinctly French Romanesque in character. It is the largest church in Portugal, internally 365 feet long by 72 feet wide by 155 feet across the transepts and 68 feet high over nearly the whole of its area.

Comparing this with Durham Cathedral, I find Alcobaça to be almost exactly nine-tenths of the size of Durham (exclusive of the Galilee chapel).

The nave has no less than thirteen bays with north and south aisles. The transept has an aisle on the west side and chapels on the east side. The choir has one bay. Then comes the apse with its ambulatory and series of surrounding chapels beyond. The whole church, except the chapels, is of the same height, 68 feet, so that there is no triforium or clerestory, the lighting being by windows high up in the aisle walls, the transept ends, and west gable and apse. There is a little chapel on the west side of the south transept to which I will refer later.

Being built for the Cistercian Order, the church is exceedingly plain in its design and details, as was enjoined by St. Bernard, the founder of that Order. The buildings were in progress more than sixty years, the monks taking possession of the conventual buildings in 1223. The monastery was very rich, and is said to have accommodated 999 monks.

ALJUBAROTTO.

A horrible reredos and other rococo fittings at the east end were put in during the seventeenth or eighteenth century, probably at the same time as the west end was rebuilt, as we see it in the Jesuitical Classic garb it now presents. Only the great west doorway is left to indicate what once was.

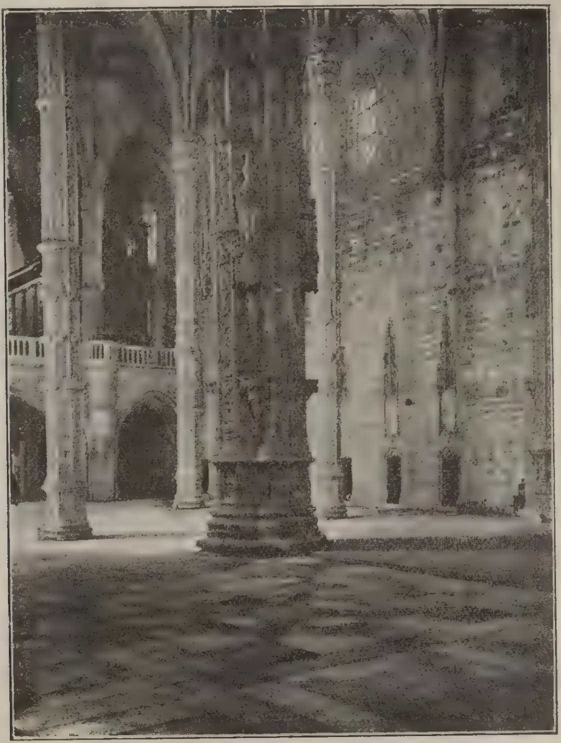
Entering the church through such a façade, one almost gasps with astonishment to find oneself inside what is practically an early French interior of the large dimensions and stern detail and proportions I have before referred to.

I have already mentioned the little chapel to the west of the south transept. This is a mortuary chapel, probably built about 1310, and contains many tombs of interest, including that of Queen Beatrice, who died in 1279; but it has clearly been second-hand and made for someone a century and a half earlier.

---

* A paper read before the Northern Architectural Association on March 2, by Mr. Joseph Oswald, F.R.I.B.A.

The most interesting tombs are those of Pedro I., who died 1367, and of his beloved mistress and post-mortem queen Inez de Castro, who was murdered twelve years previously, placed not side by side as usual, but foot to foot by order of the king, so that his first sight at the Resurrection might be his beloved Inez face to face. Their romantic story is too long to be told here.



BELEM—INTERIOR, LOOKING WEST.

The delicate and beautiful details of these tombs are quite French in character, and, alas! sadly damaged by the French soldiers in 1810, who broke them open and scattered their contents. The stone is local, very like Caen stone, soft when quarried and easily carved, but hardens by exposure to the atmosphere.

There are beautiful figures of angels supporting the effigies, dogs at the feet, &c.

The great cloister to the north of the church was begun in 1310, as an inscription tells. In the centre of the north side projects an apsidal building with two tiers of windows, quite French in character and looking more like thirteenth century than fourteenth century work. This is the lavatory or fountain house. The remainder of the cloister exhibits a mixture of trefoil-pointed segmental and trammelled arches, with something like plate tracery in the tympana of the lower storey. The upper storey was added in 1518 in the Manueline style. The fountain has some lovely Renaissance detail round the basin.

The door leading to the sacristy from behind the apse is a late Manueline insertion, and reminds us of some of the work we saw at Thomar and shall see elsewhere later. The plain wall surface in which it is set acts as a foil to its richness and has the dado of blue and white glazed tiles which occur at so many places in Portugal. In the north of Portugal (Oporto and neighbourhood) many modern houses are completely faced externally with glazed tiles. The domestic buildings are very extensive and are now used as barracks.

### *Belem.*

Belem (*i.e.* Bethlehem) is now a suburb of Lisbon, about four miles down the river Tagus from the centre of the city. Not far from the river stands the great monastery of the Order of St. Jerome (hence called "Jeronymos"), commenced by King Manuel in 1500 as a thankoffering for the safe return during the previous year of Vasco de Gama after his successful voyage to India and back.

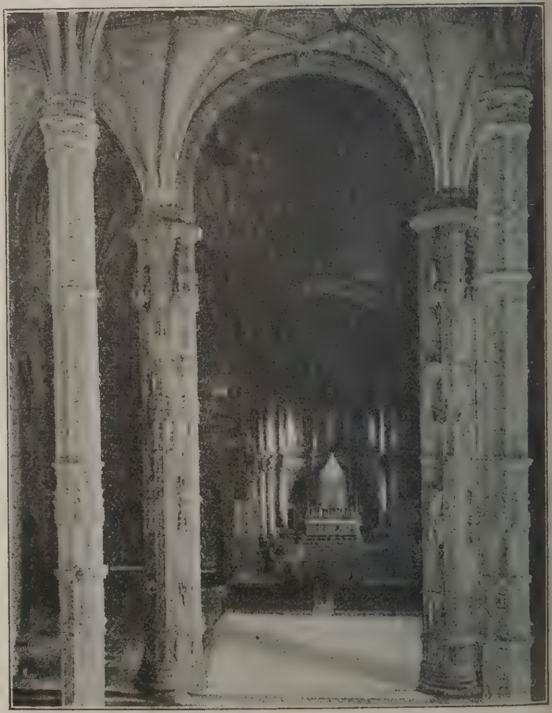
The plan is cruciform. The nave is of four bays and has north and south aisles of equal height with the nave itself. At the west end of the aisles are oblong towers, and the space between these towers, together with the westernmost bay of the nave, is divided in height into two storeys, the upper one forming the coro like that already described at Thomar, but in this case retaining its stalls and organ.

The nave and its aisles from the west wall of the church to the transept is 165 feet long by 77 feet wide and at least 80 feet high. The spacious transept measures 95 feet by 65 feet, and rises higher than the nave and its aisles owing to the greater span of the vault, which is said to be the largest attempted since the days of imperial Rome. It is remarkable that it should have withstood the great earthquake of 1755, especially as its western edge is supported on columns and two only of these. From the ends of the transept project narrower rectangular chapels, and to the east is the chancel, which is later than the rest of the building, the previous one said to have been pulled down almost as soon as built and replaced by the present poor Classic design in 1551.

Externally the church is not at all impressive. The petty little cupola on the south-west tower is quite modern. The great features are the south and west portals. The south door is characteristic of the Manueline style, and may be compared with that we have already seen at Thomar, though it lacks, I think, the latter's refinement. This is perhaps partly due to the stone here being of a coarser nature, and therefore not lending itself to such delicacy of detail. The portal is divided into two doorways by a column which supports a statue said by some to be Prince Henry the Navigator, by others Vasco de Gama. Right and left are twelve Apostles; above the door the Blessed Virgin Mary, to whom the church is dedicated, and twelve other saints, and over all St. Michael the Archangel.

The west portal is less elaborate, but quite as characteristic of the style. It was designed with a narthex outside of it, now non-existent. The sculpture includes King Manuel and his Queen Maria kneeling right and left, the Annunciation, the Nativity, and the Adoration of the Magi.

Internally the general effect is one of great spaciousness, and the eye is at once attracted to the slender columns (nearly 70 feet high and only about 3 feet diameter) dividing the nave from its aisles, all of equal height. The absence of anything like an arcade upon the columns gives the effect of a vaulted hall rather than a church with nave and aisles The two columns at the junction of nave and transept are only about 6 feet diameter. All are covered from bottom to top with carved foliage and arabesques, except where canopied niches for statues occur. The capitals are not strongly defined, and the ribs of the vaulting rise from the top of the column like the fronds of palm trees.

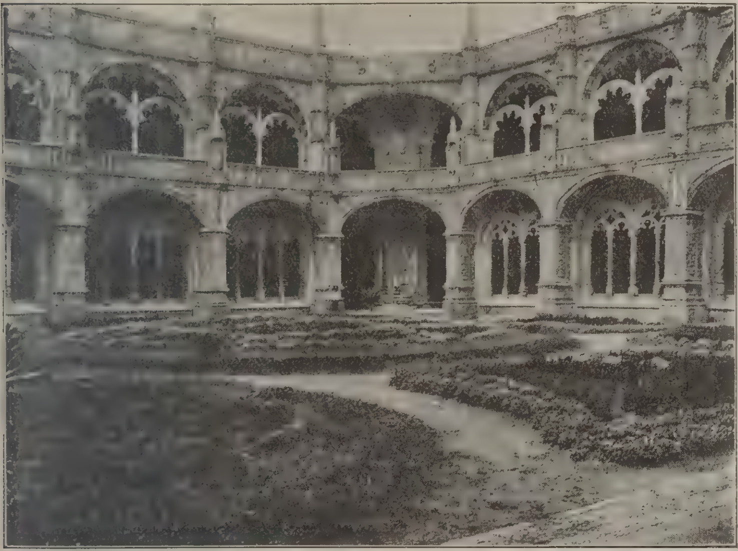


BELEM—INTERIOR, LOOKING EAST.

It is interesting to note that the work is just about co temporaneous with Henry VII.'s Chapel at Westminste Abbey.

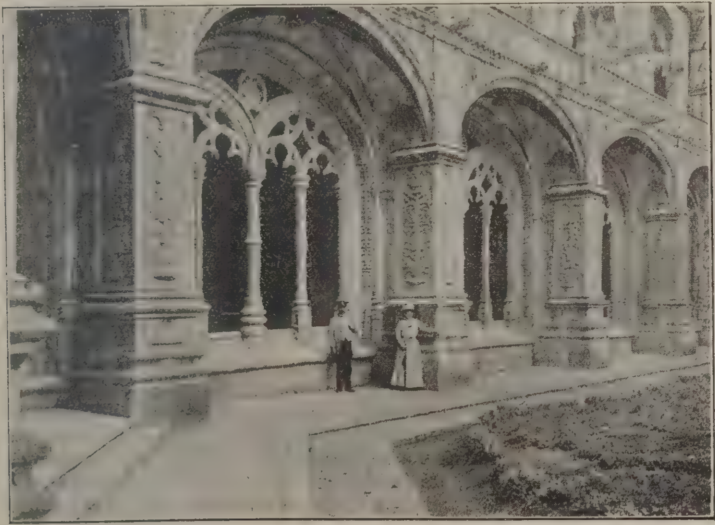
In the view looking westwards we see the raised coro the west end with its gallery front towards the church, i stalls and organs. In the north wall of the church are series of confessionals arranged with doors from the church (for the penitent) and from the cloister (for the priest) alternately.

The cloister on the north side of the church is about 180 feet square, and is celebrated for its elaborate ornamentation, which can hardly be described. It is an extraordinary, yet not inharmonious, mixture of Manueline and Renaissance detail, and it has been suggested that the panelled pilasters and arches which exhibit the later details may have been grafted on to earlier work to strengthen it. The fountain in the north-west angle is not so elaborate in itself or its surroundings as at Alcobaça and Batalha.



CLOISTER AT BELEM, LOOKING NORTH-WEST.

The Manueline tracery in the windows of the lower cloister is full of interest and will bear the closest scrutiny. The tracery in the upper windows does not strike one as ornamented construction, but as constructed ornament. I cannot help thinking it is not part of the original design.



CLOISTER AT BELEM.

The refectory has good groined vaulting of a very flat pitch and a dado of azulejos or glazed tiles.

The dormitory above the refectory has similar vaulting. Both are now in use in connection with a boys' orphanage, to which the buildings have been allocated since the suppression of the monastery.

The chapter-house and sacristy are on the east side of the cloister. Both have interesting groined vaults.

*(To be continued.)*

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Royal Institute was held at Conduit Street on Monday, March 14, when the chair was taken by Mr. Ernest George, A.R.A. (President).

Mr. H. T. Hare announced the decease of the following members:—Mr. George Thomas (F.), elected in 1901; Mr. H. Jarvis (F.), elected in 1878; and Sir Thomas Drew, the distinguished President of the Royal Hibernian Academy. Sir Thomas Drew was Doctor of Laws, Dublin University; elected Fellow of the Institute in 1889; past president of the Royal Institute of Architects of Ireland, and represented that body for some years on the Council of the R.I.B.A. His many distinctions indicate his versatility and the range of his accomplishments. He had always taken an active interest in the cause of architectural education, and had recently been appointed to the chair of architecture at the National University of Ireland. A vote of sympathy to the relatives was passed unanimously.

Mr. Alfred A. Hudson (H.A.), barrister-at-law, then read a paper dealing with—

### The Business Side of Architecture.

Mr. Hudson said he approached the subject with diffidence, but also with the knowledge that he had once been in practice himself, that he had for twenty-five years acted as counsel in building and engineering cases, and that he had also gained experience as a building owner.

The growing custom of the young architect receiving his education in a school instead of in an office rendered it imperative that the training in the former should be as practical as it used to be in the latter. The scheme drawn up by the Board of Education expressly said that the two-year course given in the schools should be limited to a thorough training in the ground-work of architecture, and that it should be followed up by two years as pupil-improver or assistant in an architect's office with supervision by the Board. They recommended five subjects for the school:—(1) Building materials; (2) construction; (3) drawing; (4) architectural form; and (5) ancient architecture. Simultaneous training in the workshop or laboratory was considered essential, with visits to buildings in course of erection. Excellent as this course was, Mr. Hudson contended that it hardly emphasised enough the practical part of the profession, and in that respect it fell short of the old-fashioned pupilage. The school course rather ignored such subjects as planning, preparation of specifications, measuring, and estimating. With the present system the pupil, if he started in practice, would have had no business training, besides being entirely without experience in the performance of the professional duties cast upon him under an ordinary building contract.

The Architectural Association School of Architecture follow those recommendations and give the student knowledge of architecture, of art, and even science, but nothing to fit him to put into practice that knowledge or to bring it on to a business footing except some lectures in the last year. Instruction as to the cost of building, or the relation of design to cost, or the application of art to practical everyday work, is absent. Whether the student likes it or not he must prepare to be an art architect and give up all other training for that one object. The lectures at the evening classes only in the final fourth year deal with business matters. Then there is apparently one lecture for each of the ten subjects. But what can a student learn from one lecture, on, say, the London Building Act? No doubt the building owner in general would much prefer that the design should be artistic; but of still greater importance are such matters as proper planning, a complete and well thought out specification of the work to be done, and an accurate forecast of the cost. Instruction in planning was recommended by the Board of Education, but it does not appear in the A.A. syllabus. Yet the subject should be taught most thoroughly. A young architect ought to be instructed in the objects of planning under such heads as the comfort and requirements of the occupants, the economic working of the management, and so on. The first essential in house planning is good arrangement, the second is design. Another matter for instruction is to teach the student how to make a well-designed exterior for a properly planned building. The study of ancient architecture, modelling, material, and construction has no doubt produced a race of able young draughtsmen, but there seems to be a striving after eccentric features without much regard to the comfort of the occupants. One sees a house on the top of a hill with bedroom windows the whole width of the room, and therefore so large that there is no warmth, while the lower floor of living rooms has windows so small there is no light. Young architects might also be instructed in the planning of sites for country houses and cottages, and even in the laying out of gardens. In conjunction with these courses the student would also be taught the relative cost of the different methods of planning and the increased cost due to various methods of exterior architectural treatment. Perhaps it would not be too much to expect that the building owner should be consulted as to his requirements.

One of the first matters with which an architect will have to deal when he confers with his employer is the question of cost. For this purpose he must be trained to measure and estimate and learn the value of different materials, for many architects have to settle up builders' accounts. Then there is the proper specifying of the materials and the works to be carried out. This is a matter in which very great foresight is required, besides a thorough knowledge of every kind of detail. Yet only a single lecture is devoted to this first essential in the Architectural Association school.

But assuming that the student has picked up sufficient knowledge to make a plan and write a specification, the next question is, What does he know about his duties to the building owner, the clerk of works, the quantity surveyor, and in connection with the employment of manufacturers of special materials? Upon a proper knowledge of these depends whether the building owner will be protected from troubles from various quarters and possibly from litigation. Disputes arise generally from (1) misdescription in the specification and discrepancies in the drawings; (2) under-estimating the cost of the works; (3) unauthorised alterations and additions; (4) failure to supply the builder with drawings and instructions when they are wanted; (5) insufficient supervision; (6) the employment of specialists; (7) the supply of materials to the builder by the building owner; and (8) the settlement of accounts. Other disputes sometimes arise from the indecision of the architect, his failure to act according to the conditions of contract, and from many other causes. It is essential that the architect should act in accordance with the conditions of contract, which regulate the rights of the builder and the building owner and his own duties while employed as architect under the contract. The standard form of conditions of contract approved by the Royal Institute of British Architects contains many difficult puzzles of interpretation. For example, the provision that arbitration is not to take place until after the completion of the works is a very undesirable one, for it leaves the owner at the mercy of any action of law the builder likes to bring during the progress of the works. Further, it would appear that in one clause of these conditions the works are to be completed to the reasonable satisfaction of the architect, while other clauses are ambiguously worded, if reasonable satisfaction is intended by the conditions generally. Inasmuch as the young architect may have to act as arbitrator as well as architect, he should be taught the principal duties of an arbitrator, and it should be pointed out to him how essential it is to act with the most scrupulous fairness between the builder and the building owner during the course of the works in view of that quasi-judicial position. If he inadvertently acts otherwise he may be disqualified from acting as arbitrator. One elementary rule is that the young arbitrator should at a very early stage either ask for a cheque on account or for a joint undertaking to take up his award and pay his fees.

The Institute might with great advantage when appointing an arbitrator select one specially conversant with the kind of matter in dispute. This would be facilitated if builders and building owners when applying for an arbitrator were to fill in a form with particulars of the dispute, and also give the name of the parties and the architect so that the arbitrator may be an impartial one. The arbitration should be conducted in the same manner, and decisions given on the same principles, as in the High Court. In the High Court if a party wins he is entitled to his costs, unless the judge in the exercise of a proper discretion deprives him of them. In matters like the proper awarding of costs it is by far the better and safer plan for architects to take legal advice and act upon it.

The employment of merchant specialists gives rise to constant litigation, difficulties and disputes occurring from many causes. The chief cause is a defective contract; but another, and almost equally important one, is the unbusinesslike and uncertain arrangements made with them by the architect, and the delays and hindrances caused to contractors in consequence. Another cause is the not uncommon practice of corporations and other employers of purchasing some of the materials themselves, with the result that they are delivered at the wrong time. The duty of architects is to advise in such matters.

The instruction in the school should be divided into two parts—the business side and the art side. No student should be allowed to join the art side unless he joined the other; the two branches of study should go on together, and no student should be qualified as an architect unless he had passed an examination in the business side. There is even then a danger that the student may never have the opportunity which he had as a pupil of learning at first hand how to uphold the honour of his profession.

At the conclusion of his paper Mr. Hudson suggested that an architectural standards committee should be formed in order to put the specifications for the ordinary requirements of everyday building practice into standard form, and to keep these forms up-to-date by periodical meetings. Later they might standardise details of various work in respect of which the considerations of art do not enter. This committee would be supported by sub-committees consisting of representatives of local and government departments, and technical societies, contractors, merchants and surveyors, as well as architects.

*(To be concluded.)*

# MODERN COLD STORAGE AND REFRIGERATION.

By W. S. Douglas, B.Sc.

## VI.—THE REFRIGERATING MACHINE (*continued*).

We are now acquainted with the physical characteristics of the three refrigerants, and, as they vary considerably, it will be seen that there must be certain divergences in design, according to which of the three is adopted. The two points which most materially affect the proportions of the machine are the great difference in working pressures, already observed, and the corresponding variation in the capacity of the compressor, which is yet to be investigated. An exact knowledge of the latter involves going slightly further into the theory of the machine than we have done hitherto, but it is necessary in order to appreciate the relative values of the three systems that the investigation should be given in full.

It must be clearly understood, first of all, that the gross amount of cooling done is directly proportional to two factors: the weight of refrigerant passing through the evaporator, and its latent heat of vaporisation. Each pound which is evaporated absorbs a certain number of B.T.U.'s, which is exactly equal to the latent heat (measured, of course, in B.T.U.'s) of the particular refrigerant employed, and a machine pumping 10 lb. per minute of a given gas will do ten times as much work as one pumping only 1 lb. Similarly, if the latent heat of one gas is four times that of another, a machine using the first gas will do four times as much work as one using the second and pumping the same weight.

Hence the work done by different machines using the same gas, whose weight per cubic foot remains constant, will be exactly proportional to the "displacement," or capacity of the compressor (measured by the cubic feet of gas it will pump in one minute), and, the displacement being known, it is very simple to calculate the refrigerating output of the machine. We must know, first, the compressor displacement in cubic feet per minute; second, the weight of one cubic foot of the gas in pounds at the temperature of the evaporator, and, third, its latent heat at the same temperature in B.T.U.'s. The weight pumped per minute will then be equal to the displacement multiplied by the weight per cubic foot, and this quantity multiplied by the latent heat gives the B.T.U.'s extracted per minute. To find the B.T.U.'s absorbed per hour we must multiply by 60.

Putting it down in symbols, let

D = Displacement in cubic feet per minute.

W = Weight in pounds per cubic foot at, say, 14° Fahr.

L = Latent heat in B.T.U.'s at 14° Fahr.

(The refrigerant would evaporate at about this temperature—14°—when cooling an ordinary store.)

Then B.T.U.'s absorbed per hour by the machine—

$$= D \times W \times L \times 60.$$

The same number of units, plus those developed during compression, are of course discharged into the condensing water

There is yet another point to be considered in this calculation. The figure obtained by the above formula will represent the gross heat extracted by the evaporating gas, but the net heat will be rather less, as the liquid enters the evaporator from the condenser at a relatively high temperature, and, before useful work is done, must be cooled down to the temperature of evaporation. The B.T.U.'s necessary for this must, of course, be subtracted from the gross number of B.T.U.'s absorbed, and the capacity of the machine is, therefore, proportionately reduced.

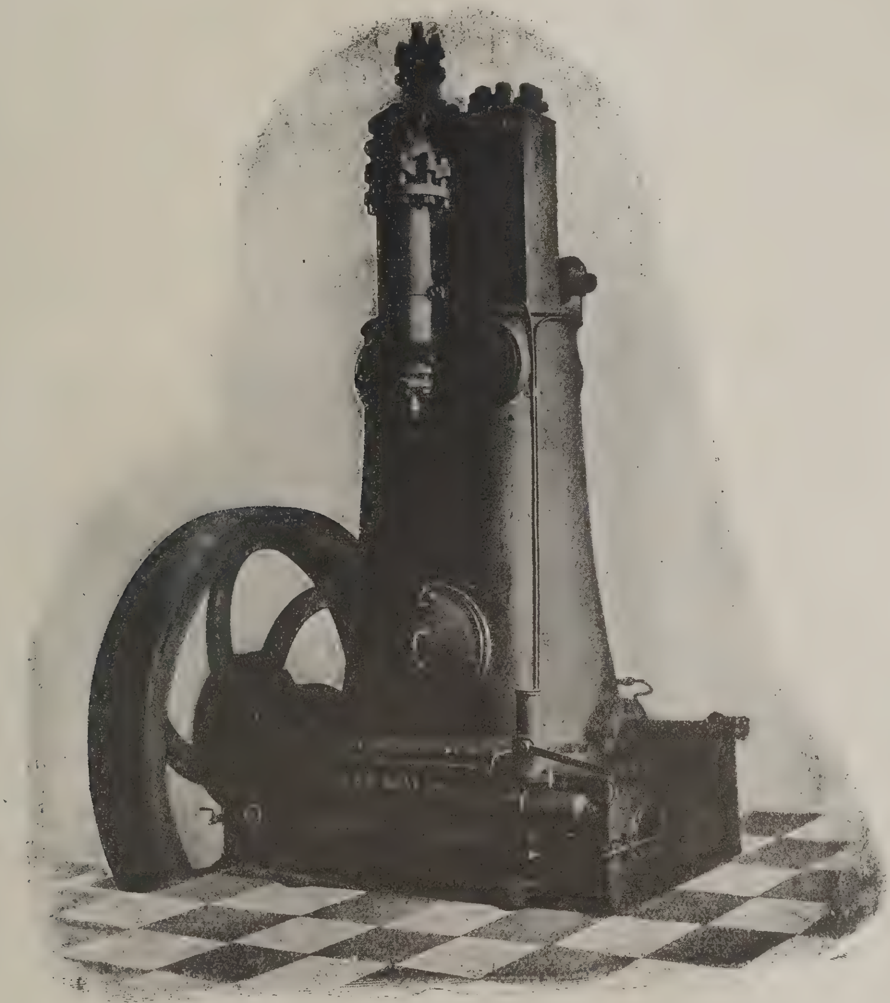


Fig. 18.

The exact amount of the reduction depends on two quantities, the specific heat of the liquid refrigerant and the weight passing through in a stated time. Specific heat, it will be remembered, is the number of B.T.U.'s necessary to cool 1 lb. of substance by 1° Fahr., and is generally less than unity. Hence the B.T.U.'s wasted per minute in this process will be equal to the weight of refrigerant pumped in that time multiplied by its average specific heat and by the fall of temperature past the expansion valve. The amount of the latter, if the evaporating temperature is as before, 14° Fahr., and if the gas leaves the condenser at 68° Fahr., will be 54 degrees.

Resorting once more to symbols, let

$S$=Average specific heat of the liquid refrigerant in B.T.U.'s.

$D \times W$=Weight pumped per minute in pounds.

$T$=Fall in temperature in Fahr. degrees past the expansion valve.

We have then:—

B.T.U.'s wasted per minute $= D \times W \times S \times T$.

B.T.U.'s wasted per hour $= D \times W \times S \times T \times 60$.

Net B.T.U.'s extracted per hour=gross less wastage.

$$= (D \times W \times L \times 60) - (D \times W \times S \times T \times 60)$$

$$= D \times W \times 60\,(L - S \times T).$$

If a further deduction of 10 to 15 per cent. from the net B.T.U.'s is made to allow for slip in the compressor and minor losses, we have finally the actual B.T.U.'s per hour which we may reasonably expect the machine to absorb.

If this calculation has fulfilled its object, it will be apparent that the displacement or capacity of the compressor, for a given output of refrigeration, is different with each different refrigerant. It has been proved, in fact, to depend on three variables—the weight of the refrigerant per cubic foot as a gas, its latent heat of vaporisation, and its specific heat as a liquid. Now, from our formula it is obvious that the larger the values of the two first and the smaller that of the third, the greater will be the number of B.T.U.'s which can be extracted by a given displacement. Hence a compressor pumping a stated number of cubic feet per minute will do the maximum amount of refrigeration, when working with a refrigerant, which is dense as a gas and has a high latent heat, and whose specific heat as a liquid is low; or expressing it in yet another form, a refrigerant possessing the ideal qualities just enumerated will require the minimum displacement in the compressor for a given output.

This fundamental law is of great importance, and it has been reiterated in its various forms in order to make it thoroughly clear, as on it the whole design of the refrigerating machine depends. Hence, before we can compare the compressor capacities needed with the different refrigerants, which is our present object, we must be well acquainted numerically with the three physical constants of each (*i.e.*, latent heat, specific heat and density). It is impossible, of course, to assign definite values to these, as, more especially in the case of the density, they vary to such an extent with the temperature, but, as the result of numerous experiments, standard tables are now available by means of which, for any given temperature, the constants are easily read off. For the sake of comparison their values at an evaporating temperature of 14° Fahr. are appended below. The specific heat given is the average value between 14° and 68° Fahr.

| | Density. Lbs. per Cubic Foot. | Latent Heat. B.T.U.'s. | Specific Heat. B.T.U.'s. |
|---|---|---|---|
| Carbon dioxide ... | 4.535 | 115.70 | 1.02 |
| Ammonia ... ... | 0.147 | 575.40 | 1.02 |
| Sulphur dioxide ... | 0.190 | 168.73 | 0.36 |

It will be seen from this table that the highest latent heat is possessed by ammonia; the greatest density by carbon dioxide; and that sulphur dioxide has the lowest specific heat as a liquid. Hence no one gas is superior in all the qualities which make for the minimum compressor displacement, and it remains to be seen which most nearly approaches the ideal. This is easily done by substituting in the formula obtained above and assuming a refrigerating duty of, say, 100,000 B.T.U.'s per hour. When the calculations have been carried out for each refrigerant, it will be found that to obtain this output the respective theoretical displacements in cubic feet per minute are as follows:—

| | Displacement. |
|---|---|
| Carbon dioxide ... ... ... ... | 6.09 |
| Ammonia ... ... ... ... | 21.80 |
| Sulphur dioxide ... ... ... | 58.82 |

(Assumed evaporating temperature =14° Fahr.; condensing temperature =68° Fahr.)

The compressor in $CO_2$ machines is therefore of smaller capacity for a given duty than in either of the others. This is due to the highly compressed state of the gas, which renders it relatively very dense, as shown in the table already given. The density is in fact so great that it more than compensates for the higher latent heat of ammonia and the lower specific heat of sulphur dioxide. The compactness of the $CO_2$ machine does not, however, extend beyond the compressing cylinder itself, and even then is neutralised to a certain extent by the great thickness of metal, which is necessary to stand the enormous working pressure. The dimensions of both the evaporator and condenser for plants of the same output remain constant, as the heat transfer in each is the same, no matter what the nature of the refrigerant. The working parts of the compressor must also be of equal strength and amplitude, irrespective of the refrigerant, as the total load (which is proportional to pressure multiplied by capacity) is always the same. The cylinder, in fact, is the only part of the machine affected, and, as this is relatively a small item, the total bulk is very little changed.

It is clear then that the compressor capacity and the working pressure are both dependent on the nature of the refrigerant. Now the compressor must be driven, and for this purpose suitable motive power has to be provided. The question at once arises, Is this always the same for a given output, or does it, like the pressure and capacity, depend on the refrigerant? At first sight it might be thought that the answer to the last part of the question is in the affirmative, and that $CO_2$ machines, owing to their high pressure, would absorb a great deal more power than the others. But actually this is not so. The power absorbed theoretically by all vapour compression machines giving the same output is exactly the same, and it is solely due to the difference between practice and theory that there is any variation at all. Theory demands that the machine, for maximum efficiency, should carry out a round of operations, which is known as the "Carnot cycle reversed," and any divergence from this cycle naturally involves a certain loss. For practical purposes, however, it is convenient that there should be such a divergence, and the consequent loss we have already measured. It is equal to the heat wasted in cooling the liquid from the condensing to the evaporating temperature just after it has passed the expansion valve, and depends, as we have seen, on the specific heat of the liquid refrigerant. The loss is greatest in proportion for machines using carbon dioxide, and is about equal for those using sulphur dioxide or ammonia. Hence the first named machine takes rather more power than either of the other two, and ammonia or $SO_2$ machines may be taken as of about equal efficiency as far as power consumed is concerned.

To conclude the study of this type of machine a compact $CO_2$ plant, by Messrs. J. & E. Hall, Ltd., is illustrated in fig. 18. The evaporator, as explained when dealing with double pipe condensers, is placed inside the condenser, and the condensing coils lie between the outside of the evaporator and the inside of the outer cast-iron tank. The latter is utilised as a support for the compressor, which is seen in front, and the small size of the cylinder will at once be noticed.

We have now considered the essential points of the vapour compression system and of the three principal refrigerants by which it can be actuated. The system has been discussed in some detail, as it is by far the most important of the four into which refrigerating machines are divided. Of these three remain, and they are named, it will be remembered, as follows:—

1. Water evaporation.
2. Cold air expansion.
3. Ammonia absorption.

*Ammonia Absorption Machines.*

The cycle on which absorption plants act is rather more complicated than that followed in vapour compression. Essentially it is the same, inasmuch as heat is absorbed into the system by the evaporation of the refrigerant (always ammonia in these machines), and again dissipated by its condensation But, super-imposed on these main effects, we have a number of smaller heat transferences, and for this reason the laws governing the action of the plant are not so simple as those we have already found for vapour compression.

Primarily the system depends, as before, on the latent heat of vaporisation of the refrigerant, and the action of the evaporator is still exactly the same. That is to say, the refrigerant is vaporised under the influence of reduced pressure, and, in doing so, takes the latent heat necessary for the operation from its surroundings. These, as in vapour compression plants, may be either brine tanks or the cold stores themselves, and this part of the system is in no way different to what we have already become acquainted with.

(*To be continued.*)

## ILLUSTRATIONS.

### CATHEDRAL SERIES, LLANDAFF.—THE SANCTUARY.

OUR series of views of Llandaff Cathedral is now drawing to a close, and will be completed next week. The description of Llandaff by Mr. S. BOWEN WILLIAMS was concluded in our issue of March 11.

### RUST EN VREDE, MUIZENBERG, CAPE COLONY.

THIS house was built a short time since at Muizenberg, on the sea coast, a few miles from Capetown, for Mr. ABE BAILEY, the architects being H. BAKER & F. MASEY, FF.R.I.B.A.

The materials are of the simplest description, the walls being of brick plastered and whitewashed, and, with a few exceptions, the whitewash is carried throughout the whole of the interior of the house. The choice of materials and their treatment are influenced by the fact that the building is placed very close to the sea, and has to withstand the deteriorating effects of the salt spray; the wood is, therefore, teak or jarrah throughout, and the metal work generally is executed in bronze. The dining-hall is lined with teak panelling, whilst a decorative result is obtained in the hall by using slabs of Greek Cippolino marble. In designing the building the architects have followed the style of the old Dutch Colonial houses, which is well adapted to the particular requirements of the country, and the rooms are largely furnished with beautiful specimens of old Cape-made furniture. The view from the loggia is remarkably beautiful, embracing a panorama of the whole of False Bay, from the Naval Station at Simonstown on the one hand to the mountains beyond the Hex River Valley on the other.

## THE LATE MR. HERBERT RAILTON.

WE regret to announce that Mr. Herbert Railton, the well-known black-and-white artist, died during Monday night in St. Mary's Hospital, Paddington, to which he was removed on the previous day suffering from an attack of double pneumonia. Mr. Railton, who was in his fifty-third year, was a native of Pleasington, Lancashire. The first drawing prepared for publication by Herbert Railton was published in *The Architect*, and since that time he has held a foremost place in the sphere of book illustration. His work is admirable in respect of textures and fascinating in its colour, although there is sometimes a tendency to unreality in his treatment of values.

THE Bishop of Crediton, speaking at the annual meeting of the Exeter Diocesan Church Building Society, said the Society had again been regretfully obliged to refuse grants owing to unsatisfactory plans, and they desired to call the attention of the clergy and others to the great importance of employing a really competent architect for church building and restoration, and also that the architect should be a Churchman and one well acquainted with the Church's worship, &c.

# THE MEDIÆVAL HOUSE.*

*(Concluded from last week.)*

ON one of the matter-of-fact pages of Bridges's " History of Northamptonshire " there is a brief but interesting ketch of the fate of a mediæval house of wood. In the reign of Stephen, some seventy years after the Conquest, the lordship f Clopton belonged to a knight of Norman descent, William e Grauntkort, usually called, on account of the difficulty which the common people found in pronouncing his name, William de Clopton. Being of somewhat the same profane urn of mind as Gamelyn, he had converted more than a third part of the churchyard to some secular use of his own, and e had cut down a noble grove of ash-trees which grew in it in rder to use the timber in building his mansion-house. Soon fterwards he got married, and as his bride lived near Newark he went thither, as he would have done in the present ay, for the wedding. Honeymoons were not then the ashion, so the bride and bridegroom, with their retinue, set ff to ride to the bridegroom's house at Clopton, where a reat feast was ordered to be ready. They travelled southwards towards their home, much as in later times, only, in his case, with a great deal more comfort and splendour, Katherine and Petruchio travelled towards Petruchio's ouse. After passing through the ancient town of Stamford hey gained the high land near Wittering, where still stands he church which they must have passed. But however much William may have wished to show this interesting building o his bride, Ivetta, their attention was attracted by a distant onflagration, almost due south, exactly in the direction for which they were making. Their forebodings were but too well justified. The blaze came from their own house, the ouse so profanely built of the sacred ash-trees from the hurchyard. The whole mansion was consumed, and with it he wedding feast and all the preparations for welcoming the ride.

The ancient chronicler quoted by Bridges regarded this alamity as a direct judgment for William's profane conuct. No further particulars are given, and we are left to arren conjectures as to when and where the wedding feast was eventually held.

This incident, casually included among more important etails, such as the descent of the manor, the alliances of he lords and their relations, and so forth, brings home to s vividly the usual fate of such early houses, and enables us o see more clearly why none of them have survived for our nvestigation.

Although in the county of Northampton, the home of a most beautiful building stone, Clopton stands on clay, and William de Grauntkort probably found it much easier to cut own the ash trees than to fetch stone from Weldon, some welve miles away, with a river to cross. However, he paid early for his choice.

It was the wooden kitchens which led to this digression bout William de Grauntkort and his lamentable home-comng. But kitchens were not always built of wood; many of hem were very notable buildings of stone. Of early examples here are few, if any at all. But there are several of later mes, all of them independent structures connected to the main building by a corridor. Among the more notable are he kitchen of the monastery at Durham, that of the abbey at lastonbury, that of the house at Stanton Harcourt, and that t Cowdray House. Most of these had several huge fireplaces n the walls, all of them had fine louvres, or ventilating turets, carried on stone groining ribs. Stanton Harcourt apears to have had an open fire on the floor, and its louvre is f wood; but the principle is the same in all cases—plenty of re for cooking and plenty of ventilation for the smoke and mell. These examples were all attached to large establishments; in the case of smaller houses the kitchen was one mong the rooms covered by the general roof. Haddon ffords a good example of this kind, although it can hardly e considered a small house; circumstances, however, did not llow of a detached kitchen in this case.

But now, having got a more or less vague idea of the size, he accommodation and the appearance of a mediæval house uilt of stone, the interesting question arises, How did it ook inside?

The only rooms which need detain us in this connection re the hall and the solar. The kitchen, for instance, would e clothed in its own dark livery of soot; the pantry, the butery, the spence, and other inferior rooms would have bare alls or embellishments of a purely utilitarian character. But the family rooms received a certain amount of decoration, according to the wealth and taste of their occupants. The hall was usually a one-storey structure with lofty walls and an open-timber roof upon which the carpenters had spent their trained skill. It was lighted by windows upon which the masons had spent theirs. The mere elements of its construction, therefore, made it as handsome as a village church. But among the rich its walls were adorned in handsome fashion with beautiful hangings, some being of the most costly kind. Armour and trophies of the chase and of war hung here and there, and at night cast flickering shadows from the light of the fire and of great torches. The smoke eddied about in the upper regions, and finally made its escape through the unglazed windows or the louvre in the roof. Very few windows were glazed, but they were closed by means of wooden shutters, which were painted bright with the glowing colours of heraldry. Some few houses had their windows glazed in part, and Henry III. gave orders for the glazing of some of his with painted glass representing well-known stories, his favourite subject being the parable of Dives and Lazarus.

The walls were very frequently plastered; and plastering was much more common in houses and churches than the restorers of twenty and thirty years ago seem to have been aware of. Even now some enthusiastic parsons think that the first step towards restoring a church is to hack off the plaster, little realising how the original builders would have stood aghast at the effect. The plaster was not laid on thickly and brought to a beautiful even surface; on the contrary, it was quite thin, and showed the wavy surface of the wall. On the plaster were frequently drawn thin lines of colour, as though to represent the joints of stones. In the prior's chamber at Abingdon Abbey, now a dark hay-loft, the enterprising inquirer can still see the original plastering of six and a half centuries ago, marked out with just such lines.

Panelling was another method of covering the walls, or, as it was then called, " seeling." Orders were given by the king in one case to " seel " both the walls and the roof of one of his halls for a certain number of bays, in order to lessen the draughts as he sat on the daïs. Whether the panelling was framed together or merely consisted of boards it is difficult to say; but the examples of thirteenth century panelling are few, if any. The " seeling "—whichever form it took—was painted green and powdered with gold stars.

There can be no doubt that Henry III., in the thirteenth century, strove to make his houses more comfortable than he found them. Even in those hardy times it was felt desirable to do something to lessen the draughts, to circumvent the weather, and to warm and decorate the rooms. The king possessed innumerable houses, large and small, in the southern and midland counties; and the orders given in respect of them are of great interest. Chimneys were built to many rooms to warm the inner air; porches and corridors were built to check the incoming of the outer air. At Everswell a porch was made before the door of the queen's chamber; at Oxford a fair and decent porch was ordered to the south door of the hall, another at Clarendon, and again at Marlborough and Kennington. At Westminster, in the year 1245, Edward Fitz-Otho was commanded to build a porch such as might become so great a palace so that the king might dismount from his palfrey in it at a handsome front. At Woodstock an aisle was made between the queen's chapel and her chamber so that she might go to and return from that chapel with a dry foot.

In 1238 orders were given to glaze a window of one of the rooms at Westminster so that that chamber might not be so windy as it used to be. In another case two windows were inserted with white glass casements to open and shut; and at Northampton a glass window, which might be closed and opened, was made in the hall opposite the king's daïs, and painted with the figures of Lazarus and Dives.

There are several orders for louvres—one for the great hall at Woodstock in 1244; another, four years later, over a hearth of freestone, high and good, in the chamber above the wine cellar of the same house; and yet another in the hall at Winchester, to carry off the smoke.

There are also many orders for decorating the various rooms, one of the most frequent being for the application of whitewash. The tower of Corfe Castle was ordered to be whitewashed externally; the new tower at Winchester to be whitewashed inside and out; the great hall at Clarendon, the tower at Guildford, the hall of the same house, within and without, were to be treated in a similar fashion. The queen's chamber at London was to be thoroughly whitened internally and painted with roses; a chamber, chapel, and wardrobe at Nottingham were to be whitewashed and pointed lineally—

---

* A paper read before the Architectural Association on March 4 y Mr. J. Alfred Gotch, F.R.I.B.A.

like the prior's room at Abingdon. The favourite method of internal decoration, however, was to paint the walls green, spotted or scintillated with gold. Occasionally pillars were to be painted of a marble colour—so the decorators of twenty years ago had an august precedent for what we consider their enormities. Figure subjects were frequently painted on the walls or on the chimney; the "history" of a saint or a town, the Wheel of Fortune, the Four Evangelists, or, once more, Dives and Lazarus. On the chimney of the queen's chamber at Westminster was depicted a figure of Winter, which, as well by its sad countenance as by other miserable distortions of the body, might be deservedly likened to winter itself. On the wall at Winchester a map of the world was painted.

What would we not give to find some of these things now?

These orders, given in the ordinary course, just as one of us might order a room to be papered, convey to our imaginations a most valuable picture of the inside of a mediæval house. It is true that the owner was the king, and that, like Dogberry, he liked to have everything handsome about him. It is also true that the idea is conveyed of a multiplicity of rooms. But it must be remembered that the houses belonged to the king, who not only lived in considerable state himself, but was attended by a considerable retinue. If we translate the terms of a king into those of a knight, we come back to the more simple accommodation shadowed forth by Chaucer in his tale of Gamelyn. But some of the splendour which surrounded the monarch no doubt found its way in a chastened form into the houses of his subjects; and Gamelyn, as he stood bound in the hall, may have beguiled the weary hours with studying a picture on the wall, the history of a saint, the Four Evangelists, or even the figures of Lazarus and Dives, and he may have idly wondered how far he resembled the one and his brother the other.

Mr. GERALD HORSLEY, in proposing a vote of thanks to the lecturer, said the part of the paper which interested him very much was Mr. Gotch's description of the decoration which took place in a mediæval house—the paintings on the walls and so forth. It was a matter of great regret, he thought, that there were so few instances left in England of early painting in houses. He had been interested to hear that in Abingdon Abbey there existed the remains of that wonderful decoration in painting on a wall in imitation of the joints of stonework, and he believed it must be the last example remaining of what was the only form of decoration at that time. He remembered a similar and very beautiful one in the castle at Coucy, in France. The reference the lecturer made to the exterior plastering and whitewashing of whole buildings was very interesting. There were some Saxon towers still remaining in England which had Saxon plaster still upon them. He thought they would be pleased if Mr. Gotch could tell them why they were in the habit of doing all that exterior plastering. They knew the people were fond of colour, and it might have been with that idea that they whitewashed their buildings, though perhaps they resorted to it because plaster and whitewash came cheaper than working the rough stone.

Mr. G. L. ELKINGTON seconded the vote of thanks and said the evening's lecture would be remembered for the delightful way in which Mr. Gotch had opened up to them a page from the greatest or the earliest real English poet, and at the same time he had shown them the exteriors and interiors of some of the most delightful examples of the mediæval houses. He had been rather hopeful, he said, that Mr. Gotch would take them a little further through the interior of some of those houses. The question of furniture would have interested them as architects, and even the bedstead had a history of its own. Another point was in relation to chimneys. When they remembered that the house was probably intended as shelter or defence rather than as a place of comfort, they could understand that the inmates were prepared to bear with a good deal of discomfort. Was the hooded chimney earlier than the recessed? It seemed to him that the hooded type should be the earliest, and yet the illustrations they had seen suggested the reverse. On the question of wall hangings, he did not know whether such forms of decoration were to be found in some of the houses Mr. Gotch described, but he believed they were valued and borrowed and lent to different people.

Mr. BRITTAN suggested that the raised solar was perhaps planned as a preventative against the damp, which must have been common in mediæval houses.

Mr. F. DARE CLAPHAM said the lecturer had not told him if any attention was paid to aspect in planning mediæval houses. They were crude and rough, but in one respect we could take a lesson from them. In those old houses they seem to have paid great attention to their kitchens, and there was plenty of space and ventilation.

The PRESIDENT said he thought they appreciated those old houses more now than if they had to live in them under the same conditions, for they must have been extremely uncomfortable.

The vote was passed by acclamation.

Mr. GOTCH, in his reply, said as to chimneys, be believed the earliest examples were recessed. In later years tunnels were used with them, and still later hoods were introduced. In conclusion, he said the whole history of mediæval domestic architecture was the development of one room into many. It was a long process and only affected the upper members of the family, but as with the motives of all changes in domestic architecture its aim was towards providing greater comfort to the inmates.

## THE LATE SIR THOMAS DREW.

BY the death of Sir THOMAS DREW on Sunday last many members of the architectural profession in Great Britain, as well as in Ireland, have lost a valued friend. His frequent participation in the annual excursions and other proceedings of the Architectural Association gave many of us the opportunity of a close acquaintance with one of the most genial personalities amongst the architects of our time. The high position that Sir THOMAS DREW attained as an artist and architect is well expressed in the following obituary notice, for which we are indebted to the *Irish Times*:—

By the death of Sir Thomas Drew, Dublin has lost a distinguished citizen and the Irish profession of architects one of their foremost members. An Ulsterman by birth fifty years ago Sir Thomas took offices in Clare Street, and during that long period never changed his business address No person who had seen him lately would have thought by his appearance that he had passed the allotted span of three score years and ten. He was born in Belfast on September 18 1838, his father being a clergyman of the Irish Church, the Rev. Thomas Drew, D.D., Rector of Loughin Island, Co Down, and a Precentor of the Down Cathedral. Having received his early education in Belfast, he was apprenticed to the late Sir Charles Lanyon, C.E., and shortly after being admitted to the architects' profession established himself in this city. From the beginning of his professional career he made the subject of ecclesiastical architecture one of specia study, and was at a young age appointed as consulting architect to the three principal cathedrals in Ireland—St Patrick's, Christ Church, and the Armagh Cathedral—which positions he retained to the last. His principal original work as an ecclesiastical architect was the designing of the Belfast Cathedral, whch is a noble conception, and worthy of hi high reputation. In Ireland of late years most of the new churches that have been erected belong to the Roman Catholi denomination, and naturally were entrusted to other hands The church of St. Kevin, on the South Circular Road, on of the few Protestant churches built in Dublin of late years was designed and erected by Sir Thomas Drew. A complet list of his works in the city would be a very long one, bu some few may be mentioned—viz., the Ulster Bank, in College Green; the Belfast Bank in the same vicinity, and th much-admired head offices of the Hibernian Banking Company. Sir Thomas designed that fine building, the Northern Bank, in Grafton Street. In Trinity College the addition to the library and the present fine reading room were alteration which were carried out from his plans, while exactly opposit to the library is the handsome Graduates' Memorial which h designed. In 1901 Sir Thomas Drew designed the beautifu spiral staircase leading to the organ chamber in St. Patrick' Cathedral. The construction of this chamber cost 11,000*l* which was defrayed by Lord Iveagh. As is well known, th restoration of Christ Church Cathedral was entrusted to Mr Street, who, however, employed Sir Thomas, then Mr. Drew to assist him in carrying out this great work, which he di in the most admirable manner, sparing neither time no labour.

During his long life Sir Thomas Drew filled the highes positions in many of the learned and artistic societies in th city. For two years he was President of the Royal Institut of Architects of Ireland (1895-97), and he has also bee President of the Royal Society of Antiquaries, a society i which he took a deep interest, and at whose meetings he constantly read valuable papers. As a writer Sir Thomas po sessed a lucid style, which always made his contribution acceptable. Of the history of Christ Church Cathedral h had mastered every detail, and for many years on each St. Stephen's Day it was his custom to conduct a party round the cathedral, to whom he explained each object of interest. These lectures, as they may be styled, were largely attended, but they have never been published, although, without doubt, most of their substance is to be found in the various articles written by Sir Thomas Drew on this subject. He has shown by comparison that the ground plan of the Danish Christ Church of Waterford is a genuine replica of Dublin Cathedral. A subject which Sir Thomas Drew was never tired of discussing was the theory, originally started by a ady, that all the Christian cathedrals were copies of designs by early Comacine builders, whose secret marks he has discovered on many of the stones in both Christ Church and St. Patrick's. Having succeeded Sir Thomas Farrell as President of the Royal Hibernian Academy, Sir Thomas Drew received the honour of Knighthood from Earl Cadogan in 1900, and five years later the University of Dublin conferred on him the degree of LL.D., honoris causa. His many professional distinctions include the Fellowship of the Royal Institute of British Architects and the honorary membership of the Royal Society of Scottish Architects. As a cathedral architect he was considered one of the highest authorities in the kingdom, and on several occasions his services have been requisitioned in connection with work to be done in English cathedrals. In knowledge of the profession to which he was so long attached he was second to none, and as an arbitrator on the merits of designs he was much valued. Last year he was appointed a member of the International Exhibitions Royal Commission, and he was also a Governor of the National Gallery. It was only the other day that Sir Thomas Drew was chosen as Professor of Architecture in the National University. Sir Thomas Drew was a member of the Masonic body, and a man of the most charitable disposition. In all ists of subscriptions for the furtherance of humanitarian objects his name was invariably to be found, and his wide circle of friends included persons of every shade of politics, while his religious views were of the most tolerant description. In 1871 Sir Thomas Drew married the daughter of another distinguished architect, Mr. William Murray, formerly of he Board of Works, and for many years resided at Monksown. A scholarly gentleman and a supporter of art, his place will be hard to fill on many Boards. Sir Thomas Drew possessed probably the finest collections of miniatures in Ireland, some of which were of much value.

## JAPANESE DECORATIVE ART.

IN a lecture delivered on the 10th inst. at Carpenters' Hall before a crowded audience, Mr. W. Harding Smith, hon. librarian of the Japan Society, gave a general outline of the history of Japanese decorative art. He divided the lecture under four heads, viz., pictorial art, sculpture, acquer, and metal work. Japanese decorative art was not, he explained, the highly conventionalised and restricted variety which passed under that name in European art, but t was art in its fullest sense, an art intended to beautify. Mr. Laurence Binyon, in his "Painting in the Far East," had thus expressed the fact:—"In Europe we talk of decorative art as different in kind from pictorial art, but in Japan the division is hardly apparent"; and, again, "such an art never loses sight of the condition of a picture as a decoration on a flat wall."

Without much exaggeration it can be said that the Japanese are a nation of artists. The flexibility and suppleness of hand acquired by them through many generations n writing the complicated forms of their picturesque script with the brush must have been a considerable factor in their art training, and has educated their eyes to appreciate beauty f form and arrangement. To understand the pictorial haracter of the Chinese ideographs which they use, it is only necessary to look at the more ancient forms, dating about 50 to 300 B.C., to see that at some remote period they were really pictures of the objects they represent, although nearly all trace of the original forms has disappeared through abbreviation.

The earliest mention of painting in Japanese history occurs in an ancient chronicle of the year 463 A.D., when it was recorded that skilled artists came over from Korea, and among hem a painter named In-sa-ra-ka. But the commencement f Chinese influence is usually ascribed to the reign of the Empress Suiko (565-567), when Buddhism brought with it Chinese literature and fashions. In the quick process of assimilation the Japanese developed an art of their own, adding a lightness of touch, an originality and boldness of esign, and a harmony which is seldom found in the older art. Two of the reasons why Japanese painting lends itself so well to decorative art of all kinds are its simplicity of purpose and its directness of method. Instead of the elaboration of the Western gallery picture it is content to depict one idea, one theme. In many cases backgrounds are ignored. The absence of direct light and shade and also of cast shadows is another element in favour of decoration.

In temples the walls, sliding panels, doors, and sometimes the ceilings were painted with designs *in situ*. In private houses the chief places for decoration were the sliding partitions of the room. But the principal form of Japanese pictures was the "kakemono," or hanging picture, that could be rolled up and put away when not in use. These pictures, painted either on paper or silk, and usually set in a mount of silk brocade of two colours, form a very pleasing combination. They were always hung in a special recess, and were changed from time to time at different seasons and on special occasions.

The earliest known painting is in the temple Horiuji at Nara; it is of the eighth century and is a representation in distemper of Buddha in Chinese style. But in the next century a more national school was founded, until last century there arose a succession of styles which were passed on through many generations. In the eighteenth century the Shijo or naturalistic, and the Popular schools had their origin, the former showing signs of Western influence. The latter is better known to us in the form of colour prints, which form of art was brought to perfection about 1760 by Harunobu (and for the first time a full palette of colour was used). His prints, rather effeminate in style, were the first to combine elegance of line, agreeable composition, and harmonious colour. From his time to the middle of the nineteenth century a great host of colour print designers flourished. In considering Japanese painting it must be remembered that while in the West the painting of the undraped human figure is regarded as the highest aim of art, in Japan the human figure as a thing of beauty may be said not to exist. The Buddhist religion with its high spiritual ideals teaches that the body is a vile and unclean thing. The beneficent deities are therefore draped, while those of demoniacal origin are represented as nearly nude. This dislike of the nude may also perhaps be attributed to the custom among the lower classes of exposing their bodies while at work.

The sister art of sculpture finds its highest expression in religious subjects. Wooden figures carved by priests and men of noble birth are often met with. Perhaps the most notable of them are the two Deva kings, guardians of the Todaiji temple at Nara, which are attributed to the eleventh century; they are 26½ feet high. It is, however, in bronze that the most notable monuments are to be found. At Kamakura there is a seated figure dating from 1252, which is 49 feet 7 inches in height. It was built up in sections and soldered together.

Towards the close of the sixteenth century the temples grew to be profusely decorated with sculpture and lacquer work. Their chief characteristics were a great preponderance of roof, and elaborate carved work and corbelling under the eaves; they were also richly decorated with gold and brilliant colours. Some of the gates are magnificent. There is a curious parallel between the sculpture of these temples and that of the mediæval woodwork in some of the choir stalls of European churches and cathedrals where we find angels, demons, monsters and animals of all varieties mingled with birds, flowers and other objects. The same kind of medley, though of a still more profuse character is seen in the Japanese temples where the effect is further heightened by gold and carving coloured. One of the greatest masters of this kind of carving was Hidari Jingoro (or left-handed Jingoro). He worked between 1590 and 1634, and may be said to have founded a school. He was to Japan what Grinling Gibbons was to England at the end of the seventeenth century, a master-craftsman in his kind of work. Many of the temples were decorated by him. Some of his best known work is at Nikko and Kyoto. One great feature of these carvings is the subordination of detail to general effect, thus showing the feeling of the true artist; in this respect he differed somewhat from the general run of Eastern carved work which so often aims at great minuteness of detail. The great feature of most temples was their beautiful environment, the cool green of the trees forming an effective background to the gold and colour of their shrines. This love of nature was largely owing to the influence of the Buddhist religion.

The contrast between the domestic dwelling and the temple was very great; while the latter was gorgeous with carved work, painting and gilding, the private houses were built of plain unpainted wood, generally selected for the beauty of its grain, which was regarded as sufficient ornament. No paint or artificial graining was used, but every advantage was taken of any natural peculiarity in the wood to add a picturesque touch to the room. The Japanese carpenter, who was also the builder, never lost an opportunity of introducing something which was quaint, and yet natural. There was one part of a Japanese room, however, which lent itself to carved work of a more or less elaborate character, and that was the part between the lintel, where the sliding panels run, and the ceiling. This space, from 18 inches to 2 feet wide, was often filled with panels of carved work, forming a ventilating frieze. Sometimes it consisted of open fretwork or diaper patterns; at others, it was carved with various designs, birds, flowers, &c., and sometimes coloured with distemper in the natural colours of the design. Painting was freely employed on the sliding panels, which were of paper stretched on a wooden framework; in the palaces and castles these were often richly gilt and decorated.

In Japan the carpenter stands pre-eminent as the chief constructor of buildings. The saw used is quite unlike our own in shape, and is worked in the reverse way, being drawn towards him; the same with the plane. The drill, which is his substitute for the bradawl and gimlet, he rotates rapidly between the palms of his hands. He very often sits to his work, where our carpenter would stand, and he holds the plank with his feet. The use of lacquer was carried in Japan to heights unknown in any other country. The styles and schools of the different periods vary as much as those of painting, and in fact there are many points of similarity between the two artists. Lacquer is the juice of a tree, which is collected from cuts made in the bark, and then purified. After many long processes, amounting in all to twenty-five or thirty, the article is left many days to harden in a damp cupboard, and after that it is polished. The earliest known specimens are of the ninth century; they appear to have a flat surface decoration sprinkled with gold. Perhaps the golden age of the lacquerer's art may be said to include the latter part of the seventeenth century down to the early nineteenth century. The great feature of Japanese lacquer was the impartiality with which the precious and the baser metals were associated, lead and pewter being often inlaid in gold grounds together with silver and even tin. The lacquerer cared little for the commercial value of the material so long as it suited his scheme of colour.

Mr. Harding Smith concluded his lecture by referring to the decoration of Japanese swords, these being the most interesting branch of native metalwork.

## COMPETITION FOR OLDHAM TOWN HALL EXTENSION.

THE following is the text of the assessor's report on the architectural schemes lettered "A" to "R" submitted by local practitioners:—

Acting on your instructions I have now made a thorough and exhaustive examination of the whole of the drawings sent in for this important public building and herewith have pleasure in laying before you the result of my adjudication. Every scheme has received my most careful study and investigation and as a result of my anxious deliberations, extending over many days, I have no hesitation in awarding the set of drawings marked "O" the honourable position of first place. The author of this design has shown considerable ability in successfully mastering the problem given, viewed either from the points of arrangement, design, or construction, and without displaying any exceptional originality yet taken as a whole this scheme stands out as the best submitted, and in the planning admirably embodies in a compact and convenient form the accommodation as clearly defined in your "Instructions and suggestions to architects," with such elasticity as all such requirements permit. The architectural conception indicates strength and refinement both with the internal as well as the external treatment with ample light and ventilation. The principal façade to Greaves Street, as well as those to Firth Street and Mill Street are all scholarly and dignified, yet simple in character without any excess of ornament and in my opinion will enhance rather than detract from the architectural importance of the present structure. This problem necessitated very careful handling, the difficulty being increased owing to the somewhat rapid fall in the levels of the Greaves Street and Mill Street elevations. Taken as a whole the premier scheme "O" is not an extravagant one, considering the liberal accommodation it provides, but after carefully checking the cubical contents as supplied by its author in his report, I am of opinion that his figures are, if anything, slightly in excess of the actual measurements. Also I certainly considered 10*d.* per foot cube should be the minimum allowance for the moneying out of the main structure (above ground floo
level) and that 1,500*l.* should be provided at least for th
alterations to the existing building. With the addition o
these amendments, however, the author of scheme "O'
will still be able without difficulty to carry out his design i
a satisfactory manner within the stipulated expenditure o
25,000*l.* and strictly in accordance with the particulars give
in your "instructions and suggestions," due care being exe
cised when detailing the work generally.

Respecting my decision as to the awarding of the secon
and third premiums I have experienced considerable diffi
culty in advising you. Although many capable designs car
fully conceived and conscientiously developed have been su
mitted, yet in each certain blemishes and points
weakness (more especially in the planning of util
tarian arrangements generally) are to be found when com
pared with scheme "O." Some also have failed through a
imperfect knowledge of the requirements of the several de
partments, more especially as to their general working an
routine. An elaborate set of drawings lettered "K," com
prising ten sheets of strainers and representing a large ou
lay of time and labour, has been submitted. Unfortunatel
their author has taken upon himself to entirely remove bot
existing Borough Court and the Council Chamber and r
plan the same in the new portion. Such a drastic deviatio
from the "instructions and suggestions" issued for com
petitors' guidance, and in which no such provision is eve
outlined, entirely extinguished their author's chance irr
spective of other defects in the designs, especially in t
planning. I was, therefore, compelled to further disrega
same—I had no alternative.

There are, however, two schemes, lettered "D" an
"H," which I have finally chosen from the remainder aft
a lengthy scrutiny, each of which contains certain merit
its own either in arrangement or design (or both) coupl
with a sincere and earnest effort to faithfully solve t
problem. Although there is but little to choose betwe
them, yet in one or two points I consider the former has t
advantage, and therefore I award "D" second place a
"H" third place.

My adjudication therefore is:—

First design, lettered "O," premium of 50*l.* and I tru
also its author to be appointed architect for the work on t
terms of the conditions specified.

Second design, lettered "D," premium 30*l.*

Third design, lettered "H," premium 20*l.*

I can only affirm should your Corporation accept my awar
(after an inspection and explanation of the designs sent i
and adopt scheme "O" for execution, in my judgme
without doubt they will secure the best design submitted a
one that most fully and adequately embodies their requi
ments as a whole. It is an excellent solution of the proble
and I believe few will be found to dispute its positio
indeed, this competition clearly indicates Oldham has
lack of capable architects to choose from for her importa
undertakings. Remembering the importance of this compe
tion to the architectural profession locally I would respe
fully suggest your Corporation making such arrangements
will permit the whole of the designs being publicly exhibit
(as is frequently ignored) for at least seven consecutive da
This will give every competing architect the opportunity of
personal inspection together with a perusal of my report.
conclusion, I desire to express my sincere thanks to t
several officials of the Corporation, more especially t
borough surveyor, borough treasurer, and the chief co
stable, for the valuable information each most readily ga
me respecting his particular department, and also t
town clerk for the admirable arrangements he made
ensure the absolute privacy and entire immunity from int
ference or distraction which I enjoyed throughout my som
what lengthy examination.

George H. Willoughby.

The premiated designs are those of Messrs. Taylor
Simister, first (50*l.*); Messrs. Winder & Taylor, seco
(30*l.*); and Messrs. Jenkins, Matley & Mills, third (20*l.*

## NORTHERN ARCHITECTURAL ASSOCIATIO

THE annual meeting of the Northern Architectural As
ciation took place on the 9th inst. Mr. G. T. Brow
F.R.I.B.A., of Sunderland, president, presided over a la
attendance. Mr. James Forbes, Middlesbrough, and Mr.
D. James, South Shields, were both elected members.

In connection with the competitions open to students
the Association the assessor's award was read, and it w
found on opening the sealed envelopes that the followi
gentlemen had been successful:—For measured drawings

existing works: Under twenty-one years, G. E. Charlewood; under twenty-five years, W. W. Nimmo. Architectural sketches: Under twenty-one years, G. E. Charlewood; under twenty-five years, W. W. Nimmo. For the best set of testimonies of study required for the Royal Institute final examination, Wilfrid Lawson; and for similar drawings for the intermediate examination, Joseph Hill and S. W. Milburn were bracketed together.

The Glover studentship, which, subject to certain conditions being fulfilled, carries with it the Glover Medal and a prize of ten guineas, was awarded to Joseph Hill.

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

On Thursday evening, March 10, after a general meeting, the students of the Society held their annual conversazione. The prize essay of the year, by Mr. Fred Scatchard, on "The Use and Value of Colour in Architecture," was read and discussed. Mr. Scatchard, in his essay, cited many of the best known examples of coloured architecture of past ages as arguments in themselves as to the value of colour, and dwelt upon the varied agencies by which colour was introduced into buildings, whether by the use of naturally coloured materials or by the application of artificial colour in pigment, mosaic, or glass.

Speaking of modern conditions, he exampled the use of terra-cotta in its many forms as that of an impervious, washable material, capable as far as possible of resisting the ravages of the smoke demon, and, so far, adapted to use in manufacturing cities, a point round which the subsequent discussion revolved; opinion leaning towards the adoption of terra-cotta in preference to the perpetual gloom to which the stone building would appear to be condemned in a place enjoying similar atmospheric conditions to those at work in Leeds.

The Sketching Club's programme for the coming season received consideration and numerous suggestions were made towards formulating a series of visits.

A selection of works by the students was exhibited, comprising studies of ancient buildings, suggestions for imaginary buildings, and numerous sketches of architectural subjects at home and abroad.

A general meeting, the last of the present session, was held on Thursday evening, March 17, when Mr. S. D. Kitson, F.R.I.B.A., read his paper on "Carr of York."

## THE USE OF COLOURED MATERIALS IN BUILDING.*

The use of coloured materials in building goes back to the very roots of history—indeed, if we dig in the garden of Eden we find them there. The charm of colour—its protection as well as its ostentation—has been felt by all animated creation, and man has used colour, in the heraldry of his dress and in the heraldry on his buildings, as he has used music: to express emotions, too lengthy and too abstract when put in terms of words, in a way at once intelligible to the members of his tribe, and also directly recognisable by others, his aliens and his enemies. The cries of pain and victory, of sorrow and of joy, are sounds substantially common to the whole human race; the heraldic use of colour is less international, but the pennon and the gonfalon—the helm and, in these present days, the uniform—explain, in a kind of shorthand in the day of battle a mass of personal and national facts in such a way that the eye of a foreigner can at once grasp and understand, where language might be unintelligible and would certainly be too slow and too indefinite. In the garden of Eden, which we now call Mesopotamia, the use of coloured buildings came about from the pressure of constructive conditions. The great walls and terraces which surrounded and formed the cities of the plain were built for the most part of sun-dried bricks made from the alluvial mud and clay, their sole building materials so far as masonry and brickwork were concerned. These bricks were adequate for all their needs, so long as protection from rain could be secured. For the action of frost they had little to fear, but rain falling on these mud bricks melted them into slime and brought about their ruin. Moreover, mud bricks were a poor defence against hostile attacks; excavation into them was easy, battering rams disintegrated them, the stones from the catapults effaced their towers and battlements. The remedy was to plate them with a coat of mail, and kiln-burnt bricks were found the most easy way of making this veneer. But fuel was scarce, kiln-burnt bricks were precious, and there were miles of wall to be protected. It was found that by coating these bricks with an easily-fluxed glaze, they could be fired at a lower temperature and yet be more durable than the unglazed ones. Later on, in the time of Darius, a kind of conglomerate, akin to concrete, was used, which would glaze when required. The Egyptians also had a stone which would stand the necessary heat for melting the glass.

The immense shapeless table lands and mounds that mark the site of Babylon show the deliquescent action of the mud bricks. They are the remains of the great walls and terraces that, range upon range, rose up majestically out of the wide plain, tier upon tier, ever higher, till on the topmost level stood the king's great palace; and soaring yet higher was the tower of observation, from which the astronomers watched the courses of the stars, recorded the nightly roll of the constellations, dictated the chronology of the seasons, the time for sowing, the time for ploughing, the advent of the waters, the rage of the Dog Star. On the overthrow of this gigantic and amazing civilisation of the Chaldees, and the ruin of the elaborate system of irrigation that made the lands between the Tigris and Euphrates fertile as a garden, the huge towns became all too vast for the shrunken population, the empty buildings were stripped of their costly coverings, the walls, no longer needed to protect a folk beneath even the notice of marauders, were treated as quarries for material to fence round their sparse holdings from wandering animals and predatory neighbours, and the winter rains washed away their shape and dissolved them into mounds of mud. There they remain, great silent heaps of soil, to attest the immensity of the once mighty Babylon. Accident at first probably threw a stain into the glazing of the bricks, and experiment led the makers to discover the methods of producing coloured glazes. Thus came about, some 6000 or more years B.C., the axiom in the Eastern mind that buildings of importance must be sheeted for their preservation, and where the buildings were to be monumental or palatial the most royal sheeting was all glorious in colour. This ideal was accepted throughout the East—the Egyptians glorified their buildings by inlay, by enamel, by paint; the Chinese by plaques of enamelled faïence, by wood in coloured lacquers, by roof tiles in brilliant colours. It was accepted by the Greeks, who heightened their sculptured marble work with colour, and by the Romans, who adopted the Greek methods of decoration, but in far greater profusion. The Babylonish method of decorating with glazed plaques and bricks was perpetuated in Asia Minor and Syria, and under the Arab conquerors was carried into India, and along the coast of Africa into Spain. Where marbles were obtainable the plating was done with thin sheets of this material; patterns and pictures were formed with the tesseræ made of coloured glass, or from fragments of the most brilliantly stained marble; rivulets of gold sparkled and ran along the mouldings and across the panels, and the paint brush completed what the statuary and mosaicist attempted to fulfil. Whilst Italy was being overrun by desolating hordes of northern barbarians, Byzantium was taking toll of the stream of commerce passing through her gates, intercepting the choicest treasures and accumulating in her church of Santa Sophia and in the Emperor's palace the *ne plus ultra* of all that was valuable in art and costliest in decoration. Ravenna was following suit in a more modest way, and Venice was taking form amidst the shallows of her lagoons. Sicily, in the hands of the Normans, was luxuriating in the fusion of three civilisations—the Greek, the Saracen, and the Northman. The Crusader, on his return home, had strange tales to tell of the wonderful buildings he had seen on his way to the Holy Land; the marvels of Byzantium, the enchantment of Damascus, the long siege of Acre, the deadly stagnant waters near Alexandria where dwelt the Soldan of Babylon, the precarious sovereignty of Jerusalem. His listeners were not to be crushed by his extravagant accounts of the joyous revelry of colour. The craftsman of the twelfth century needed no spurring. The marble of Carrara could vie with that of Pentelicon or Proconessus. All Asia had nothing to show that could not be matched in Europe. Florence, Pisa, Siena, Lucca, churches like Le Puy in Auvergne, grew up in coloured stones and marbles; brickwork coquetted with marble columns and enrichments; mosaic lent its aid to the glorifying of the cathedral fronts, as at Orvieto and the many examples in Rome; terra-cotta, at first unglazed, becomes in the hands of the Della Robbia family the supremest examples now left to us of coloured sculpture. In the pictures by Mansueti we get an idea of the profusion of colour Venice displayed, even

FIRST PREMIATED DESIGN FOR COMMERCIAL BANK, KHARKOV.—M. L. SOLOGOUB, Architect.

up to the sixteenth century. But by now the crafts had specialised into different branches of the building craft; the image maker was become the sculptor, the painter was to be found learning his trade in some studio without the cathedral close, the glass to the windows was imported from some specialist whose factory was miles away or in foreign lands. The printing press released the scribe from his toil of illuminating his manuscripts; the goldsmith was become as secular as the armourer; the masons' guild became bare and independent of these artists, and their almost only interest was centred in the stones they were handling. Artists, too, who had founded themselves on the careful examination and measurement of the bleached relics of exhumed antiquity and were impressed with the sculptured finish of the workmanship, and assumed that the colourlessness of the specimens was their proper aspect, began to talk about "proportion" and "light and shade" and to dominate the masons, calling themselves architects. Colour vanishes from the buildings externally. The wayward diapers woven in the coloured brickwork, the chequer of stone and flint, were considered as scarcely serious enough for the grand style. It might be pardoned in the stables; it was inadmissible in the mansion. Gradually the true working and the perfect jointing of the stones became all that the mason had to take pride in in his craft, and the stones were not always of his choice, nor those from quarries with which he was familiar. Into the midst of this languor of weakened tradition came the Gothic Renaissance, with the avowed intention to replace the stiffened tradition of workmanship by the vital and exuberant tradition of the thirteenth century. The attempt was really foredoomed from the outset, and it, together with the sudden expansion of the use of machinery in every direction, played havoc with the methods and experience of the workman; it puzzled and disorganised him, and made him more than ever dependent upon the senseless and outlandish, to him, drawings and instruction that he was receiving from the architect. It took away from him his initiative, his desire to take advantage of the varying peculiarities of his materials, their humours and their tempers, qualities that you can only discover at the times of handling them. These conditions of docile submission to the paper designs of the architect still exist, and they were met by Mr. Butterfield in the frankest and most logical way in his methods of building. He schemed, in the quietude of his office, elaborate examples of the use of coloured materials, and these were set down fast on paper, stone for stone, brick for brick; there was no excuse and scarce any opportunity for going wrong in the actual building; everything had been foreseen and provided for. This dominance of a single mind over both men and material is in his case less oppressive than it would be in most others, because he was a great artist and he had trained himself on mediæval methods at a time when many examples of these methods remained unrestored and consequently instructive. But for all that, one is conscious of the difference there is between the scholarly dictation of the use of building material and the Gothic craftsman's use of the same on the scaffolding. Time will bring its own special touch to Mr. Butterfield's work, developing and accentuating the individual characteristics of the well-drilled units, fusing and blending the opposition of their colours; yellow brick and red brick will play at interchanging their tints till we get the flecked russet of the apple, and the black headers will make themselves the repository of the rainbow, the iris centres to the mingled hues vibrating around them. The dance of diaper will calm down, giving us the feeling of a rich woven fabric that adorns and distinguishes the splendid framework which it clothes. Time's hand is already justifying Mr. Butterfield's confidence in its action.

The Norfolk house has much more fellowship with the mediæval craftsman; beyond the main lines of the design and the spaces for the windows, laid down at the outset by the exigencies of the plan, the walling has been built to suit the caprice of the material almost as much as the humour of the architect. Some of the materials must have been a good deal startled by the use to which they found themselves put. Roofing tiles, for instance, that might reasonably expect to be accommodated with a lath on the back of a rafter, find themselves summoned to pack themselves into a lintel, or wind themselves into a chimney-stalk, or help form patterns in the walling, whilst the roof on which they counted to rest gets itself covered by a distant branch of the same family, the pantile. The materials for the most part were local; the flints and gravel came out of the site and were made, with lime, into the concrete walls, the largest flints being reserved for the facings. Bricks and tiles came from near by. A golden brown sandstone, sparingly used, had to be imported from near Sandringham; the roof tiles, starting as pinkish red, have weathered to a warm brown. These are the elements evidently of a beautiful colour scheme.

The colouring to the house in the Addison Road has been arrived at by another route, and belongs to a different category. Instead of using Nature's materials and painting from her palette, the colours in this case are all artificial; instead of the natural colours of brick, terra-cotta, and tiles, we have the materials covered with a glaze, and that glaze either whitened or stained with colour as required. The justification of using such materials, on which the wing of Time scarce brushes, is the corrosive atmosphere of our manu-

facturing towns. Even supposing we could free the air from the soot and grime that pours from our chimneys, we cannot stop the issue of the products of coal combustion in our factories and on our hearths. These gases, in our moist climate, become solutions of acid which disintegrate our marbles and stones before they have had the time and the chance to get case-hardened. Brick and terra-cotta get befouled; to clean them is to hasten their destruction. Granite endures, but it is a grim material, almost repellent when polished and generally unattractive when not. We are driven, if we wish our work to resist the ravage of the biting air, to the employment of glazed surfaces externally, and we find ourselves almost forced by the nature of our materials to use colour. The glass that is poured over the surface of the terra-cotta and the bricks, to make them imperishable, is liable to discoloration in the kiln, and moreover, being in fact a stained-glass window spread thin upon a film of porcelain, is capable of nearly as magnificent colouring. To refuse to avail oneself of this property would amount to misprision of the qualities of one's material and to confine oneself to its limitations. The fact that glazed bricks and glazed terra-cotta are virtually unchangeable—that the years that roll over the building will do almost nothing to blunt and soften the sharp edges of the moulded work, to coax interchange and play of colour from one brick to another, from one material to another—are limitations indeed, and we want some considerable advantage on the other side to think it commensurate. Durability is good; that the building is impervious to wind and rain is a considerable merit; that it is easily and inexpensively cleaned and comes up smiling under a good wash down; and, moreover, since the surface is non-absorbent, the cleaning process washes the dirt off and away. But these good hygienic qualities are scarcely forcible enough to overcome one's repugnance to the imperturbability of such a material, were it not for the charm of colour that is obtainable. The gamut of colour is the same as in a cathedral window; what you choose to call for you can command to come. The almond blossom hue that flushes the sea front of the Doge's palace at Venice can be fixed here in London; the stained amber and gold of the marble sheeting to St. Mark's can be matched and displayed in Trafalgar Square, not transiently, but for always. Nor can it be questioned that colour is desired in our streets. It is pathetic to note the agony of effort that people make to invest their houses with a little colour and so mitigate the drab universality of our city. Ivy, ampelopsis, vine, laburnum, and magnolia are laboriously invited to smother the walls, and no end of pains are taken to forward their growth. The National Gallery has made itself widely popular with its strip of green grass, its fig trees, and its shaped trees in green flower-tubs. It has become the custom when forming a new street to plant trees at the same time, not, I take it, for shade, but for the refreshment to the eye of colour. Every evening thousands upon thousands escape by every railway from the masterpieces of correct architecture and superfine sculpture in our streets to the shelter of the country, where the earth is green about them and the heavens blue above them. Would it not be well to temper their lot to the prisoners who must remain?

## "CASTLES IN THE AIR."*

*(Continued from last week.)*

UNTIL we come to realise the blessed functions of trouble, and admit the power to be gained through it, we shall be ruled and conquered by it. Only when we feel the beneficent power behind it, and recognise His loving purposes, then, and then only, shall our darkness melt into light, and we shall regard all our troubles as blessings in disguise, to be interpreted by us and made to issue in good.

This searching for good in painful things will supply us with loads of material for our castles.

The more sensitive we are, the more we must suffer; therefore the more needful it becomes that we should search for the good purposes of our pain.

If this is not a rational theory, I fail to see what we are to rely upon to hold us up and give us courage when we feel outcast and no one wants our best work—a feeling too often known to art workers in these days.

Let us not deceive ourselves by going forth as artists when all the while our main object is to make money, and our true intent to degrade our art to the market value. Go on your way, but do not mistake it for anything better than it is, viz., a ministering to the flesh, and a sacrifice of soul to body.

The purpose of moral consciousness is gradually to reverse this order. We must more and more learn to sacrifice body to soul and value giving more than getting, if we would create beauty.

Carlyle, who was neither artist nor sickly moralist, has written, "I honour him who is seen toiling for the spiritually indispensable; not daily bread, but the bread of life. Is not he too in his duty endeavouring towards inward harmony, revealing this, by act or by word, through all his outward endeavours, be they high or low? Highest of all when his outward and his inward endeavours are one; when we can name him artist; not earthly craftsman only, but inspired thinker, who with heaven-made implement conquers Heaven for us."

The pursuit of art should be an indication that the seeker is trying to build up the good, the beautiful, and the true; and to dwell on what is lovely and of good report rather than tread the warpath and fight the evil and ugly. The love of beauty should drive out hate and tune our minds for castle building.

The true and noble object of refined sensibility is mainly to overcome the demon of selfishness, and so make us more loving. If thinking upon and seeking beauty does not do this, it is idle and vain. Building castles in the air is collecting in the mind all that is lovable and lovely. Ruskin says, "You never will love art well till you love what she mirrors better."

Look on the birds of the air; do not their castles teach us a lesson? Are they not labours of love, wrought with all their faculties, and as perfect as their powers allow? We cannot behold them without feeling a glow of reverent pleasure. Should we ask less of ourselves than we see bestowed by the sparrow? A full and loving bestowal of the best instincts of our nature, body and soul.

---

* A lecture delivered by Mr. C. F. A. Voysey on March 2 at Carpenters' Hall, London Wall, E.C.

The close attention we give to orders of architecture, and symbols of foreign thought, and all the residuum of human activity, will clog rather than lubricate the wheels of thought, unless we are castle building all the time, and collecting all the living forces of mind and heart out of what we study.

Would we not rather hear our work called thoughtful than quaint or original?

To some extent we see what we look for and are blind to what we cannot understand.

Every truth we utter or depict depends in great measure for its future life on the thoughtful heart that hears or sees it. So my usefulness in presenting to your minds such truths as I am blessed with depends on the degree of sympathy you have in yourselves with what is decorous and generous.

It is of little avail to have spasmodic fits of misty idealism. We need a calmly reasoned system of moral law, clear and defined; on this we collect and build in order the castle in the air, which is to be the storehouse of everything beautiful we can conceive.

We would have our castle bell to sound with sweetest melody at the exactly appointed moment, so that travellers might set their watches by our comings and goings, and so be reminded of the value of punctuality and its extended form, constancy.

We must believe that the building of castles in the air will train us to shun all that we feel impure. If we are sincerely seeking beauty, we shall turn away and not look twice on ugliness. And by degrees we shall live more and more in our castles and see no evil. And such condition of mind will do more to help our fellow-workers than all the efforts we make to convert them to our own way of thinking. Fly with me to my castle if you will, but I will not press you to pull down your own, or even so much as dare to criticise it.

The tendency to specialise is another outcome of our materialism, it is a help in the accumulation of wealth. It may increase our capacity in the direction in which we specialise. But it may also prove proportionately detrimental to our higher nature.

We often hear men say they are in business to make money. And that is their speciality, which they, consistently with their own point of view, divorce from what they call sentiment, but what some of us call moral, mental and spiritual activity. To them, all that I am saying will seem very ridiculous.

We do not want extremes of either point of view, but we do need a mixture. Cannot the craftsman by his castle building instil into the home life of the business man moral and mental qualities manifest in everyday articles of use, which shall make him long to blend those qualities of home life with the Beelzebub of business? Many a man is only kept steadfast to his business by the little element of human thought and feeling that remains in it. But for that he would go mad. Beware then of multiplying trading governments, corporations and companies. Castle building is impossible to such. It is for individuals only; it requires secrecy. Only our nearest and dearest can ever be witness to our building. Only the deepest sympathy can unlock the door of our castle.

In spite of the fact that corporations and companies have made machinery to imitate every physical function, and are doing their utmost to turn men into machines, there are countless numbers earnestly struggling to create beauty. Tons of literature is produced to show how it is, or should be done. And some companies, like the Carpenters', are recognising the importance of cultivating those personal qualities which we are now discussing. But it is rare and cannot fail to establish them in the grateful memory of many a craftsman.

May we not take encouragement from the thought of future historians, comparing us of the twentieth century with the craftsmen of the thirteenth, when people were less educated and much more spiritual? No one talked about art, but everyone loved beauty. Even the village blacksmith wrought beauty into every bar he handled. They all built castles in the air. Their heads were full of pretty legends, and angels were as familiar to them as policemen are to us. And yet, we are very anxiously and very earnestly trying to get at beauty, and even the stockbroker sometimes tries to help us with his sixpences. Is it not more credit to us to be struggling for beauty, with such odds against us, than it was to the thirteenth-century craftsmen and those of previous centuries?

The past is too often held up to us to make us feel ashamed of ourselves, instead of which we want encouraging to do better. Colour is a sure revelation of a people's spiritual condition; the more spiritual activity the brighter the colour.

In the East people were always much more spiritual, more superstitious and more imaginative, and proportionately fond of bright colour. In our own country the ignorant peasant and bargee paints his farm carts, wheelbarrows and barges in bright and cheerful colours (or used to). And the nearer we approach to city life the blacker and more gloomy our colour becomes. The more absorbed we are with earthly interests the greyer becomes our lives.

Castle building will at least help to preserve our sense of joyous colour, and in our own private castle what infinite scope we find for the exercise of harmony and joy. How bright we can be, rejoicing in freedom from fashion and the tyranny of expert authority. We are also emancipated from all forms of degrading fear. Only one ennobling fear remains to steady us, and that is the fear of ugliness.

And furthermore we are drawn towards our fellow-creatures by our thirst for every spark of brightness, every beam of strength, every atom that is beautiful and helpful. And while thus occupied, we cannot be reviling or rebuking them.

Kind, candid friends will, of course lament that our actions fall so short of our castle building, but would they be any better if we never built any castles at all?

We must try and gather strength from them to belie the taunt.

Ruskin tells us, "The true strength of every human soul is to be dependent on as many nobler as it can discern, and to be depended upon by as many inferior as it can reach."

And another wise man has said, "We make people what we call them."

So we are forced to admit that we depend on one another, and I think it is one of our highest blessings.

(*To be concluded.*)

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* (New York) makes a feature of the architect's part in the war against tuberculosis, both in an article on the planning of sanatoria and in illustrations of tenement houses for families, one or more members of which are victims of tuberculosis.

*La Construction Moderne* (Paris) has an interesting article fully illustrated of the Benedictine Abbey of Solesmes, near Sablé (Maine-et-Loire), which the French Government is desirous of selling, but which is too big for a private residence and unsuitable for a factory, so that no purchaser has come forward, although the price has been reduced from one million to a quarter million francs.

*Il Monitore Tecnico* (Milan) illustrates fully and describes a new pleasure palace, the Kursaal Diana at Milan, which combines a music hall, restaurant, hotel, and a hall for playing the game of Pelota.

The *Architectural Record* (New York) has an article on "The Apartment House," which is a description with illustrations of some of the more recent examples of flat-building to be found in Germany. In a paper on "Factories and Their Fire Protection" is given a striking view of a factory in which a fire occurred during construction. One 8 inch by 10 inch timber beam was used because the supply of 10 inch steel joists ran short; this, though charred, remained firm, but the steel joists (unprotected) are twisted and sagged in every case.

*Engineering Record* (New York) gives a useful paper with illustrations on "The Sea-wall in Connection with Buildings," read before the Connecticut Society of Civil Engineers by George A. Orroll.

## Correspondence

*[The Editor will not be responsible for the opinions expressed by Correspondents.]*

### Oxford Colleges.

Sir,—I hope you have not given up publishing the photographic pictures of Oxford Colleges. It is a long time since the last one appeared in your paper. I have been keeping these views separate with the hope of ultimately binding them up in a volume, to be followed by a similar collection of pictures of Cambridge Colleges.—Yours very truly,

Robert Gladstone.

Woolton Vale, Liverpool: March 11.

## FORTHCOMING EVENTS.

*Wednesday, March* 30.

Carpenters' Hall : Paper on "Sculpture as Applied to Buildings," by Mr. F. W. Pomeroy, A.R.A.

Edinburgh Architectural Association : Paper on "The Spirit of Mediæval Art," by Mr. J. B. Stoughton Holborn, M.A., F.R.G.S. (Report and Exhibition of Measured Drawings Competition).

*Friday, April* 1.

Leicester and Leicestershire Society of Architects : Students' Evening.

*Monday, April* 4.

Royal Institute of British Architects : Paper on "Architecture on the Eastern Side of the Adriatic," by George Hubbard, F.S.A., F.R.I.B.A.

*Wednesday, April* 6.

Royal Sanitary Institute : Paper on "Sanitary Aspects of Floods and Measures to be Taken to Prevent Epidemics Arising Therefrom," by Dr. A. J. Martin, of Paris.

Carpenters' Company : Paper on "The Craft of Repairing Buildings," by Mr. Thackeray Turner, F.S.A., F.R.I.B.A.

## COMPETITION FOR WELSH NATIONAL MUSEUM.

MAGNIFICENT collection of drawings is made up by the 130 designs that have been submitted in mpetition for the Welsh National Museum and are now ing exhibited in the old Town Hall of Cardiff. They e worth going a long way to see as evidence of the gh-water mark of English architectural design at the esent day. But the pity of it! To think that of the 0 only four receive any recompense for months of the thors' expenditure of hard work, hard thought, and rd cash. At a moderate estimate, the cost of preparing ese 130 sets of drawings must have averaged at least 0*l*. apiece, and thus exceeds the total amount of the nmission to be received by the successful architects en the whole building is completed.

If ever there was an instance in which a double-relled competition was imperatively desirable it was s. There were two questions of vital importance that ed every competitor before he began to adumbrate his eme: first, the proper relation of the new National seum to the buildings already erected in Cathays k, the Law Courts, the City Hall, and the University; ond, the proper relation of the exhibition galleries to reserve collections in the internal economy of the seum.

Each of these questions admitted of at least two wers, and hence in their combination there were at st four solutions, of which any three might be wrong. amount of skill in planning an admirable and effec- interior, in designing detail, or in draughtsmanship ld compensate for an initial error of judgment. Nor the correct answer to the primary questions at all ious, to judge from the vital differences to be found e four designs that have been selected by the assessors reward.

Many minor questions, but nevertheless of importance their bearing on the design, required satisfactory wers. Should the main entrance be on the south, ng the approach from the city, or on the west, the er and more important frontage? Should the public eries be all on one floor, and, if so, which; or might be on two or more floors? Where would be the situation for the administration, for the lecture tre, for the aquarium, for the children's museum, he refreshment room?

ll of these questions, both primary and minor, might been answered by competitors in small-scale sketch as, say 40 feet to an inch, and a perspective sketch sufficient clearness to have enabled the assessors to t a dozen promising schemes at a tenth of the cost e competitors.

The winning design, by Messrs. A. Dunbar Smith & Cecil C. Brewer, is unique in its solution of the primary questions, and as we see that solution we cannot but recognise its correctness. The Museum must be a bigger building on plan than the Law Courts to provide the accommodation required without going to such a height as to dwarf the City Hall; hence the first impulse of every competitor to make the Museum a subordinate pendant and completion of the group that Messrs. Lanchester, Stewart & Rickards's beautiful buildings have commenced must be abandoned. Messrs. Dunbar Smith & Brewer have designed a building that, although larger than the Law Courts, groups modestly with them and the City Hall, with which latter it is sympathetically allied by the adoption of twin axial lines in the length, one following the transverse axis of the City Hall and the other ranging with the centre of the road at the rear of the City Hall.

But the great superiority of the winning plan is the clever solution of the relation between the exhibition galleries for the public and the reserve collections for the student. The latter form the external range of rooms and the former the internal, thus public galleries and reserve collections are side by side, adjacent and yet separate. The large internal quadrangle thus formed is divided into three approximately square portions, the northern and southern of which are occupied by the similar and symmetrical halls, with alcoves, required for the departments of history and antiquities and Welsh natural history, leaving a garden in the middle, in the centre of which is the aquarium.

The adoption of the principle of public galleries and reserve collections side by side necessitates the provision of two floors for the public galleries, and the authors have located the departments of art, botany, and zoology on the first floor. The requisite area for the reserve collections is obtained by the use of a mezzanine floor. The entrance to the Museum is in the centre of the south front, leading to an entrance hall from which is at once entered the Welsh natural history department.

In their external treatment the angle pavilions of the City Hall are repeated in the south front of the Museum, and a central colonnaded portico marks its entrance. On the west side there are slightly projecting pavilions on the axial lines to which we have already referred. Thus the Museum is in complete harmony with the City Hall and Law Courts without, in spite of greater extent, losing that modesty which renders it an appropriate flank of the general scheme of which the City Hall is the centre.

The design placed second is by Mr. T. L. Vesper, and at once differs from the first by having the main entrance on the west side and a secondary entrance on the south.

The main entrance leads to a large hall, and this to the grand staircase to the first floor, on which are the departments of art and industries. The centre of the building is occupied by a hall for history and antiquities, which does not seem to us to be too well lighted, as above it is the lecture theatre. The reserve collections for the most part adjoin the exhibition galleries, but in the case of zoology the public space is on the ground floor and the reserve on the first floor. The plan generally is pretty and effective, but gives rather the idea of being too much cut up, and on the first floor there are dead-ends in both the art and industries departments, which means retracing of steps, a thing, in our opinion, to be avoided in museum planning.

The author does not attempt to follow closely the detail of the present buildings, but adopts a more restrained treatment based on the Ionic order.

Mr. Henry T. Hare is awarded the third place for quite a different type of plan, the main entrance being on the south and a subsidiary entrance on the west side, whilst the principal axis runs from south to north. On this axial line is a wide gallery with a cross central hall. The departments of zoology and geology are accommodated in this wide main gallery, and from it branch off those of Welsh natural history and of history and antiquities. Beyond the centre the departments of botany and of industries also branch off from the main axial gallery. Outside of the exhibition galleries are the reserve collections, but Mr. Hare has not been able to find room for all of these on the ground floor, and accordingly provides for the reserves of history and antiquities and of industries on the first floor, where, also, he has placed the art department. The refreshment-room is at the extreme north end of the main axis, the board-room, administration and library at the front. No attempt has been made at subordination to the City Hall, and, indeed, a great central tower, added to the general mass, would make the Museum the dominant building, which may be right as expressing the sentiment that the National Museum of Wales is more important than the City Hall of Cardiff, although wrong from the view that the central building in a group of three should be dominant. Who can say which is right? We think Messrs. Dunbar Smith & Brewer have won quite as much from the superior workableness of their plan as from the selection of the right sentiment.

Messrs. David Milne & J. William Hepburn in their design, placed fourth, are the only competitors amongst those favoured by the assessors who have taken the frontage lines of the University into consideration as well as those of the City Hall. They thus give a front block extending as far back as the City Hall and add an annexe, the west front of which aligns with the University, and which is arranged around an open quadrangle forming the service court. The main entrance in this design is on the west side, and leads through an entrance hall, vestibule, and central hall to the lecture theatre. On the ground floor are located the departments of geology, history and antiquities, art, zoology and botany, and industries. Some of the reserves are on the ground floor, but those for botany, zoology, history and antiquities are on the first. "We think this design owes its measure of success to the recognition of the University as an element in the planning of the *locale*. The treatment of detail is of the modern municipal Renaissance type, and does not attempt to follow closely that of Messrs. Lanchester, Stewart & Rickards. *(To be continued.)*

## NOTES AND COMMENTS.

Mr. William Burton, in a letter to the *Manchester Guardian*, has offered the following criticism on the enthusiastic account of the discoveries of Mr. Hewitt Myring by Sir William Bailey, which we print elsewhere; but apparently Mr. Burton's criticism is based on a short abstract of Sir William Bailey's paper that appeared in the *Manchester Guardian*:—

1. The typical specimens illustrated in your paper are by no means new. Pottery of the same type was illustrated or described by Brongniart in his classical "Traité des Arts Céramiques," 1844, and in Rivero and Von Tschudi's "Antiguedados Peruanas," 1851.

2. There is no proof, so far as I am aware, that this pottery is of great antiquity, not to mention 5,000 or 10,000 years. To mention the fact that no horses—pottery horses, I presume—have been discovered would only show that the vessels were made before the sixteenth century, when the horse was first introduced into Mexico and Peru by the Spaniards.

3. Your note states that "the Egyptian pottery of any dynasty was not equal to the best of these Peruvian specimens." This is an extraordinary statement, and I wonder what it means. The Peruvian pottery is obviously the work of a naturalistic, brutal race; while every artist recognises the severe intellectual restraint of those who were responsible for the Egyptian pottery of even the earliest dynasties. Besides this artistic difference there is an equally important technical difference. The ancient Egyptians had discovered the application of a glaze to pottery, and of a coloured glaze, "turquoise," that has remained unsurpassed for forty centuries. The Peruvian pottery is destitute of glaze, and is only coloured with earth tints—of the earth, earthy—like the primitive pottery of any other race.

One can understand and sympathise with the elation of a discoverer like Mr. Myring, and I am sure that Sir William Bailey will agree that the value of such discoveries is diminished when extravagant claims are made as to their historica or artistic value.

Sir William Bailey has replied in the *Mancheste Guardian* to Mr. Burton's comments, principally b referring more fully to the points in his original paper and he also says:—

I ventured the opinion that the best of this pottery i superior to the Egyptian of any dynasty. On second thought I might have said "any dynasty before Egyptian art wa influenced by that of Greece and Rome, say during the twent sixth dynasty, about B.C. 550," and I desire to reiterate tha the manifest quality of this Peruvian art impresses upon an student that there is internal evidence of intellectual libert They did not copy each other, and they did not make the plaster and clay ornaments from moulds, as sometimes th Egyptians did, in producing the effigies of the mummies whic have the beautiful blue enamel that Mr. Burton admires. Th "intellectual restraint of Egyptian art" is too long a subje to examine. They had no intellectual liberty. The artis were the mere unconscious tools of the priests, and the Sphin half brute and half human, symbolises the serfdom of the art. The people were kept in obedience and terrified in slavish subjection by huge stone monsters which filled the with horror. Art was the exclusive property of the Machiav lian priesthood, whose religion was the mere tool of tyrann and was divorced from all pretence of morality.

The authorship of the famous Flora bust attribut to Leonardo da Vinci by Dr. Bode seems now to b finally determined by the analysis made by Dr. Geor Pinkus of the wax used in its modelling, which is composition of lac, spermaceti, and beeswax. Th mixture was undoubtedly used by Lucas in work u questionably from his hands, so that the evidence is n practically conclusive that the Flora bust was not ma by Leonardo da Vinci, but by Lucas. When so gr an expert as Dr. Bode is thus deceived, the authentic of old masters must usually be dubious and the fictiti values put upon reputed antiques more than e ridiculous.

The lengthy litigation between the late Mr. William Mackison, continued after his death by his daughter, as trustee under his will, against the Town Council of Dundee, has at length been brought to a conclusion by the decision of the House of Lords. Mr. Mackison, as our readers may remember, was for many years the official and salaried engineer and architect of the town of Dundee, and during his term of office carried out much work which seems to have been acknowledged as outside the ordinary duties of his office; indeed in 1873 he was paid for extra services. Subsequently a dispute arose, and Mr.

Mackison was dismissed from his office, and then brought his action for 15,000*l.* as remuneration due for extra services. This claim the House of Lords has now decided to be untenable. There is no doubt that official engineers and architects are often eager to undertake work which is not properly within the scope of their duties, as these were defined at their appointment, and that their eagerness is partly inspired by the hope that extra work will bring extra pay. The law as determined by this case is clearly what to a layman appears to be common sense, that when an official agrees with a public body to give his whole time for a fixed salary, he has no just claim for extra pay, for having sold to his employers his whole time and energy he has none to give for extra services, and all work that he does must be considered to be included in the terms of his appointment.

---

The tower of the church of St. Philip, the cathedral for the diocese of Birmingham, has for some time been suffering from decay of the stonework, which during the last few years has advanced to such an extent as to become dangerous to the public safety. During last year a special Tower Committee of the Cathedral Council was formed to ascertain what was the best course to pursue, and they have agreed unanimously that, in view of pressing needs of other kinds, no expenditure ought to be incurred which was not absolutely necessary; and that the present appearance of the tower should be altered as little as possible. On both grounds they decided against re-casing it. This would involve an expenditure of at least 5,000*l.*, and would make it a crude and unsightly object for years to come. The alternative plan which they have adopted is that of renewing those portions of the casing which are hopelessly decayed, and of dealing with the rest of it by a preservative process of a special kind. The cost of this alternative plan is estimated at about 2,000*l.*

---

Messrs. William Whiteley, Ltd., have offered the price of 82,000*l.*, the valuation of the Local Government Board, for the public baths and washhouses and freehold site in Queen's Road, Bayswater, London, and the Paddington Borough Council has accepted the offer. The Borough of Paddington has thus made a very good bargain, for the site was purchased thirty-nine years ago for 8,500*l.*, and the buildings and plant cost 41,500*l.* The Borough Council has visions of improved and more convenient baths, and perhaps also a new town hall, out of the sum to be paid by Messrs. Whiteley.

---

## OLDHAM TOWN HALL EXTENSION COMPETITION.

Owing to the rapid fall of the land from the rear of the present buildings to the boundary of the site, the competitors in general fixed the ground-floor level of the extension at the level of the basement of the present portion, and the first-floor level with the present ground-floor level.

Apparently the difficult part of the problem to the bulk of the competitors was the arrangement of the police station portion, especially the cells, and few dealt with the latter in a satisfactory manner.

The selected design (Messrs. Taylor & Simister) is undoubtedly the best submitted. In the basement are placed the borough treasurer's strong rooms, the overseers' book store, a staff mess room, meter room, and caretaker's room. On the ground floor are the cash receiving and rental rooms with cashier's office and rate-collector's office. On the first floor is the borough treasurer's department, the surveyor's department, and the overseers' department. On the second floor is an audit room, staff mess room, staff lavatory, and a caretaker's room; on this floor also is provided two general offices in connection with the town clerk's department.

Considering the difficulties of the site the plan is well conceived, and has the principal entrance from Frith Street to the cash receiving and rental rooms and to the rates office. The first-mentioned room is provided with an additional entrance from Greaves Street and an exit to Mill Street for use on special occasions. The approach for the prison van is from Greaves Street direct into the parade room, and has the exit at the opposite end into Mill Street. The cells are well arranged, and the cell corridors are entered direct from the parade room.

On the first and second floors the arrangement consists of a centre corridor with rooms on both sides. A door leading from the private portion of the inquiry space of the borough treasurer's department to the borough treasurer's private room might be advantageous. To what extent the staff rooms are proposed to be used is difficult to define, as no kitchen arrangement is provided for either.

The elevations of the present portion of the building are in a severe Classic style; the new portion, though freer in treatment, will harmonise well, and is illustrated by a perspective in monotint.

The second premiated design (Messrs. Winder & Taylor) has the cash receiving office abutting to Frith Street with the entrances direct. The arrangement of the special entrance and exit is not good and would lead to draughts on the days when the doors were in use. The positions of the magistrates' room and the magistrates' clerk's room are not satisfactory, as it would necessitate the magistrates passing along a public corridor to the bench.

The elevations are treated in a more severe manner than those of the first premiated.

The third premiated design (Messrs. Jenkins, Matley & Mills) has the cash receiving and rental offices placed parallel to Greaves Street. An objectionable feature is the number of folding gates to be opened to admit the entrance of the prison van to, and the exit from, the yard, there being no less than four pairs. The first floor is somewhat disconnected, and through communication can only be got by passing through offices. The approach to the magistrates' clerk's room is also bad, being either through the magistrates' room or the witnesses' room. The elevations are severely treated.

Design A (Mr. H. Cheetham) has the various departments more separated, and the long van approach from Frith Street to the prisoners' yard is not a desirable feature. The elevations can hardly be considered to be in keeping with the present building.

Design B (Mr. H. M. Johnson) has a disjointed appearance. The corridors are too narrow; the elevations are well finished, and would group up well with the existing buildings.

Design C (Mr. Thos. J. Hill) has a plan with a feeling of directness. The prison-van entrance is not good, being from Mill Street only, which street is very narrow. Only one exercise ground is provided, and the cells are on two floors, not a good arrangement. The treasurer's general office is narrow. The elevations have been designed in harmony with the existing buildings.

Design E (Messrs. J. Stott & Sons) also has the van entrance from Mill Street and the cells placed on two floors; the distance between the charge room and the cells being considerable is not good. The first and second floors are well arranged, and the elevations follow in outline and detail the present building, with the façade with one unbroken face, which tends to give the observer the impression of a commercial building rather than a town hall.

Design F (Mr. F. Wild) has the prison-van entrance from Mill Street, and male prisoners would approach the cells through a portion of the females' corridor. The corridors as shown by the plans would be somewhat dark.

Design G (Messrs. Matley, Davies & Baker) is fairly good in general conception, but the separation of the units of the borough surveyor's department is not desirable, nor is the arrangement of following the line of Frith Street and thereby throwing the rooms at that end of the site out of square. The rental office is bad in proportion, being 70 feet long and only 17 feet wide.

Design I (Mr. Thos. Hilton) has a fairly well-conceived plan, but here again the approach to the female cells is not direct, and the prisoners must either go through the male cells' corridor or round through the parade room. The tower would be a costly feature for the position shown.

Design J (Messrs. J. Collins & Son) has the van entrance also from Mill Street. The corridors are narrow, and the lighting of the court room would be interfered with. The elevations group up well with the present buildings.

Design K (Messrs. Heywood & Ogden) has many points to commend it. In endeavouring to make a satisfactory arrangement of the old and the new portions the authors have exceeded the instructions laid down in the conditions by designing a new council chamber and new court room, with the result that they have been disqualified. We noticed an undesirable arrangement in the public staircases in the form of winders.

Design L (Mr. C. J. Taylor) has the van entrance from Mill Street. The supplementary entrance and exit to the cash-paying office would create draughts when in use, and the lighting of the court would be interfered with by the close proximity of the new buildings.

Design M (Mr. F. Sharp) has the van entrance from Mill Street and the cells placed on a floor below the level of the van yard. The entrance hall to the cash-receiving office appears wasteful, the corridors are narrow, and the magistrates' room is too far away from the bench.

Design N (Mr. Sidney Stott) has the van entrance from Mill Street. The corridors are narrow and the lighting of the court would be interfered with. The position of the cash-receiving office is bad, being placed on the first floor.

Design P (Mr. C. J. Taylor) is practically an alternative to his scheme L, and has similar faults with regard to the van entrance and narrow corridors.

Design Q (Mr. Frank Herne). We notice some of the cells are placed under the building above, with windows in the archway; and the scheme suffers through a lack of knowledge of the subject.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

In our issue of last week we gave the abstract of a paper read before the Royal Institute by Mr. A. A. Hudson on March 14, dealing with "The Business Side of Architecture." The main point emphasised by Mr. Hudson was the necessity of making the training offered in every architectural school of a highly practical nature. Under existing conditions he believed that the art side of the education was allowed to overshadow all else. Mr. Hudson discussed the many pitfalls which awaited the young architect who commenced practice with little or no familiarity with business matters. An interesting discussion followed, and this is reported below:—

Mr. E. T. Hall proposed a vote of thanks to Mr. Hudson for his great kindness in coming to read such an interesting and valuable paper. In addition to his eminent qualities as a barrister, Mr. Hudson possessed some of the judicial qualities as being one of the members of the Tribunal of Appeal. The paper had dealt very fairly with the many shortcomings of architects and had pointed out considerations of great value in the education of students. Of course, the art side of the profession was the one that had the greatest fascination for them all, but the practical side was extremely important. There were multifarious duties to perform towards clients; and these, though they might not be always pleasing, were at least interesting, because interest would always result from a determined attempt to master a difficult and troublesome subject. One of the many excellent points which Mr. Hudson had brought out was the necessity for students to be trained in the writing of specifications and the preparation of quantities. The student in studying quantities was doing a most useful work even though he may never practise as a quantity surveyor. Mr. Hall said in his own young days he had made a practice of studying them, and it had since proved of inestimable value to him both in the disposition of many features in the design and in the consideration of the client's pocket. Many architects seemed to think that the writing of a specification was a laborious and quite unessential undertaking. But it was, nevertheless, one strongly to be recommended, for it teaches the architect really to know about his building, more perhaps than the clerk of works or even the contractor, and it will enable him to come to a decision quickly. Yet another point about it was that the writing of specifications fostered a certain amount of literary style, for the writer had to express himself clearly and tersely. The question of cost to which Mr. Hudson had alluded was an important matter, so that the study and knowledge of the cost of a building is of very great value. The foresight requisite for the proper specifying of the materials and the various works to be carried out was only to be gained by an architect writing his specifications and training his mind to imagine all the difficulties which may later be met with. If this is done the client will be saved from the payment of large bills at the end. With regard to planning, it was now usual for the planning of the exterior to proceed *pari passu* with that of the interior. The custom prevalent thirty or thirty-five years ago of first getting a fine exterior and then fitting the interior to it as well as might be had fortunately died out. Mr. Hudson said that the result of the existing art education had been to produce a race of young draughtsmen of great ability, rather than a set of practical men. It was undeniably true that though draughtsmanship was good it was not architecture. An examination of the drawings made by the architect of York Gate showed that he would have been plucked at any architectural school examination. There seemed to be a great tendency at the present day to make draughtsmanship too prominent. The paper alluded to a house set on a hill top which had bedroom windows the whole width of the room. There was this much to be said in favour of too much window, that the sun which it admits is a germ destroyer, and the room would be, at any rate, a healthy one even though cold. Mr. Hudson had emphasised the necessity for an architect to act with the greatest fairness between the builder and the building owner, in view of the judicial or quasi judicial position in which he is placed under the contract. The architect who boasts that he is the master on his work and that he keeps the builder under his thumb i making a wild boast; rather he should boast that the builde is his friend and that the workmen are endeavouring to d what he wants. If the architect sets the builder at loggerheads he will never get good work out of him. One of the pitfalls that beset the architect's path is in connection wit supervision—a matter about which he is often not very clear It is iniquitous that he should be held responsible for wha he could not be expected to have seen. An architect canno spend the whole twenty-four hours on a job, and yet he i made accountable for what has been done in his absence Architects sometimes also get into trouble because they fai to keep their client regularly and quickly informed of th variations that are necessary in the building while in cours of erection. They should bear in mind that it is quit questionable how far any variation can be made without th client's knowledge unless the architect is willing to be hel responsible. Mr. Hudson was very wise in advising then to act in accordance with their conditions of contract; thi was only too frequently not done. Architects appear t imagine that they can work their own sweet will in everything, though this is far from the real experience of most The provision in the R.I.B.A. arbitration clause, that arbitration should not take place until after the completion o the works, was inserted as a check on any litigious contractor who could otherwise break the heart of an architect b constant recourse to arbitration. Mr. Hudson had take great exception to it; but in actual practice the clause i often ignored, as a reasonable architect and contractor wil hold necessary arbitration in the middle of the job whe that seems to be the desirable course. The conditions issue by the R.I.B.A. were the result of a very great fight betwee architects and the builders, and they were therefore more o less of a compromise. Mr. Hudson's advice that an arbitrator should at an early stage of the proceedings ask for cheque, or an undertaking from the solicitors to take up hi award and pay his fees was a most proper one. The neglec to do this often places the arbitrator in a most unsatisfa tory position. The suggestion made as to possibility of certain standardisation was fraught with the utmost diff culty; it was far easier to standardise engineering tha architectural work.

Mr. John Slater, in seconding the vote of thanks, sai that it was a great pleasure to have Mr. Hudson among the that evening. What he did not know about the busine difficulties that beset an architect was certainly not wort knowing. But after hearing the somewhat disparaging comparisons made in the paper between the present system architectural education and the old-fashioned pupilage it was impossible to help thinking that the lapse of twenty-five or thirty years had thrown a certain amount of glamour over Mr. Hudson's recollections of his young days. According to the experience of most people the average youth in an office did not, as a pupil, get very much instruction. They were certainly told to trace things and so on, but the instruction was not of a kind that went very far towards training them for the practical work of their after-life. Mr. Hudson had said that the scheme prepared by the Board of Education gave the idea that the young architect was compelled to study architecture as an art. But, as a matter of fact, the Board felt that practical work was the main thing. Mr. Hudson had also commented on the arrangement in the evening classes at the Architectural Association School whereby business matters are reserved for the fourth and final years, and then ten lectures are devoted to as many different subjects. But it might be asked whether such matters as dilapidations, light and air, contracts and agreements, specifications, and so on, could be taught in a school. As for the London Building Act, they had been practising under it for years and years, and had not learnt it yet. Indeed, with many of the matters that Mr. Hudson appeared to think should be taught in the school it was doubtful whether they could be satisfactorily learnt in that way at all. For instance, was it possible to teach a young student the various data and facts that relate to an arbitrator's work? The probability is that before he becomes an arbitrator the young architect will have gained experience in giving evidence in such cases. An architect should no doubt know all about such things, but there were very great difficulties, if not impossibilities, in trying to teach him all these things in the school. Mr. Slater said that long ago he had been told by a Q.C., as a piece of advice, that more cases were lost by trying to make them better than they were than by any other way. This had proved to be quite true. The only advice that he would venture to give was that the young arbitrator should not be cajoled into explaining his reasons for any decision come to. He could quite endorse the advice that an architect should make up his mind quickly whether work carried out by the contractor was to his approval or not; it was a very bad thing for the architect to say that he would give his decision later.

Mr. W. Woodward said that he must disagree with Mr. Hudson's suggestion of standardisation. As to arbitrations he hoped that clause 16 which gave the architect absolute power as to materials and workmanship would be modified. He had a case before him at the present time in which he felt convinced that the architect had rejected certain materials owing to lack of knowledge, for they were of the best quality possible. There ought to be a guard against a decision of that sort. He would like to warn every young architect that sub-contractors are a pit-fall which should be avoided, for he had found that the fewer sub-contractors there were on the job the better. They were a nuisance to the builder, and ultimately became a nuisance to the architect. The builder ought to be given greater control than at present. It was perfectly true, as Mr. Hall had said, that a knowledge of quantities and the leading prices would prove of the utmost value to the young architect; if he was an art architect he would not find the knowledge interfered with his art instincts, but he would find that he was a master of the building when he gets on his job. Mr. Woodward recommended every student to read carefully the list of points prepared by Mr. Hudson on which litigation might arise, for they included all the causes he should keep prominently under his consideration. Particular attention should be paid to the risks incurred in unauthorised alterations and additions, for it was so easy to allow addition after addition to run on without telling the client until the inevitable quarrel had occurred. In concluding, Mr. Woodward said that the paper was brimming over with information. It came from one who had been an architect and who was at the present time a very successful lawyer.

Mr. W. H. Atkin Berry said that the paper and its subsequent discussion reminded him of a discussion many years ago in that room as to whether the art side or the business side of architecture should receive the greatest consideration. Professor Aitchison had then said that if he wanted to select a baker he did not ask him if he knew the ancient history of the trade, but he asked him, "Can you bake bread?" Professor Aitchison believed that we may easily waste too much time in discussing historical questions; what he would ask a young architect was, "Do you know your business?" Mr. Hudson had spoken in his paper of "the desirability of putting the specification for the ordinary requirement of every-day practice into standard form." The proposal was a rather alarming one, for it threatened to crush out all individuality and leave nothing for the architect to do except to become a sort of architectural sausage-machine, out of which a building would come to the entire dissatisfaction of everybody.

Mr. H. P. G. Maule said that for seven years he had had control of the Architectural Association Day School. In that course of time two things had been most particularly borne in upon him. The first was the immense scope of an architect's calling and the amount of things he has to know; while the second was the danger of overcrowding the curriculum and giving the student not education but confusion. There were two ways of looking at education: one was to regard it as a sort of cramming-box, and the other was to try, in the very limited time, to train the student in principles so that he may apply in detail his own knowledge. Mr. Hudson had alluded to the fact that there was only one lecture given up to the London Building Act; it was never claimed that a single lecture would make a student proficient in the Act, but it might indicate to him the principles underlying the Act and enable him to tackle later its difficulties. So far from putting such things in the curriculum it seemed to him to be shown that they ought to be kept out. Ninety-nine per cent. of the A.A. students went into an office as pupils at the end of their two years, and their training was not ended at four years. Mr. Hudson had apparently written his paper from a study of the curriculum and not from a study of the actual work done in the School. A great deal was talked and thought about the education of the young architect, but comparatively few people had had to do with the handling of students. The more one has to do with them the more one feels how dangerous it is to go fast. In the school the pupils were trained in writing about the work they were doing and about the visits paid to various buildings. In his opinion, if a student had a fairly solid knowledge of his materials and of the workmanship he will find little difficulty in writing his specification. There were various other points raised by Mr. Hudson which he would hardly have made if he had had more first hand knowledge. The paper certainly showed that architects should not be content with a slight education. It was impossible for a student to cover all the ground he will meet with when he gets into practice, so that it would be an advantage if he had some further opportunity of acquiring knowledge.

Mr. Max Clarke said he would like to support the proposal as to standardisation. It had been stated in the discussion that bricks cannot be standardised; but they had not learnt that architects take the trouble that the various kinds of brick should work in together. The Science Committee were at the present time engaged in trying to get information with regard to the standardisation of paints; and they had arrived at a state of unutterable confusion. It was known that 50 per cent. of the material is not paint at all. Mr. Max Clarke said that he had brought before the Science Committee a specification of timber; 50 per cent. of the present day specifications are of timber that cannot be got. It would be an excellent thing to put, not only before students, but before the members of the Institute also, a description of materials that cannot be got in this country. The specifications in use contain clauses which are copied from generation to generation and include things that are not now obtainable. The same kind of thing occurs in plasterers' work.

Mr. Hudson, in acknowledging the vote of thanks, which had been carried by acclamation, replied to the various points raised by the speakers. With regard to the School, he thought the teaching should be on the basis of the architect asking himself, "How is the thing to be described and what will it cost?" There ought to be no tendency towards making pretty drawings. Mr. Hudson said that as he walked down a street and saw the buildings he often remarked to himself, "That was a pretty drawing, but it is a wretched bad building." The architect should see the building in its very worst light and not in its very best on paper. He was still of opinion that it was quite possible to make the work a great deal more practical. With regard to his proposal of standardisation, he would only say that there was the greatest difficulty in getting any one clause of the specification written correctly. It would be of the greatest value to architects if they had every description of wrought masonry put on paper correctly, for there was more litigation about masonry than anything else. Mr. Hudson concluded by saying that his only desire was that the profession of an architect should advance by great strides.

## CHURCHES AND CLOISTERS IN PORTUGAL.*

*(Continued from last week.)*

### *Batalha.*

BETWEEN Alcobaça and Batalha is the meagre little village of Aljubarotto, in the vicinity of which took place on August 14, 1385, the great battle which secured the independence of Portugal for about two centuries. In passing through the village I noticed a mutilated pillar or cross, close to the quaint tower of the humble village church, a great contrast to the magnificent Dominican abbey church erected in commemoration of the battle of Aljubarotto some nine or ten miles away at a place then called Pinhal, but now Batalha or "Battle."

BATALHA ABBEY—FROM SOUTH-EAST.

As already stated, the victor in this battle, King John I., soon after it married an English princess, Philippa, daughter of John of Gaunt, and therefore grand-daughter of the English King Edward III. The abbey was started in 1387 or 1388, and possibly to this English union may be attributed some of the features we see in its architecture. For instance, unlike Alcobaça (so much earlier in date) and Belem (so much later), we have the clerestory, as in England, but no triforium, as the roofs are practically flat and covered with stone slabs on top of the vaulting. There are no western or central towers. There is a small bell tower in an unusual position, rising from a thick wall north of and continuous with the western wall of the north transept.

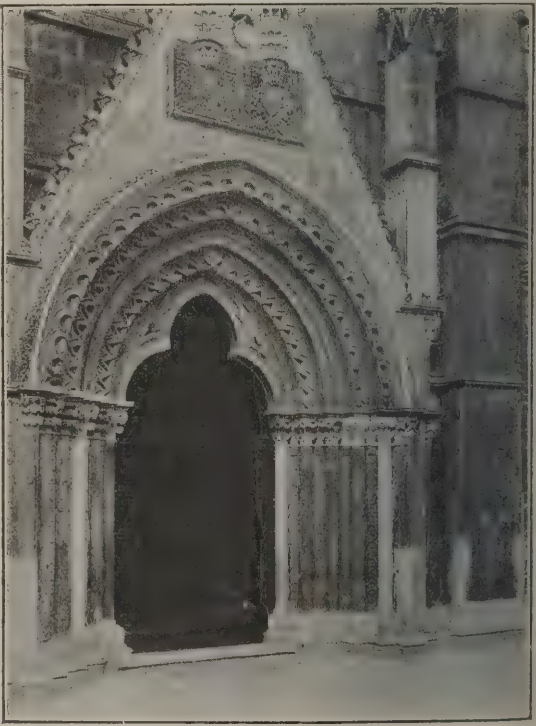
At the south-west corner of the nave is the large Founders' chapel, which we will come to later.

The whole of the buildings are constructed of a beautiful fine limestone, like that of the tombs of Pedro and Inez at Alcobaça, which acquires a beautiful old ivory tint by exposure, except where damp and in the shade, when it goes nearly black; hence the weather stains on the north side of the church are very marked in vertical lines.

Just as we arrived at Batalha a heavy rain shower of about ten minutes' duration had just ceased, and the sun shone brightly. The effect was marvellous. The atmosphere was brilliantly clear, the gargoyles were spouting forth jets of water from the flat roofs, a film of water was still standing on the paved courtyards to the west and south of the church and reflected its architecture and the blue sky above with a fairy-like effect.

The total length from east to west, including the remarkable unfinished chapels at the east end, is 416 feet, but the church proper is not really large, its internal length being 260 feet. It consists of a nave of eight bays 27 feet wide by 90 feet high, with north and south aisles measuring 72 feet from north to south. The transept is 121 feet long without aisles; there is a short choir and central apse to the east, and on each side of this two apsidal chapels about half the height of the choir and central apse. There are fine ranges of aisle and clerestory windows.

The church, so far, was finished in 1415, when the queen died and was for the time being interred in front of the high altar. The king then set to work to build the large "Founders' chapel," already referred to, at the south-west corner of the nave, to receive her remains and his own. This was finished about 1433, when the king died, and he and his wife were buried in it. The chapel is square on plan, 82 feet over all each way (internally 66 feet square), with a central octagon 40 feet over all diameter, which rises up above the flat roof of the square, and is said to have been surmounted by a spire or octagon roof of open-work tracery which was destroyed by the earthquake of 1755.



BATALHA—SOUTH DOOR.

In the centre is the tomb of the king and his wife Philippa, with Latin epitaphs of portentous length, their effigies on top, side by side, with their right hands clasped together. One feels it was a scene like this that inspired Matthew Arnold's beautiful lines in his "Church o Brou," "So rest, for ever rest, O princely pair"—too long to quote here, but which must appeal to every architect on account of their exquisite word-painting of an architectura interior. In recesses of the south wall are the tombs of thei sons, Pedro, Henry (the Navigator), John and Fernando (o these only Henry's has an effigy, and his tomb displays the English Garter). The eldest son and successor, King Duarte (*i.e.* Edward), and his queen lie in front of the high altar, their effigies also having clasped hands. This king only lived five years after his accession, but he commenced the most remarkable feature of the abbey called the "Capella Imperfeita," or unfinished chapel, which stands at the extreme east end with a central octagon 65 feet in clear diameter surrounded by seven apsidal chapels 25 feet deep, one on every side of the octagon except the west, and between these chapels little low chambers intended to be the actual resting-places of those members of the Royal family who were expected to lie there.

*(To be concluded.)*

## MODERN COLD STORAGE AND REFRIGERATION.

By W. S. Douglas, B.Sc.

### VI.—THE REFRIGERATING MACHINE (*continued*).

*(Continued from last week.)*

THE difference lies in the machine itself. In designing this we are still faced with the same problem; a low pressure must be produced in the evaporating coils to bring about evaporation and consequent absorption of latent heat; and a high pressure must be maintained in the condenser to cause, with the aid of the cooling water, liquefaction of the refrigerant. The problem, in vapour compression machines, is solved, as we know, by using a mechanical compressor. But in absorption plants, owing to a peculiar property possessed by ammonia, this appliance is eliminated. The property referred to is the powerful affinity existing between ammonia and water, which, as is well known, will dissolve more of this gas than of any other, and its application will be seen by considering the diagram given in fig. 19.

This shows the five principal elements of the machine, namely, the generator, condenser, evaporator, absorber, and circulating pump. We are already familiar with the evaporator and with this we have nothing further to do. Tracing out the rest of the cycle, we may start from the generator, which consists of a vessel, wherein strong ammoniacal liquor (*i.e.*, a strong solution of ammonia in water) is heated by means of steam. The effect is to drive off the ammonia as a gas and to force it in the direction of the arrow into the condenser. This is separated from the evaporator by an ordinary expansion valve, which, if closed, will cause the pressure of the ammonia vapour to accumulate until, with the aid of the cooling water it is sufficient to bring about its own liquefaction. The liquid is then allowed, by slightly opening the expansion valve, slowly to escape into the evaporator, where it is vaporised and absorbs heat from its surroundings in the usual way. The vapour passes next into the absorber, into which at the same time the weakened liquor from the generator flows at a definite rate through the regulating valve shown. The absorber is kept cool by circulating water, and the weakened liquor by reason of its strong affinity absorbs the gas coming from the evaporator, thus forming once more a strong solution which the circulating pump forces back into the generator. The cycle then starts afresh.

This is the crude form of the cycle, and, if the machines were carried out exactly on these lines, there would be two important sources of loss. To avoid these two refinements have been introduced involving two extra pieces of apparatus. Firstly, the weak liquor coming from the generator is naturally at a high temperature, and, for economical working, must be cooled down before being allowed to enter the absorber. This is accomplished by means of a heat exchanger, through which the weak liquor flows in one direction, and the strong liquor, coming from the circulating pump to the generator, in the other. The result is that the cold strong liquor is heated and the hot weak liquor cooled, a mutual benefit being effected. Secondly, the heat acting on the strong liquor in the generator always drives off a certain amount of water vapour together with the pure ammonia. The vapour is therefore passed through an analyser and rectifier, into which the strong liquor coming from the absorber is sent, after leaving the heat exchanger. The effect is to separate out the water vapour from the ammonia and give it to the strong liquor, leaving the anhydrous gas (*i.e.*, gas freed from water) to enter the condenser. The strong liquor then goes on to the generator, having passed through, on its way from the circulating pump, two pieces of apparatus—the heat exchanger and the analyser. Yet another economy may be effected by allowing the steam cylinder which drives the pump to exhaust into the generator, thus utilising the waste heat of the steam.

Fig. 20 illustrates a practical form of the machine, as made by Messrs. Ransomes & Rapier, Ltd. The long cylindrical vessel on the right is the generator, on top of which is mounted the ammonia circulating pump, consisting of the pump proper and a direct driving steam cylinder. The four vessels on the left, reading from bottom to top, are respectively the condenser, absorber, exchanger, and rectifier, and the remaining element—the evaporator—is not shown. This may be made in the form of an insulated brine tank, as previously described, or it may consist of direct expansion piping, located in a cold store, ice making tank, or other position, according to the purpose in view.

The advantage of these plants is that there are very few moving parts, the compressor, which is necessary in the vapour compression machine, being replaced by the small liquid circulating pump. Minor expenses, such as packing renewals, lubricating oil, &c., are, therefore, saved, and the number of wearing parts is reduced to a minimum. Against this, however, must be set the complicated pipe connections and general intricacy of the machine. These render it quite unsuitable for small plants, although in larger sizes it compares favourably with the compression machine, when driven by its own or separate steam engine.

Another disadvantage is the high water consumption. Exactly the same amount of water must circulate through the condenser as in the compression machine, but in addition we have to deal with the absorber. This must be kept cool, and, to counteract the tendency of the temperature to increase, on account of the dissolution of the ammonia, a continuous circulation of cooling water must be maintained. The water already used in the condenser might, of course, be afterwards sent through the absorber, but it is much better, for the efficiency of the machine, that a separate supply should be provided. Hence the total consumption is very large.

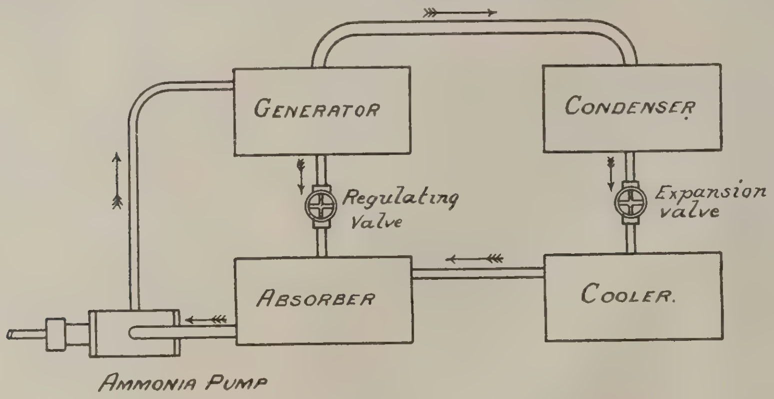

Fig. 19.

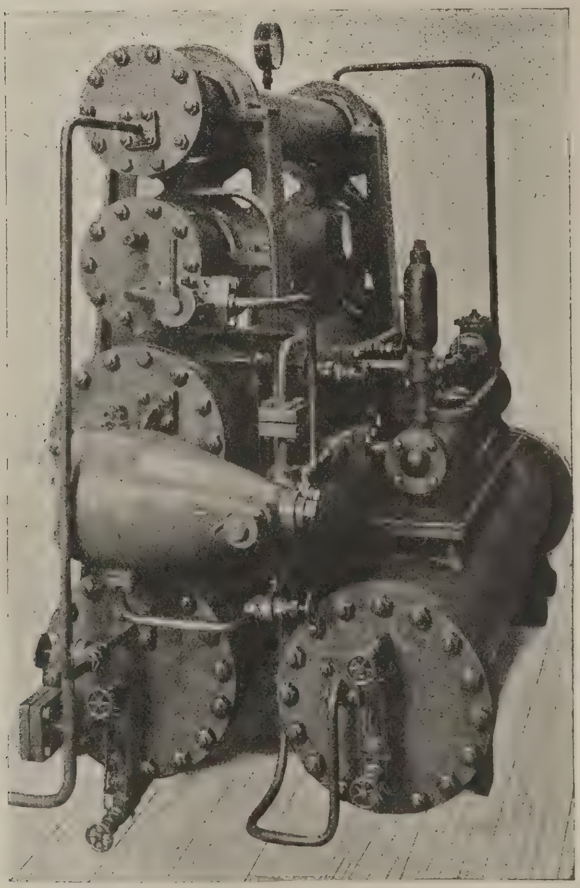

Fig. 20.

When working with steam specially generated, the absorption machine does not compare with compression plants for economy, especially if the latter are driven by gas engines operating on suction gas. But, where other steam plant is in use, a very considerable saving can be effected by running the exhaust from the various engines into the generator coils of the machine. Then, instead of the latent heat in the exhaust steam being wasted on the cooling water in the steam condenser, it is usefully employed in heating the ammonia liquor. The saving of fuel will in fact amount to some 40 per cent. when an absorption machine is used, in conjunction with compression plant already installed, although on the other hand the interest on the capital expended on extra plant has to be considered.

*Cold Air Expansion Machines.*

These machines were at one time used to quite a large extent at sea, as they work with ordinary atmospheric air, but at the present day they are practically out of date.

The air is sucked from the cold rooms into the compression cylinder of the machine, is there compressed, and afterwards deprived of its heat of compression in cooling coils. It then passes into the expansion cylinder, where it expands, doing useful work on the piston, and at the same time reducing its own temperature (heat being taken from the air and converted into work). In this state it is allowed to escape back to the cold room and effect the necessary cooling on the objects stored.

There is, therefore, a continuous circulation in the cold chambers, and there is no evil smelling gas to escape from the machine should a leakage occur. But, unfortunately, two cylinders are necessary—one for compression, and another for expansion—and this means a large increase in the loss by friction. In fact, even the best cold air machines absorb two to three times the horse-power taken by corresponding plants, using vapour compression. In addition to this the machine is very bulky, and minor troubles, such as the choking of the air passages with snow, &c., are found to occur.

*Water Evaporation Machines.*

These machines act on a principle somewhat similar to vapour compression. Water is evaporated at a reduced pressure caused partly by a pump and partly by absorption of the water vapour into concentrated sulphuric acid, and for continuous working an extra pump is provided in order to exchange the diluted acid with the concentrated. Machines of this type are now used only for domestic purposes and even then are very seldom found.

(*To be continued.*)

## ILLUSTRATIONS.

### CATHEDRAL SERIES, LLANDAFF.—THE SOUTH DOOR.

We this week complete our illustrations of Llandaff Cathedral, with a view of the South door and a measured drawing by Mr. W. Eaton of the West door.

### SKETCHES OF STAIRCASES.

The sheet of measured sketches of staircases by Mr W. Eaton are mostly of well-known examples, and at least speak for themselves.

### COMPETITION DESIGN FOR BERKSHIRE COUNTY COUNCIL OFFICES, READING.

The accommodation has been arranged for on four floors, with a basement below; good and well-lit corridors and a wide staircase with passenger lift opposite providing means of communication between the different departments. Externally the elevation to the Forbury has been treated in a dignified manner, ornament and sculpture being sparingly used; this front and the side and the back elevations depending upon good lines and proportion rather than elaboration for their effect. The offices of the clerk of the peace and one of the committee-rooms have been placed on the ground floor with direct access to the Assize Court hall by means of a wide corridor, with an inquiry office and committee-room near. The offices of the education secretary are on the first floor, together with the committee-room. The county surveyor is upon the second floor, care having been taken to give the drawing office and the assistant-surveyor a good north light. The county treasurer and the land steward are located on the third floor. The cost of the building (including 1,500*l.* for fitments and lift) was estimated at 15,850*l.* The design was prepared in competition by Messrs. Gibson & Robertson.

## PRE-HISTORIC POTTERY IN PERU.*

PRE-HISTORIC man and his methods of life may be best studied by his pottery: it is one of the earliest and simplest of crafts, for by means of baked clay, with his fingers and the most elementary tools of wood or stone, he could shape his cooking pots or gods, his jugs, bottles and urns, and these have as much interest to the archæologist and art student as nature's earthenware fossil plants, and those of animal life which are

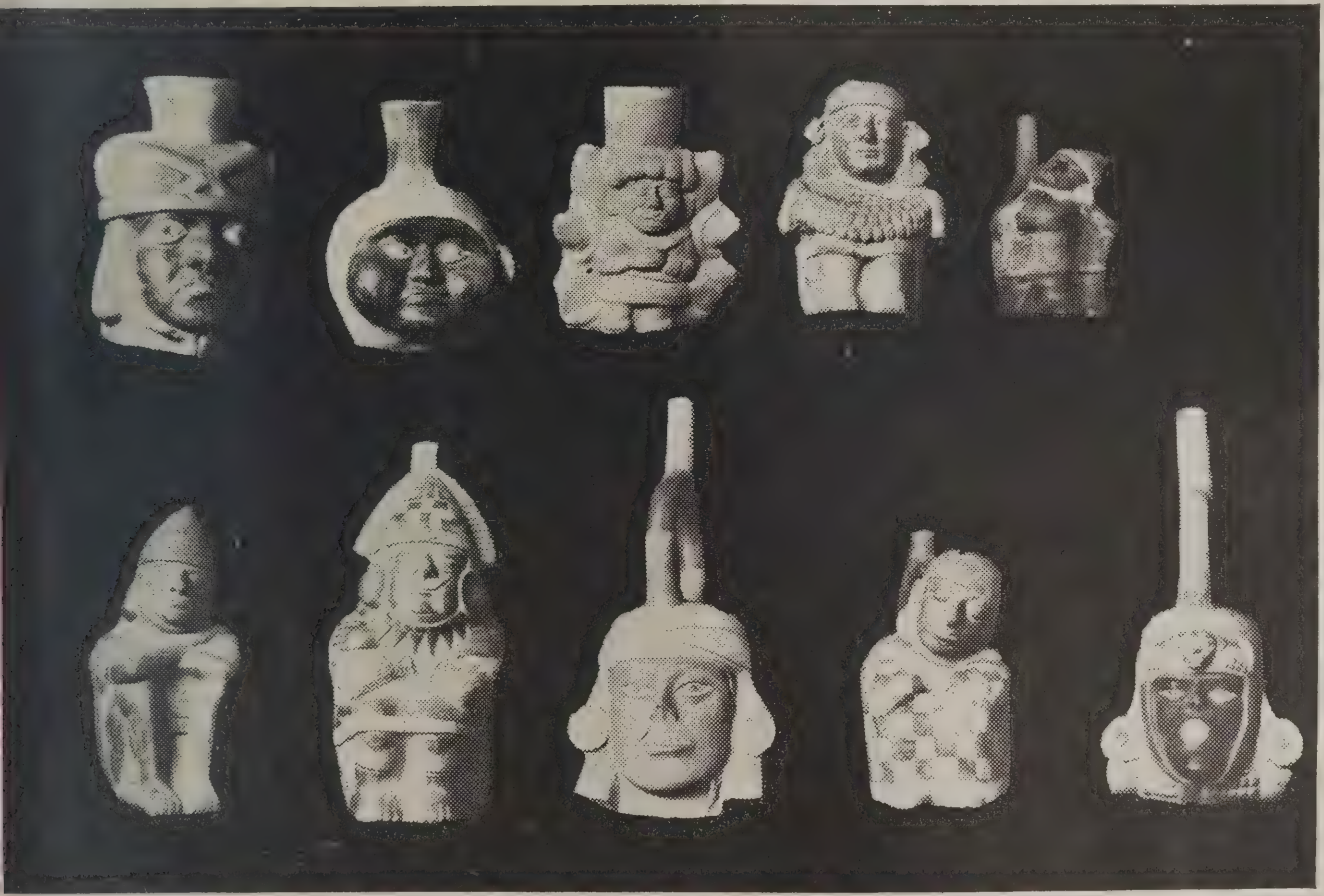
"In the ages lying
In the buried past of the earth"

have to the geologist and the students of botany of the ancient world.

I have seen the pottery discovered by Mr. Hewitt Myring and he has been good enough, at short notice, to lend me many photographs, some of which are here reproduced.

I hope that we may, before long, see some of his specimens in Manchester.

Mr. Myring is a mineralogist and mine owner, and while waiting for assistant engineers' reports, he, being in South America, visited the Chincuna Valley in Peru, and seeing some sand ridges there he obtained assistance and explored them with the view of finding something in the Inca graves; but the race before the Incas, the ancient people, the Chimus, had used this valley as a cemetery, and the result has been the discovery of many hundred pieces of probably the most ancient pottery in the world, the product of a lost civilisation, possibly 10,000 years old.



The pieces are in the best state of preservation, for there is no rain in Peru and the silicates in the earth have arrested decay; even metals thus buried oxidise very slowly.

The climate in the valleys of Peru is similar to that of Egypt and probably drier; it is an accepted fact that iron resists oxygen, except when damp; iron does not rust in dry oxygen; sycamore planks and cases in the Cairo Museum have no sign of decay although 4,000 years old; there is an arm-chair there nearly as good as new about 3,000 years old, which I saw the other day.

No alphabet has yet been discovered, no language has been found, and in the absence of proof opinions differ about the age of this pottery. Symbolism is the parent of the alphabet, and we owe much to China and Egypt for its elucidation; there it took thousands of years to blossom, and the supreme partnership between the tongue, the eye, the ear, and the hand at last gives us the written word that will in scorn of time for ever silently speak to man.

When the Spaniards destroyed the Inca civilisation and murdered their leaders, even then the native language was uncouth, and calculations and accounts were kept by knotted cords.

It is difficult for us to believe that these people, with their symbolism in this pottery, should have had no alphabet and no method of record. They must have had some, unknown at present, and that is the quest that should crown Mr. Myring's work, if his health permits; then we shall hail him as another Rawlinson, who discovered the key to unlock the doors of ancient Babylon.

When looking at the Peruvian pottery we cannot escape the feeling of Chinese and Indian influence, and then again in looking at the head-gear we feel an Egyptian bias; indeed, the Egyptian pottery of any dynasty except when under the influence of the Greeks, after clay from Europe had been used, is not equal to the best of these Peruvian specimens, for the modelling of the human face is human and startling in its art; there we find dignity and even laughter, the muscles of the cheeks, and the wrinkles in the skin, and the flexibility of the nostrils all show great care, skill and art.

The signs on some of the figures suggest Egyptian influence; it may be natural independent evolution, but it makes us wonder if Atlanta was not more than a dream of Plato's, when he wrote that beyond the pillars of Hercules (Gibraltar) there was a large island in the sea.

Peruvian and Mexican art bear traces of evolution and progress almost identical with early Egyptian work, but stopped half-way.

Professor Zerffi, in "The Historical Development of Art," says:—

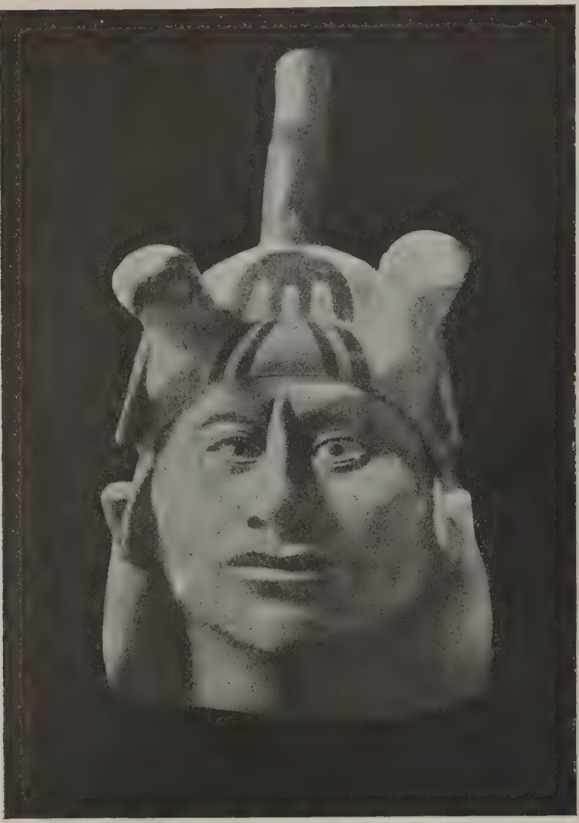
"By some means Atlanta was separated from the East, and the pyramids, temples and palaces of Central America remained in the same relation to the pyramids, temples and palaces of Egypt as the tapir to the elephant, the alligator to the crocodile, and the llama to the camel."

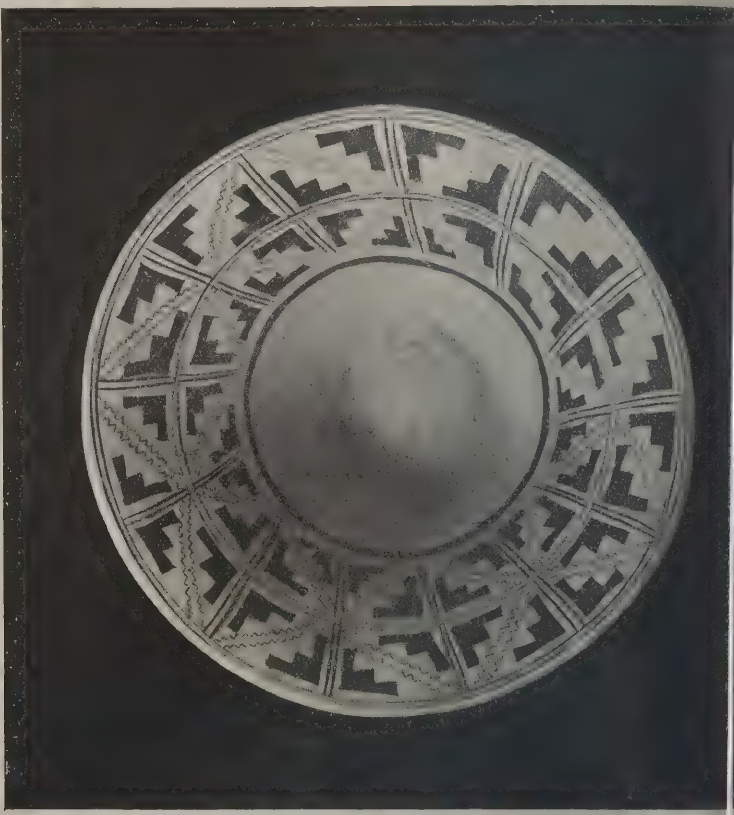
One of the gods discovered in Peru, notably one carved from a lava block, has a head strip like a sphinx and is also like the goddess Isis. The word God is similar in the west to the Deus of the east, for in Peru it is Teotl. Sepulchral mounds are similar. Astronomy had made similar progress in both places.

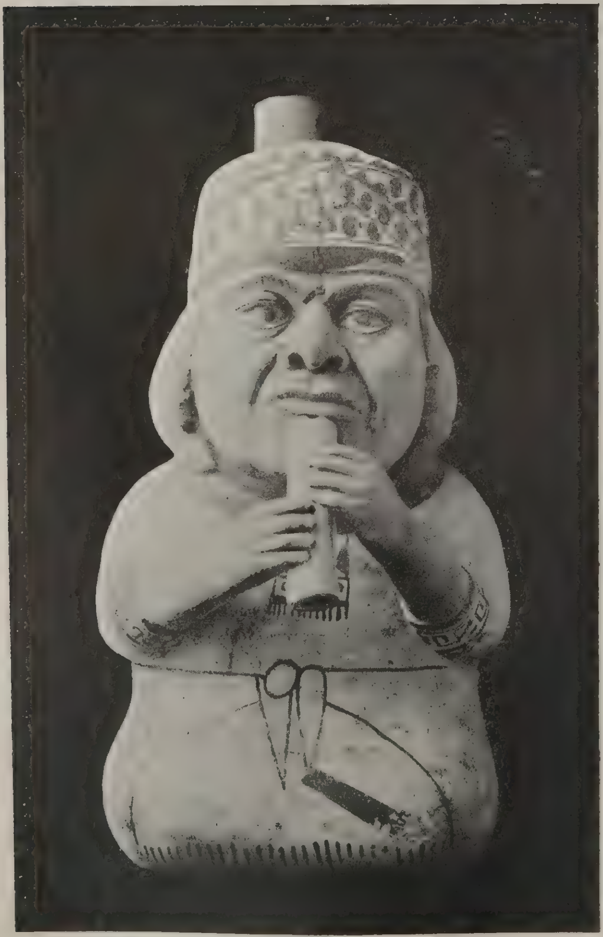
---

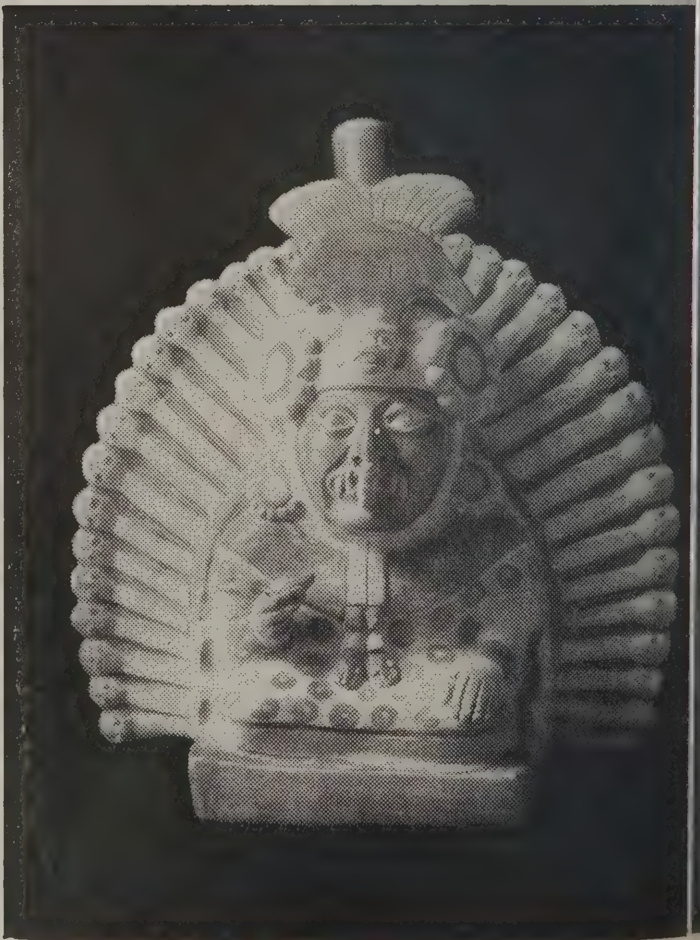
* A paper on Mr. Hewitt Myring's discoveries, read by Sir William H. Bailey before the Manchester Literary and Philosophical Society on March 8.

As I have said, wood and clay were shaped by primitive man before he began to use iron or bronze; pottery is the easiest, for few tools are required; those who could mould and shape clay were in the right way to make bronze statuary. The artists of Samos were the first to run metal round a clay model, probably about 600 years before our era; but it may have been anticipated by the Chinese, as









they were far in advance of the Greeks and probably the Egyptians in pottery, and are yet; but the bronze age follows that of the clay if the right metal is available.

This pottery discovered by Mr. Myring has one remarkable, one important, quality—no two pieces are alike. We thus see that the ancient moulders had made one great step in human progress, for they did not copy each other. There is individuality in each figure; the serfdom of habit and custom and tradition did not govern their work; such workers must have had intellectual liberty and original genius, which might have made a great future, but from some unknown cause that progress seems to have been destroyed, and left little trace behind.

There are several hundred examples of this Peruvian pottery brought over to this country by Mr. Myring.

About one-third of those discovered have been secured for the British Museum, and may be seen any day in the cases in the porcelain rooms.

The Sun God is in Mr. Myring's private collection, and it will be seen that the figure has a helmet and a number of serpents with their heads at the outside edge of the nimbus.

These pots were buried with the dead, and like wreaths at our funerals are supposed to be evidences of love and respect of friends and relations.

They vary in shape and size; some are portraits, some are animals, birds and fishes; the turtle, the owl, and men and women are here; some laugh and others are full of dignity; one is the face of a man winking with one eye; one face is asleep, it may be the sleeping sickness; others show signs of misfortune, of disease—it has been surmised that such indicate the cause of death; others seem to provide for the comfort of the departed in the spirit world, some for food, others for water; others have gold and silver pellets, probably for fare money at the ferry. No stamped coinage has been found. The gold and silver is hermetically sealed on the false bottom of the jugs and vases, for the bottoms have been baked into position.

Some jugs have a whistle in the spout, pandean pipes are represented, and one is the figure of a man playing a flute, and bugle horns made of terra-cotta that make a pleasant sound. One figure shows a man with cymbals.

Weapons are not much in evidence, one man has a mace and the spear and shield seem to be the only weapons. Neither bows nor arrows have been discovered. No horses are to be found; there is a beast like a hornless antelope; birds are somewhat abundant, several owls and a bat-like beast, and stags and frogs are imitated. The bugles end with a dog's head; there is a walrus, and something like a Welsh heraldic lion is biting a man. Parrots are represented and also ducks and fish are here. One specimen of the finest is a learned doctor with a plumed head dress, one—probably the finest—believed to represent a Chimu chief or a wealthy law giver; one represents a seal eating a fish, and known and unknown effigies of the animal kingdom are in this collection.

The faces represented are doubtless portraits, and look English or German; some would be taken as easy going Dutchmen sitting in the market place at Haarlem, waiting for custom, broad faces and intellectual, and the workmanship equal to any of the portrait jugs in vogue in this country in the eighteenth century, and in some cases better art; the vases and dishes are beautiful specimens of ancient ware.

We can only guess at their meaning; some are painted as well as moulded but all scarcely bear any indication of what we call the hand of time.

The bars of silver that were buried with this pottery have oxidised nearly away; some bars that were about an inch square have dwindled down to about one-eighth of an inch. Comparisons have been made with the oxidation of silver buried 400 years ago by the Incas in the same soil, which being so full of silicates preserves metal; the silver is only slightly tarnished. This and the utter disappearance of the baser metals give reasons for assuming the age of the pottery to be anything between 5,000 and 10,000 years old.

Mr. Myring has also discovered more modern Peruvian antiquities, a large silver god and a gold crown of one of the Inca kings and some jewellery.

All archæologists and students of art and antiquity are indebted to Mr. Hewitt Myring for his great and priceless work in Peru. Single-handed, at great personal danger and cost, he has contributed to our knowledge of ancient man and a buried civilisation, and earned our gratitude, and also made a reputation which will cause his name to rank in history with those of Layard, Rawlinson, Loftus, Professor Flinders Petrie, and other illustrious explorers.

## THE SOCIETY OF ARCHITECTS.

A LECTURE, entitled "The Art of the Plasterer," was delivered before the Society of Architects on Thursday, March 10, by Mr. Geo. P. Bankart.

The lecturer said that when Mr. Butler had written to him, asking if he would give a paper on the subject of plasterwork, he (the lecturer) had replied asking which side of the subject he would like, whether the historical, technical, or modern side. The reply, which Mr. Bankart said had placed him rather in a quandary, was that it would be very nice if he could combine the three. The subject was too large to take in all of its branches. He was, however, not going to give a formal paper, but a selection of slides and a general chat.

Continuing, Mr. Bankart said:—The chief point I want to drive home is this, that in whatever age the "art of the plasterer" was practised the greatest result was attained by the proper development of the different kinds of material that were used. That is the chief point I want you to bear in mind right the way through viewing the slides.

The immense variety that took place in the modelling and handling of the decorative work was due almost entirely to the difference in the nature of the plaster that was used;

and, historically, I want to classify these plasters into four distinct headings. First of all the "Stucco-duro" of the Italians (or carbonate of lime), that is to say, it was the "limestone" of the hills, which was thoroughly well burnt and slaked for a large number of years, thoroughly thumped and knocked about, and so toughened in that way that it became very flexible and very malleable; so malleable, in fact, that the die-sinkers used it in preference to wax for die-sinking.

The next division is the "Pargework," that is to say, the ordinary lime sand plaster that was used (and that we know) for parging flues, differing from the ordinary lime-plaster in that it contained road scrapings, cow-dung, and ox-hair. Then we have the third division, the "Plaster of Paris," which was introduced into this country in Henry the Seventh's reign, although in general it was not much used until Elizabeth's. Then we have our modern process of casting in fibrous plaster, which is also plaster of Paris (sulphate of lime).

The use of stucco-duro was known as far back as 3,500 years B.C. Stucco-duro had been exhumed in the early part of the sixteenth century, and in this series of slides, obtained from the tombs at Rome, executed in the first half of the century, you can see the actual marks of the metal tool. This work was modelled *in situ*, and was not intended to be seen by daylight, consequently perhaps some slight imperfections were excusable; but the work was very fine and wonderful for all that, and coloured also.

Later, a band of artists, trained by Raphael, executed much work in Italy and France. The photographs seemed to indicate that some parts of the work were cast and stuck up. One photograph distinctly showed the foundation or inspiration of the English school of flat relief work, and I think I may safely say this absolutely flat decoration is again being revived in a healthy way. Troubles followed in Italy, and this band of artists had to escape from Rome and were scattered. Some went in one direction, some in another. Some went to Florence, some to Venice, and some to Mantua, where a school of modellers was founded in each place. The art spread all over Italy, and from there to France, where Primaticcio decorated Fontainebleau for Francis I. This, however, was by no means the first stucco work executed in France.

The first stucco-duro work in England was carried out at "Nonsuch" Palace, on the hills between Epsom and Cheam, Surrey, from where the art, fostered by the Italians, spread, sooner or later, to Longleat. An English plasterer named Charles Williams, who had modelled at "Nonsuch," and travelled in Italy, carried out the Longleat work, and that on the walls of the giant's chamber, &c., in the first Hardwick Hall. This first work was of very simple character. In the later hall the frieze in the throne (4 feet 6 inches deep) was done by men trained by Chas. Williams, and coloured in tempera. The leaves were simply dabbed on in large groups, and shaped with a small metal tool or trowel, and slightly undercut at the same time. They were done very quickly and simply. Sometimes the birds and animals were painted on the groundwork instead of being modelled.

It was found that the material was rather difficult and inconvenient to procure in those days in this country, because of the marble dust and other ingredients that were necessary; and the art did not live long in the hands of the English plasterers after the Italian fashion, but the Englishmen stuck to their parge-plaster and developed an art of their own. The first development in the English plaster ceilings took place in the form of very simple panellings formed by beaded mouldings, with little bits of sprigs of modellings stuck at the mitres and angles, and with rosettes, &c., in the panels. Then they added simple rounded mouldings, and this gradually grew, as shown by the slides, until they covered the ceiling all over with easily repeating arrangement of panelling. This sort of thing continued to develop by degrees, and although the modelling is very, very simple, I think that the work of this period was perhaps the purest. The leaves nearly all took a slight concave form, with now and again convex lumps of flowers, fruit, bosses, and heraldic bearings.

Now we come to the exterior pargework. This type of work was done practically all over the country, and in London particularly, before the time of the Great Fire in 1666. The timber construction of the buildings was covered mostly all over with this parge plaster stuff, which was as tough as leather, and weather-proof. Old engravings of London pageants and street processions show this very clearly. The work was of a simple type, put on with a trowel *in situ*, in panellings and flowerings in between and under windows, across beams, and in the gables and oriel coves. I am sorry to say the examples shown have been a good deal filled up with whitewash. One very interesting feature about this pargework is that you can, in Essex, Norfolk, and Suffolk (particularly Norfolk and Suffolk), drive through various districts and every few miles can mark quite a distinct change and type of work, showing that it was done by the native and local plasterers or "daubers," or perhaps masons, and that they worked in their own little radius, and had their own set of patterns, which they varied. Then we come to the same material used inside buildings. The examples shown were of overmantles and friezes in cottages at Barnstaple and elsewhere, showing that the art was by no means confined to the larger buildings of the wealthy, but that it was general.

Then we come to the Elizabethan period. We have an example in Burton Agnes, which is attributed to Inigo Jones, and I want to call your special attention to this, because, if this is so, it was done before his visit to Italy, and was done by traditional craftsmen. The piece of work referred to was from a semicircular vault once existing in Burton Agnes Hall, long since perished save but the fragment shown. The work was modelled scrolls of roses, done *in situ*, and coloured. This was one of the most beautiful bits of modelling we had. There is only a small portion of it left. Jones's work after his visit to Italy is absolutely different and distinct; it is more set and orthodox Renaissance work, and without the freedom and life there is in this earlier work; very stately and fine work all the same.

Other slides illustrated in great detail the drawing-room ceiling at Speke Hall, Lancashire, where there are many panels between beams, all different in design. Each panel is different in detail and type of flower, growing from a set rhythm and stem work.

Several very interesting examples of ceilings of this type of work, in which the stem work was modelled direct into the ceiling, partly pressed with a die or stamp, and partly cast and stuck up so far as the flowers and lumps were concerned, were illustrated, including work from Kellie Castle, Fifeshire, with a full explanation of how each example was done, attention being specially drawn to the resource of the builder, or architect as he was then, in taking advantage of the opportunity given by the rooms formed in the roof space and the quaint constructional developments afforded by this means, which were taken advantage of.

Slides were shown of the flat ceiling of Queen Victoria's bedroom at Holyrood Palace, Edinburgh, by kind permission of His Majesty the King, who enabled photographs to be taken and shown.

The ceiling of this room was formed centrally into a large square panel by a moulding bound round by a belt of leafage and fruit modelled and cast in individual members, and stuck up leaf by leaf and fruit by fruit in a continuous growth of decorative rhythm. Bounding the large central square panel at the cardinal points were four circles of leafage curiously modelled, dividing four V-shaped panels, filled with straggling stem work modelled *in situ*, and vine or oak-like leafage, cast separately and stuck up loosely in one rich filling.

The lecturer then went on to describe and illustrate the revival of stucco-duro *in situ* modelled ceilings of Inigo Jones's, Webb's, Wren's period, by Italian plasterers, who wore goggles to protect their eyes from the falling fragments of lime stucco which they used. Fine examples were shown from Coles Park; Ashburnham House, Westminster; Holyrood Palace; Balcardine House; Brickwall House, Northiam; Grantham House; Belton House; Melton Constable; Groombridge Place, and elsewhere, showing the beauty and technical value of stucco-duro as a material for working *in situ*.

In all these examples it was explained how the quality of the material, which could be regulated in the setting to any degree to time by the introduction of various ingredients, enabled the modellers to give sharpness of edge, thinness of substance, and depth of "undercutting" and relief to any extent; how the flower-heads stuck out from the bulk and were attached by isolated stalks steeped in the same "plaster"; how in some cases the stem work corkscrewed round and round the highly-relieved lengths and garlands of modelling, and how the leaves and flowers could be modelled as thin in substance as the petals of a rose or a piece of drawing-paper, which was a perfectly legitimate and beautiful process for the well-burnt and long-slaked lime and fine grit material then in use, although not so for the soft plaster of Paris process now in use. The lecturer went on to show by comparison the fruitless imitation of this type of work;

at the present time, and how impossible it was to procure anything like the same result by the modern process of modelling in clay and trying to reproduce it by casting in plaster of Paris from gelly moulds in fibrous plaster construction. The softness of plaster of Paris would permit neither the thinness of substance nor the sharpness or crispness of edge without breakage, the final result ending practically in a makeshift or parody of the old work done *in situ* in the stucco-duro material.

He urged that this material might be forthcoming again by the desire of those who wished to use it, and by arrangement between the architects and builders to put down the lime and keep it stored for a few years, as was done heretofore. This class of work was undoubtedly desired, as manifested by the attempted reproduction of the so-called "Georgian" ceiling decoration for many years past.

Until such time the best possible means of arriving at the nearest result was in modelling the leaves, fruit, flowers, &c., individually, and casting them individually in plaster of Paris or Keene's cement, and tucking them up into a prepared hollow-ground work *in situ* on the ceiling, as illustrated in two or three examples thrown on the screen. Even this would not give the same beauty of definition, but it was the next best thing, and required the judgment and arrangement of an artist which was not always forthcoming in the purely mechanical training of the modern plasterer, although there were signs of considerable ability in this direction.

The lecturer said that he had sometimes been misunderstood and charged with predilection, almost to prejudice, for one kind of work in preference to another, namely, the earlier work for the later, but such was in no way the case. He believed he would be borne out by all others who knew anything of different materials and processes that each kind of work was equally beautiful, interesting, and legitimate, according to the right use of the various plasters employed.

A few examples of the plasterwork following this period were then shown, illustrated by examples of Wren's later work, in which the Dutch modellers re-introduced for a time the French type of work very indifferently; also the work of Hawkesmore, Archer Talman, and others, and describing the work of the brothers Adam, who took their inspiration from the Pompeiian masterpieces and gave these islands the last bright flash of "artistic" plasterwork in a plaster composition in which they were financially interested. Then followed that degrading period of so-called pseudo-Classicism, in which the London squares and streets, and also the provincial towns revelled for a time—imitation Classic "ornament" that sent a thrill of hatred against plaster decoration, and which had created a prejudice that, with a large portion of the general public (and even amongst some architects) had lasted to the present day, and done so much to retard any real development of the plasterer's art.

Mr. Bankart then passed on to modern materials and modern work, showing by illustration that a considerable amount of work had been done by some living journeymen plasterers, who had, by diligence and careful study, picked up the threads of past traditional methods of working, and applied that knowledge to modern materials and modern construction with considerable ability and success as artists as well as mechanics. This, he maintained, was a "feather in the cap" of the present time, and gave bright hope of the foundation of a new living school of decorative plastering. The fault, he maintained, was not the plasterers', but the misfortune of their training for generations back in being trained to think that mechanical accuracy and perfection of surface was the zenith of plasterers' work.

The covering of the walls and ceilings of our homesteads with insanitary printed patterned papers and pulps was but the manifest desire for decoration of some kind, and this was evidence that something better, something genuine, was desired.

Much good and interesting plasterwork was being done in different parts of the country, and there was every encouragement for the younger generation of plasterers to study and take up the once living art of their trade, and to develop it in a manner suitable to and worthy of our modern methods of construction—and this he firmly believed would come sooner or later.

The lecturer dwelt at some length on the opportunities offered to architects in the modern system of concrete construction, in the shaping of concrete barrel vaultings and saucer domes for simple decorative treatment—in the arrangement and placing of iron girders to form a scheme of design apart from the purely engineering aspect of their setting—in the decorative treatment of concrete piers and pilasters; the simple vaulting, cross vaulting, and sectioning of rooms in the roofs of houses and public buildings, as illustrated by many slides shown on the screen.

Details of many simply decorated flat ceilings were shown, in which there was quite a modern spirit in the arrangement of belts of modelling, possessing distinct modern interpretation and refinement of design and workmanship, whilst at the same time reflecting something of the traditional treatment of the past.

In conjunction with this, various interesting methods of working suitable modern plasters were explained, the lecturer concluding with the optimistic hope and belief that architects were giving much more thought and attention to the natural constructive development of their buildings for decorative purposes than they had done in the past.

Mr. G. A. T. Middleton, in proposing a vote of thanks to Mr. Bankart, said the lecture must have brought home to them how extremely rich England was in artistic work, almost as much as Italy. He was afraid, however, this was not always realised and appreciated, nor was the same care taken of them, and consequently examples of old craft work were destroyed or lost to the nation. He knew of pieces of wrought-iron work which had disappeared from their original places, and Mr. Bankart no doubt could call to mind many pieces of old plaster work which had been lost to sight either by the demolition of buildings or by sale to foreign agents or Americans.

Colonel F. S. Leslie, R.E., who seconded the motion, said he was acquainted with some of the best examples of plaster work in Egypt. The designs were generally in direct geometrical patterns and floriated arabesques. The work was very beautiful, and he said he had no doubt that it was modelled direct on the walls and ceilings.

Mr. Bankart, in reply to the vote of thanks, said the disappearance of pieces of English craft work was largely due to the transportation of old examples to America. The Reindeer Inn at Banbury, which had a splendid Jacobean ceiling, was now threatened, and he urged the artistic societies to co-operate and so prevent the house being carted away bodily out of the country.

## "CASTLES IN THE AIR."*

*(Concluded from last week.)*

It is rather remarkable that, in these days of boasted freedom, we find that the higher we go in the social scale, the less so-called freedom there really is. Till we come to the king himself, and note that he cannot utter a syllable without consulting diplomatic and other forces, and must take counsel with the wisest men he can find before he can take tea with his friends.

The more educated and the more sensitive we are, the less our ugly actions will be, or should be forgiven.

Again Ruskin helps us with the statement, "Ignorance, which is contented and clumsy, will produce what is imperfect but not offensive. But ignorance discontented and dexterous, learning what it cannot understand, and imitating what it cannot enjoy, produces the most loathsome forms of manufacture that can disgrace or mislead humanity."

Some of us have to spend most of our time in work for others, which we hate and detest. Let us remember for our consolation that the faithful performance of duty never degrades; and bear in mind that at such times castle building may be made a special help and blessing. To all so circumstanced let us say, build on, have courage, your time will come when the beauty you have stored in your minds must bear good fruit—perhaps when you least expect it.

To bemoan and chafe against your lot will help you not. Only looking for the moral purpose of it, as it affects your own character, and by determination to see the beautiful and true and not the ugly, will you gain patience and strength.

We may learn the possibilities and limitations of material from the dead. But only from ourselves can we gather those vital forces of thought and feeling without which our work will be mischievous. The reliance on moral bases will very much help us to avoid the undue adulation of technical skill. Our powers of execution should always be secondary to the mental and moral qualities of our work. And must be so, if we are sincere. But if we merely choose a moral theme to display our technical skill, we are soon betrayed

---

and found out by the thoughtful observer who will value our work, not for its vital force, but for the dexterity it displays. Would we not rather create sermons in stones and poems in pictures?

We are surrounded by museums full of a heterogeneous mass of objects supposed to have an educational value. And yet how little that is really beautiful are we now producing? Much less than we were before we had the museums. Is it not because we have regarded the outsides of things and worshipped idols, and not held fast to the mental and moral qualities that originated those symbols? It is hoped our castle building will help us to see beneath the surface of things; "to live more contented lives; to win the greatest pleasure from the smallest things; to do what is likely to be serviceable to our immediate neighbours, whether it seems to them admirable or not; to make no pretence of admiring what has really no hold upon our hearts, and to be resolved in refusing all additions to our learning, until we have perfectly arranged and secured what learning we have got—these are conditions and laws which will lead us up to fine art if we are resolved to have it fine."

Castles can be built by those who have never passed out of their own country. All the material needed may be found in their own hearts and brains and is of such a nature that all nations can understand them. Neither are they of any time, but of all time. Only finer, and more full of beauty as we advance in character.

Let us be consoled with the thought that such building brings no applause, calls for no press notices, gains no academy honours; so we are not exposed to the weakening effects of popular praise—all the reward we can ever get, or should ever hope for, is a clearer sight, a deeper love and a juster sense of values.

It is an industry that will not interfere with our daily duties but, rather, cheer us on the road.

The material for our castles in the air is subject to no freights or tariffs. It comes to us free; indeed, it floods into our minds as fast as we can use it.

The many problems that arise out of our common occupations are the precious stones that we need for our main walling. They must be examined and looked into, dressed and squared, and their fitting places found.

Thank Heaven! this form of building never comes into the market. It never will be the subject of thirteen different kinds of valuation, like our land. This is a great blessing because taking stock of our moral and mental progress is a dangerous and discouraging operation. The less we stop to value our building, the better. We need encouragement the more sensitive we are, not praise that produces satisfaction, but encouragement that goads us on. In valuing our own work we either blame or praise it too much, and possibly what we try for is often more precious than what we accomplish.

Castles in the air must not be built out of stray fancies or sudden external charms. Artists often speak of inspirations and suggestions which they gather from material things. But to fasten on an idea, so derived, and then build round it, is a dangerous method. All our best work is built up slowly from the beginning. First we must examine the motive—why do we build at all? Then the requirements; and then the materials and conditions Everything we make, from a coffin to a cathedral, must proceed in this order. It is a useful and practical order of procedure for daily life. It will not discourage the emotions, but it will prevent them from running away with us. This order of sequence is no one man's invention but the orderly process of all thoughtful craftsmen. The significance of it is often clouded over by the emotionalist who traces all good work to one faculty instead of the combination of them all.

By combination of our faculties we are able to appea through our work to the greatest number of our fellow creatures. Here a bit of emotionalism, here a little fitting use of material, here an appeal to the senses, here a suggestive thought, a touch of reverence, and an appeal to the spirit—so that all minds, although coloured with a bia

COUNTRY HOUSE AT NEUBABELSBERG, FOR PROFESSOR Dr. RIEHL.—Herr Ludwig Mies, Architect.

for one quality more than another, are reached. Colour and form and texture seldom appeal to the same mind in equal degree. So we need a wide and universally understood base for our castle building.

Many an artist is discouraged by finding his work unappreciated when the cause is that he has appealed to one faculty only, and that one possibly dominant in the few.

If you exhibit craftsmanship only, you cannot expect to attract the mind that is looking for thought and moral feeling, poetry or passion as well.

Infinity is an idea of the mind only partially conceived, but of vast importance to the artist. It is a quality of the sublime. We can only approximate to it in thought by reflecting on what it is not. It expresses mystery and keeps the mind open, and ready for fresh growth; and it makes us feel that the realms of thought are limited only by our particular stage of mental and moral development, which is for ever advancing, or should be. Our air castle is, therefore, never finished; we feel that every fresh beam of light is a blessing. Whereas the opposite of infinity is the very negation of growth and development. It leads us to reject all that we cannot prove, and disbelieve in anything we cannot measure and weigh. It leads to a materialistic state of mind and to a contentment with the merely practical which deadens the emotional and spiritual.

Oh that we could stimulate that state of mind which puts the moral and mental activities before the five senses. More spirituality and less materialism is the only remedy for our present state of ugliness. Then shall there be more real art and less talk about it. We shall enjoy beauty in the best way; that is, by growing like it.

The rise and fall of nations has been due to the change of balance between the spiritual and material activities, and we find dominating activity in material matters leads to a weakening of the poetical, æsthetic, and religious vitality. The machine has turned our thoughts to material things, until we have produced pianolas and gramaphones, and steam whistles and hooters welcome in the New Year, instead of as of yore, peals of merry bells and happy human voices. We need castle building to help us to revive the spiritual side of our natures, and we hold that it is the special duty of artists, while dealing with materials to breathe into them that spiritual breath of life which may yet save our nation from extinction.

"Remember," says Ruskin, "we can represent with prudence or success only the realities in which we delight. What we have with us and before us, dearest to our sight and hearts, we can gloriously express to others; and nothing else can be truly seen and loved. And unless that first be made beautiful, idealism must be false and imagination monstrous." As craftsmen we have to consider convention—or what some call tradition when applied to buildings—I mean that blind following of custom (not always blind, perhaps).

Fear is generally the master of convention. I appear before you in black because I am afraid of what you would think if I were to appear in purple and gold. We do innumerable things merely because others do them, and we have a vague fear of the consequences if we did not go with the stream. It is good for trade; things can be made by the gross, men can repeat the same design until it has paid for the patterns and all preliminary expenses. All these considerations are governed by a genuine practical common sense and must not be ignored, although they help us little with our castles in the air. Some of us welcome convention as a screen for personality; we like to hide ourselves behind convention, and so avoid attention; the sensitive nature is miserable when attracting attention.

If building castles in the air were more common, individualism would be strengthened, it would cease to be peculiar to be oneself and sincere. Independence in dress and behaviour would not be so noticeable. And I think we should gain moral courage and that true sense of independence which makes us more concerned with our own conduct than with the conduct of other people.

We march on together because we are afraid of the opinions of others, or the trouble of regulating our own pace.

A regiment of soldiers marches to obey. Forced on, not by base fear, but by a recognition of a superior authority, and

AT CHATEAU FERVACQUES.
Drawn by A. N. Prentice, F.R.I.B.A.

therefore the soldier is not weakened by it. We need to be led by reverence not driven by fear.

The craftsman wants the freedom to obey, and emancipation from the degrading fear of the consequences of offending popular prejudice, or being thought wanting in good taste. We do most cordially hate to be thought wrong in our taste. And that feeling drives us to inquire whether we cannot build up our taste on facts and qualities that everyone admits are beautiful, viz., moral qualities.

If we can show that vermiculated surfaces express any moral quality that is not base, we will admit them on our castle walls; but, on the other hand, if such is the mechanical expression of a demoralised people, we cast it from us with scorn.

How much we might feel helped if we determined to limit our requirements to those essentials we have put into our castles in the air. In those we were not trying to imitate the tastes of our superiors, or of foreigners, or of schools who denounce all but that one particular style they have been brought up to imitate.

We shall not regulate our requirements by their money value. Many cheap things are dear at any price, and it is almost joy to go without, until you can have the best of its kind, and so avoid the reproaches of the ugly compromise.

Cold vegetables are less harmful than ugly dish covers. One affects the body and the other affects the soul.

Before you build anything, ask yourself for which side of your nature you are undertaking to do battle. For battle it will be.

You will find the whole world waiting for you and ready to administer to your flesh, only too delighted to be able to gratify your greed.

Your animal instincts have been studied with exquisite precision, and every appliance perfected to minister to and to multiply your physical wants. It will be an easy matter for you, if you are well off, and animal enough. But if you are rich in thought and feeling and have a lively appetite for ideas, you must brace yourself for war; it will be a hard long struggle, and cost you many a tear and many a sigh. But remember, we value that most for which we suffer most. And the more labour we bestow on most things, if it is the right kind of labour, the longer they last.

Countless articles are presented to us which are like something else only cheaper. Spurn them all. Admit nothing into your company that looks better than it is, and you will find this one determination to consort with that only which is genuine, will carry you a long way and help you to brush mountains of mischievous rubbish out of your road.

By limiting our needs and simplifying our methods, we feel more able to cope with the difficulties that remain.

If we have the speculative builder to deal with, we cannot hope to do more than tell him what we want, although he has not got it. And in time no doubt he will try to produce what we do want. It is a slow process and does not satisfy you or him. The fruits of such a course must take centuries to grow. Who knows? Who knows what good is done to you by cultivating such a want, and to him who hears you ask for it? It is in the spirit that all progress first takes form. Shape first your castles in the air—then you shall live in them.

It is almost an impertinence for me to go on telling you all these things, which you know as well as I do. But repetition helps the memory, and we all need perpetual encouragement to see that the trials and troubles of the craftsman's life are really the stepping-stones which lead to our right judgment, and tend to free us from degrading fear, if we will but regard their moral aspect and look for good in them. We weaken our power of producing beauty by dwelling on the ugly and painful side of things.

We want encouraging, too, to reverence natural law and order and to induce that habit of mind which shall dwell on the good, the beautiful and the true, and resist the evil effect of ugliness, or the petrifying influence of substituting material appearances for thoughts and feelings.

We need to encourage that power of introspection and of gathering light from others, without interfering with them.

Artists must be leaders of men, not drivers.

We need to be cured of our cold, calculating study of the outsides of things, from the hardening influences of materialistic methods and easy going reliance on antiquated schools. We need to be brought into the broad daylight of living problems and living thought and feeling, to be constantly reminded of the supremacy of mind over matter, and, by building castles in the air, to keep our minds actively employed in collecting and storing up all the beauty and loveliness we can find in mind and matter, and thus gain houses, not made with hands, for our souls to live in.

## COMPETITION.

London.—The Royal Colleges of Physicians and Surgeons recently organised a limited competition for the building of an examination hall to be erected on the site of Nos. 8, 9, 10 and 11 Queen Square, Bloomsbury. Mr. T. E. Collcutt, who acted as assessor, recommended that Mr. A. N. Prentice, F.R.I.B.A., Hastings House, Norfolk Street, W.C., should be selected to carry out the work out of the seven architects competing. This has been agreed to, and the following three premiums of 100*l.*, 75*l.*, and 50*l.*, have been respectively awarded to Mr. Henry T. Hare, F.R.I.B.A., 13 Hart Street, Bloomsbury; Mr. E. Stanley Hall, 54 Bedford Square; and Mr. J. W. Simpson, F.R.I.B.A., 3 Verulam Buildings, Gray's Inn.

## COMPETITION FOR WELSH NATIONAL MUSEUM.—II.

WE may gather from the four designs rewarded by the assessors that proximity of the reserve collections to the exhibition galleries of the departments to which they belong is to be deemed of importance; that there is no objection to the public being admitted to more than one floor; that the subordination of the Museum to the City Hall, though perhaps desirable and certainly admissible, is not essential; that it is immaterial whether the entrance is on the south or west or both, and in the light of these principles we may estimate the approximation to success of those designs that have failed.

Messrs. LANCHESTER & RICKARDS, as might have been expected, have tried hard to win, and feeling no doubt a certain amount of difficulty in deciding on the right answer to primary questions, have sent in two designs. Both of these are similar in outline, but very different in their internal arrangement. The main block corresponds to that of the Law Courts, but the required accommodation necessitates an extension northwards, to which a semicircular form is given. In the internal disposition the authors have made the fatal error in both designs of assuming that the reserve collections need not be adjacent to the public exhibition galleries of their respective departments. Although in one design (No. 31) the departments for art and industries, which are on the first floor, have their reserves also on that floor, the remaining departments have their exhibition galleries on the ground floor and the reserves on the first or second. In this design the entrance is on the west, leading through a vestibule to a central hall, and continuing on the main axis to the lecture theatre of semicircular plan. North and south of the central hall are the departments of Welsh natural history and of history and antiquities. A very fine and impressive plan is the result, but it fails *ab initio*. The second design by Messrs. LANCHESTER & RICKARDS (No. 44) has the reserve collections all together on the ground floor, which is wholly given up to students, save for the aquarium, children's museum, refreshment room, and administration, the public exhibition galleries being all on the first floor. In this design the entrance is on the south front.

One of the finest designs in the exhibition is that by Mr. JAS. B. FULTON, which, with an entrance on the south, has on its major axis a grand central hall 220 feet long by 50 feet wide, a provision of supererogation to the minimum accommodation required by the particulars. Perhaps this was thought by the assessors to be extravagance and combined with some laxity in respect of reserves, put the design out of court. Thus the reserve for zoology is on a mezzanine, although the exhibition galleries of the department are on the first floor. The reserve for history and antiquities is also dissociated from the public galleries in respect of floors, and is also a long way from them. Mr. FULTON has designed a pure Greek building with beautifully drawn detail. Perhaps this was not considered "in sympathy" with the Baroco detail of the City Hall.

Pure Greek detail has been adopted in two other notable designs, and in other cases Greek with a modern French feeling is the basis, so that it almost looks as if we were in for a Greek revival.

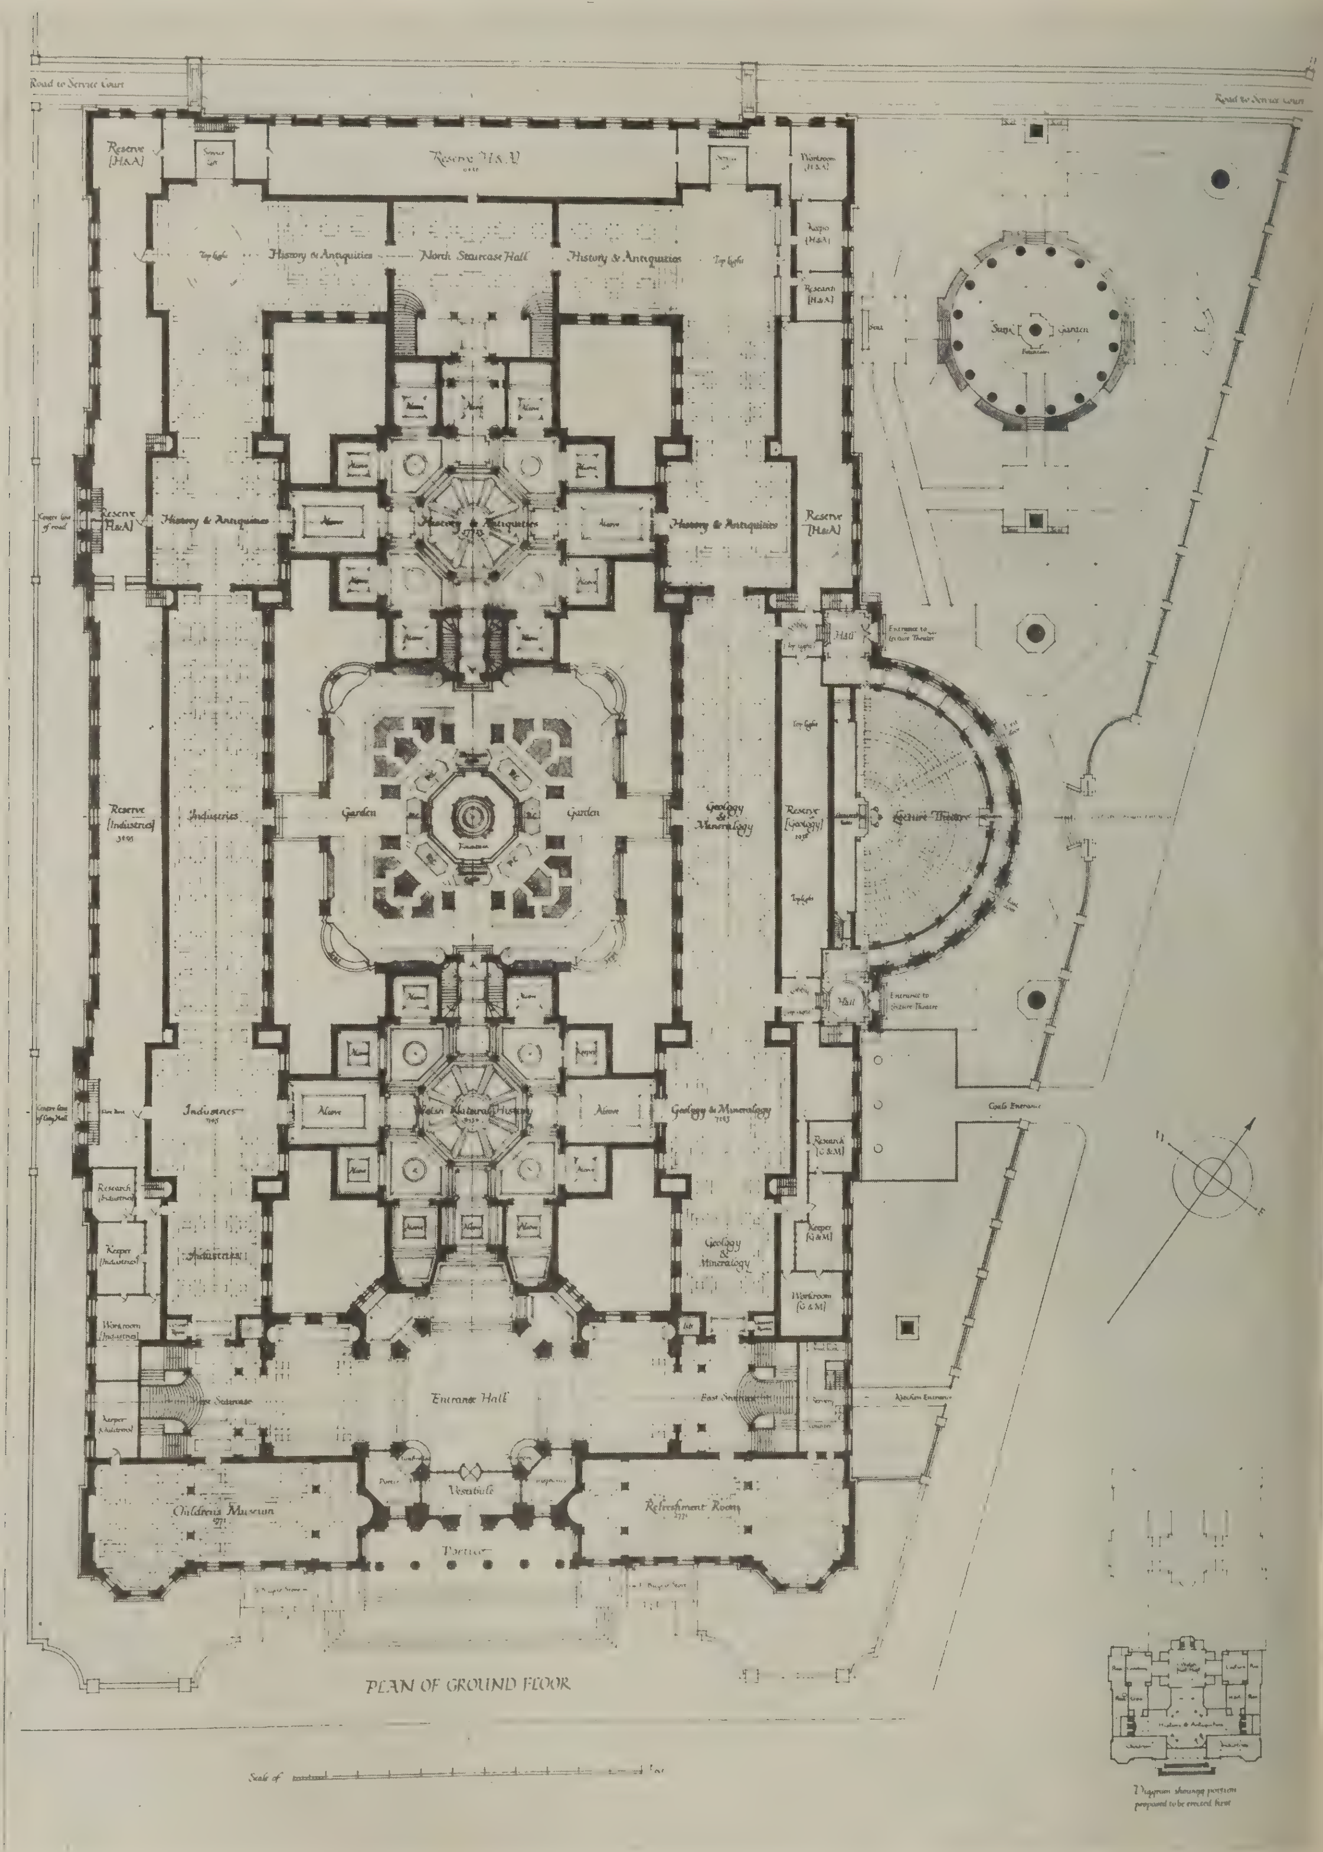
Professor C. H. REILLY, with Mr. H. McG. WOOD and Mr. H. O. BURROUGHS, contribute one of the Greek designs, and in their plan have made a strong effort to unite the frontage lines of the City Hall and the University Building by laying out the garden at the rear of the City Hall to axial lines of University College, and on a diagonal to these, arranging an entrance to the Museum in the re-entering angle between the frontage lines of the University Building and the City Hall. Their Park Place front is parallel to the road, and leads on to the rear elevation of Mr. CARÖE's building. In their internal disposition the reserve collections, children's museum, and sculpture are located on the ground floor and the public galleries on the first floor. Thus, like Messrs. LANCHESTER & RICKARDS, the authors have started from the wrong basis, though on this basis they have produced a fine plan.

Mr. A. GILBERT SCOTT sent in a beautiful design with pure Greek Doric for the *mot d'ordre*, but he has ignored the conditions and fully coloured his detail. His plan with entrances on all four sides is good, with a great hall on the longer axis and the reserve collections in segmental galleries on each side, too distinct from the public galleries to meet the views of the selectors.

Messrs. CROUCH, BUTLER & SAVAGE have an admirably simple plan, but we doubt if they have provided sufficient space for the reserve collections, which are quite apart from the exhibition galleries and not allocated to the several departments. The design of their exterior is excellent, with a central tower.

Messrs. GARRATT & SIMISTER, in conjunction with Messrs. BUCKLAND & FARMER, have submitted an excellent and very compact plan by which they are able to restrict the length of their building from south to north to the dimensions of the City Hall, and yet, notwithstanding this compression, they include all the public galleries except the art department on the ground floor. Their reserve collection being on the mezzanine and first floors has, however, disqualified their scheme. The exterior is well treated with a good tower.

Messrs. ERNEST RUNTZ & SON have an effective ground floor plan, and, having taken the whole of the site,



SELECTED DESIGN FOR THE NATIONAL MUSEUM OF WALES.—Messrs. A. Dunbar Smith & Cecil C. Brewer, Architect

are able to include the greater part of the accommodation on the ground floor; the main entrance is on the west side, with a secondary one on the south; a long hall on the longer axis is an impressive feature of the plan, and a semicircular art gallery, though unusual, is quite effective. The reserve collections are somewhat scattered. The external treatment is quite successful with two domes and a broad treatment of windowless wall.

Messrs. Forbes & Tate send a good plan, but the reserve collections are on the mezzanine and first floor,

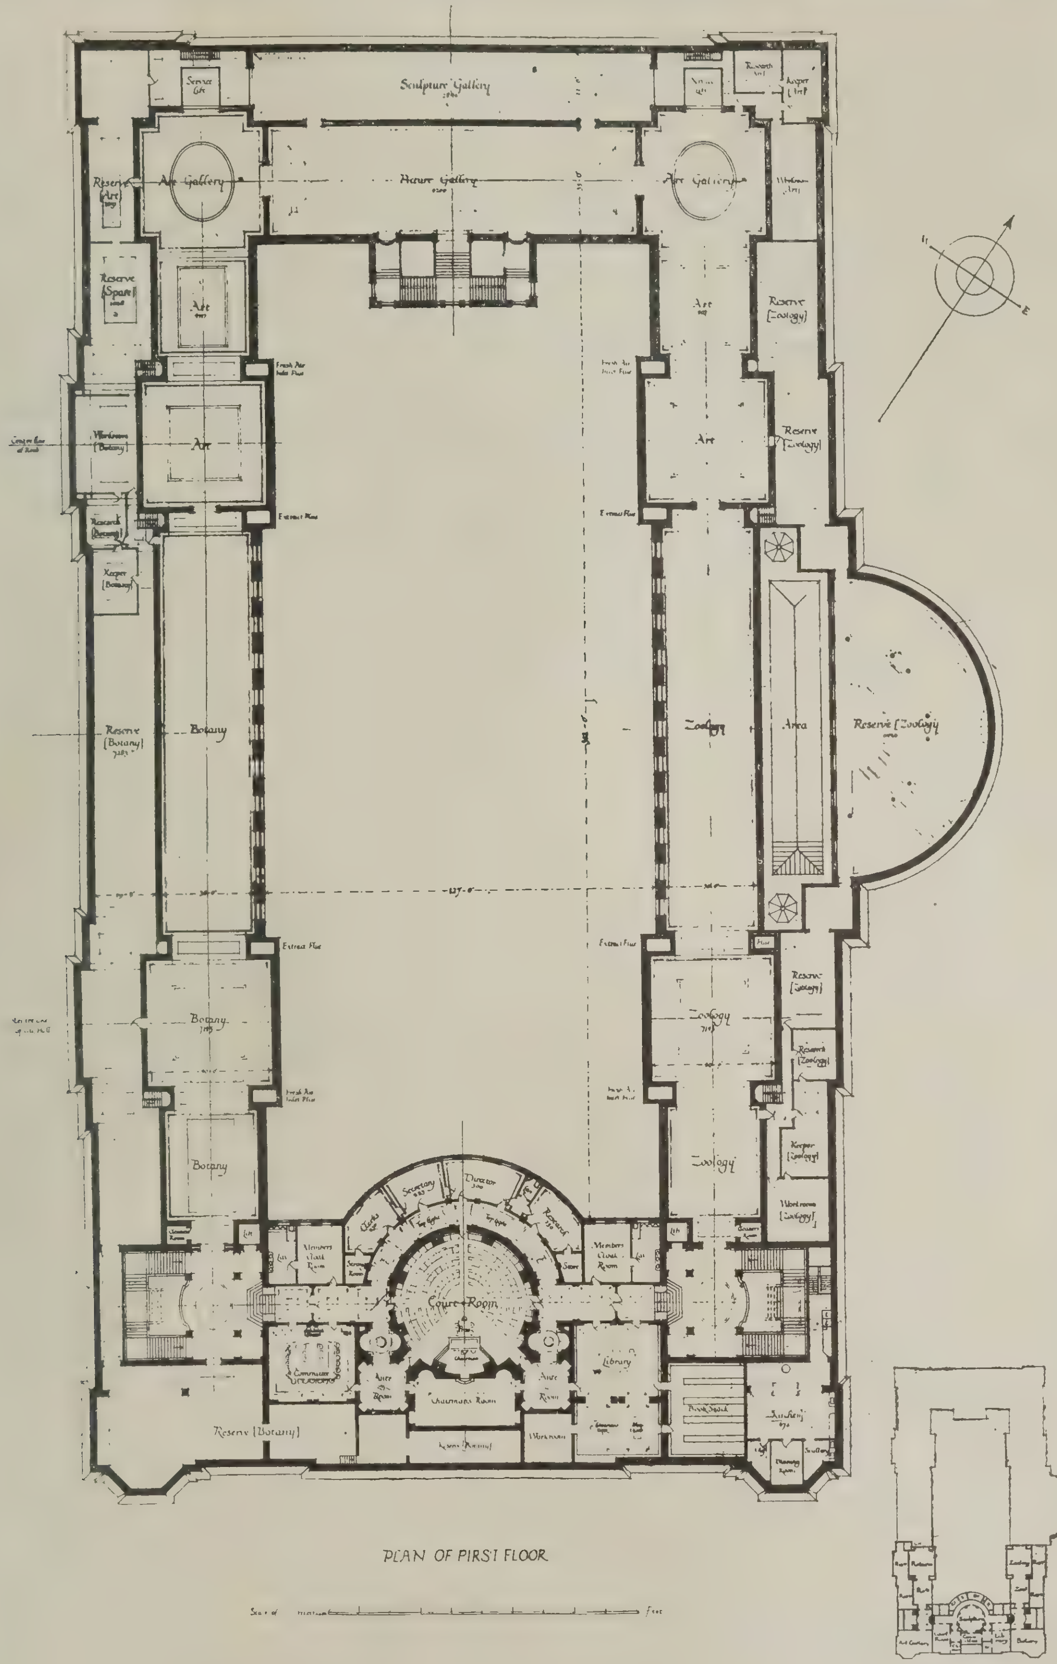


Diagram showing portion

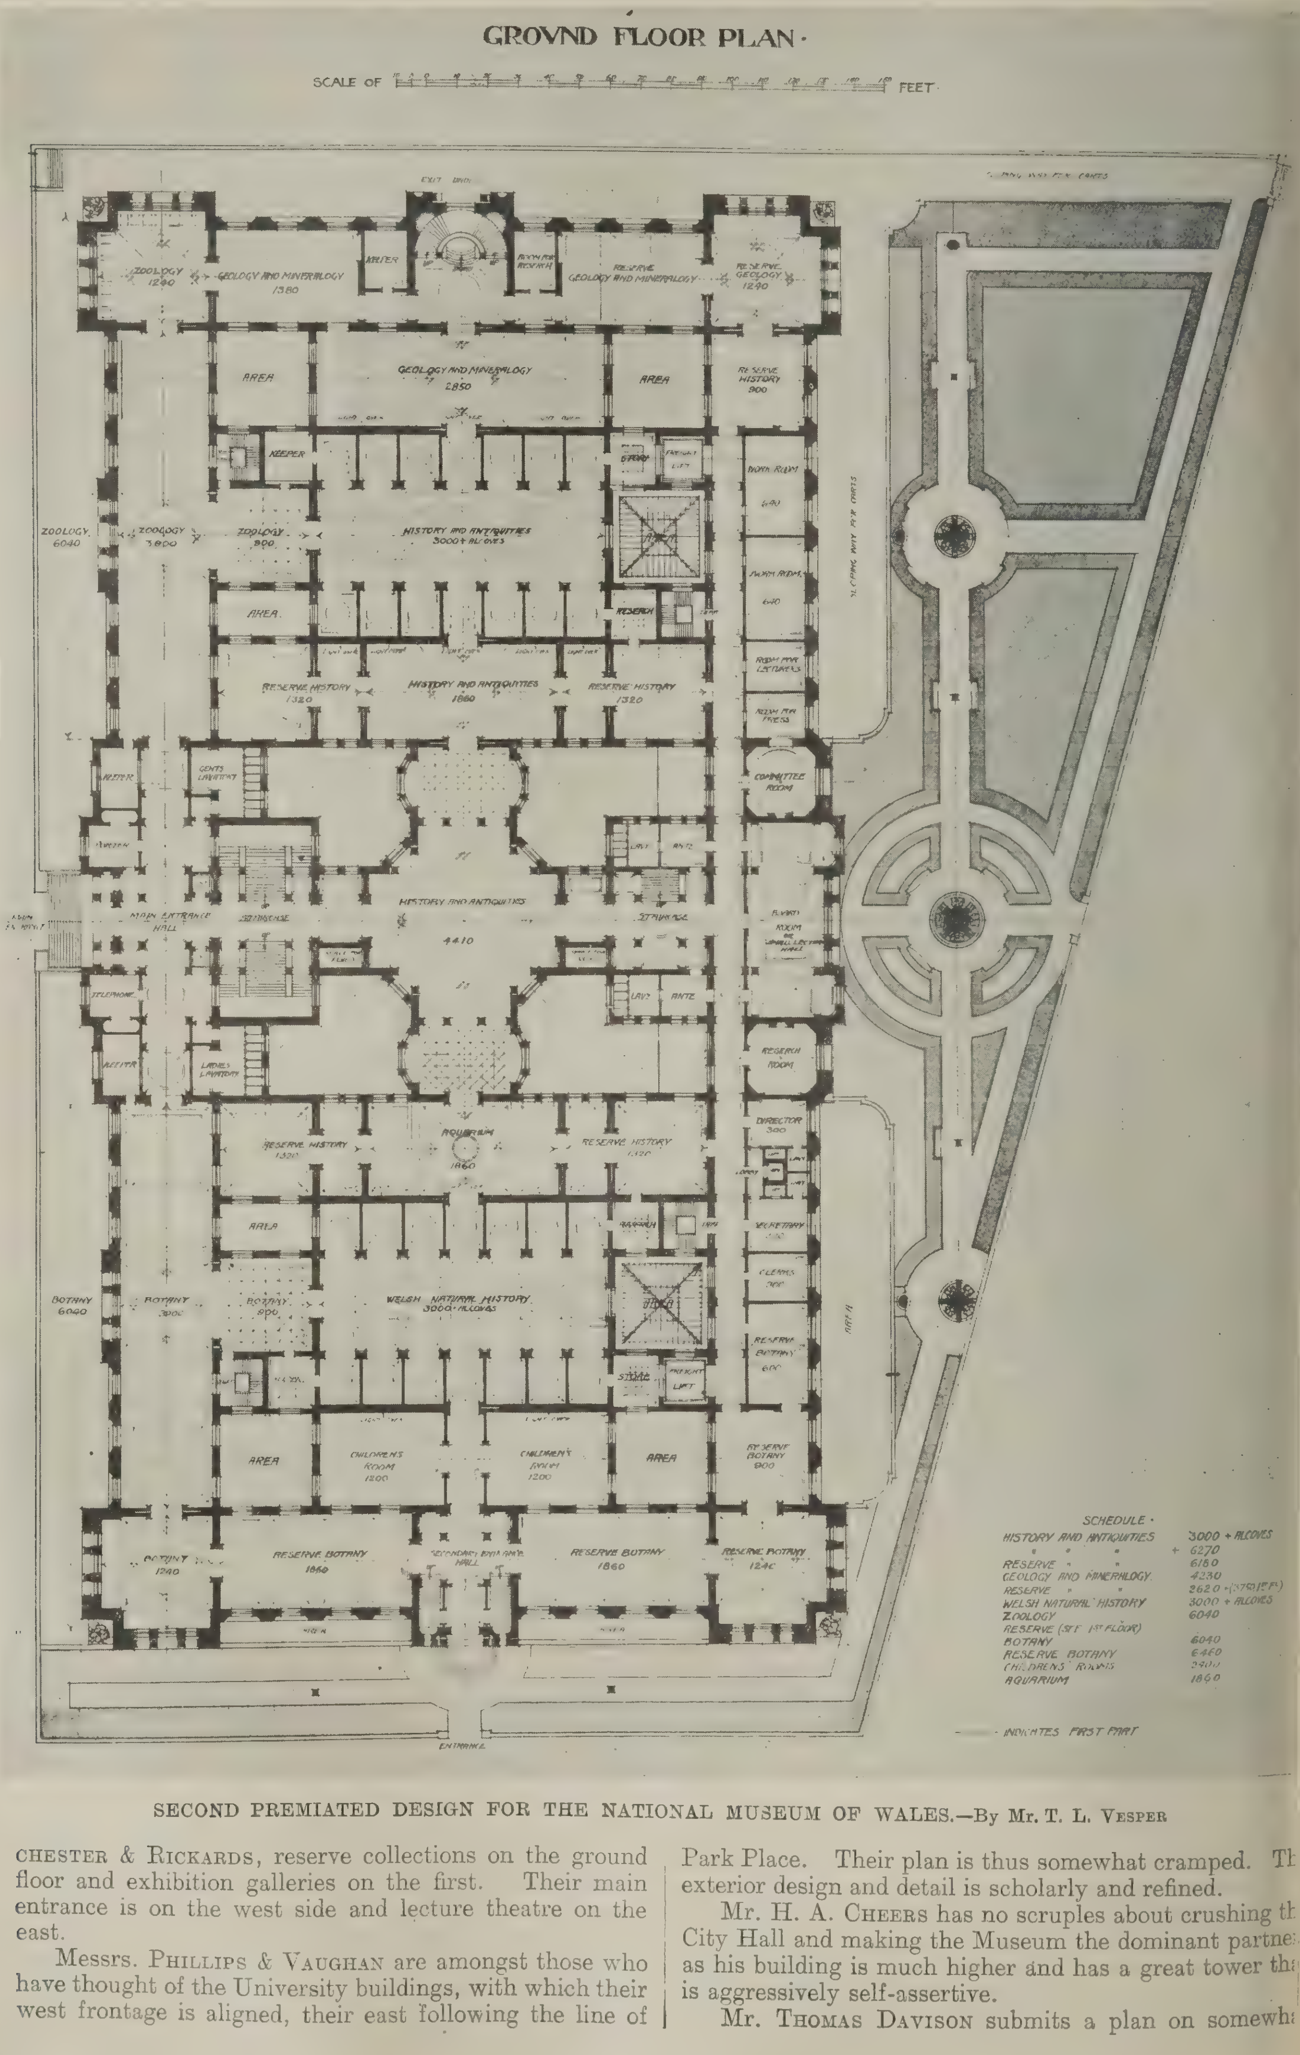
SELECTED DESIGN FOR THE NATIONAL MUSEUM OF WALES.—Messrs. A. Dunbar Smith & Cecil C. Brewer, Architects.

and not near the exhibition galleries. Their outline follows the frontage of Park Place, with a semi-circular extension northward. The detail of their design is in the modern Franco-American feeling.

Messrs. Warwick & Hall have evolved an admirable plan with the main entrance on the south, and a succession of galleries on the longer axis with halls right and left, the reserve collections being outside. Most of their rooms are somewhat small, with the exception of a large central hall for the department of industries. The art department is located on the first floor. The exterior design is very good in itself, but does not behave modestly to the City Hall.

Messrs. Stockdale, Harrison & Sons and W. H. Thomson in some degree have come within measurable distance of success, as their reserve collections are near the exhibition galleries; but, like many other competitors, they have an aquarium suited only for stuffed fish. The queer shape of their lecture theatre is a blemish on their plan.

Messrs. Wills & Anderson adopt the arrangement we have noted in one of the schemes by Messrs. Lan



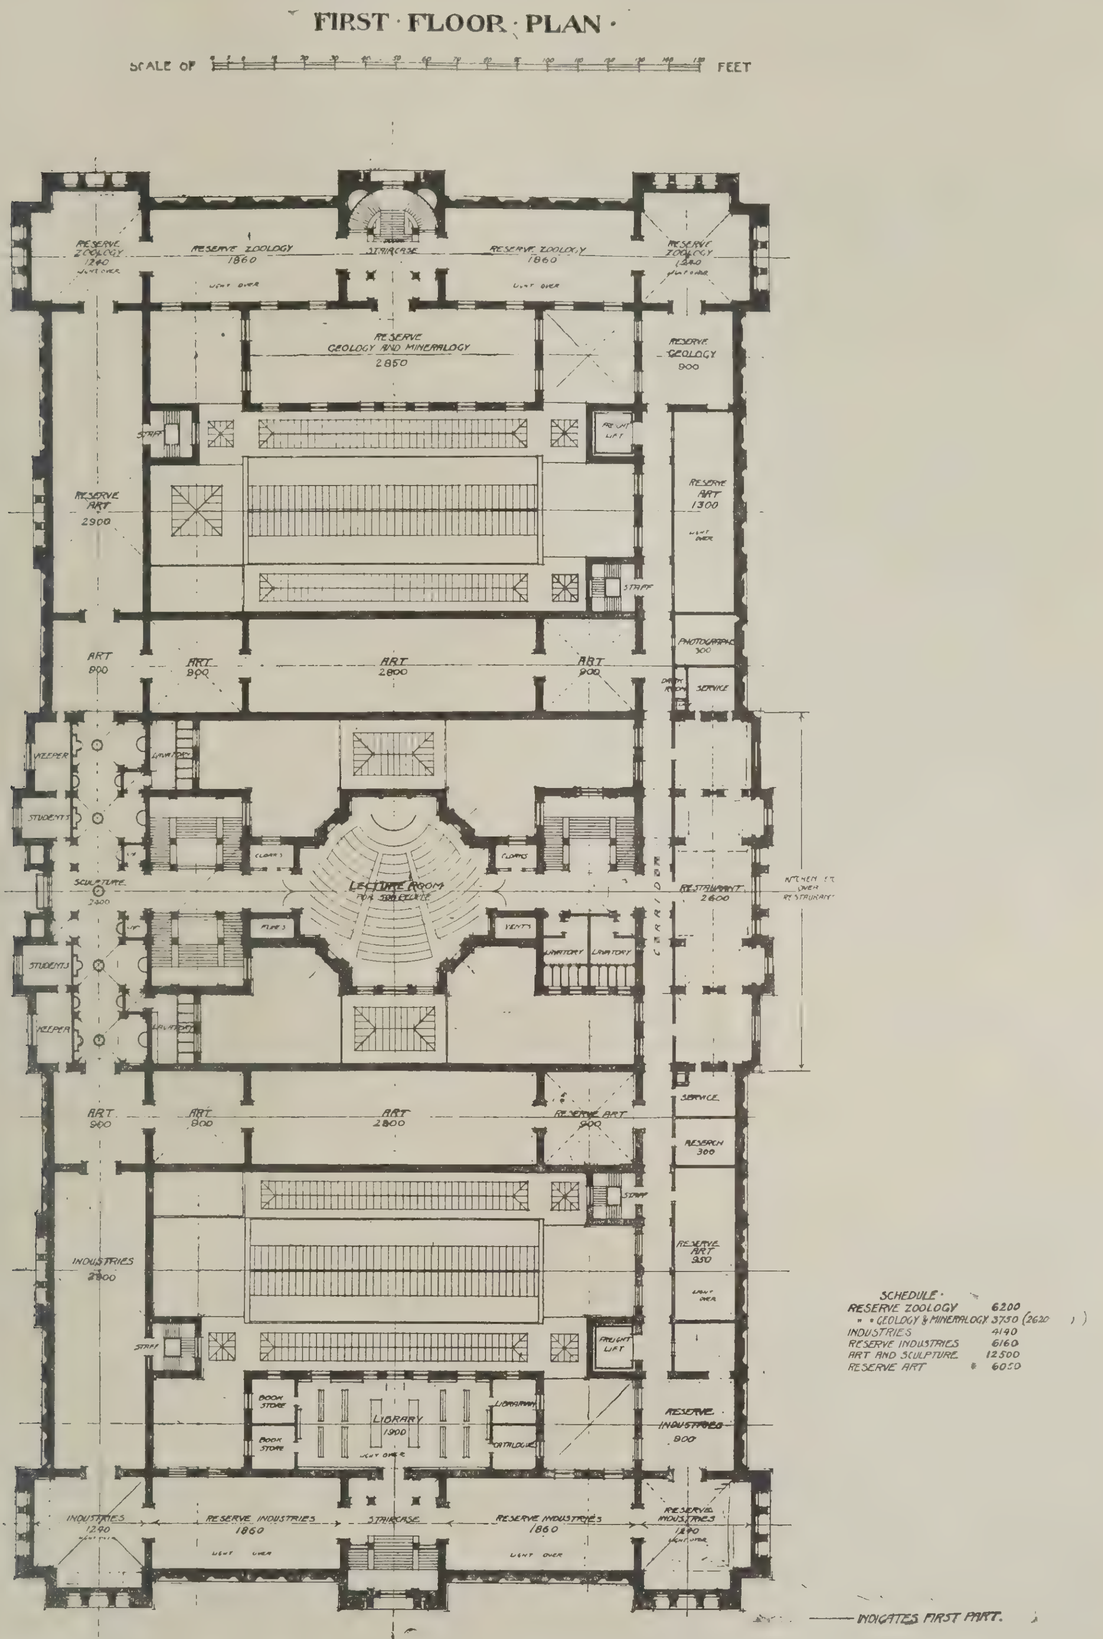
SECOND PREMIATED DESIGN FOR THE NATIONAL MUSEUM OF WALES.—By Mr. T. L. Vesper

Chester & Rickards, reserve collections on the ground floor and exhibition galleries on the first. Their main entrance is on the west side and lecture theatre on the east.

Messrs. Phillips & Vaughan are amongst those who have thought of the University buildings, with which their west frontage is aligned, their east following the line of Park Place. Their plan is thus somewhat cramped. Tl exterior design and detail is scholarly and refined.

Mr. H. A. Cheers has no scruples about crushing th City Hall and making the Museum the dominant partne as his building is much higher and has a great tower tha is aggressively self-assertive.

Mr. Thomas Davison submits a plan on somewha



SECOND PREMIATED DESIGN FOR THE NATIONAL MUSEUM OF WALES.—By Mr. T. L. Vesper.

similar lines to those of Messrs. Warwick & Hall—entrance on the south, with galleries on the main longer axis and two transverse axes; all the reserve collections adjoin the exhibition galleries, space being obtained by placing the departments of art and industries on the first floor. The design of the exterior, with a small central tower, is almost too modest.

Mr. A. N. Paterson has a notable feature that would be charming in summer time in the shape of an internal garden court on the eastern side, with a semi-circular loggia and exedrae for architecture and open air exhibits. He has adopted the unappreciated arrangement of exhibition galleries on the ground floor and reserve collections on the first.

Sir A. Brumwell Thomas and Mr. E. Montague Thomas have set back their west front to the line of University College. Their plan covers the whole area within their building lines, except for a few small well holes for the benefit of the basement. The provision of exhibition galleries on the ground floor and reserve collections on the first floor invalidates their plan, as it does that of many other competitors. An excellent feature of the external design is the western entrance with a loggia for sculpture.

Messrs. E. C. Frere & W. Wilcot have submitted a remarkably clever and original treatment of the elevations, even if not perhaps quite suitable for a museum, and certainly not in sympathy with the neighbouring buildings.

Messrs. Lovegrove & Papworth have cleverly arranged to produce a symmetrical plan with an extension beyond the rear frontage line of the City Hall that aligns with the University building. They have placed their exhibition galleries on the outside and reserve collections on the inside, but the latter seem to be a little short in area. The departments of art and industries are on the first floor. The authors have made a point of describing all parts of their plan in Welsh as well as in English.

Mr. Clyde Young's design is remarkable for the absence of external windows on the principal fronts, except to the stairs and entrance hall on the western side. A feature of the plan is the provision of two large internal garden courts, from which the galleries are lighted, and which also enable the author to dodge the crux of the basement by placing the board room, library, refreshment-room, and administration on the lower ground floor. The design is hopeless, because the reserve collections are on the first and second floors.

Mr. Matthew J. Dawson has some excellently drawn detail and sculpture and a striking plan, but the fact of the reserve collections being in a northern annexe and not closely connected with the exhibition galleries relegates excellent work to the limbo of failure.

Messrs. Jemmett & McCombie have indulged in a bit of town planning by suggesting future buildings to the north that should form a regular composition with the University and the Museum. In the plan of their own building the entrance is on the south, and there is a fountain court on the intersection of the transverse axis of the City Hall and the major axis of the Museum. Elevations and details are admirable, and the whole scheme a fine design, but the provision for study and research is separate from that for exhibition, which, for the nonce, is fatal.

Mr. Edgar Wood, like the authors of the selected design, has arranged his exhibition galleries in the middle and his reserve collection on the outside; but there is a lack of simplicity in his plan, not assisted by the provision of unnecessary galleries of communication.

Messrs. A. Marshall Mackenzie & Son send an effectively planned interior, with a western entrance leading to a central hall on the minor axis, and the alcoved galleries for Welsh natural history and history and antiquities left and right. Their scheme fails by the location of the reserve collections in a separate annexe.

Mr. William Haywood has devised a very effective external treatment by providing a number of open courts between projecting galleries, connected by open colonnades, but the galleries are small and reserve collections on upper floors.

Messrs. T. L. Dale, Alec Horsnell & Leslie Wilkinson have formed a syndicate to contribute a simple plan, but are marred by a wearisome and monotonous sequence of galleries with the reserve collection on the ground floor and the exhibition galleries on the first floor.

Messrs. Leeming & Leeming are, like many others, put hopelessly out of the running by the fact that their exhibition galleries are on the ground floor and their reserve collections on the first floor; but their plan is also vitiated by the provision of much corridor centrally and around the galleries. They submit a well-drawn detail and a good perspective showing a design thoroughly in sympathy with, and following closely that of the City Hall.

Mr. Theodore Fyfe has peculiar notions of the function of reserve collections in a museum, which he places in cupboards in the basement, euphemistically styled "lower ground floor," and in which they are mixed up with "storage" and work rooms. Other reserve rooms are in a rear building in three storeys. The main exhibition galleries are on the first floor.

Mr. Malcolm Stark provides in his plan an impressive feature of a great central court 154 feet by 90 feet, with a gallery round on the first floor. Two internal garde courts also give effectiveness. The disposition of th reserve collections is erratic; sometimes they adjoin th exhibition galleries of their departments, sometimes the are on different floors.

Messrs. Ashley & Newman send a nice plan symmetrically disposed about the minor axis, but the departments are not sufficiently distinct and often overlap, whils the reserve collections are scattered and for the most par separated from the exhibition galleries of their respectiv departments. Their detail is a fine drawing.

Mr. Frederick R. Hiorns has a good plan with th reserve collections mainly on the same floor with the exhibition galleries, but, like many others, he has an impossible aquarium, whilst his exterior is spoilt by a rathe ugly dome.

Mr. Martin S. Briggs has worked out an origin idea with his museum galleries arranged around two quad connected by a cross gallery with extensions at the rea forming a very effective exterior, but his exhibition ga leries are on the ground floor and his reserve collection on the first, so once again a good conception is hopelessl out of court.

Messrs. Honeyman, Keppie & Mackintosh have plan that approximates to that of the winners', wit entrances from the west on similar transverse axe principal entrance from the south, a central garden cour and reserve collections to some extent outside of and adjoi ing the exhibition galleries, but their plan suffers from lack of simplicity.

Mr. A. W. S. Cross has followed the wrong idea reserve collections on the ground floor and exhibiti galleries on the first floor, whilst his galleries in the cent of courtyards spoil these, and are badly lighted for t reserve collections in the departments of industries a zoology and botany. His exterior is quiet and dignifi and detail well drawn.

The syndicate formed by Mr. Henry Tanner, Jun Mr. F. D. Clapham, and Mr. T. F. Green has adopt the idea of a western entrance with a colonnaded logg that we have noted before. Whilst some of the reser collections adjoin the public galleries, in other cases t two constituent parts of departments are separated a sometimes far apart on different floors.

Another syndicate, Mr. Macartney, Mr. Halley, a Mr. Bacon, make a feature in plan of a grand central h for sculpture approached from a western entrance. Mo departments are on the ground floor, art and industri being placed on the first. Whilst some reserve collectio are connected with their exhibition galleries others a separated. Externally an imposing colonnade employed with detached columns on the south and we and attached on the northern façade.

Mr. Sydney K. Greenslade is another competit with a western entrance leading to a grand sculpture h and art gallery, but in his case also much fine design a labour is fruitless because the reserve collections are the ground floor and the public galleries on the first flo

Mr. Robert Atkinson keeps his main block within t compass of the Law Courts, with an extension having axis in line with that of the road behind the City Ha and with an entrance thereon leading to the lectu theatre, board-room, and administration. The ma entrance to the Museum proper is from the south, t public galleries being on the inside and the reserve c lections outside, with the departments of industries a art with their reserves on the first floor. The exterior well designed in a Franco-Grec manner.

Mr. Ernest E. Morgan aligns his plan with frontages of the City Hall and the University buildi as well as with the Park Place frontage. With a weste entrance he has arranged the public galleries in the cen and the reserve collections around, but in the case of department of history and antiquities, the location of exhibition galleries on the first floor and the reserve c lections on the ground floor mars an otherwise good pl The exterior treatment is good and well shown in perspective.

Messrs. Hall, Jones & Cummings have adopted the idea of a south entrance and long axial corridor with branches leading to galleries, not the best way of planning a museum, and moreover they have committed the *faux pas* of placing reserve collections on the ground floor and exhibition galleries on the first, as so many others have done.

Mr. F. Radford Smith has achieved the feat of restricting the Museum to the lines of the Law Courts, but only by the inadmissible device of putting reserve collections on the lower ground floor, alias basement.

Mr. A. Jessop Hardwick sends a plan of some merit with a lecture-hall of considerable architectural pretension, but with a great dome that would be bad acoustically. His reserve collections are arranged in a too haphazard manner.

Messrs. D. Robertson & W. J. Anderson have submitted a plan which contains the good feature of reserve collections adjoining the exhibition galleries, but they have indulged in too much corridor, and their plan lacks coherence.

Messrs. Lovell & Bulman contribute a simple plan that fails by the location of the reserve collections for the most part on upper floors.

We understand that many of the designs submitted will be exhibited in London at the rooms of the Architectural Bureau, where no doubt they will be visited by many who will take advantage of the opportunity to study a very remarkable display of modern British architectural designs.

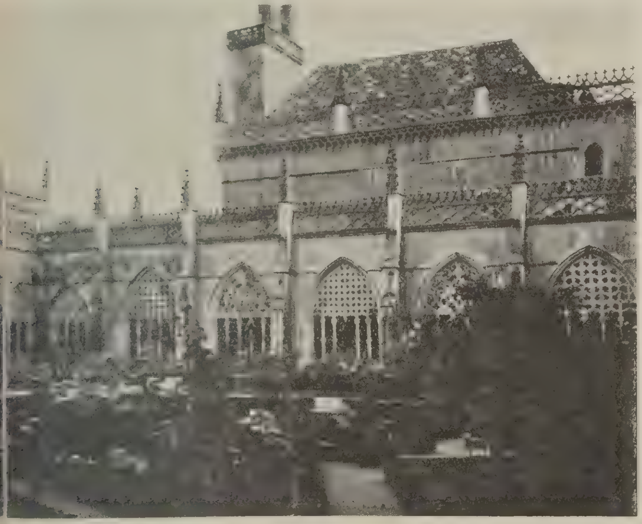
## CHURCHES AND CLOISTERS IN PORTUGAL.*

*(Concluded from last week.)*

### *Batalha.*

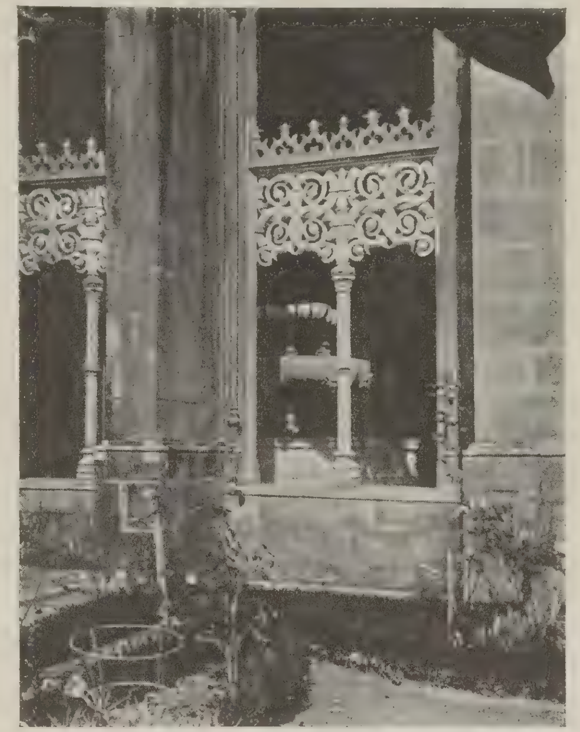
King Edward's son and successor, Alfonso V., built the north-western cloister, which we will visit later, but probably did little, if anything, to the eastern chapels. When King Manuel came to the throne in 1495 he carried on the work there and built the great western portal and the pateo or vaulted hall between the octagon and the church. He also constructed the vaults above the chapels surrounding the octagon, or most of them, and carried up the eight huge piers 80 to 90 feet high which rise above the rest of the structure.

But when we see the great west portal we feel transported to the Arabian Nights. This portal is about 17 feet in clear width and 28 feet high to the spring of the arch. No verbal description can convey what a remarkable piece of work it is.



BATALHA—ROYAL CLOISTER, LOOKING NORTH-EAST.

King Manuel died in 1521, leaving the work unfinished, and so it remains to the present day, except that some work above the great portal was done in 1553 when Renaissance feeling prevailed. It is said that the then king did not like it, and stopped the work. No one knows how it was intended to complete this wonderful building, or how it was proposed to connect it, if at all, with the church. It is quite cut off from the church, and the only access is by a quite unpretentious doorway at the north end of the pateo. Murphy gives us his idea of how the building ought to have been completed.



BATALHA—DETAIL OF TRACERY OF FOUNTAIN HOUSE, ROYAL CLOISTER.

The tracery of the great west window of the nave of the church, completely filling it (and indeed the tracery throughout the church), must not be judged by our Northern standards. The sun shines hotly in Portugal, and shade is a desideratum.

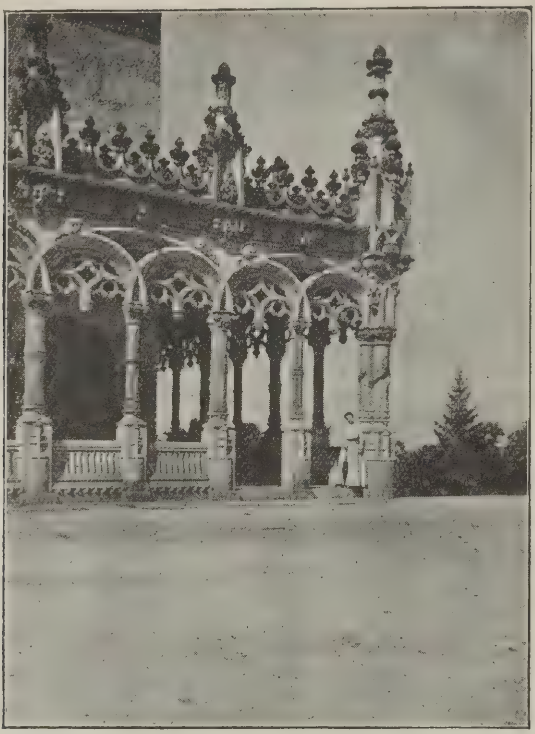
Now we come to the Royal cloister on the north side of the church, placed there for shade, no doubt, 182 feet square, including the walks, 17½ feet wide. Here again we have a close network of tracery to exclude rather than to admit the light.

BUSSACO HOTEL.

This cloister was built by the founder, John I., and may have had traceried windows originally, or may only have had openings awaiting tracery. In any case, at the same time as King Manuel was busy with his remarkable work at the Çapellas Imperfeitas he executed the tracery now existing. Here again no description will convey to your minds the richness and elaboration of the work. Most picturesque is the lavatory or fountain house in the north-west corner. Externally the angle turret with its plain surfaces acts as a foil for the elaborate transom-like tracery inserted by Manuel half-way up the tall and narrow lights.

---

* A paper read before the Northern Architectural Association, on March 2, by Mr. Joseph Oswald, F.R.I.B.A.

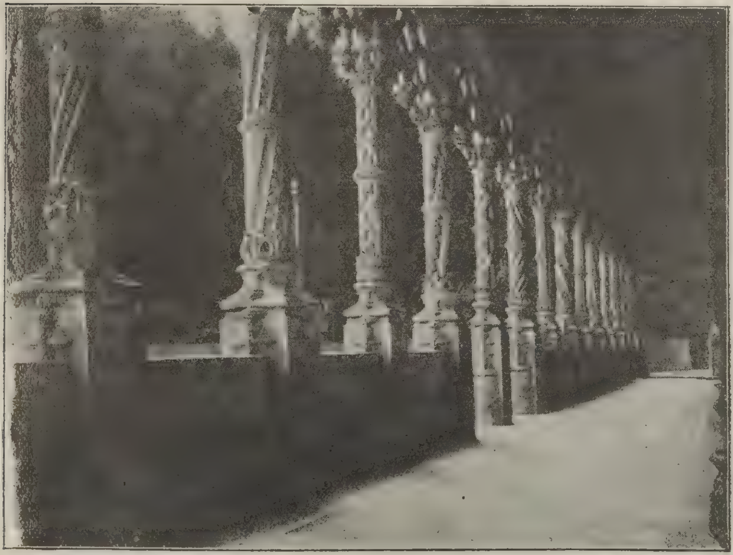


BUSSACO HOTEL—CORNER OF VERANDAH.

In the usual position on the east side of the Royal cloister is the chapter-house, 63 feet square, covered by a vault rising to a height of 43 feet without intermediate support—a bold achievement.

Murphy gives a very good section of it. It is not of lofty pitch, and yet it has withstood earthquakes that damaged other parts of the buildings from time to time.

In the south-east corner of the chapter-house the corbel from which the vaulting springs is carved to represent a man. It is evidently a portrait and said to be the architect.



BUSSACO HOTEL—INTERIOR OF VERANDAH.

To the north of the Royal cloister is another smaller and simpler cloister 143 feet square, including the walks, built by Alfonso V., which one would think by appearance to be much earlier in date than it really is. The upper storey is a later addition. To the east stood two other cloisters, destroyed by the French in 1810.

The cloister courts are cultivated as rose gardens, and the foliage and flowers, framed in by buildings gleaming like old ivory against the deep blue sky is a sight not to be forgotten. I have seen many beautiful cloisters in France and Italy, but the Royal cloister at Batalha excels them all as a picture.

Since the suppression of the monastery in 1834 the church and cloisters have been maintained by the Government as a national monument, and it is delightful to see in what excellent condition they are kept. Portugal is not a wealthy country, and only about 450*l.* a year is available for the purpose. One might wish that even less money were spent in supplying missing features, as the architects in charge appear to have a mania for cresting walls with pierced stone parapets and for filling the windows with hideous coloured glass set in wooden fretwork. These are the only blemishes due to the present generation.

There is a humble parish church not far from the abbey where one sees in the west door the influence of its prouder neighbour. The detail is very refined, partly Renaissance, with the Cross of the Order of Christ and the armillary sphere, showing it to be the work of King Manuel's time.

My paper is now finished, but I feel I ought to mention the hotel at Bussaco. This has been quite recently built (in fact, building is still going on) in the revived Manueline style, which appears to appeal to the Portuguese taste of the present day, as I saw a fine mansion in course of erection at Cintra, near Lisbon, in the same ornate style. The hotel shows the traditional clumsiness of outline and elaboration of detail, the execution of the latter proving that the right hand of the Portuguese carver of to-day has not lost the cunning of his sixteenth-century ancestors.

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

At a general meeting held on Thursday, March 17, Mr. Percy Robinson, F.R.I.B.A., occupying the chair, the election of the officers for the forthcoming session took place, the following gentlemen being appointed to the several offices:—

As president, Mr. S. D. Kitson, M.A.; vice-presidents, Mr. R. P. Oglesby and Mr. A. E. Kirk, A.R.I.B.A.; hon. treasurer, Mr. R. Fielding Farrar, A.R.I.B.A.; hon. librarian, Mr. Fredk. Musto, A.R.I.B.A.; hon. secretary, Mr. R. W. Thorp, A.R.I.B.A.; to the Council, Mr. C. B. Howdill, A.R.I.B.A., Mr. J. F. Walsh, Mr. G. F. Bowman, Mr. H. A. Chapman, F.R.I.B.A., Mr. J. C. Proctor, A.R.I.B.A., and as Associate member, Mr. W. Whitehead, A.R.I.B.A.

In proposing the election Mr. W. H. Thorp, F.R.I.B.A., acknowledged the Society's indebtedness to Mr. Percy Robinson, the retiring President, who, he said, had done yeoman service on its behalf, and whose untiring efforts towards the furtherance of its aims were appreciated by every member, sentiments which were endorsed by Mr. H. S. Chorley, M.A., who seconded the proposal.

Mr. Kitson then read his paper on the "Life and Work of Carr of York," an architect who flourished during the eighteenth century, and to whose hand so many of the Yorkshire Georgian mansions owe their stolid simplicity. He is perhaps best known as responsible for the erection of Harewood House, where he came in contact with the Brothers Adam, a circumstance which considerably affected his subsequent work.

Commencing life as a mason with the traditions of several generations of mason forbears, he was one of the last links with the mediæval past, when the craftsmen had so great an influence on architectural development.

## ILLUSTRATIONS.

### PREMIATED DESIGNS FOR THE NATIONAL MUSEUM OF WALES.

All our illustrations this week are of the successful and premiated designs in the important competition for the National Museum of Wales. A critique on these designs appeared in our last week's issue, and is followed this week by a review of some of the more important unsuccessful designs.

The Royal Sanitary Institute have appointed Prof. Henry Adams, of the firm of Henry Adams & Son, and Dr. Louis C. Parkes as their representatives upon a joint committee which is being formed by the Institution of Heating and Ventilating Engineers to consider the question of legislation in connection with the ventilation of public buildings.

## THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening, March 18, in the premises at Tufton Street, Westminster, S.W., Mr. C. Wontner Smith (Vice-President) in the chair.

Mr. A. W. Lloyd was elected a member.

The Hon. Secretary announced that the sixth spring visit would take place on April 9 to Westminster Abbey, under the guidance of Professor Lethaby. As the visit was limited to twenty members, those wishing to attend were advised to make early application to the secretary for tickets.

Professor Beresford Pite read a paper, illustrated by photographs and lantern views, entitled—

### Filippo Brunelleschi and the Renaissance.

The period covered by the life of Filippo di Ser Brunelleschi, who was born at Florence in 1377, and died in 1446, seems to claim especially, as do so many similar epochs of a life-span, a pre-eminence in artistic and historic importance.

In England this is the term covered by the rapid recovery of national life after the terror of the black death of 1349, and is evidenced in the vigorous development, bold and inartistic though it was necessarily at first, of the so-called Perpendicular phase of Gothic architecture. Henry VII.'s Chapel here at Westminster belongs to a full century later than the youth of Brunelleschi, and enables us to judge by the measure of a hundred years the handicap of England in the evolution of Renaissance architecture.

The Eastern Roman Empire of Byzantium was still a fact, for Constantinople was not captured by the Turks until seven years after Brunelleschi's death, and the strange and short-lived fancy of reunited mediæval Christendom was enacted beneath Brunelleschi's unfinished dome in the cathedral of Florence, when, on July 6, 1440, Pope Eugenius IV., with all the Court of Rome, accompanied by the Emperor of the East, John Palæologus, and the chief prelates of the Eastern Church, with all the other bishops and prelates went to St. Maria del Fiore, which had been prepared, in the words of Vespasiano, "as beseemed such an occasion." The scene is thus described by the late Professor Eliot Norton. "The Pope, cardinals, and bishops of the Western Church took their places on the Gospel side, and on the other was the Emperor of Constantinople with all the Greek bishops and archbishops. The Pope sang a solemn mass. Cardinal Julian and Bessarion, Archbishop of Nicea, read from the pulpit in their respective tongues the act of union, and 'mutually embraced in the name and in the presence of their applauding brethren,' and before the multitude who crowded the vast nave of the cathedral and filled the space beneath its majestic dome. 'All the world,' says Vespasiano, 'had gathered in Florence to witness an act of such dignity.'"

Neither the parent dome of the Divine Wisdom at Constantinople or that later assertor of the claims of the West, the dome of St. Peter at Rome, have been more nearly the harbour and scene of so historic an achievement as that architectural wonder of Brunelleschi's enshrined on that "solemn day" of July.

But the reunion in the cathedral pulpit was but a pageant, its incompleteness typified, perhaps, by the yet unfinished building work. Ere the lantern had been placed upon the dome Constantinople had been taken by the Turks, the great empire of the East dissipated, and the Greek and Latin churches each suffering from the clay of earthly polities, left to pursue divergent courses; Santa Sophia to become a mosque, and St. Peter's to rear itself rather as a protest against Protestantism than as the shrine of an undivided Christendom. How ephemeral seem the deeper aspects of life when one gazes at the still-vivid illumination of the architect's mind throughout the lines and facts of such monumental tabernacles as Sta Sophia, Sta Maria del Fiore, and St. Peter's.

Symonds will describe for us better than anyone else the intellectual movement and spirit of the era of Brunelleschi, the Cinquecento literally beginning when, as we have seen, he would be twenty-three years of age, so that his prime came with the full tide of that most delightful and wonderful phase of early Renaissance art which included his rival Ghiberti, 1378-1455, and his attached intimates, Donatello, the incomparable sculptor, 1386-1466, and Luca della Robbia, whose delicious art and technical achievement so fascinates ourselves. To this group we have only to add the names of three contemporary painters to indicate the marvellous galaxy of Florentine artistic power:—Fra Angelico, 1387-1455; Masaccio 1400-1443; and Filippo Lippi, 1400-1469. Symonds says, "Speaking roughly, the half century between 1450-1500 may be termed the culminating point of the Renaissance," and we now quote him at length:—

"The Italians of the fourteenth century, more precocious than the other European races, were ripe for this emancipation of enslaved intelligence. In the classics they found the food which was required to nourish the new spirit, and a variety of circumstances, among which must be reckoned the pride of a nation boasting of its descent from the Populus Romanus, rendered them apt to fling aside the obstacles that had impeded the free action of the mind through many centuries.

"Petrarch not only set his countrymen upon the right method of studying the Latin classics, but he also derived the importance of recovering a knowledge of Greek literature. To this task Boccaccio addressed himself, and he was followed by numerous Italian enthusiasts, who visited Byzantium before its fall as the sacred city of a new revelation. The next step was to collect MSS., to hunt out, copy, and preserve the precious relics of the past. . . . Learning was then no mere pursuit of a special and recluse class. It was fashionable, and it was passionate, pervading all society with the fervour of romance. For a generation, nursed in decadent scholasticism and stereotyped theological formulæ, it was the fountain of renascent youth, beauty, and freedom, the shape in which the Helen of art and poetry appealed to the ravished eyes of mediæval Faustus. It was the resurrection of the mightiest spirits of the past. 'I go,' said Cyriac of Ancona, the indefatigable though uncritical explorer of antiquities—'I go to awake the dead.' This was the enthusiasm, this the vitalising faith, which made the work of scholarship in the fifteenth century so highly strung and ardent. . . .

"Fortunately for the unimpeded expansion of Italian art, little was brought to light of antique workmanship during the fourteenth and fifteenth centuries. The classical stimulus came to painters, sculptors, and architects chiefly through literature. Therefore there was narrow scope for imitation, and the right spirit of humanism displayed itself in a passionate study of perspective, nature, and the nude. Yet we find in the writings of Ghiberti and Alberti, we notice in the masterpieces of these men and their compeers, Brunelleschi and Donatello, how even in the fifteenth century the minds of artists were fascinated by what survived of classic grace and science. Gradually, as the race became penetrated with antique thought, the earlier Christian motives of the arts yielded to pagan subjects. Gothic architecture, which had always flourished feebly on an Italian soil, was supplanted by a hybrid Roman style. . . . The perfect plastic art of Italy, the pure art of the Cinquecento, however much imbued with the spirit of the classical revival, takes rank beside the poetry of Ariosto as a free, intelligent product of the Renaissance. That is to say, it is not so much an outcome of studies in antiquity as an exhibition of emancipated modern genius, fired and illuminated by the masterpieces of the past."

It would not be difficult to find material for an architectural biography of unusual interest to modern professional men in the career of Filippo Brunelleschi—competitions, committees, strikes, rivalries, the employment of models, and tactical manœuvres of various kinds would be provided such as insure a sympathetic ear; while force of personal character, versatility in sculpture and mechanics, and many points of contact with other branches of art and science would almost fill up the ideal and make Brunelleschi's story the true modern exemplar of an architectural student.

Brunelleschi has not lacked enthusiastic biographers. Vasari, who wrote in 1550, about 100 years after his death, as far removed as we are from Sir William Chambers, declares that he "was of such exalted genius that we may truly declare him to have been given us by Heaven for the purpose of imparting a new spirit to architecture, which for hundreds of years had been lost. But it pleased Heaven, the earth having been for so many years destitute of any distinguished mind and divine genius, that Filippo Brunelleschi should leave to the world the most noble, vast, and beautiful edifice that had ever been constructed in modern times, or even in those of the ancients."

It may be noted that Michel Angelo had only shortly before these words were published succeeded to the appointment of architect to St. Peter's, at Rome, which was not therefore in a position to rival this claim of Vasari for the Duomo at Florence.

The stormy rivalries of Florence during his lifetime point to the existence of strong appreciation of his talent, and we find that Cosimo de' Medici introduced him to Pope Eugenius IV. by an autograph testimonial, which runs as follows:—"I send your Holiness a man of such immense capacity that he would have confidence enough to turn the world back on its axis," a character which Brunelleschi did not abate by giving the Pope the not original Archimedean assurance:—"Let your Holiness only give me the point whereon I can fix my lever and I will then show what I can do." Truly, this architect would have succeeded in impressing a modern building committee.

Mons. Müntz (quoted in Blashfield and Hopkins's edition of Vasari) "calls Brunelleschi the Christopher Columbus of modern architecture, and asserts that he created it as a complete entity. A mathematician and engineer to the very centre of his being, the cupola of Florence is quite as much an engineering feat as an architectural performance; he left formulæ for the resolution of all problems, and sinned, if at all, by excess of sobriety and gravity." This reticence in architecture, by the way, is not characteristic of the modern engineering intellect. M. Müntz, "admitting that the Italian architects of the thirteenth and fourteenth centuries were not from the special point of view of architecture worthy to untie the shoes of a Brunelleschi, an Alberti, or a Bramante, nevertheless regrets the charming decorative fancies rejected for the three orders," but sums up by saying that "the Italians during the Gothic period had become a people of decorators, and that Brunelleschi made them again a people of architects." In the same work Michelet's opinion, in "Histoire de France," is given of him as one "who had the soul of Dante and his universal mind, but, ruled and guided by another Beatrice, the divine music of numbers and of visible rhythm. Through her he escaped all other temptations, even that of sculpture, whose virile fascination held him for a time. Perspective, mechanics, and all the varied arts of the engineer guided him along the road which he followed in continuous pursuit of that Urania who imitates upon earth the measure of Heaven and the eternity of the handiwork of God."

The brilliant and much-lamented William J. Anderson writes, in the introduction to "The Architecture of the Renaissance in Italy," that that movement "has been claimed as a result of the influence of literature and the study of the ancient manuscripts; but literature, while bolstering its decline and fall, had scarcely more influence on its origin than the writings of Virgil, Horace, Livy, and Ovid had on the architecture of the Augustan age they adorned. Originality has never been displayed to greater degree than by the architects of the Early Italian Renaissance, and considered in relation to the direction of all architectural effort for centuries, the interiors of San Lorenzo, the Badia at Fiesole, and Santo Spirito—all churches of Brunelleschi—are real works of genius. Brunelleschi, seeing the confusion and incoherency of the work of his time, went farther afield for his architectural technic to find it in the ancient principles of building, laying the foundation of a great revival by his masterly use of them, while fully satisfying immediate requirements. In Brunelleschi's resolution to acquire the Roman principles and to build upon them, we have just a distinctive circumstance unprecedented in the world's history, it may be, but in its audacity quite characteristic of the deeds of the time. In its own way it involved as much uncertainty as the voyage of Columbus, and was indicative of the same inquiring and unsatisfied tendency. But Brunelleschi, too, discovered a hidden world, and in the most brilliant way. His discovery was not fraught with the material consequences of that of the mariner, nor the scientific results of that of the astronomer; yet it has had an incalculable influence upon all forms of art production to this day. First in time, he was not second in intellect, in pertinacity, in achievement; and wherever the forms of art are understood and beloved, the genius of Brunelleschi will not fail of honour and renown."

To this, the view of a modern architect, we will add the testimony of Leon Battista Alberti, a young contemporary of Filippo Brunelleschi. Of all the men of the Renaissance Alberti is perhaps the most characteristic embodiment of its many-sided romanticism, by consent of his own, as well as of our time, the most extraordinary personality of the Cinquecento period. Man of letters, of arms and art, aristocrat and craftsman, dilettante and antiquarian, the father to all of us of the five orders of architecture. After a family exile of thirty years he returns with the revolution brought about by Cosimo de' Medici in 1434 to his native city, and dedicates his treatise on painting two years later to Brunelleschi with these words:—

"I have been accustomed both to wonder and to grieve that so many supreme and divine arts and sciences, which, alike from their works and from their history, we see to have abounded in those most highly-endowed ancients, were now lacking and almost utterly lost. And, indeed, hearing from many that this was the case, I thought that Nature, mistress of all things, now grown old and weary, even as she no longer brought forth giants, in likewise no longer produced geniuses such as those most ample and marvellous spirits which she produced in her youthful and more glorious days. But I, since I have been restored, after long exile in which I, Alberti, have grown old, to this our native land, that surpasseth all others in her adornment, I have recognised in many, but chiefly in thee, Philip, and in our near friend Donato, the sculptor, and in those other, Nencio (*i.e.*, Ghiberti) and Luca (*i.e.*, della Robbia) and Masaccio, genius capable for every praiseworthy work, not inferior to that of any ancient and famous master in the arts. Who is so unfeeling or so envious that he would not praise Pippo (*i.e.*, Brunelleschi), the architect, beholding here a structure so grand, lifted to the heavens, ample to cover with its shadow the whole Tuscan people, erected without aid of framework or multitude of timbers—a work of art, in truth, if I judge rightly, such as, deemed incredible in these days of ours, was neither conceived nor known by the ancients? But there will be another place for reciting thy praises and the virtue of our Donato, and of the others most dear to me by their ways. Do, then, only persevere in inventing, as thou dost from day to day, things by which thy marvellous genius shall acquire perpetual fame and name, and if, perchance, some leisure shall fall to thee, it will please me shouldest thou look over this little book of mine on painting, which, inscribed to thee, I have written in the Tuscan tongue."

How Time mocks, in its progress, at architectural doctrines professing to be grounded upon ethical principles, and makes merry over this confusing of things that differ, may appear from a passage in the preface to the late Mr. G. E. Street's book on the Gothic architecture of North Italy. It might be dangerous to make the quotation with such a purpose, lest the delicate and precious growth of earnestness in the breast of the architectural student might fade, were it not that Brunelleschi's achievements and personality provide us with a healthy corrective, and thus tend to clarify our judgment, enabling a well-directed enthusiasm to analyse the facts that underlie architectural fancy, instead of imagining that principles of moral action apply when but little else than the physical law of gravitation works. Mr. Street says:—

"It is impossible not to feel that the great and general interest in art created by a revival of true principles within the last few years is a subject of the greatest congratulation to all true artists. It was therefore with the desire to see how far these first principles were worked out by the architects of the Middle Ages in Italy that I undertook my journey. Let me say, too, at the same time," he continues, "that I started without either the intention or the desire to examine at all carefully the works of the Renaissance architects. I should wish also, I must confess, in all my studies of foreign architecture, to confine myself to those buildings in which there appear to me to be the germs at least of an art true and beautiful in itself, and of service to us in our attempt to improve our own work. It does not appear to me that the works of the Italian Renaissance architects really contain this. I see no reason for doubting that if we wish for a purer school of art we must either entirely forget their works, or remember them so far only as to take warning by their faults and failures."

Brunelleschi's practice will without doubt satisfy Mr. Street's genuine admiration for direct architectural expression, and his zeal for the pointed arch which, in the same book, he says is "not only the most beautiful, but at the same time incomparably the most convenient feature in construction which has ever been, or which, I firmly believe, ever can be invented." It may, with some ease to our feelings under the strain of Mr. Street's personality, be well to reflect that his enthusiasm for Mediævalism, and nothing else, was itself an antiquarian revivalism, though appearing as the only solvent of the latest problems of architecture, and that it issued through the hand of its enthusiastic devotee into beautiful and really original detail and decoration.

Further, with some deference, one may allege that the "furore" which Brunelleschi's compeers, whether brethren or employers' committees, experienced was the expression of a vigorous personality and a qualification with which more modern architects than himself have been equipped, necessary to the bringing to fruition of great architectural conceptions.

Individualism came to architecture with Brunelleschi, remained to us until Mr. Street, and is not apparently yet replaced by co-operative design and workmanship.

The works of Brunelleschi may be divided into two fairly distinct groups, and it may appear simple to do so, appraising the value of either to the Renaissance movement as follows:—(1) The completion of the Mediæval cathedral of

Florence by the addition of an octagonal-pointed vault involving architectural and mechanical problems of great importance; and (2) the revival and employment of architectural features, derived from classical studies, of great refinement and beauty, forming the first clearly-defined phase of a new Italian style, and of great subsequent influence and permanent artistic value.

The first, a special problem completing a Mediæval conception in a practical manner, came to its termination, and the second, the origination of a method of architecture with new detail and proportions, developed until it obtained a practically complete hold of the architecture of all civilised peoples. These divisions and estimates may be true, but are so only in part. Either achievement, whether in completing Mediævalism or initiating Classicism, might have been distinct and independent, but in Brunelleschi's case they fell within the grasp of one man, and were effected by a single course of events.

Mediæval architecture is primarily a system of construction achieving artistic expression by features developed and ornamentation arising out of the direct fulfilment of constructive or decorative purpose. The much bandied and battered phrases about truthful design and true principles of the Gothic revival illustrate, though they parody, the beautiful engineering of Gothic building. In the exercise of these predominating constructive principles Brunelleschi excelled by vaulting the great octagon of the Mediæval cathedral, the largest ever erected with a pointed arch, and thus brought its Gothic design to a harmonious completion. Renaissance architecture, on the other hand, assumes the Roman garb, whatever construction may underlie the form of the building, by an assumed civilisation putting a classic face upon any Philistine nakedness to mask its native or Gothic rudeness.

Brunelleschi was an enthusiast for this classic spirit also; he loved it, mastered it, employed it tentatively in the Pazzi Chapel, and as a revelation of new and wondrous gracefulness in the churches of San Spirito and San Lorenzo, while the Badia at Fiesole and the Loggia of the Innocenti Hospital show that he knew how to employ these artistic materials naturally in expressive construction. The development of a charming architecture, connecting and enshrining the swift movements of sculpture and decorative painting until the time of Michel Angelo a century later, is due to his initiative and school. It is difficult to imagine the trend of Renaissance art in the fifteenth century apart from the character imparted to it by its architectural features and principles. Difficult because setting aside the work of Brunelleschi we find no architectural leader sufficiently forceful to do more than gradually adulterate the weak Gothic of North Italy with sculpturesque feeling, as at Pisa and Siena, from local Romanesque sources. It is difficult to speculate upon what might have been in the absence of this genius who crystallised the problem of an age, but one may well doubt if Alberti, a quarter of a century afterwards, could have vaulted the octagon of the Duomo, and may certainly conclude that the long struggle and failure at St. Peter's at Rome of Bramante and his school evidence the fact that their hope to erect a dome similar to the Pantheon was foredoomed to failure. Michel Angelo, himself an enthusiastic Florentine, ultimately reverted both to Brunelleschi's pointed dome form and double arch.

The problem of the completion of the church of St. Mary of the Flower, that is, of the Lily, alike the Flower of Florence, and hence her name, and of Mary, was urgent just at that period in the early manhood of Brunelleschi, when, as with you, apparently insoluble enigmas exercise perhaps their greatest fascination over the mind. The new cathedral replaced the old historic church of the Santa Reparata, which resembled the beautiful San Miniato, the citizens in 1294 having determined upon its rebuilding. The foundation was laid upon the day of the Nativity of the Virgin, September 8, by the Papal Legate, to the honour of God and St. Mary of the Flower, and a tax on public expenditure, a graduated poll tax, or legacy duty, indulgences and pardons were ordained for the purposes of the work.

Arnolfo di Cambio was at this time architect to the Republic, and to him Florence owes the bulk of her fourteenth-century monuments. The Palazzo Vecchio and the Bargello, each with a wonderful belfry, the great church of Santa Croce, and the greater Duomo, were all buildings of his hands. Until Arnolfo's death in 1310 the works had continued in spite of much disturbance of civic peace by calamitous wars, seditions, and fire, the exile of Dante coming within this period.

The diminished revenues of the Commonwealth caused the suspension of works until 1331, and in 1334 Giotto, the painter, was appointed chief master of the work of the cathedral, and overseer of the other constructions of the Republic. He quickly began the design and erection of the Campanile, but died in two and a half years' time, when the tower was only about one-third of its height.

Taddeo Gaddi, his godson, having worked with Giotto for twenty-four years, was one of those to whom was intrusted the oversight of the works on the Campanile; this Gaddi is the celebrated painter, but he also was the architect of that Ponte Vecchio, with its charming street of shops, which has formed the fabric of Mr. Collcutt's pretty dream that London may some day also have a covered bridge across the Thames.

At the church of Sta Maria Novella, in the chapter-house, which became in 1567 the chapel of the Spanish colony, and therefore is now called the Spanish chapel, Taddeo Gaddi, in conjunction with Simone Memmi, executed one of the most complete and beautiful series of frescoes of the fourteenth century.

(*To be continued.*)

## WOOD-CARVING.*

WOOD-CARVING is an art with a past, and to-night I am chiefly concerned with an attempt to make the past live. To tell you, if I can, what I think the art has been, that you may the more easily form an idea of what it should be, for, in consequence of the peculiar organisation of industry at the present time, it rests with you more than with the craftsman to further that idea. You will forgive me if I liken the modern architect to an entirely new kind of organism whose parts have only a mystic connection.

By the exercise of strange and wonderful powers the directing intelligence sits in an office and attends to his profession (or is it an art?) whilst the several members are laying bricks or carving stone.

You will admit that in the early stages of its evolution the quality of the products of such an organism must of necessity be limited by the directing intelligence; the complexity of the organism tends to standardisation of processes, and it is that standardisation, when applied to wood-carving, against which I wish to protest to-night. A study of old work emphasises the fact that in the woodwork of to-day we are limited in ideas and in capabilities.

Compare the best or even the most extravagant of modern work with the work of the ancients of which we have descriptions, and I think you will agree with me that we show a distinct lack of the spirit of adventure in our treatment of wood. Take, for instance, these extracts from the annals of Thothmes III., 1500 B.C., describing plunder from conquered peoples:—

Plunder of Syria: Six large tables of ivory and kharub wood inlaid with gold and all precious stones.

Statues of the fallen chief, of ebony inlaid with gold.

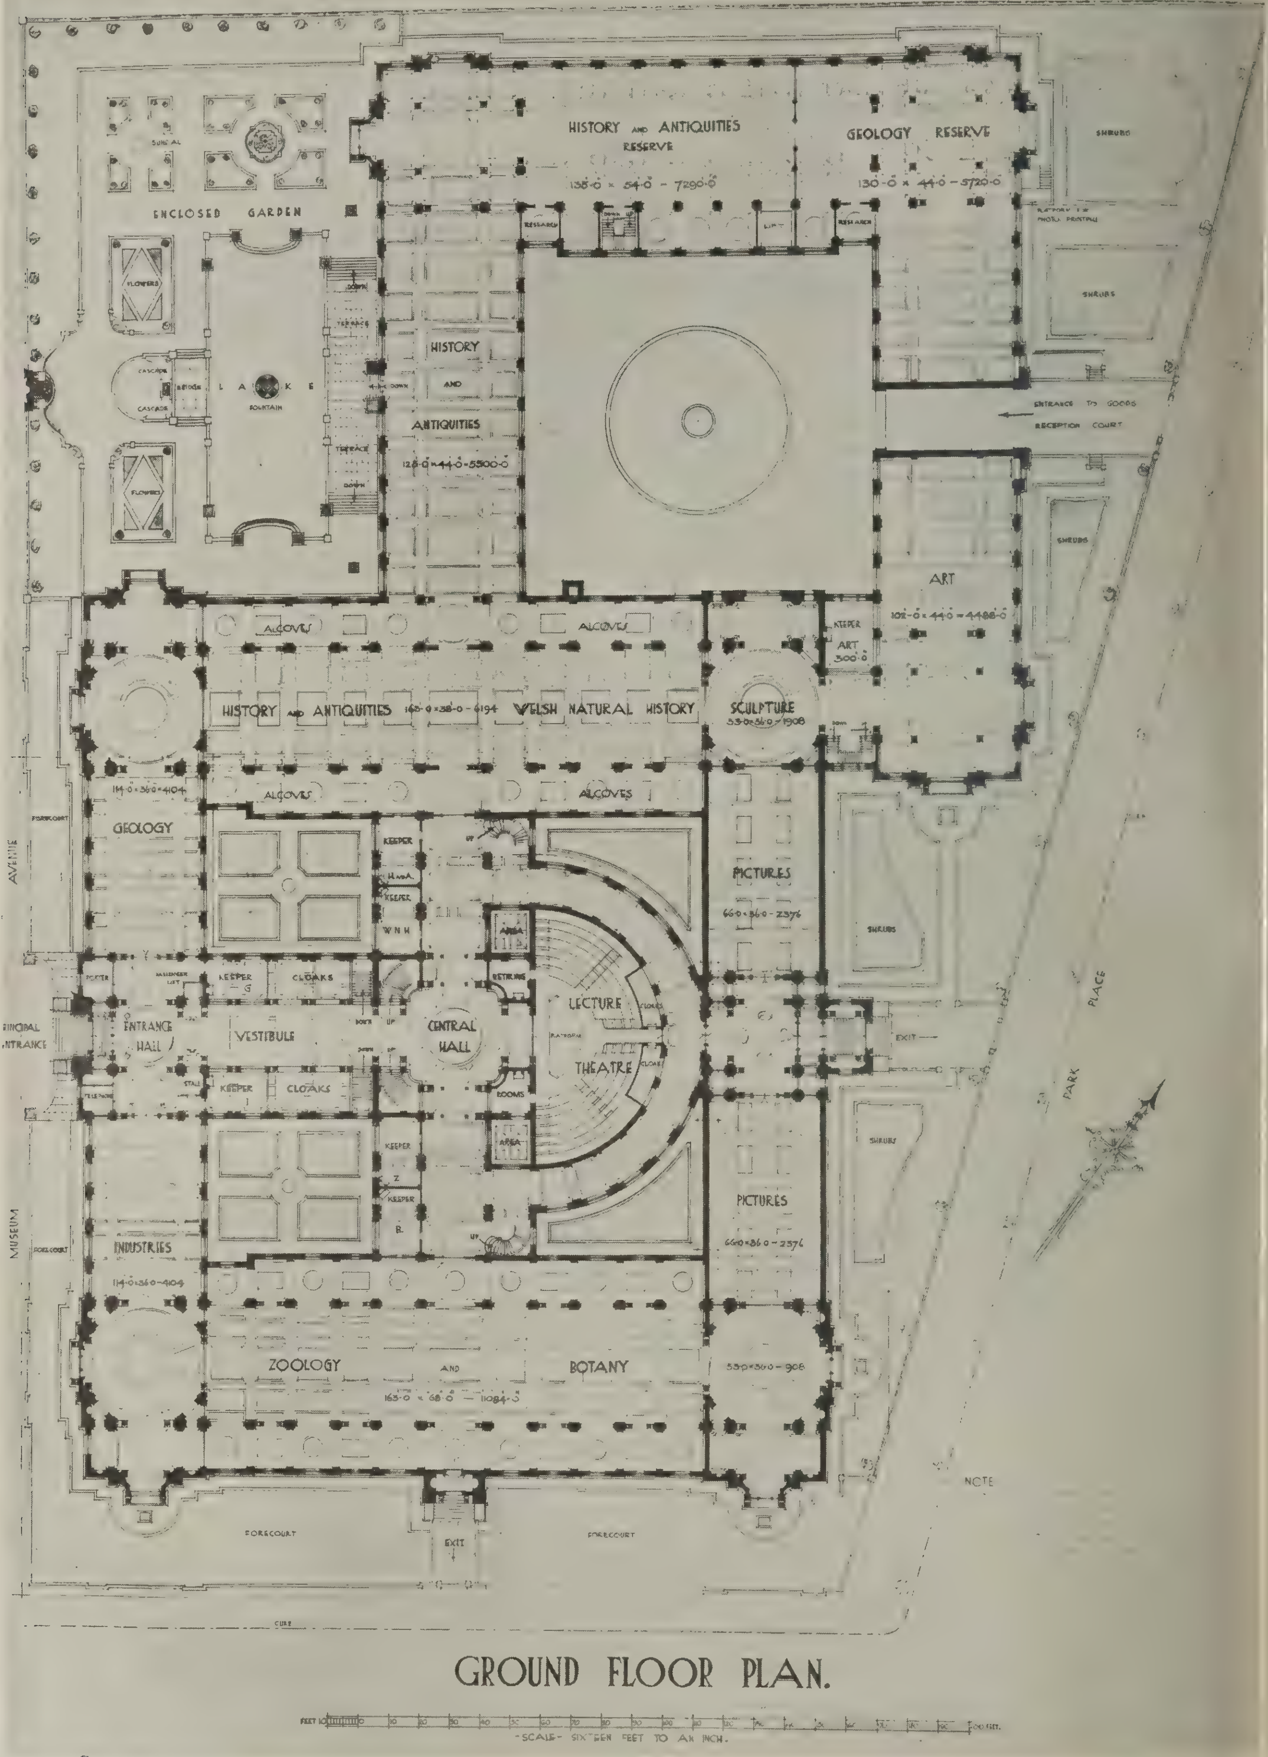
Forty chariots inlaid with gold and silver and painted.

Take again the description of Solomon's Temple, which can be built up from references in the Bible. It was built of stone, lined with cedar, and consisted in the main of the holy place or nave—a rectangular chamber of 2 cubes of 24 feet, and the holy of holies (answering in plan to our chancel) of 1 cube of 24 feet. The porch at the east was lined with cedar, and the olive wood doors to the holy place were four-leaved, carved in low relief and overlaid with gold. The temple was a place of thick darkness, so there was a shallow vestibule with inner doors of cypress wood, carved as the outer doors. The holy place and the holy of holies were lined with cedar and the roof was of beams and planks. On the walls were carved cherubim, palm trees, and open flowers covered with gold fitted on. The ceiling was overlaid with gold and the cedar floor was plated with gold. Dividing the holy place from the holy of holies was a screen of six pillars, which reached half-way to the ceiling; double doors of olive wood filled the centre opening, and were carved and overlaid with gold. Above the screen were festoons of golden chains decorated with a hundred pomegranate flowers and garnished with precious stones for beauty. A curtain (the veil which was rent at the Crucifixion) hung over the screen on the outside and was blue, embroidered. Against the walls in the holy place were ten tables bearing ten seven-branched candlesticks, five of which burned by day and five by night. These were the only lights in a chamber 48 feet by 24 feet by 24 feet.

Think of the beauty of the golden chamber—the holy place, with its blue embroidered veil, in the dim candle light. Then again, think of the great statues of Athena Parthenos and the Olympian Zeus; wood overlaid with gold, ivory, and precious stones.

---

* A paper read before the Leicester and Leicestershire Society of Architects on March 11, by Mr. Joseph Armitage.



FOURTH PREMIATED DESIGN FOR THE NATIONAL MUSEUM OF WALES.—By Messrs. David Milne & J. William Hepbur

because we are still under the influence of the Puritan idea that beauty is the enemy of the soul. You will remember the legend related by Heine to the effect that in 1433 a party of ecclesiastics walked in a grove near Basle wrangling over theological disputations; but suddenly in the midst of their abstract and dogmatical discussions they paused, transfixed before a linden tree, on which sat a nightingale, trilling and trolling the sweetest and tenderest strains. The learned m were ravished with delight. The glowing melodies of spri penetrated to their scholastic, musty, bookworm hearts, th souls awoke from the mouldy, wintry sleep, they looked one another in astonished ecstasy. But finally one of th made the sagacious remark that such things could not co of good, that the nightingale might be a devil, and that th

evil might be seeking through its sweet music to decoy them rom their pious conversations and to lure them to voluptuousess and similar pleasant sins, and then he began to exorcise, hereupon the bird replied, "Yes, I am an evil spirit!" and ew away laughing. But those who heard its song sickened hat very night, and soon after died.

People do not yet distinguish between fascination and beauty, and the artist is still somewhat of a bogey-man with loose morals, an entire misconception of art and beauty. Art, I take it, is an auxiliary of language in the transmission of ideas. By means of words man can only imperfectly express emotion, it is the function of art to give it more complete expression. Art, then, is an important means of communication between man and man, the universal language of the soul, and may be used basely to express base and ignoble feeling and emotion, to stir base passions; nobly to express the highest ideas and the most pure emotions. It can debase humanity or uplift it, and is technically good in so far as it succeeds in doing either—that is to say, the excellence of a piece of art qua art is to be judged by its success in conveying an idea or an emotion from the artist to the greatest number of his fellow-men. It follows, therefore, that its success or failure as art is largely dependent on its attractiveness, that is, good art must be either fascinating or beautiful. In practice, of course, immoral work (if I may use this unfortunate word) is fascinating, moral, beautiful. Bernard Shaw has said that beauty is a bye-product. We might add that fascination is consciously produced.

The range of expression open to the art of the wood-carver pure and simple is, of course, limited. His material is perishable and liable to fire. The wood-carver must, from the beginning, realise that he is dealing with a humble material; he must be content to be the architect's poor relation, happy if he can produce what Ruskin called a "pleasing roughness."

The great characteristic of wood is the grain; whether it be straight or twisted into fantastic knots, it puts difficulties in the way of perfectly smooth and accurate finish. Looking at most modern work one feels that the grain spoils the effect, or, to put it in another way, one feels that the work would look better in a perfectly homogeneous substance, such as cheese. One wonders why a man should attempt to produce such marvels of accuracy and smoothness in such a stubborn and wayward material. In mediæval work, on the contrary, one feels that the carver has conquered his material by kindness and judicious give and take, giving it a beauty that is almost human in its blending of imperfections into a harmonious whole.

Wood is distinctly the wrong material for subtleties of expression. But if the carver has something to say and is not merely roughing wood for a living, he can make us feel his delight in nature and in life, or amuse us with his jokes. Only by the crudest symbols can he tell us of the deeper things of life, and only then if he is of the élite. His beauty will grow round a core of symbolism, and will be so much the better if it is only a bye-product.

But how far is the carver justified in imitating nature? If he is to make us feel his delight in nature, ought he to stop short of exact imitation, give us not only the texture and colour but the smell of the flowers, if he can? What prevented the mediæval worker, with all his delight in nature, making his work naturalistic? Why is it that in all the great periods, side by side with great technical skill, there is a strict convention? The teaching of the tool is the text-book explanation, but the tool would lead one to damnation if one would let it. There is a constant temptation to greater and greater finish and skill in pure craftsmanship, the desire to excel as an executant. Again and again in history we see it struggling with some other power. Norman work developed towards naturalism until checked by the Cistercian reformation, which led to the weird convention of the thirteenth century, through which the naturalism of Decorated work gradually breaks, which again gradually hardens through Perpendicular to the convention of Late Perpendicular and the Early Renaissance, then to naturalism of Grinling Gibbons, back to convention of the eighteenth century, and so to the anarchy of to-day. Through it all there was a definite standard or tradition, development was fairly even, and behind it all there was the ideal, towards which it continually returned, the ideal of architectural fitness, the true sense of which was lost with the severance of the craftsman and the architect from the actual building. Now, when the parts of the work are executed in different parts of the country, in separate workshops, it is difficult to keep the units in proper relation, and our work suffers. The architect must paint his picture with ready mixed paint, or he must carefully mix his complete palette before starting the work. There can be little adjustment of values, and therefore less unity.

Professor Blomfield, in his lectures on the mistress Art, sees great possibilities in the further development of the architects' ego, as opposed to the commonwealth of building. He dreams of the architectural superman and warns his students against any inclination to find religious or moral sanction for the method of design which appeals most to their individual temperament—that excellence of intention does not to any extent atone for incompetent art, that architects have failed through a concentration on detail, and architecture is a personal art.

But surely if we are to have art at all, intention must be everything. The best individual art must be incompetent
The only art which approaches competence comes at the en
of a long chain of attempts at expression. The beginning o
true, artistic expression must be chaotic, incoherent, con
fused. The Iliad and the Odyssey are clear expressions, be
cause they were stories told and re-told and infused wit
new life at each telling until, when they become literature
they have a power and clearness of expression which is onl
possible as a result of this infusion to saturation point wit
the feeling and imagination of generations. Greek sculptur
of the fourth century would be miraculous if it were not th
result of generations of concentrated effort to realise th
divinity in material form.

Then there is one great and important distinction betwee
architecture and all the other arts, to which Professor Blom
field appears to give less than its proper value, and that is
we must live with the architecture which surrounds us, bu
we need not live with a bad picture or hear bad music o
poetry. The ideal of a great commonwealth of building a
least spreads the responsibility for bad architecture, keep
architecture in tune with contemporary life, makes it, in
deed, the expression of that life.

Then, again, the superman in architecture is self-destruc
tive. The Renaissance in architecture developed unifor
mity; Gothic, diversity.

If the crafts are dead, or, to put it another way, if the
have so far suppressed their traditions that they can b
used for the personal expression of every man who choose
to call himself an architect, there can be no architecture
If the parts are dead no amount of co-ordination can make
living whole. If the musicians are bad no amount of con
ducting can create good orchestral music.

To-night I have chosen my slides to illustrate existin
work which I consider shows most life, for that is, or shoul
be, the test to apply to all work. Does it add anything t
the sum of life, and if so, is life better for the addition? I
the expenditure of labour on this ornament or that decor
tion justified by the pleasure which will be derived from it-
the good it will do? That is the real political economy of ar
"Produce, produce, be it the infinitesimalest product, pr
duce," not matter, for that we can only re-arrange, bu
knowledge of life, for that is always waiting to be reveale
and its revelation is the artist's life work.

## GENERAL.

THE Royal Hibernian Academy held a specially convene
meeting last week, when the following resolutions wer
unanimously adopted:—In the lamented death of Sir Thoma
Drew, the Royal Hibernian Academy has to deplore the loss o
a president, who for the past ten years had devoted his bes
energies with indefatigable zeal and enthusiastic self-devotio
to its interests—and the members, individually, the loss of
kind and generous friend. In thus giving expression to thei
own sense of deprivation they desire to offer their most heart
felt sympathy to Lady Drew on her irreparable loss. Th
Royal Hibernian Academy desires to express its sense of th
loss it has sustained in the death of Mr. William M. Mitchell
R.H.A., who occupied the position of its treasurer and truste
for some years, and was otherwise a useful and energeti
member of the body, and directs that a message of sincere con
dolence be directed to Mrs. Mitchell and the members of hi
family.

A CIRCULAR has been issued setting out in detail the in
structions of the Local Government Board for the guidance o
their inspectors in cases where a public local inquiry is hel
on an appeal to which sec. 39 of the Housing and Town Plan
ning Act, 1909, applies. The inspector holding an inquiry ha
power to summon persons for examination on any matter pertaining to the subject matter of the inquiry. He can als
administer an oath, and to what extent he will avail himsel
of this power is left to his judgment, but it is enjoined tha
he should do so in all cases where the circumstances appea
to render such a course desirable. In place of the oath it is
open to him to require a witness to make and subscribe a
declaration of truth.

MR. CHARLES R. PEERS, M.A., F.S.A., has been appointed Inspector of Ancient Monuments. Mr. Peers was educated at Charterhouse and King's College, Cambridge. He took part 1 of the Classical Tripos in 1890, and part 2 Classical Archæology in 1891. Since 1905 he has been archæological editor of the Victoria County Histories and secretary of the Society of Antiquaries since 1908. He is an Assistant Commissioner of the Royal Commission on Ancient Monuments in England.

## FORTHCOMING EVENTS.

*Monday, April* 11.

Royal Society of Arts : Mr. A. B. Searle on "Modern Methods of Brickmaking." (Cantor Lecture 1.)

Surveyors' Institution : Paper on "The Report of the Royal Commission on the Poor Laws," by Mr. T. A. Dickson.

*Wednesday, April* 13.

Edinburgh Architectural Association : Annual Business Meeting ; President's Valedictory Address.

*Thursday, April* 14.

Society of Architects : Paper on "Construction Steelwork," by Mr. S. Bylander.

Illuminating Engineering Society : Continuation of Discussion on "The Measurement of Light and Illumination," Professor S. P. Thompson, D.Sc., F.R.S., in the chair.

Paint and Varnish Society : Paper on "Zinc Oxide," by Mr. Gaston Depierres, President.

*Friday, April* 15.

Society of Architects : Annual Dinner at the Holborn Restaurant.

## THE REMUNERATION OF ARCHITECTS.

NOW that the Schedule of Charges hitherto sanctioned by the Royal Institute of British Architects is under consideration for revision, if necessary, it is appropriate for all members of the Institute to give some thought to the question of the remuneration of architects for services rendered.

The basis of the present scale is that an architect should be paid a commission of 5 per cent. on the total cost of the works executed from his designs and under his superintendence, and although there is a proviso that for works of small amount or of exceptional character this rate of payment is not sufficient, the public who employ architects have become accustomed to regard the 5 per cent. commission as universal, except when, owing to special circumstances, it may be reduced.

It appears to us that an uniform and inflexible rate of remuneration at a fixed 5 per cent. on the cost of the building is radically wrong in principle.

In the first place, payment by a percentage on the cost suggests to the ordinary man that it is to the architect's interest to increase as far as he can the cost of the building. The feeling of this suggestion is very frequently expressed, and still more often lurking unexpressed operates to the prejudice of both architect and employer. When an architect suggests an expenditure of another 100*l.* which would improve the building, artistically or commercially, to a far greater value, the client is apt to be warped by the unexpressed idea that the architect makes the suggestion for the purpose of putting another five-pound note in his own pocket. Hence payment by percentage is prejudicial to the Art of Architecture, as well as to the status of a professional adviser, for the ordinary client does not realise that the first endeavour of every true architect is, as an artist, to make his building as beautiful as possible, and, as a professional man, to secure for his client the best possible value for his money.

If, for the sake of its convenience, a percentage on cost is taken as the basis of the architect's remuneration, it is still, in our opinion, obviously wrong in principle that this percentage should be uniform for all buildings and for all architects.

There can be, for example, no question that the amount of time, labour and skill required from an architect in the design and superintendence of a workhouse costing 200,000*l.* bears a very different proportion to the cost of the building to that required in the case of a house or village church costing 2,000*l.* Hence, if payment by percentage is adopted, there should be different rates for different types of building.

This fact is well recognised in Germany, where different rates obtain for different classes of buildings, and this is, we think, a reform that is very desirable in the Institute scale. Nor should the revision be confined to different classes of buildings. It should extend in some cases, at any rate, if not in all, to buildings of varying cost though of the same class. There can be no doubt, for example, that the services required from an architect in the case of a church costing 20,000*l.* are not ten times those necessary for one built for 2,000*l.*

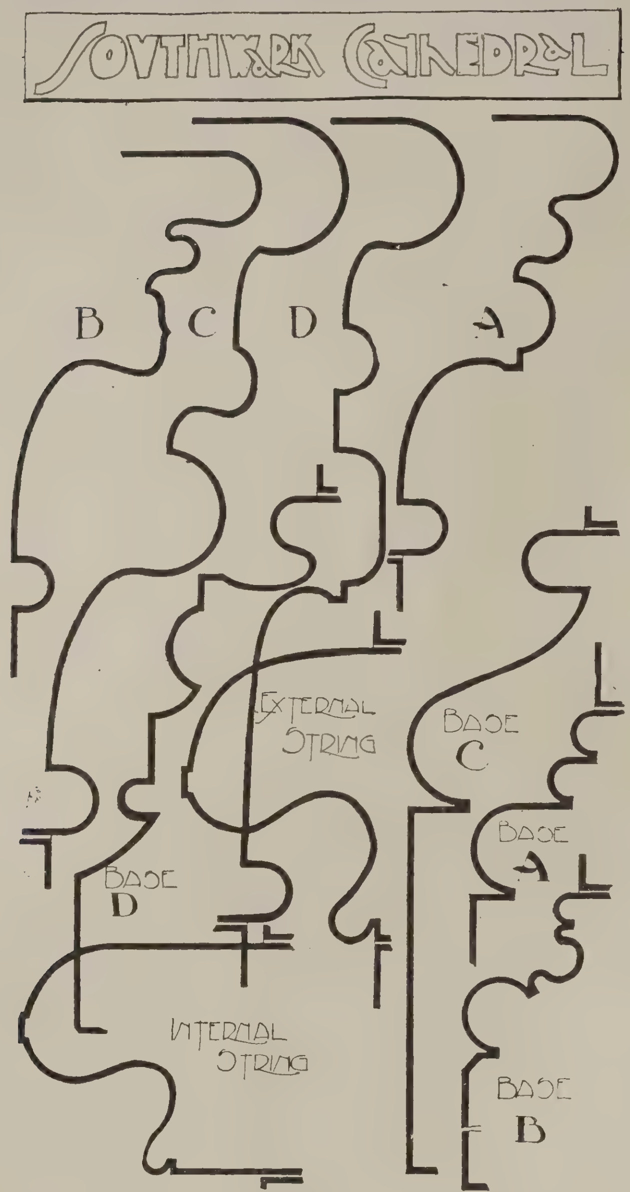
Again, the idea that all architects, from the newly-elected A.R.I.B.A. to the R.A., are properly paid at the same rate is one that can only be justified on the trade union principle of a living wage for every man and no more for the best. This is absolutely opposed to the practice of every other art or profession, except perhaps that of a solicitor, which is not quite on all fours with other professions, for a solicitor's business is very closely analogous to that of a contractor, in that a great portion of his work is done by moderately-skilled employés who only need the direction of a captain of industry.

The remuneration of a painter, a sculptor, a barrister, a physician, or a surgeon varies with his position and his ability in his calling. So should it be with architects. The architect who by his artistic power and ability has obtained the recognition of his merits by election as R.A. ought surely to receive higher remuneration for his exceptional powers than the young and inexperienced practitioner who has just put up his brass plate.

It might be said that the adoption of an uniform rate works out all right in practice, because if the public know that they can obtain the services of the R.A. at the same price as they would pay the A.R.I.B.A., the R.A. would get the offer of the most of the work, and could pick the jobs that would pay best, and by the help of an army of assistants, improvers, and pupils make a good thing out of it. But it is not to the advantage of the Art of Architecture that the R.A. should make a big income by the help of a large number of less able men as his employés. It would tend to better artistic work that the R.A. should make the same income with a less amount of building under his control, but receiving a larger portion of his personal attention.

There need be no fear that the public who employ architects would rebel against a system of higher fees for leading men. They cheerfully pay them for the leading K.C., the Harley Street specialist, the R.A. painter or sculptor, and why not for the R.A. architect?

The K.C. whose clerk will not receive a brief marked at less than a hundred guineas has more work than he wants, or can manage, whilst the junior who is ready to go into Court for a couple of guineas does not make enough to cover the rent of his chambers.



Drawn by Mr. REGINALD PYWELL.
"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

The R.A. who will not part with a specimen of his work for less than a thousand guineas sells as many pictures—at least in ordinarily prosperous times—as the man who will do a portrait for a ten-pound note.

The Harley Street specialist has his consulting-room occupied all the morning, whilst the man who runs a dispensary with advice free is usually on the look-out for a successor, fresh from the hospitals, who will buy his practice—save the mark!

The truth is that the public is always ready to buy the professional man or the artist at his own valuation, and in many cases the higher the price, the bigger the demand. We have seen an illustration of this recently in the United States, for our American *confrères* during the past year came to the conclusion that the 5 per cent. commission which, following English precedent, they had previously adopted, was under modern conditions insufficient, and they, in their annual Convention, decided to raise it to 6 per cent. As far as we are aware the American public have raised no protest or objection.

It is not possible for the employers of architects or other artists or professional men to estimate what expenditure of time, labour, and skill is entailed by the work done, and the public must therefore look to the profession itself to appraise the value of its services—to fix what the lawyers call the "quantum meruit."

Having pointed out the defects of the present system, it behoves us to suggest an alternative. As there should, in our opinion, be a varying scale of charges for differen classes of buildings as well as for different costs, the scal should prescribe a definite fee, not a percentage for eac description of building within a certain range of expendi ture—for example, churches under 2,000*l*. so much; fron 2,000*l*. to 3,000*l*. so much, and so on; another scale fo domestic work, for workhouses, and for the various othe possible classes, and a provision for payment by time.

To meet the desirability of seniors receiving highe remuneration than juniors the scale should be the max mum for members of the Institute who, by reason of the executed work and position, hold the front rank. The each member of the Institute should be allowed to fix th percentage of the maximum scale to which he conside his knowledge and ability entitle him, and should recei from the Council a certificate that in their opinio Mr. A. B. is entitled to payment at the rate of 90, 80, other percentage of the maximum scale. Members the Institute should then be advised to send to their clien a copy of the maximum scale and of their certificate fro the Council on receiving a commission for, or engageme of, their services. In this way a contract would acknowledged or implied, and the public would so realise that the percentage of the maximum scale wou indicate the standing of each architect, and would deci whether they desired cheapness or efficiency in ea particular instance.

## NOTES AND COMMENTS.

FROM an evidently inspired article in the *Times* we lea that the by-laws which have after much discussion be drafted and approved by the Royal Institute of Briti Architects have on Friday last received the sanction of t Privy Council, and therefore now become the law of t Institute. The article gives an epitome of the history the Royal Institute from the date of its first Chart in 1837 to the inception of the new class of Licentiat which the now-approved by-laws legalise. Attention drawn to the part that the Institute has taken since 18 in assisting with its advice in the drafting of "practica every piece of legislation affecting the public impro- ment and embellishment of towns and cities, includi the Town Planning Act of the last Parliament." our mind, the most pregnant statement in the article that "as soon as the Licentiate class is established t Institute proposes to apply to Parliament for an Act enable the public to distinguish between a properly qua- fied architect and a man who merely uses the title co- mercially, without having any trained aptitude for exercise of the art."

THE article being evidently inspired, as we have sa we may take it that the policy thus publicly put forw is recognised as the present policy of the Royal Institu and it therefore behoves all members of that body w agree with this policy to take care that their votes recorded at the approaching election for active support of the policy, and not for reactionaries or procrastinat of the proposed application to Parliament, howe exalted their position as successful exponents of the of architecture.

IT is of great importance that it should be as wid known as possible that the class of Licentiates can o be entered during the ensuing twelve months, and tha affords a means of entering the class of Fellows by p motion from that of Licentiates. The number of arc tects who at present are outside any professional b may be sure that it will not be long now before they find themselves obliged to inscribe their name or register and to give evidence of their right to do so. evidence will most easily be provided by membershi the Royal Institute of British Architects.

WE did not anticipate that the number of drawings should receive for the March subject in our Stude

Sketching and Measuring Club would be very large, as water-colour sketching is rather a novelty to many of our members, and we are pleased, therefore, to find that eleven drawings have been contributed. A review of these will be given in our next week's issue, and the name of the successful competitor for the monthly prize will be then announced.

The National Association of Master House Painters and Decorators of England and Wales has issued a leaflet drawing attention to the grave prejudice to the public health which arises from the practice of papering walls of dwelling-houses on the top of existing papers, and the equally dangerous practice, from a health point of view, of laying one coat of distemper upon another without first washing off the old colouring matter. The Association is, however, in error in stating that such practice is more likely to be prevalent in the case of poorer tenants, as under the new Housing and Town Planning Act local sanitary authorities have full power to require anything to be done to make a house sanitary when the rental value does not exceed a fixed figure.

*The Engineering Magazine*, in a series of articles on "The Industrial Applications of Reinforced Concrete," by Mr. M. M. Sloan, is giving some useful and interesting details of the application of this material to factory and mill construction.

In a letter to the *Times* anent the vandalistic tree-lopping in South London, Sir Aston Webb draws attention to the desirability of planting only such varieties of trees as may be expected to maintain their growth and natural form without the necessity of drastic lopping to counteract undue spreading and rapid growth. Unfortunately the most suitable class of trees for town planting are the planes, which are able to flourish in sooty atmospheres by reason of their habit of discarding their old bark, and so presenting a new surface whose pores are clean and unclogged. The planes are much given to spreading, and hence in town streets soon become excessively luxuriant. Perhaps the most beautiful examples to be found in the metropolis are those in the enclosure of Lincoln's Inn Fields, where they have had an opportunity of growing unchecked by the lopping which is almost unavoidable in a public street.

## THE NEW CLASS OF LICENTIATES, R.I.B.A.

The following letter, explanatory of the status, privileges and qualifications of the new class of Licentiates of the Royal Institute of British Architects, has been sent to the architectural societies allied to the Institute:—

Dear Sir,—We have the honour to invite the attention of your Society to an important development in the constitution of the Royal Institute of British Architects which has lately been sanctioned by the grant of a supplemental charter and new by-laws by His Majesty the King and the Privy Council.

A new class of members, having the chartered right to the designation of Licentiates of the R.I.B.A., has been created. This class is open to all practising architects of good standing who have attained the age of thirty years, and either (*a*) have been engaged as principals for at least five successive years in the practice of architecture, or (*b*) have been engaged for at least ten successive years in the practice or the study of architecture.

Candidates for this class are not required to pass an examination or to submit to election by the general body, but must satisfy the Council of the Royal Institute that they are fit and proper persons to be admitted to the class.

*Under the provisions of the supplemental charter of* 1908 *candidates for the class of Licentiates will only be admitted during the twelve months from March* 23, 1910, *to March* 23, 1911.

Under His Majesty's charter any Licentiate who is eligible as a Fellow may at any time before December 31, 1920, be admitted for nomination to the class of Fellows when he has passed an examination to be prescribed by the Council.

Licentiates will be required to make an annual payment of one guinea to the Royal Institute, and for this they will be entitled (1) to use the affix Licentiate R.I.B.A.; (2) to receive the *Journal*, the *Kalendar*, and other publications of the Royal Institute; (3) to use the Institute premises; and (4) subject to the charter and by-laws to attend the meetings of the Royal Institute.

In view of the necessity of closer organisation of the members of the architectural profession throughout the Empire, both for the advancement of the art of architecture and for the promotion of the interests of the profession by means of Parliamentary or other action, it is highly desirable that a knowledge of this new means of becoming associated with the work of the Royal Institute should be spread as widely as possible among those architects who are at present outside its walls.

Any action which may be taken in the future to secure a higher standard of professional attainment and a greater security for properly qualified architects can only be successful if it is based upon the support of a substantial majority of the practising architects of the Empire, and the Council of the Royal Institute hope that your Society will do all in its power to assist the efforts that are now being made to obtain this support.

We have pleasure in sending you herewith a packet of nomination papers for Licentiates, and we shall be glad if you will take an early opportunity of making an official announcement and of taking effective steps by sending by post to all the architects in your province a notice of the creation of this class, drawing special attention to the fact that it is only open for twelve months, and informing them that the above papers are in your hands and may be obtained on application at the offices of your Society.

We feel that it is the duty of the Institute and its allied

societies to get into touch with all architects in the empire, and we are sure we may count on your zealous personal assistance to this end.—We have the honour to be, dear sir, yours faithfully,

(Signed) Ernest George (*President*).
Henry T. Hare (*Hon. Secretary*).
Ian MacAlister (*Secretary*).

9 Conduit Street, Hanover Square, London, W.: April 4.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute was held at Conduit Street on Monday, April 4, Mr. A. W. S. Cross being in the chair.

Mr. Henry T. Hare, hon. secretary, announced that intimation had been received of the sanction of the Privy Council to the revised by-laws, with one exception. They will come into immediate operation, and copies will be issued to members with the next number of the Journal. Mr. Hare also announced the decease of the following members:—Mr. W. Mansfield Mitchell, R.H.A., Mr. Jesse Horsfall, and Mr. C. A. Monday.

Mr. George Hubbard, F.S.A., F.R.I.B.A., then read a paper on—

### Architecture on the Eastern Side of the Adriatic.

There is no part of Europe less understood and less visited than the Balkan States; yet few lands are more interesting, and the struggles that have taken place in this great peninsula lying between Europe and Asia have preserved Europe from being overrun by the Asiatic.

Of the various Greek colonies which settled on some of the Dalmatian islands, perhaps the earliest came from Syracuse, and were settled by Dionysius the Elder on the island of Issa, B.C. 387. Two centuries later the Greeks were compelled to appeal for the assistance of Rome against the Illyrians, and by the beginning of the Christian era Dalmatia had become a Roman province. In 284 the Roman Empire fell to Diocletian, whose palace at Spalato forms the great central point of interest of Dalmatia. The Roman Empire was again united after many vicissitudes under that great building emperor Justinian, who reigned from 527 to 565. Under him rose Byzantine architecture, one of the finest examples of which may be seen at the Duomo of Parenzo, built between 535 and 543. The progress of the style was arrested for two hundred years, while the Avars from Central Asia overran the country, until in 806 they were subdued by Charlemagne. The Romanesque works at San Lorenzo, in Pasenatico, or at St. Donato at Zara, are examples of the crude architecture that then emerged when order and civilisation began to return. Many of the coast towns are beautified by examples of Venetian architecture, due to conquest by the Venetians of the Narentine pirates in the Adriatic. But the most lasting power of all arose in the middle of the thirteenth century, when the Ottoman Turks began to establish the predominance which lasted until the eighteenth century. It is in the interior of the country that the Turkish work is to be seen.

A typical island on the eastern coastline of the Adriatic is Veglia. In the tenth century it was subject to the kings of Croatia; in the twelfth century it fell to the Hungarian King Coloman; while later in the century it came under Venetian rule; and in 1133 it was ravaged by the Croatian pirates, and its city walls and buildings were destroyed. The inhabitants, however, with the aid of the Venetians, obtained a decisive victory on March 8, 1133, and they rebuilt the walls. At the ancient Porta Pisana the winged lion of St. Mark stands above the site of the old gateway. The Duomo is a twelfth-century building, Byzantine in the main, but with a very distinct flavouring of Romanesque.

It is deeply interesting to compare the church in San Lorenzo and the Duomo of Parenzo. The former was erected in the eighth or ninth century when the Byzantine art had been stifled by the Avars and Slavs; it is crude, deformed, and misshapen, though in it are the germs of the Romanesque style, which grew and survived longer on the eastern side of the Adriatic than anywhere else. The Duomo of Parenzo was commenced in 535 and shows a marvellous refinement, the perfection of Byzantine art being realised in the interior. It is as fine as Sant' Apollinare in Classe at Ravenna, or Santa Fosca at Torcello, and it surpasses them in the completeness of its plan, with its square atrium with a covered ambulatory round its four sides and octagonal baptistery. The chief glory of the east end is in the early Byzantine mosaics of the sixth century, forming a high panelled dado above the marble seats of the clergy, which are placed right and left of the episcopal throne. Above this the wall surface is entirely covered with mosaic of a more usual Byzantine pattern.

Pola contains much Roman work, including an amphitheatre outside the city walls which would hold 21,000 spectators, besides 10,000 who might take part in the performances.

The cathedral of Zara was probably not begun before the thirteenth century, though it retains the basilican plan. This Romanesque building, with its arcaded front, built in 1324, is considered by Fergusson to be superior to San Michele or San Martino at Lucca, or the cathedral at Pistoja. Another fine example is St. Grisogono (1175), with its external arcaded apse and delicate colonnade. It is very doubtful if anything finer of its kind could be found among the Lombard churches of Italy.

The cathedral of Sabenico is perhaps unique in its construction, for throughout the building neither brick nor wood has been used; the walls and roof are entirely of stone, no timber or tiles being introduced.

The Duomo of Traü is a building of the first importance. It was begun about 1200, and the body of the church was completed in 1440, though the tower was not finished till 1598. It has a basilican plan, and at the west end is a large and beautiful porch, which is perhaps the most perfect example of any Romanesque work that exists. In the carving there is an extraordinary wealth of Romanesque imaginings, and the whole is finished with a marvellous perfection of execution. On either side of the west doorways are great archaic lions standing on Classic consoles about 6 feet from the ground and supporting brackets on which stand life-size nude figures of Adam and Eve.

The Palace of Diocletian at Spalato covers an area of 9½ acres. Through the originality of its detail and the striking development of its construction, this building exerted a greater influence upon subsequent styles, either Romanesque or Gothic, than any other building in the whole history of architecture. It is a rectangular building, and on the north, east, and west the external walls are defended by square and octagonal towers; while on the south front, towards the sea, is what Adam calls the great cryptoporticus, having a frontage of over 500 feet. From this gallery some of the royal apartments could be entered. The royal apartments were to the south, and they were flanked on the west and east by an elaborate system of baths. The octagonal building in the south-east section is called by Adam the "Temple of Jupiter," but it is suggested by Dr. Arthur Evans that Diocletian intended the edifice to be his mausoleum. The building is now, however, converted into the cathedral of Spalato. The small temple in the south-west section was referred to by Adam as the "Temple of Aesculapius." According to Adam, possibly the block of buildings in the north-west section was for women, and perhaps the block in the north-east was for courtiers. Probably the cubicles around the external walls were for soldiers. The principal entrance was on the north, which is still called by the ancient name "Porta Aurea" or Golden Gate. The east gate was the "Bronze Gate," and the west gate the "Iron Gate." At the entrances provision was made for the raising and lowering of a portcullis. The four leading features which marked the decadence in Roman architectural forms occur in the palace in a more striking manner than in any other building: they are (1) the arch over a wide central intercolumnation; (2) capitals carrying an arch without intervening entablature; (3) columns carried on corbels; and (4) the accentuation of the Roman relieving arch over a lintel by enriching it with mouldings.

When the great wave of the Avars swept over the country in 639 the inhabitants of Salona fled from the capital and took refuge in the islands. At a later date they left the islands and took up their abode in the deserted palace of Diocletian. The walls became the city walls, and from that time the palace has been the centre of a town. Salona, when it fell before the Avars, was a mighty city surrounded by a wall with eighty-eight towers. At one of the city entrances three arches stood, the centre one for vehicular traffic and the side ones for pedestrians. The paved roadway here, as at Pompeii, shows ruts some six inches deep.

The beautiful Ragusa, unlike other coast towns, maintained itself as an independent commonwealth. The original Greek settlers at the approach of the Avars fled from Epitaurum and founded the present Ragusa on the rocky coast, surrounding it with impregnable walls. The most interesting building is the palace of the rector of the Ragusan Commonwealth, first built in 1388, and rebuilt after a gunpowder explosion in 1435.

This outlying independent State continued to build in the primitive Romanesque style till a later date than anywhere else, even in Dalmatia. The Dominican convent, by Fra Stefano, was erected about 1424, but judging by its style it might quite well be the work of the eleventh or twelfth century.

It is not only the architecture of this coast-line which is so interesting; there is a wild charm about the Balkan States which is extremely fascinating. But it has not been the Turk nor the Serb who has left the lasting memorials on the eastern side of the Adriatic; but it has been the Latin races and the descendants of the Latin races who have been the great builders, whose works should be seen to be more fully appreciated.

Mr. T. G. **Jackson**, R.A., proposed the vote of thanks to Mr. Hubbard for his most interesting account of a country which he himself, he said, knew better than any other with the exception of his own country. Mr. Jackson said it was twenty-eight years since he first saw Dalmatia, and he had no doubt many things had been altered since then, as for instance the difficulties that beset travellers. Now, no doubt, means of communication were much improved, and he had heard of the Cook conducted parties thither; nevertheless it was impossible to believe that it would ever become a popular touring country, because with one exception the roads are atrocious—mere tracks over stony heaths. With an increasing number of people visiting the country it was inevitable that the inhabitants should lose their primitive simplicity. When Mr. Jackson first went there was practically nothing available in the way of a guide-book, the best being a small one published in Trieste. Professor Freeman's account did not go further than the eleventh century, and gives no idea of what can be found after that date. Therefore to some extent he had the country to himself, at all events for the later monuments, and he had to discover what was to be seen. There was not even a connected history of the country, the traveller had to hunt it out for himself. The history was really most interesting; that of the towns and of the interior being quite distinct. The towns are survivals of the later Roman Empire; the country outside the city walls was peopled by Slavs. There was considerable hostility between the two. During the Middle Ages the cities had a history somewhat like that of the great Lombard towns. Each had its own laws and independent control, waging war one against the other without much reference to the central authority. However, they were never able to shake that authority completely off as did the Lombard towns. The history of each individual town ought really to be studied separately. The spirit of rivalry made the citizens strive to surpass the monuments erected by their neighbouring towns, just as happened in Italy. Mr. Hubbard had alluded to and shown on the screen a window at San Lorenzo in Pasenatico, purely Romanesque in appearance, and covered with a rough tracery of interlacing circles. There is, according to Mr. Jackson, an almost identical window in the Saxon church of Barnack, Northamptonshire, which might have come from the same place judging by the primitive carving. The entire district is remarkable for its great wealth in lovely embroideries, and in the work of the silversmiths. Most of the latter is of Venetian origin; some pieces bear a mark showing that they came from Ragusa; in one or two cases they came from Germany, but the majority came from Italy. The architecture of the Slavs was extremely humble, the churches and other buildings being very small. Such Slav artists as there were were absorbed into the coast towns, where they became Romanised.

Mr. **Phene Spiers** said that the ground covered was so extensive that he would only deal with one point, and that was with reference to the Palace of Diocletian at Spalato. He wished to help towards clearing away an erroneous general opinion that it was in that palace that the first sign of decadence from the true Classic style manifested itself. As a matter of fact all the changes had their birth in the East, where nearly all the new novel features to be found in later Roman buildings had their origin. It was said that some architects from Antioch came over to Spalato in order to design the palace for the Roman Emperor.

Dr. **Arthur Evans** thought that one of the points which stood out was the way in which the architecture to a great extent depended on the physical and geographical conditions of the country. In Dalmatia there was a long line of sea coast admirably adapted to prosperous development, sheltered to some extent and lying on a great line of intercourse between the Greeks and central Europe. There is a civilisation that grew from the time when Greek colonists were sent out early in the sixth century. So that on the coast civilised life goes back to the fourth or fifth century B.C. There are no great architectural remains existing there. When the Roman influence passed away the interior of the country quickly relapsed into barbarism.

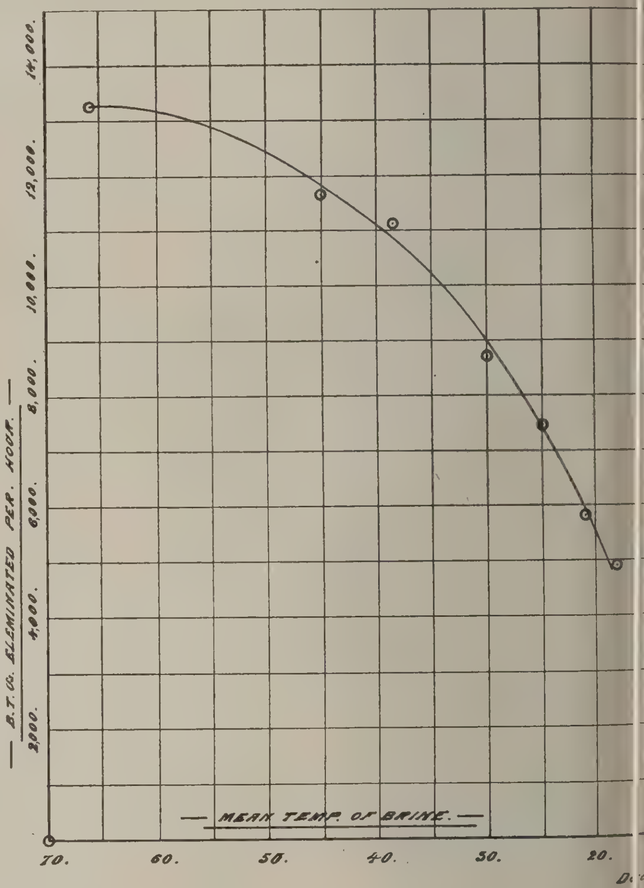
A vote of thanks was passed by acclamation and the meeting closed.

## MODERN COLD STORAGE AND REFRIGERATION.

By W. S. Douglas, B.Sc.

### VII.—RATING OF MACHINES.

It is important, before leaving the study of the freezing machine itself, that we should know exactly how it is rated and what units are adopted in different circumstances. The simplest method is, of course, to measure or state the B.T.U.'s which it will eliminate in some convenient space of time—say an hour. Unfortunately, however, the figures given on this basis are rather liable to misconception, and may by unscrupulous individuals be quite considerably manipulated.

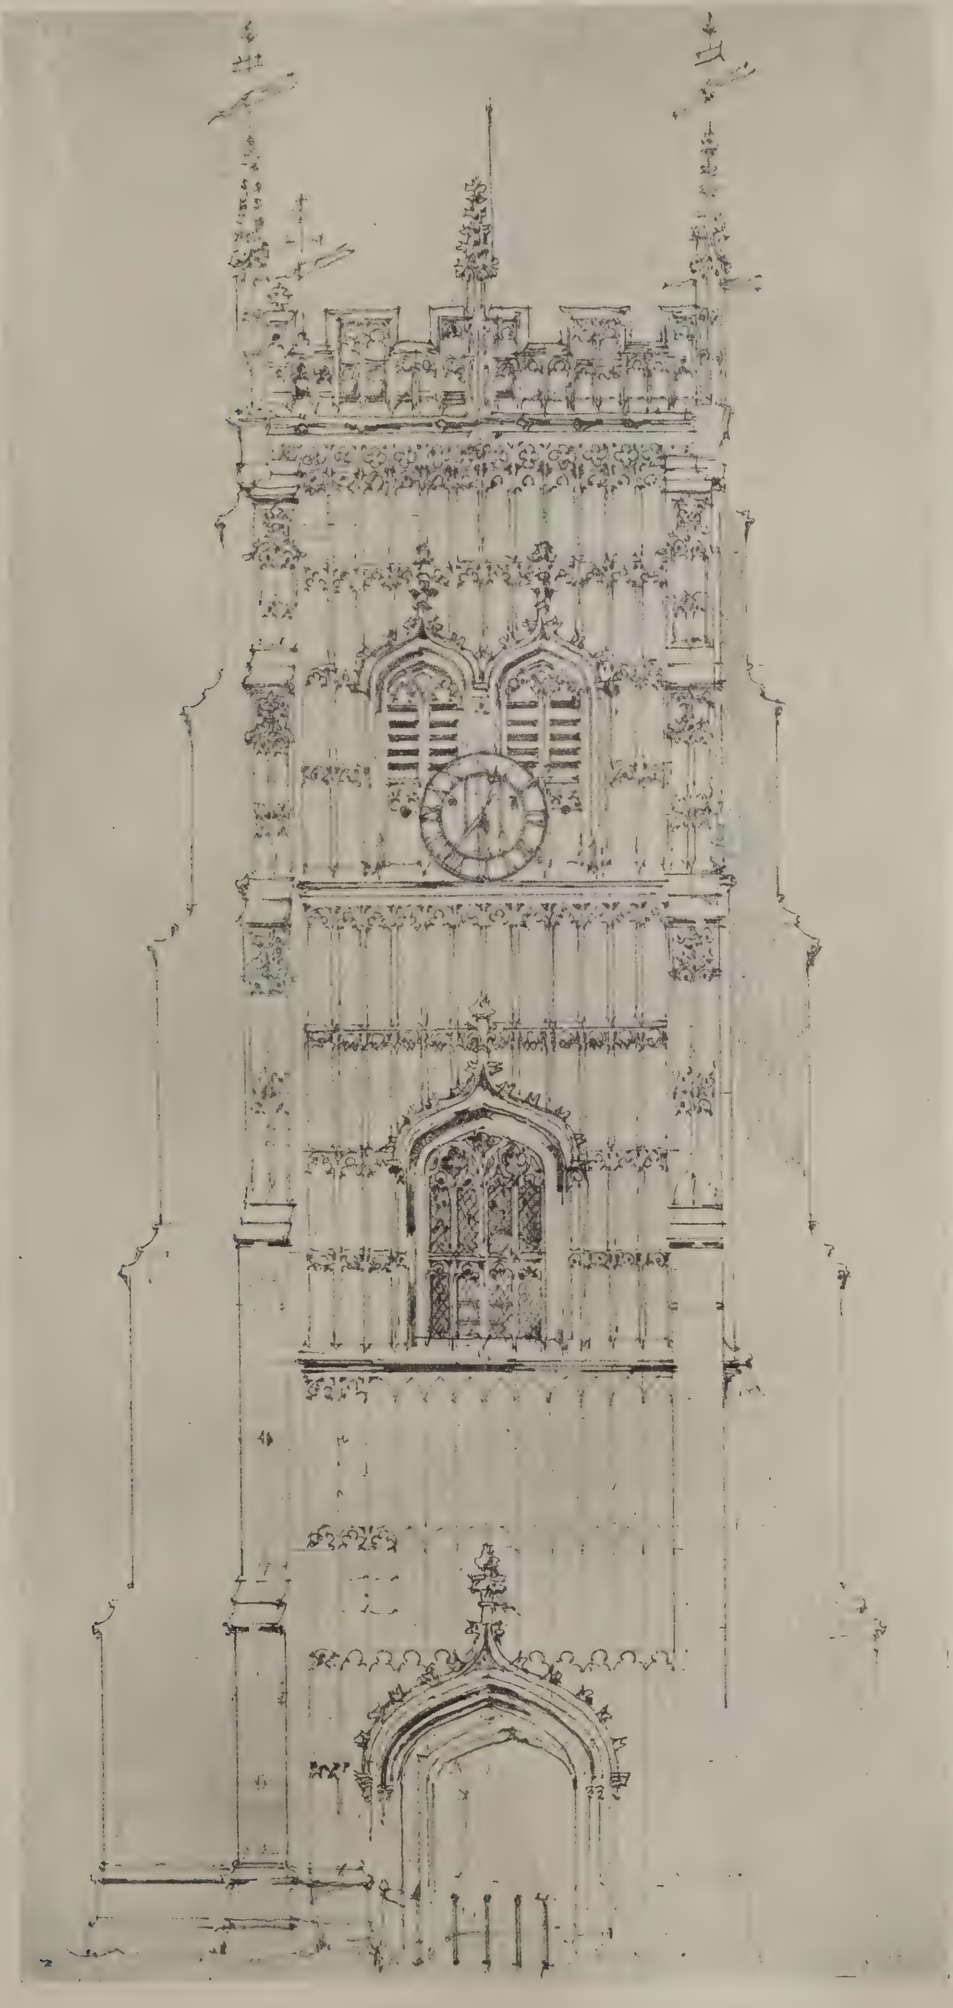


— CURVE ILLUSTRATING VARIATION IN CAPACIT
FREEZING MACHINE AT DIFFERENT EVAPORA
TEMPERATURES. —

FIG. 21.

This is due to the fact that the number of B.T.U.'s eliminated is entirely dependent on the temperature of evaporation, owing to the variation in the density, &c., of the gas.

To show this in graphic form the curve given in fig. 21 has been plotted from the results of a test which was carried out by the writer on a small machine using sulphur dioxide as a refrigerant. The evaporating coils of the machine were immersed in a tank filled with calcium chloride brine, which was first heated up to about 70° Fahr., and then the compressor having been started up, reduced gradually to a temperature of some 15° Fahr. Readings of the temperature were taken every quarter of an hour, and from these the weight of brine and its specific heat at the particular density being known, the B.T.U.'s eliminated per hour were calculated. Such a test, as will be explained later, does not admit of the highest accuracy, but for the purpose of comparing the output of the machine at different evaporating temperatures it is sufficiently near the mark.



THE BELL TOWER, EVESHAM.—Drawn by Mr. Leslie Wilkinson, F.R.I.B.A

Brine temperatures are set out horizontally and the outputs in B.T.U.'s per hour are represented by the vertical ordinates. That is to say, if we wish to find the output at a brine temperature of, say, 35° Fahr., we must first find the point marked 35° on the horizontal base, and then measure the height of a vertical line from that point to its intersection with the curve. By referring next to the scale of B.T.U.'s on the vertical axis at the side the output will be known. In this case it is seen to be 10,200 B.T.U.'s per hour. Similarly at 21.5° Fahr. the output is found to be 6,000 B.T.U.'s, and at 46.5° Fahr. it is exactly double the former amount. Obviously therefore a specification of the B.T.U.'s to be eliminated by a given machine would bind the manufacture very loosely, unless at the same time the evaporating temperature of the gas or the temperature of the medium surrounding it (*e.g.* brine in the evaporator or goods in the cold store) were specifically stated. The guarantee would then be perfectly binding.

Although this method is that which naturally first occurs to one, based as it is on first principles, in practice it is found to be rather too cumbrous for general use, owing to the smallness of the unit. To meet this objection a much larger unit is frequently employed, which is exactly equal in magnitude to the amount of heat absorbed by one ton of ice in melting, and is known as "one ton of refrigeration." The latent heat of fusion absorbed during the melting of 1 lb. of ice is, we know, 142 B.T.U.'s, hence the ton refrigeration is equal to 142×2240=318,080 B.T.U.'s. On this basis machines are rated at so many tons refrigeration per twenty-four hours, and a 10-ton compressor would in that period eliminate 3,180,800 B.T.U.'s, or 132,533 B.T.U.'s in a single hour.

One point arises in connection with this method; it must be remembered when dealing with the capacities of American machines that the ton weight in the U.S.A. is only 2,000 lb. Hence the American ton of refrigeration is only 0.893 of the British ton, and capacities stated in American units are higher by 12 per cent. than those based on the larger unit in use in this country. The metric ton is, of course, nearly equal to the British, but outputs measured in that system are usually given in calories. One calorie is the amount of heat necessary to raise the temperature of 1 kilogramme of water by one degree Centigrade. It is sometimes known, in dealing with refrigeration, as the "frigorie," and is approximately equal to 4 B.T.U.'s.

A simpler and at the same time more reliable method than either of the two which have been given, is to state the actual quantity of ice which the machine will produce in twenty-four hours. In fixing this amount due allowance has, of course, to be made for working losses, such as radiation, &c., and the cooling of the water from atmospheric temperature to freezing point. Hence the "ice-making" capacity is actually about half the "ice-melting." The beauty of the method is that it states the duty, and at the same time specifies the evaporating temperature, since in making ice the latter is always constant. The manufacturer cannot therefore escape from his guarantee, and, moreover, he can be called upon at any time to prove it by connecting up his compressor to an actual ice-making tank.

There are, of course, numerous other ways of stating the output of which a given machine is capable, but most of these are applied to particular cases, such as storing meat, cooling milk or cream, &c., and will be discussed in their respective places. The methods which we have up to now considered are those which can be applied universally without reference to the purpose for which the machine is designed. Summing them up they may be tabulated as follows:—

1. B.T.U.'s absorbed per hour.
2. Tons of refrigeration per 24 hours (1 ton = 132,533 B.T.U.'s per hour).
3. Tons of ice made per 24 hours (1 ton ice made=2 tons refrigeration).

To be absolutely accurate in any of these methods we should also specify the temperature at which the cooling water enters the condenser. If it is high the loss past the expansion valve is corespondingly great, and the output is reduced in proportion. Taking, for example, a submerged condenser with water entering at 50° Fahr., the effect of raising this temperature to 60° Fahr. would be, in a sulphur dioxide plant, to reduce the output by only 2.67 per cent. Hence it will be seen that the loss, although not absolutely negligible, is quite a small one.

---

THE late Mr. Benjamin Tabberer, F.R.I.B.A., left estate valued at 38,010*l.* The sum of 100*l.* has been left to each of his clerks, Mr. W. G. Aldridge and Mr. H. Thorman.

## SOUTHWARK CATHEDRAL.

THIS church is now popularly known as St. Saviour's Cathedral. John Stow, who lived at the end of the sixteenth and beginning of the seventeenth century, states on the authority of a communication made to him by Bartholomew Linstede, the last Prior of St. Mary Overie:—"East from the Bishop of Winchester's house directly over against it, standeth a fair church called St. Mary-over-the-Rie, or Overy, that is over the water. This church, or some other in place thereof was (of old time long before the Conquest) an house of Sisters, founded by a maiden named Mary, unto the which house and sisters she left (as was left to her by her parents) the oversight and profits of a cross ferry or transverse ferry over the Thames, there kept before that any bridge was builded. The house of sisters was after by Swithun, a noble lady, converted into a college of priests, who in place of the ferry builded a bridge of timber, and from time to time kept the same in reparation, but lastly the same bridge was builded of stone, and then in the year 1106 was the church again founded for Canons Regular, by William Pont de l'Arche and William Dauncey, knights Normans."

This has been doubted as to many facts. Probably an early Saxon convent was there and destroyed by the Danes in the tenth century. Tolerably well authenticated is the fact that in 1106 William Pont de l'Arche and William Dauncey (or D'Ansey) did renew foundation for Canons Regular of the Order of St. Augustine (Black Canons). Very few traces of the building then erected remain; it was burnt down in 1207.

Peter de Rupibus, Bishop of Winchester 1205-43, built the chapel on the south side of the choir. It was founded and dedicated in honour of God and St. Mary Magdalene, and was afterwards used as the parish church; the nave was probably built in the time of the same prelate.

The choir, choir-aisles, and retro-choir a little later. Building was in progress as late as 1273, the whole of both transepts among other parts being unfinished. The north transept was built first, and the south transept about 1327-77.

In 1377 fire damaged the nave, and in the time of Henry IV. Perpendicular windows were inserted in it. The flying buttresses were then removed and the vault fell in 1469; the vault was re-erected as oak-groined vaulting. The roof of the north transept was done in a similar manner. In 1520-28 the reredos was erected by Richard Fox, Bishop of Winchester, and the two upper stages of the tower were erected at this time.

At the dissolution of monasteries the parishes of St. Mary Magdalene and St. Margaret's, Southwark, purchased this church as the parish church, the two parishes uniting under the name of St. Saviour's.

The lady chapel, which was east of the retro-choir, was let to Master Wilson, corn chandler, till 1624; in 1830 it was taken down to permit of the approach to the new London Bridge. The retro-choir, in the old days used for processions, &c., is now used as a lady chapel. The shafts to the windows and piers are detached. The stone used is very hard and smooth, and resembles Kentish rag. The outside walling is faced with flints.

In 1821 the choir was restored by George Gwilt, and in 1822 the chapel of St. Mary Magdalene was removed, and south side of choir renewed.

In 1830 the transepts were restored by Robert Wallace, and in the following year the roof of nave and north transept was removed, and the church was roofless for seven years. In 1839 the new nave was erected by Sir Arthur Blomfield, and the high pews, gallery, three decker, floor above choir (seven steps) were taken down and removed. It is interesting to note that among pilgrims to Canterbury from this church are John Gower, Shakespeare, Massinger, and Fletcher.

## ILLUSTRATIONS.

### A CHURCH IN REINFORCED CONCRETE. DESIGN FOR GRISSELL GOLD MEDAL, 1910.

THE drawings we reproduce were submitted by Mr. MORLEY in the competition for the GRISSELL gold medal of 1910, and in our opinion ran the successful design very close.

## FILIPPO BRUNELLESCHI AND THE RENAISSANCE.*

*(Concluded from last week.)*

THERE are few items so wholly illustrative of Mediæval beauty and feeling as some of these decorated chapels at Florence, and one does not wonder at the enthusiasm either of the critics or at the raptures of Ruskin in discussing them. Upon a wall of this chapel the visible church is typified by the Duomo of Florence, which has its proper nave of four bays but with flying buttresses, and an octagon crowned by a cupola of very similar pointed form to the present one surrounded by the semidomes of the transepts and eastern tribune. But it is important to observe in this carefully drawn representation, in which we find early perspective nervously making itself evident, the fundamental variations from the present cathedral. Some of these are the existence of flying buttresses, as well as the extending raking buttresses to the transept apses, also the treatment of the square angles of the octagon, but chiefly the absence of the great upper story of the octagon, corresponding to the drum of a dome, with its eight eyes. Some difference will be noted in the setting out of the vaulted apses to the transepts, the apices of which are built in front of the walls, but we observe that a lantern is added to the dome. The whole forms an unmistakable representation of the Duomo, about half a century before Brunelleschi erected his dome, which, apparently so long before, was decided upon and accepted both in its general lines and defined intentions.

Professor Charles Eliot Norton has pointed out that after the calamity of the plague of 1348, in which Boccaccio declares that more than 100,000 died within the walls of Florence, one of the natural consequences was a sudden outbreak of pious superstition. Numerous sums had been given and bequeathed by dying men to the Church, so that when order was restored to the community the Church found itself richer than ever before. To quote Professor Norton:—

"Old things had passed away; old designs appeared unsuited to the new conditions. To such a spirit the Duomo, begun sixty years before, in days of comparative weakness, seemed hardly to correspond with the demands of the more lavish and luxurious age. Florence was more pre-eminent than ever among the cities of Tuscany, and her Duomo ought to be representative of her present power and wealth. Accordingly, and doubtless after much deliberation, it was resolved, 'out of regard to the magnificence of the commune and the riches and fame of the city and the citizens,' to adopt a new design for the Duomo on a grander scale than that of the building planned by Arnolfo. The breadth was to remain the same, perhaps in order to preserve the beautiful side walls already constructed; but the walls were to be raised about 21 feet, the length was to be increased by more than a third, and the central area and the eastern end of the church were to be vastly enlarged. This change of design required not only the destruction of the work already done within the walls, but also the strengthening of the foundations, and a doubling of the façade wall."

Professor Norton adds:—

"This reconstruction of the Duomo has been generally overlooked by the historians," and "it appears that only a general scheme of the reconstruction was adopted, leaving the consideration of details until the time when, in the progress of the work, a decision in regard to them might become necessary. Probably all that remains of Arnolfo's building are the foundations and part of the interior brickwork of the façade, and the side walls for about 175 feet eastward from the front."

Francesco Talenti was appointed architect, having succeeded the celebrated Andrea Pisano, and in 1357 the digging for the foundation of the new piers was begun.

Ruskin has fallen upon the vast scale of the interior with zest in his "Mornings in Florence"; the contrast to the scheme of the conventual and collegiate cathedrals of France and England which employ a developed multiplicity of parts to give measure to the eye is very marked, but the difference might almost be described as that of one mind to many. The simplicity and homogeneity of the design of the plan, the apparent thinness of the side walls being that of the pre-existent design, is attractive and architectural. I would venture to urge that to a mind prepared to admit all the charms of the nave of Westminster, with its lofty proportions and narrow vistas, it should not necessarily be impossible, difficult, or provocative of that eloquent vituperation customary to the last generation of enthusiasts, to accept and value the purpose and dignity of this great provision of width, spaciousness, and reduction of pillar area evident in the huge municipal nave of Florence. This spaciousness is Italian, the vast cool enclosure in the hot sunny climate is a phase of ecclesiastical design required by circumstances, and is here achieved with constructive skill and common sense not inferior to any traditional development of Mediæval buildings in northern circumstances with different materials. The rubble core and ashlar facings of the north make greater demands upon the floor space than the slender brick piers of the south, and in a just comparison it is not so evident that the nave of Florence deserves Mr. Ruskin's narrow but bitter judgment that "the most studious ingenuity could not produce a design for the interior of a building which should more completely hide its extent and throw away every common advantage of its magnitude than this of the Duomo of Florence."

It would be tedious if interesting to digress upon the variations in Mediæval building north and south of the Alps, and tempting to enter upon the uncertain influence here of the building guilds of Northern Italy, though each digression has a bearing upon our subject. It will be impossible however to appreciate Brunelleschi's task unless it is borne in mind that the progressive development of Mediæval cathedral building is regulated and marked by the construction of vaulting. The fact that it was necessary to vault the nave occasioned the whole series of factors of aisles and buttresses, and conditioned the plan of transepts and eastern extension. The use of the pointed arch had enabled vaulting chambers of all shapes and sizes to be constructed with facility in diverse materials by the employment of ribs which gradually assumed to themselves nearly all the constructive qualities. This rib principle left the spaces between without strains or stresses, so that they were filled in with the lightest material, or even left in an open veil of tracery, as in Henry VII.'s Chapel. In Italy the use of brickwork for vaulting enabled the fillings to be extended, but it never became the practice there, as here, to multiply the strengthening ribs for the sake either of stiffening the vault or for æsthetic reasons. The earlier and later Mediæval vaults of Italy, alike, were quadripartite in system, and, as at Florence, of the greatest size, the nave having a width of 55 feet, and consisting of only four immense square bays. The nave of Westminster Abbey having a clear width of 35 feet, employs twelve bays in a similar length of 240 feet.

The principle of both is, however, the same; the rectangular chambers of the vault at Florence are spanned by pointed arches, having stone ribs at the intersections and brick cells between.

The boldness with which the principle of stone groin ribs with brick filling had been employed in the vast span of the nave seems to have convinced the builders that no greater difficulty would attend the vaulting of the octagon. It may be remarked here that the use of tie-rods to the vaulting and arcades of the nave is an economy designed to dispense with flying and other buttresses, and that where the octagon was placed, and masses of wall occur which provide abutment for the great arches, neither protruding buttresses nor tie-rods are employed.

The enormous scale of the octagon, 135 feet across, with the choir stalls grouped in the centre, was to provide the city with the grandest temple then in Western Christendom, and if the cupola shown in the fresco of the Spanish chapel were superposed upon the basis of Talenti's octagon, but little diminution of its external glory and none of its internal beauty or usefulness would have been sacrificed.

The greater work began in 1357 was pushed on, and ten years later the four bays of the nave were nearly completed. Many consultations with the Board of Works ensued, and difficulties soon became apparent. In 1368 work was begun on the eastern apse, and in 1369 Talenti was succeeded by his son. Municipal funds being required for other objects, among them the erection of the Loggia de' Lanzi from Orcagna's design, it is not till 1382 that activity at the cathedral is again evident, for in 1383 the building of the chapels to the choir was commenced and commissions distributed for sculpture. In 1407, after nearly forty years, the eastern tribune, with its five chapels, was completed, and at the threshold of the Cinquecento the construction of the octagonal vault could no longer be deferred.

I have little doubt that it was believed that the vault of the ancient octagon baptistery of St. John, opposite the west front of the Duomo, and so well beloved of all Florentines, afforded all the precedent requisite for that of the Duomo, though approaching double its span. The baptistery vault consists of a plain-pointed brick arch springing from each side of the octagon without ribs and very closely represented by that of the completed Duomo. It was not a dome; the art of building domes, we might assert, was, if not unknown, certainly not practised by mediæval builders, even when circular, and therefore lending themselves to domical treatment as in the case of the Baptistery at Pisa. These buildings were simply groined with pointed vaults; but in Florence both the prototype at the baptistery and the greater example at the cathedral are polygons—*i.e.* octagonal.

---

* A paper read before the Architectural Association on March 18, by Prof. Beresford Pite.

It would be a longer digression to consider the relation of domical construction to the planning of Christian churches. The Pantheon at Rome presents no difficulty, the plan being a circle and the dome a semisphere. By the time Santa Sophia at Constantinople was erected the method of poising a circular dome above a square plan upon piers, by means of pendentives, had been attained, and Anthemius of Tralles had earned the compliment for Justinian of suspending his dome from heaven by a chain.

St. Mark's at Venice is an Italian instance of a Constantinople method, and its group of five domes is entirely pre-Gothic, each being supported on four pendentives. A true dome is a vault—that is, one which is arcuate on plan as well as in section, horizontally as well as vertically, having the strains equally distributed throughout its hemisphere, without constructive ribs, and therefore without the distinction that exists in Gothic vaulting between the rib and the web. The true dome is, theoretically, as homogeneous as an inverted earthenware basin, and the Gothic vault is as distinct in its texture as an opened umbrella with its armature of ribs and flimsy filling.

The four centuries that lay between St. Mark's, Venice, and the octagon at Florence obscured most singularly from the vision of the hide-bound guildsmen the attractive power of the dome as a constructive method. Known but unknown, not scorned maybe, for they decorated them with the Oriental quaint cupolas of the fourteenth century which give character to the Piazza of St. Mark, but ineffective and buried as far from their building practice as radium.

Another aspect of domical vaulting, however, was not quite foreign to the Mediæval builders of Florence. The fresco in the Spanish chapel depicts an octagonal cupola crowning the cathedral with a domical form having external dignity and beauty, forming a feature by which the building would be recognised as domical, and entering into the perspective and landscape with a graceful curved outline that is the proper complement of the apsidal tribunes around its base.

This external domed outline was practically new to Mediæval building, the internal cupolas and lanthorns of Italian churches being covered with roofs and concealed behind screens of arcades and colonnades. Yet neither the fresco of the Spanish chapel nor the dome erected by Brunelleschi quite convince us that the external aspect of the dome had æsthetic influence or value to that generation. It was not until a later period in Bramante's career that there is clear evidence of appreciation of the usefulness of the dome to external effect.

But a generalisation citing the Pantheon at Rome first as accomplishing the successful employment of the dome as a vault, Sta. Sophia at Constantinople as achieving its support upon pendentives high above the free area of the floor, Florence as sustaining the lantern necessary to crown its external aspect, and then St. Peter's at Rome and St. Paul's at London, as developing alike both the external and the internal values of the dome, is useful, interesting, and relatively sound. The doubtful point is whether Brunelleschi and his contemporaries at all desired to emphasise the dome as such externally, and whether it was a motive in the design or not. I would suggest from the standpoint at which he and they stood, still in the Middle Ages, that external composition as such was not present to their minds. The harmonious lines and geometrical masses of the plan related to the vault system, and the elevation of these masses was determined statically through the exigencies of the vaults so that constructive and not æsthetic reasoning led to the extrusion of the great mass of the octagon vault in its really magnificent constructive form.

The competition of sculptors inaugurated in 1401 for completing the series of bronze doors to the baptistery marks an epoch in the development of the arts of sculpture and bronze-founding. The competitors were selected, and young men are found among the six; Filippo Brunelleschi was but twenty-four, and Lorenzo Ghiberti, whose panel was accepted, was twenty. The great reputation of these two young men in their own community may be safely assumed, and each more than justified this early promise by strenuous work in later life. It is stated by a biographer of Brunelleschi that the commission of assessors proposed to divide the commission, who gives Brunelleschi the credit of declining the work under the circumstances; but in any case the work was given to Ghiberti towards the end of 1403. Vasari's story of Brunelleschi's journey to Rome, accompanied by his attached friend and junior by nine years, Donatello, seems to require further proof, as Professor Norton notes that Donatello appears as assistant to Ghiberti both in his first and in a further agreement for the execution of the gates. It is clear, however, that Brunelleschi, who was of good family, sold some property, and with the proceeds paid the expenses of his visit to Rome, the first of many—and it appears that he worked at his handicraft as a goldsmith, and exercised his mechanical genius at making clocks, maintaining himself thus, but not without visits home again from time to time.

The condition of Rome after practically a millennium of decadence cannot easily be realised. The great city had been for centuries in a repellent condition of decaying splendour. The Imperial monuments had not yet attained the credit and charm of picturesque ruin under which Piranesi knew them, and were nothing more than the dilapidated symbols of a departed glory. The exile of the Popes during three-quarters of the fourteenth century, the rival Popedoms (the Council of Constance which settled them was held in 1414), the factions and troubles crystallising in Rienzi had all tended to divert from Rome any tendency to regard it as an emporium of monumental art. The fame of pagan and persecuting Rome was still obnoxious in its monuments, and the scenes of martyrdom had not yet become sanctified by artistic as well as religious tradition.

As we have already seen, the treasures of classic literature were gradually being revealed, mainly through more cordial relationships with Constantinople at the end of the fourteenth century, but the morning of the glory of the architecture and arts either of Greece or Rome was unknown when Brunelleschi visited Rome, an eager artistic Florentine, probably disappointed at the clouding of his hoped-for pre-eminence in his art of sculpture by Ghilberti, though still strongly possessed with a zealous patriotism and fully conscious of the steps taken for completing the greatest cathedral of Italy.

It is not difficult for us to realise what Rome could reveal to such an intelligent artist. Just breathing emancipation from tradition, and conscious that Ghiberti had struck a freer and fresher note in sculpture than any before, the strong genius of his young admirer and follower, Donatello, tended in the same direction, and we are told pretty stories of how Donatello "had eyes only for sculpture"—the great antiques were not then unearthed—while Brunelleschi devoted himself to the monuments. Vasari writes—and how sympathetic every travelling student must feel as he reads!—that "he took no time either to eat or sleep, but every thought was of architecture which was then extinct; I mean," he says, "the good old manner, and not the Gothic and barbarous one, which was much practised at that period." Vasari imaginatively describes his interest in the Duomo at Florence:—

"He never rested while in Rome until he had well pondered on all the difficulties involved in the vaulting of the Ritonda (the Pantheon) in that city, and had maturely considered the means by which it might be effected. He also well examined and made careful drawings of all the vaults and arches of antiquity; to these he devoted perpetual study, and if by chance the artists found fragments of capitals, columns, cornices, or basements of buildings buried in the earth, they set labourers to work and caused them to be dug out."

Vasari imputes immense activity to him, and probably confuses the studies spread over many visits at different periods of his life. He adds:—

"Nor did he rest until he had drawn every description of construction, temples round, square, and octagon; basilicas, aqueducts, baths, arches, the colosseum, amphitheatres, and every church built of bricks, of which he examined all the modes of binding and clamping, as well as the turning of the vaults and the arches."

Brunelleschi appears to have been again in Florence three years after the competition for the bronze gates in 1404, as he matriculated as a goldsmith on July 2 in that year; the celebrated guild, which included modellers, workers in metal, and painters. To obtain civil rights it was necessary for all Florentines to belong to one of the guilds of art, which were represented in the civic government by twenty-four Consuls. The Signoria or members of the chief government acted in conjunction with the Consoli in initiating such works as the baptistery gates. The patrons of the cathedral works were the clothworkers, and it appears that in November, 1404, the Board of the Works appointed a Commission of four Consuls of the clothworkers, and nineteen special commissioners selected from the goldsmiths' and masons' and carpenters' guilds

Among the goldsmiths we find Ghiberti and Brunelleschi; the reference to the Commission was the cornice to the external walls. An interesting example of these Gothic bracketed parapets can be observed on the Loggia de' Lanzi; that to the cathedral was built in the accepted manner, and no impress of Classic idea seems yet apparent as an evidence of Brunelleschi's Roman studies. On February 16, 1405, the Commission dissolved. The building works at the cathedral proceeded slowly, and in 1407 the eastern tribune was finished, and those to the transepts were well forward.

It is probable that Brunelleschi spent the ensuing years until he was forty at Rome, a reputation for knowledge of architecture, however, accruing to him at home during the period of his absence from Florence. He must not be regarded as a disappointed sculptor who exiled himself from his own field of executive art through jealousy of an accomplished rival, but as having discovered a new source of inspiration and study in that combination of mechanics, geometry and art afforded by the buildings of ancient Rome from which he could not tear himself away. We do not find him again in Florence until 1417, ten years after the Commission about the cornice, when the Board voted him ten golden florins for drawings and work connected with the cupola. By this time the walls of the octagon had been raised above the surrounding roofs by an additional stage which provided a great clerestory, and the eight round windows or eyes were in progress.

It is not easy to understand how this stage can have been reached without the adoption of some well-defined scheme for the vaulting, as the elevation above the abutting walls removed it beyond the possibility of employing them as buttresses. The provision of this drum storey lifted the cupola vault from the category of Gothic vaults, and at once placed it among the long-forgotten and forsaken series of domes originating with the Pantheon at Rome, and developing in the later epoch of Byzantine architecture. A dome poised upon a drum has to provide for its own thrusts, which should be reduced to a minimum by horizontal arcuate construction, and can then be counterpoised by weight placed vertically upon the haunch as in the *gradene* of the Pantheon. The Gothic pointed vault, however, could not exist even momentarily without the ample lateral abutment of flying buttresses or massive walling; and it has already been pointed out how iron tie rods provided for this in the vaulting of the nave. I must confess to the strongest suspicion, though there does not appear to be direct evidence to support it, that the elevation of the cupola is due to Brunelleschi's advice, and that his observations at the Pantheon convinced him that what had been done by the ancient Romans was not beyond his powers. It is certainly highly probable that this height would not have been erected without reliance upon some guide or scheme for dealing with the thrusts of the vault. In any case, embarrassment attended upon the Board; the Guild of Master Masons seem to have exhausted their traditions, and the actual need for an impossibly big centring upon which to build the vault, after the manner of the baptistery, though so much larger, brought the works to a standstill.

The variation from the Spanish Chapel fresco raises the whole question of the use of working drawings; it would appear that designs existed, of which the fresco of the completed Duomo is evidence, and yet the deadlock and absence of prevision would indicate that drawings of any practical value did not exist, as they would have obviated progress to the point up to the edge of the impossible.

An anonymous contemporary of Brunelleschi's, whose work is the probable basis of Vasari's as well as of other biographers, tells us, "But if the master builders had seen difficulties, Philip showed them far more. And someone asking, Is there, then, no mode of erecting it? Philip, who was ingenious also in discourse, replied that if the thing was really impossible, it could not be done; but that if it were not so, there ought to be someone in the world who could do the work." The recorded payment of ten florins was not probably made only for this philosophic stimulant, but for advice and work in connection with the whole drum storey and its eight suspiciously Roman eyes.

Between this year (1417) and 1420, when Brunelleschi, Ghiberti, and Battista d'Antonio, master mason, were jointly appointed to build the cupola at a salary of three florins a month each, there was much evident controversy, and there is in the anonymous biography and in Vasari much picturesque description of indecision on the part of the Committee, rivalry on the part of the "profession," and strategical manœuvres between Rome and Florence by Brunelleschi. Amidst it all, the fact ultimately emerged that the professed sculptor-goldsmith, but amateur builder, had science and skill enough to make him confident of his ability to design scaffolds and construct a vault upon the huge octagon, 135 feet across, that would stand either without abutment or cross-ties. The three years' discussion and disputation amounted to a conviction that the little, clear-headed man of forty-three could do it, and his mystifications and secretiveness, his sudden absences, and vigorous assertiveness, were the means by which this conviction was produced.

The joint appointment of the popular artist Ghiberti, with his strong local interests (Florence had become enthusiastic over his bronze doors), and of the recognised professional man, Battista, seems, under the circumstances, reasonable, though the difficulties of joint control were little compared with those of joint reputation which were ultimately involved. This latter point was everything to such a character as Brunelleschi's, and led to the squabbles with Ghiberti, and to the ultimate demonstration that Brunelleschi could and would carry the works to successful completion alone.

A competition was inaugurated on August 19, 1418, for the designs for the cupola, and a premium of 200 florins offered, the time extending to December 12. In the next year Brunelleschi and Ghiberti each were commissioned to make models on a large scale, and Brunelleschi employed Donatello to assist him with Nanni di Banchi. A brick model was made, based on his Roman studies, exhibiting the apparently impossible feat of how to build a dome without centring, an achievement derived from the Pantheon, and embodying the fundamental difference between a dome erected in horizontal rings or series, each complete and supported on its predecessor, and the mediæval groined rib to which, from the springing, a wooden centring piece was necessary.

The Board of Consuls appointed four additional citizens as assessors to assist them in deciding, and spent some months in anxious deliberation upon the models. Brunelleschi presented a report which has been preserved in the pages of his biographer and Vasari. The latter depicts the author as previously discussing with the committee in such growing heat at their inability to understand him that they ordered him to leave the room, which he, refusing to do, was removed *à la suffragette*, though ultimately, however, as we have seen, he was appointed with two colleagues.

The report is of sufficient clearness to guide us to an understanding of his scheme, and may be cited at some length:—

"The difficulties of this erection being well considered, magnificent signors and wardens, I find that it cannot by any means be constructed in a perfect circle, since the extent of the upper part, where the lantern has to be placed, would be so vast that when a weight was laid thereon it would soon give way. . . . I have, therefore, determined to turn the inner part of this vault in angles according to the form of the walls, adopting the proportions and manner of the pointed arch, this being a form which displays a rapid tendency to ascend, and when loaded with the lantern each part will help to give stability to the other. The thickness of the vault at the base must be three braccia and three-quarters; it must then rise in the form of a pyramid, decreasing from without up to the point where it closes and where the lantern has to be placed, and at this junction the thickness must be one braccia and a quarter.

"A second vault should then be constructed outside the first to preserve the latter from the rain, and this must be two braccia and a half thick at the base, also diminishing proportionally in the form of a pyramid in such a manner that the parts shall have their junction at the commencement of the lantern, as did the other, and at the highest point it must have two-thirds of the thickness of the base. There must be a buttress at each angle, which will be eight in all, and between the angles in the face of each wall there shall be two, sixteen in all; and these sixteen buttresses on the inner and outer side of each wall must each have the breadth of four braccia at the base. These two vaults, built in the form of a pyramid, shall rise together in equal proportion to the height of the round window closed by the lantern. There will thus be constructed twenty-four buttresses, with the said vaults built around, and six strong and high arches of hard stone, well clamped and bound with iron fastenings, which must be covered with tin, and over these stones shall be cramping-irons, by which the vaults shall be bound to the buttresses. The masonry must be solid, and must leave no vacant space up to the height of five braccia and a quarter; the buttresses being then continued, the arches will be separated. The first and second courses from the base must be strengthened everywhere by long plates of hard stone laid crosswise, in such sort that both vaults of the cupola shall rest on these stones. Throughout the whole height, at every ninth braccia, there shall be small arches constructed in the vaults between the buttresses, with strong cramps of oak, whereby the buttresses by which the inner vault is supported will be bound and strengthened ; these fastenings of oak shall then be covered with plates of iron, on account of the staircases. The buttresses are all to be built of hard stone, and the walls of the cupola are, in like manner, to be all of solid stone bound to the buttresses to the height of twenty-four braccia, and thence upward they shall be constructed of bricks, or of spongite, using the lightest. Eight ribs of marble shall be formed at the angles of the external surface of the cupola of such thickness as shall be requisite ; these shall rise to the height of one braccia above the cupola with cornices. Thus the cupola shall be constructed after such manner as shall be determined by the masters who may have to build it, since practice teaches us by what methods to proceed."

This remarkable document shows actually the parting of the ways between rib-vaulting and domical construction, the horizontal linking together of the buttress ribs with lateral arches, the provision of double vaults, and the clear perception of the effect of putting weight upon a semicircular vault all evidence an intelligent discerning analysis of the Roman examples.

Another address by Brunelleschi runs as follows:—"Doubtless great things are always difficult to accomplish, and if ever anything was difficult, this affair of yours is more difficult than you perchance are aware, for I do not know that even the ancients ever vaulted a vault so terrible as this will be. And I, who have often thought on the armatures required within and without, and what means could be invented so that men could work on it with safety, have never succeeded in solving the difficulty, and I am dismayed not less by the breadth than by the height of the building. If, indeed, it could be covered by a spherical dome, the mode might be adopted which the Romans employed in constructing the dome of the Pantheon, but here we must adopt an eight-sided design with such joints and bindings of masonry as will be most difficult to execute."

The design included a great bond of timber near the base, bound with iron ties, to encircle the dome and collect any outward thrusts ; this was completed in August, 1423. The position, intention, and design of this tie is interesting in connection with the Italian practice of relying upon ties to their Gothic arches ; this bond timber has answered its purpose fully, and realising that the whole stability and success of the vault consisted in maintaining a horizontal system by means of the connecting arches between the buttresses, we regard this timber bond as an additional precaution illustrating the same principle.

We cannot stay to dwell upon the interesting story of Brunelleschi's relationship with the Guild properly charged with building, who actually once locked him up for being a blackleg, or his professional difficulties with Ghiberti, whose appointment resulted in nothing but unpleasantness. Brunelleschi's mechanical and organising genius found ample scope in the design of flying scaffolds and screens, after that the vault had risen to a point where it became dangerous to the workmen, but consistent perseverance with the system of horizontal binding by arches, the wooden bond, and series of stone cross-ties between the two vaults succeeded, so that at length on June 12, 1434, the cupola closed over the central space. In the words of Professor Norton, "It had grown slowly, marvellously, in the eyes of all beholders, who saw its walls rise, curving over the void without apparent support, held suspended in the air as if by miracle. Brunelleschi's fame was secure, henceforth his work was chief part of Florence."

Pope Eugenius IV. fled from Rome to Florence in 1434, where he was welcomed, and with great pomp consecrated the church on Lady Day, bestowing the Golden Rose upon St. Mary of the Flower. The work on the cupola was not completed until 1436, when on August 30 the Bishop of Fiesole mounted the dome to bless it. The lantern still remained to be its crown. For this Brunelleschi had made a model, but the co-operative idea was so strong that other designs were invited and considered, among them one by an adventurous but aristocratic lady, whose appearance in such an undertaking seems to have excited the contempt of Vasari, who says that even "a woman of the house of Gaddi ventured into the competition." It will be remembered that Taddeo Gaddi was appointed architect a century earlier to complete Giotto's campanile, and was the painter with Memmi of the Spanish Chapel.

Meetings and discussions ensued, and on December 31, 1436, the Board unanimously decided "that the said lantern should be constructed and built according to the model of Philip Master Brunelleschi, and that the ordering and execution of the work should be committed to Philip."

The procuring of marbles for this work and some years of delay ensued, together with war, plague, and contentions. The funds fell off, Brunelleschi's salary was reduced one-half ; for three years there is no record of work. In 1445 it was resolved that "Philip, who said that he could do the work," be appointed "sole overseer for the term of his life" ; with the extraordinary qualification but "no longer," at a salary of 100 florins annually.

Brunelleschi was now sixty-nine, and died on April 16, 1446, without seeing the completion of the lantern ; there was genuine and wide sorrow at his death ; his body was laid within the Duomo, and it was ordered that the marble slab upon it should be inscribed "Filippus Architector."

This paper has now for a considerable time trespassed upon the moments of the night, and apology is needed for its want of compression.

Brunelleschi's life-work was not, however, confined to or limited by the completion of the Duomo ; in 1420, the year of the model of the cupola, he began the erection of the mortuary chapel for the Pazzi family in the cloister of Santa Croce, a small rectangular apartment covered by a most interesting convoluted dome supported upon pendentives. This work exhibits with fulness the charm of Brunelleschi's power as a draughtsman and designer ; the elegance, refinement, and originality of the whole are wonderfully fascinating and characteristic. The original vigour of the vaulted atrium, with its delicately-moulded attic storey and beauteous frieze ; the delicacy of the doorway and the entire freshness and grace of the relief and treatment make this work a gem of Renaissance, as it indeed is its first full architectural flower. A work such as this exercised a powerful influence in Florence as justifying Brunelleschi's confidence in himself, though no part of his work at the Duomo offered the artistic scope of this little building. His intimates, Donatello and Luca della Robbia, assisted in the frieze and internal roundels and plaques.

The beautiful series of drawings by Mr. A. R. H. Jackson published a few years ago in the Architectural Association Sketch Book, illustrate this building most fully. It may be remarked that the dome has no external expression.

In 1421 he designed the portico to the Foundling Hospital, which has the celebrated Bambinos of della Robbia, a work characterised by the same delight in graceful proportions and refined mouldings, qualities which, it may be noted, were not derived first hand from Classic precedent, but infused by his own genius.

In 1426 the foundation of the great church of San Lorenzo was laid ; in the simplicity of this plan and the great success of the order and arcade, the same quality of refined grace is working upon a basis, well laid, of early basilican planning. The late Roman tradition is laid aside, and the architectural value of the order demonstrated without pedantry or antiquarianism.

The sacristy, the older one of San Lorenzo—the Medici Chapel, with the monuments by Michel Angelo, being called the New Sacristy—is also one of the most remarkable and successful buildings of Florence. The dome is employed upon properly-developed pendentives over the square apartment, and again over the altar recess. The fresh originality and freedom is very interesting, the architect evidently feeling his way to originality in dealing with his problem, reflecting with ease and pleasure the fruits of his classic studies.

The church of San Spirito was begun in 1428, and follows San Lorenzo very closely both in plan and effect ; these make a remarkable pair of churches, like sisters resembling each other with a charming family grace and elegance.

No work of Brunelleschi's after the Pazzi Chapel has such a direct appeal to an eye jaded with the later richness of the Renaissance than the Badia at Fiesole, illustrated and described with enthusiasm by Mr. Anderson. It illustrates remarkably that the discovery of the inexhaustible store of Classic ornament, and of its luxurious use, had not in any way corrupted a strict and almost Puritan taste in the employment of decorative features ; the cloister, the chapel, and the refectory are simply delicious in their delicacy, and in complete value accorded to each ornamental feature and element. The proportions are not guided by any convention and are fresh and natural to the building. The carving evidences the fastidiousness of a goldsmith in dealing with a rare opportunity in a precious metal.

The civil buildings that fell to Brunelleschi are neither few nor unimportant. His reputation brought him private patrons, for whom he designed the immense Pitti palace ; the setting out of the immense façade to the Piazza is his.

though the front to the Boboli Gardens is later, and by Ammanati. The Pazzi family palace, now Quaratesi, is another example of this class. Both are characterised by breadth, simplicity, and strength. Originality is avoided, the Tuscan type being adopted with small refinements throughout, but a larger breadth is always maintained.

These buildings laid or preserved the lines upon which the Florentine palaces afterwards developed, Brunelleschi's great pupil Michelozzo continuing his tradition with power in the great Riccardi palace for the Medici family.

The whole pathway of Renaissance architecture was now prepared, lines of progress and discovery made possible, and precedent provided. The onward march of the movement is from Brunelleschi to Michel Angelo, through a century of wonder as we look back through the mists of ages and reconnect it with the work of painters, sculptors, and craftsmen. What the movement owes to Brunelleschi it is not easy to estimate; the debt is at once so great and so involved with the completion of mediævalism.

Renaissance architecture did not come to Florence, as to France, England, and the rest of Europe, by emulation and report of already achieved wonders, but it was created, though recreated in a sense, by Brunelleschi's enthusiastic studies, force of personal character, and marvellously refined architectural discernment. Whether or not the nineteenth century in England in any way reflects the fifteenth century in Italy is a fancy with which it would be tempting to play, as with a dream which exaggerates extremes of delight and absurdity. Have not we known more Brunelleschis than one among our student enthusiasts? Have we not wrestled with clients' problems and immeasurably bold achievements? And is not England decorated with nineteenth century monuments of architectural individuality, triumphant expositions of all the virtues of foreign study and home conquest?

But where is our Duomo? Where has the problem of a changing epoch fallen into our hand? For this we wait; it may come yet; so learn patience, perseverance, and professional pride from Brunelleschi.

Mr. Beckwith Spencer, who proposed a vote of thanks to Professor Pite, said he wished as a layman in architecture to say how greatly he valued a lecture on Brunelleschi from a practical man. Many writers were often in error regarding architectural facts, so that one became often sceptical of books and placed more value on lectures from an architect with inside knowledge. The description of the spaciousness of the Italian churches had interested him, and he wondered whether Gothic architecture was introduced into Italy for a deliberate purpose. They knew that it was introduced by the Franciscans, who were popular preachers, and they could quite understand that the old style of churches did not provide for them adequate accommodation. They wanted churches with unencumbered space, churches where people could see and hear, and so they introduced the new Gothic style from France, but it was never fully adopted in Italy. As to Brunelleschi himself, the time was a period of transition in Gothic and the style of the grand old manner of building, and Brunelleschi was the decisive factor in architecture as Giotto was in painting and Donatello in sculpture. It was valuable to know the cause for the revival of the dome in building was æsthetical and constructional, and it was also one of the points in a lecture on Brunelleschi which an architect could expound to students.

Mr. Walter Cave seconded the vote of thanks, and said the great point which Professor Pite had emphasised in his lecture was the individuality of Brunelleschi and how he appeared to connect the Gothic work with the Classical and the Renaissance. He did not think the Gothic work ever took hold in Italy, and like so many other things it did not live, since it was true that anything which came from the West to the East rarely succeeded. Art came from the East and worked its way to the limits of Europe, but the Gothic style was going back when it went to Italy and so was doomed to failure. The connecting link between Spain had been most clearly shown, and so too it had been proved that the Classical dome was built on Gothic lines. Wren at St. Paul's started away on a new principle and left Gothic alone.

Mr. H. H. Statham said Brunelleschi was a man who combined enthusiasm with a strong practical knowledge and feeling for construction, but it was remarkable to hear of the requisite care he took in putting ties all round his dome. He had wondered why with an octagonal base Brunelleschi did not try making a circular plan dome with small pendentives at the angles, since it would have been easier construction. He wished to ask Professor Pite if there was any information as to the exact way one course was put upon another, for when he thought of the great octagonal dome he was rather curious to know how Brunelleschi managed to erect it without scaffolding. Another point which struck him in seeing the illustrations of the large doorways was the delicate restraint in which the mouldings were handled and the absence of the usual projections seen in Classical cornices.

Mr. Alan Potter said the problem of the dome overshadowed the whole of Brunelleschi's life, and until two years ago the construction of the dome without centring was quite a mystery. The suggestion then made, which seemed to be a practicable one, was that the inner shell of the dome was the permanent centring of the dome, and just as a circular dome on plan was built so to speak on a double arch and ring, so Brunelleschi constructed the eight sides of his dome on eight flat arches, that was horizontally, which would create a thrust at the angles, and to counterbalance that thrust he placed large buttresses, which were really the buttresses of the shell and not ribs, as was so often stated. Professor Pite had dealt with Brunelleschi's studying in Rome. One thing which struck the speaker on that point was that he went to Rome with an intention, an ambition to dome the cathedral at Florence, and the difference between going to study with a definite instead of a general intention was very great indeed, and he must have given his time chiefly to the study of construction. The speaker wondered if in his study of the Pantheon the effect of the portico afterwards influenced Brunelleschi's design in Florentine churches.

Mr. H. P. G. Maule said he supposed they were all agreed that Brunelleschi was one of the greatest of the known architects, and from the lecture they had just heard they might conclude that the architecture of all great architects was one of construction and not of scenery. The more they studied the history of architecture and the great works of the past the more they realised that so far as their education as architects went it must be a matter of construction.

Professor Pite briefly replied to the vote of thanks and the meeting terminated.

## COLOURED RELIEFS AND MOSAIC.*

THERE are two methods of decoration especially suitable to wall surfaces of considerable area—mosaic and coloured reliefs. The first, indeed, cannot be used to any advantage except over a considerable area; the second, it is true, can be quite attractive in small spaces, such as an easel picture, but its proper use, its monumental use, is as a decoration of great panels or friezes on walls of a goodly size.

Apart from the details of design and execution there are such important considerations as to how they are best used and the sort of lighting and wall-surface which develop their special qualities in the best way. A wall which is to be covered with mosaic, for instance, does not need to be so well lit as one which is to be used for coloured reliefs, which more nearly approach the effect of a wall painting. In fact, there is no doubt that a mosaic if it contains much gold, which is the case in all the really splendid mosaics, wants very little light, and that from small and numerous windows. The small lights round the base of an apse, as in the case of San Marco in Venice, is perhaps the ideal result. San Marco altogether, with its numerous small windows, gives a most sumptuous effect of a mosaic interior, though the mosaics themselves are no better than in many other churches. The basilica-shaped church, as in Santa Maria Maggiore, Rome, or the two San Apollinare at Ravenna, does not give to mosaic the opportunity of showing its full beauty. This is rather an interesting fact, for as a rule one believes that a method of decoration is the servant of and is, as it were, the child of the style of architecture by which it is developed, and suits no other so well. But mosaic was for at least three centuries used as a decoration of basilicas only; the apsidal ends of these basilicas showed to the more sympathetic architects the peculiar suitability of curved surfaces for the expression of the true glory of mosaic. The result was the evolution of the Greek cross plan and the construction of such churches as San Vitale at Ravenna—which, however, was never covered as intended with mosaic—and San Marco. Curved surfaces and a dispersed illumination not too strong is the best to express the glory and mystery of mosaic. Also it should be considerably above the eye and in considerable quantity; when in small quantities it looks quite cheap, though it is not, and the effect is very trumpery. It is unfortunately quite considerably used for altar pieces nowadays. The "Last Supper," by Leonardo, is a favourite subject for this treatment, and the fact that such a great picture produces such an odious result is one of the clearest proofs of the great artistic law that a material in which a work is

---

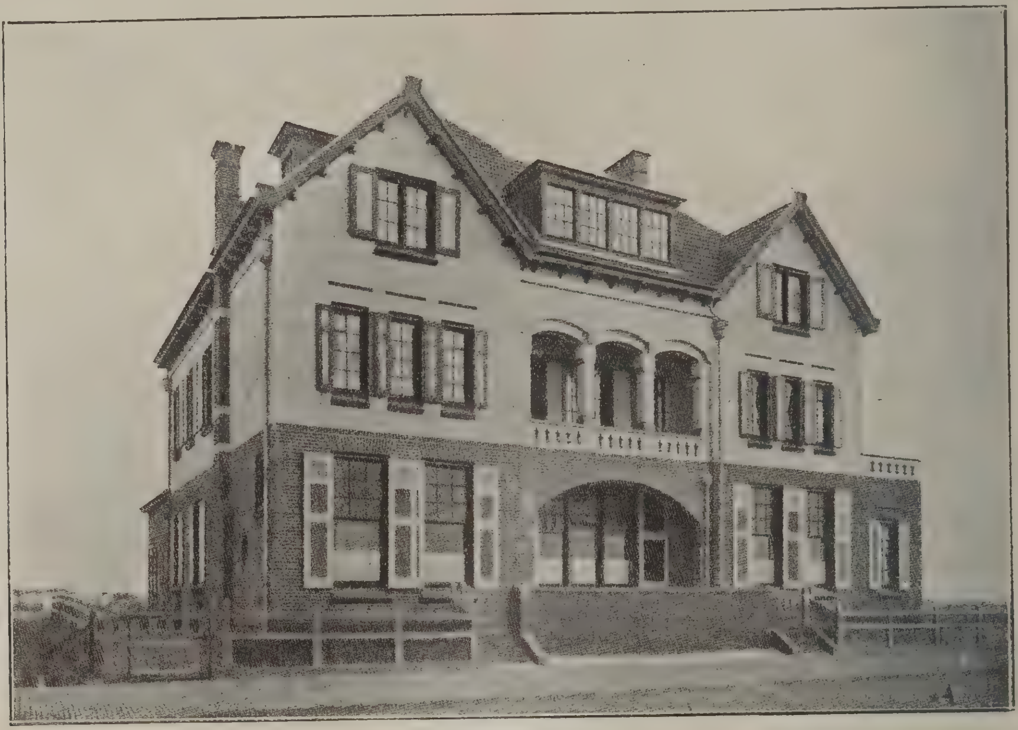
## MODERN EUROPEAN ARCHITECTURE.

### HOLLAND.



[From *Het Huis.*

VILLA AT ZANDVOORT.

executed must govern the design. Mouldings are to be avoided when mosaic is used as the decorative dominant factor. It can be taken round the windows, or from the wall on to the soffits of arches with the most charming effect; a glittering uneven gold line appears at the angles, this variation of the little pieces of gold giving the line a pleasant variety, and one which is obtained in the most natural way. In association with mosaic it is obvious that no other strong colour is wanted. Stained glass only fights with it, and painting is too weak. Coloured marble columns and panels with bronze and gilt metalwork seem to be the best treatment for the spaces below the mosaics; with them and on their own level nothing else can live.

For coloured relief a wider use is possible; it is not so dominating and will bear and be helped by the association of other forms of decoration. It can be placed low down, in which case it should be carefully wrought and highly finished; or it can be high up, when large planes of simple surface will have a good effect. In the former case the sculptor's work, the beauty of relief, will have much to do with its attraction; in the latter it is more a painter's work, the relief being used merely to give a greater strength than it would have if the surface were flat. It is remarkable how great is the superior carrying power of a slightly raised coloured surface at a distance when the fact that it is raised is imperceptible. But the resulting effect will be one of colour, and the success of the design will depend on the spacing and the colour.

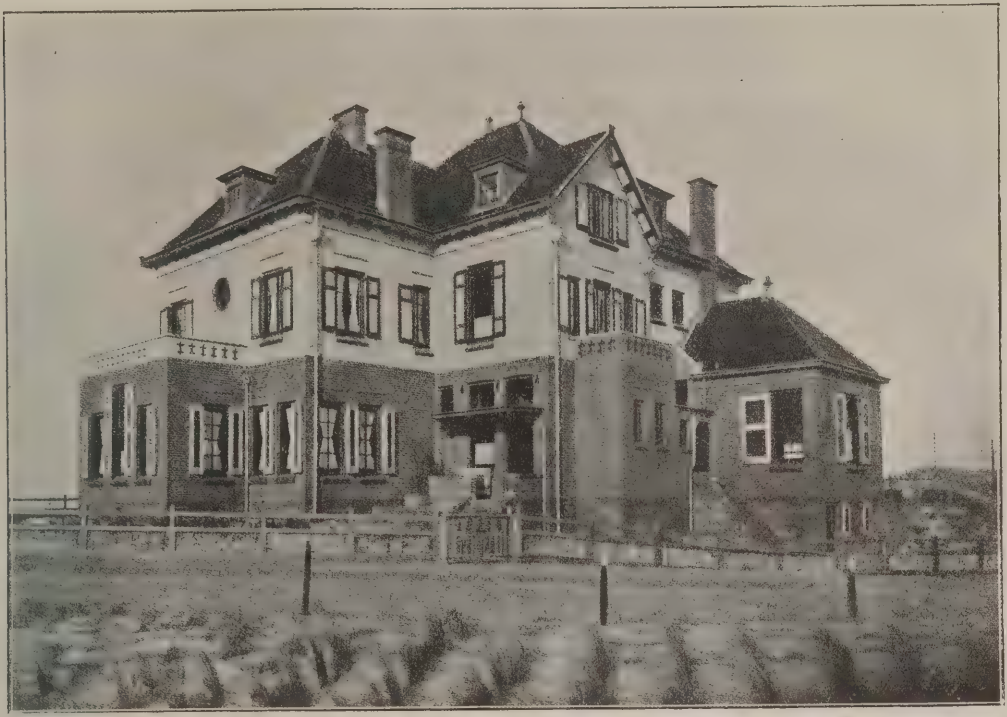
Coloured relief has not been so prominent a form of decoration as mosaic, and has not attracted the attention of such good masters. As a result, therefore, there is more fun to be got out of experimenting with it, and it is more likely to be a leading form of art in the future. Mosaic has had a great and long innings. It was the principal form of interior decoration for about a thousand years. From the second or third century to the thirteenth all the great schemes of interior decoration and some few, though they are not so successful, of exterior decoration are in mosaic. Very little fresco remains of those early years, and that is poor stuff. An art which has had such a history is not so likely to have a fresh outbreak of development as one which has been comparatively neglected.

Of course coloured reliefs of a sort are to be found all over the place. Every theatre and music-hall, almost every public-house, has them—of a sort. But one very seldom sees them nowadays done by men of personality, of original ideas; they are just pieces of ornament modelled by one set of men and coloured and gilded by another set; they are not modelled and coloured as one work under the control of one mind, they are usually chosen as modelling first and then coloured and gilded in rather a haphazard way afterwards. Now any colour scheme (any form of decoration, that is, in which the colour is the principal factor) must be designed in colour. A piece of modelling or a drawing of form coloured afterwards is but a timid experiment, or perhaps an overbold one. This does not mean that in happier days when there was a tradition in the arts it was impossible for one man to suitably colour another man's work in form; but then they had the experience—the workshop not the text-book experience, of generations to help them. They were all brought up in, were saturated with, the same style. Experience had taught them what sort of pattern suited this or that mouldin and what sort of colour arrangement suited the lighting and aspect and altitude of the work they were doing.

Let it be assumed that a definite space or spaces are to b treated with coloured relief. It is important that the subjec chosen should add to the significance of the building—for a church the story of the Bible or examples of moral nobility an steadfastness as exemplified by figures of the saints an martyrs. In a secular building, a town hall for instance, ar expression of the civic virtues and social duties, somethin to arouse the spirit of pride in the deeds of predecessors an to show that the individual is absorbed in the stream o municipal life, the great lesson of the subordination of th individual to the common welfare. For other buildings other subjects, each will suggest what is most fitting. Th subject settled, the next thing is to decide the scale of th figures or ornament and to get out a sketch of the whole worl in colour. This sketch is of course but a tentative thing t settle the destination of the colour and approximately wha the colour is, but water colour on a piece of paper canno accurately express the effect of work yet to be done on a raise scale; and as for the parts which are to be gilded, gold pain on paper gives but the slightest suggestion of it. Nevertheless the colour sketch is extremely important as the shapes o the masses of colour must be decided there if the colour used i the finished work may be changed. The colour sketch is practically a map just as the colour sketch for a stained-glas window is a map. And it is important to decide on the shape of the colour spaces beforehand in this map, because when yo get to the modelling, when the whole surface will be just sheet of clay of the same colour, the temptation to alter th design so as to get lines which are more agreeable, or seem a the moment to be more agreeable, is very difficult to resis

## MODERN EUROPEAN ARCHITECTURE.

### HOLLAND.



[From *Het Huis.*

VILLA AT ZANDVOORT

The lines which tell in the modelling, and which as a sculptor one is inclined to regard as of the greatest importance to the design, are not always the lines which are the effective ones in the finished work when coloured. Also it is the shapes rather than the lines which matter most at the end. In a relief one side say of a head will hold shadow and tell more definitely as an outline than the other which secures the light; but when the head is coloured the shadow tells but slightly, but the head as a whole tells distinctly against the background.

Parts where the flesh shows (heads and hands and feet and what not) are particularly awkward details to treat, and should be very definitely settled in the preliminary sketch. In the nature of the material these portions are sure to show rather distinctly if at all a rich or vigorous colour scheme is employed, so that slight alterations which in the clay only tend to improve the panel may, and often do, develop awkward little shapes and ungainly angles when the colour is applied.

Now having settled on the scale of the work and on the colour scheme, you proceed with the modelling in clay, either for plaster or a fired material. The relief will depend on the lighting of the position in which the work is to be placed, and its height up. It never needs to be very high relief to get the best colour effect; very high relief like work in the round has often been coloured, but the result seems to be much inferior to that obtained by a more reticent treatment. A very slight relief will make the work tell much more distinctly at a considerable distance than the boldest painting on the flat. For work which is high up very simple and well defined planes are all that is needed, and all that will tell. Subtlety of modelling on the surfaces would be quite wasted though when near the eye you cannot have the work too elaborate and careful. The great thing is to get the drawing good and the masses of colour well distributed.

The modelling is the part which takes the longest to do, and it is a most attractive and interesting part of the work. Altogether the making of a coloured relief is one of the most enjoyable forms of occupation possible. It combines the pleasures of designing good outline, modelling relief, with all the delight there is in varying the delicate planes, and the joy of sumptuous colour, combined with gold and silver if desired.

When the clay model is finished it is cast in plaster. If it is wished that the finished work be in a durable material it can be fired in lucent plaster, which will last for centuries if out of the reach of damp and rough usage. In either case the suction of the surface is stopped with white shellac. After the ground is thoroughly stopped, but not enough to make it shine, such parts as are required are gilded, whether to be left in gold or to be used as a ground for colour. After that is done and a few days allowed for it to set the colour may be commenced with. Ordinary artists' colours with wax may be used, white or paraffin wax dissolved in turps as a medium to stop the shine of the paint. Tempera can be used, but in that case the surface must not be washed or sprayed for a considerable time, while oil has the advantage that it may be washed a very short while after it is laid on. Of course anything approaching realism in the colouring is impossible, lurid tints being undesirable; it is an architectural decoration, and demands a man with the faculty of designing colour. In the application of the colour itself perhaps the best results are obtained by doing it in various stages —putting a colour on and wiping it off, and here and there from the more prominent parts; then when dry putting another colour over it and wiping it away so as to show the first coat here and there; sometimes using transparent colours, sometimes opaque, letting a colour lie in the crevices of drapery and applying another to the raised parts to get a better effect. There is no end to the variety to be obtained, and experience only can teach how much can be done. The treatment lends itself to any amount of elaboration. The effect of one plane surface of paint resembles that of those disagreeable little images of saints in ecclesiastical decorators' shops, images that have done a good deal to prevent the general use of colour with form nowadays. A broken effect of colour is necessary; but most necessary is the sense of colour. Pattern may be added to it, or anything else to make it more sumptuous and splendid; but the essential thing is to keep the colour in mind when doing the modelling. Arrange the folds of the drapery to hold shadows when it is desired to enrich the effect. Have little raised folds when it is desired to make light lines tell by wiping the colour off them. There are all sorts of ways of varying the surface in order to give the colour as much variety of quality as possible.

Strong colour is good, but no colour has its full brightness in this material as it has on a white canvas. This is because of the inequality of the surface on which it rests. One colour which is extremely useful and beautiful is black; blue is never very pure looking, somehow red tells very well. But the best results are got by combining strong colour with gold.

A mosaic decoration is composed of definite separate pieces of glass not varying greatly in size. Much of the old mosaic consisted of pieces of from $\frac{1}{4}$ inch to $\frac{3}{8}$ inch square; pieces larger than this latter are not common. The interstices between these pieces are an important element in the general effect, and can be used to gain some variety of quality to the surface by making them wider or narrower as may be desired, thus allowing the colour of the cement or putty, as it is called, in which the tesseræ are set to affect the general colour. This all-over quality given by the interstices naturally makes for a certain monotony in texture, and is one of the reasons why mosaic is unsuited to anything approaching realism. It gives a certain flatness which is eminently agreeable in a decorated wall surface and one which seems to demand a certain austerity or stiffness in the design. The florid works of the later masters all look as if they were executed under protest, as it were, and were substituted against their will for a more fluid and facile method, such as oil paint. They miss the attraction proper to mosaic, and what attractions they possess are obtained in spite of instead of with the help of the material used. These remarks apply to work designed by some of the greatest artists who ever lived, such as Titian, Tintoretto, and Raphael. The effect of flatness is assisted by the fact that the colour masses in mosaic do not look so strong as the colour of the individual pieces of glass would lead one to expect. This is partly because of the interstices, partly because of the tesseræ not lying absolutely smoothly, though this has been achieved with lamentable results—and being made of glass the surface of some few of them is sure to reflect the light somewhat at whatever angle you stand to them. An additional reason is that the tesseræ being many of them more or less transparent themselves hold a little shadow from the piece above or from the putty which lies between. Whether the shadow is above or below or at one side depends of course on where the lighting comes from. The slight shine on the surface of parts naturally affects the warm colours more than the cool ones, which lose comparatively little.

After a sketch has been made giving the general design and colour scheme, cartoons are made of the actual size of the work. These are coloured, and often the tesseræ are marked on them or at least on parts of them, showing the direction in which the lines of tesseræ are to go, a very important consideration, and one which affects the merit of the result enormously. These cartoons may be made any way—oil, water colour, pastel, or tempera. Pastel has the advantage that any colour may be exactly repeated, but it gets badly knocked about on the scaffold if the work is done *in situ* and from the front. On the whole water colour seems to answer best. When the cartoons have been made there are two methods of executing the work. The quickest is to lay the cartoons on a flat table and to match the colour with the tesseræ, laying them face down on the cartoons on the spot of colour they match. When the whole cartoon is done in this fashion, or a sufficient amount of it not to be too unwieldy, cement is spread over the tesseræ and a slab of slate placed over the whole; when set this is taken up and turned round and the finished mosaic is seen on the front. This is a quick and straightforward method, but its disadvantages are that you can never see the front until the work is finished and unalterable, and that there is an unpleasant smoothness in the surface (though it is true there are various tricks in use to modify this), and also that as the work is done in rectangular slabs usually of the same size it is possible that they may show when placed *in situ*. A most disastrous instance of this is to be seen in what must have been one of the most magnificent of the old mosaics in the Lateran Church at Rome, where the great apse is quite ruined.

The other way is longer and therefore more expensive, but it is much more interesting, and it is possible to see what is going on and to make any alterations which may seem advisable—alterations in colour, in size of tesseræ, in width of interstices, or in direction of lines of tesseræ, which latter often occurs. The wall on which the work is to be placed must be dry and with sufficient roughness to form a key for the cement or putty. The wall is soaked well with boiled oil, and after a day or two the putty is applied to as much of the surface as is expected to be covered before the putty sets hard. On this is picked out from a tracing the portion of the cartoon intended for it. Then the worker, with the cartoon behind him and his tray of tesseræ at hand, commences matching the colours and pasting the tesseræ into the putty side by side usually showing the cut edge not the front of the piece.

Something should be said as to the cement or putty. Portland cement is often used, but there are various mixtures of a more slowly drying nature. An early formula gives a simple admixture of slaked lime and Tibertine marble dust in the proportion of one to three. Sometimes a little linseed oil was used. A formula accepted by the later workers after the Renaissance was powdered travertine 60, slaked lime 25, raw linseed oil 10, boiled linseed oil 6. Care should be taken in exterior work to use a mixture which will not be affected by the heat.

Naturally the skill of the executants varies a good deal, and as it is not possible to reproduce exactly in glass the colour of pastel or water-colour on paper a great deal will depend on the taste of the individual. For this reason, if for no other, it is best to work from the front, as then the designer can keep in constant touch with the workers and can talk things over with them whenever any difficulty comes up.

Mosaic is the most splendid and the most permanent form of wall or ceiling decoration. But its limitations must be studied and respected or it will exact a terrible revenge. With the exception of stained glass no decoration can be more satisfactory and delightful when properly used, and nothing more overwhelmingly disastrous when forced beyond its scope.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* (New York) makes a special feature of Mr. Wm. H. Goodyear's sixth paper on "Illustrations of the Widening Refinement in the Architectural Exhibition at the Brooklyn Museum," in which attention is directed to the church of St. Alpin, Châlons; the Balaban Aga Mesjid Mosque at Constantinople; the church of St. Loup, Châlons; the church of St. Ouen and the cathedral at Rouen; the cathedrals at Rheims, Amiens, and Laon; and the main doorway of St. Mark's, Venice.

*La Construction Moderne* (Paris) has in recent issues illustrated the successful designs for the Rougevin prize in the Ecole des Beaux-Arts, a *cottage ornée* at Crozant by M. Henri Geay, and the centring for the new Pont du Moulin des Pierres, over the Valserine.

*Der Architekt* (Vienna) confines its illustrations to the work of two architects, Professor Jan Kotera of Prague and Mr. M. H. Baillie Scott. A charming little house, delightfully situated, of which Professor Kotera is the architect, is the villa for Dr. Tonder at St. Gilgen.

*Het Huis* (Amsterdam) continues its account of Oud-Deventer, giving some excellent illustrations of the seventeenth century work thereat. A new town house at Dordrecht is also illustrated and some of the treasures of the museum at Zutphen.

*Arkitektur og Dekorativ Kunst* (Christiania) gives a description and several views of the exhibition buildings at Aarhus by the architect Carl Berner, the design of which is based on a variety of sources of inspiration from Greek Doric to the *dernier cri* in *art moderne*.

*Industrial Engineering* (New York) gives an account of the hypocaust heating of the workshops of the Morse Chain Company, Ithaca, New York, which is described as "a radical departure from the usual methods." It is not particularly novel in modern work, as the Bourse at Vienna had an installation of a similar heating system a quarter of a century ago.

*Stone* (New York) illustrates the new Municipal Building, Pennsylvania Avenue, Washington, of which Messrs. Cope & Stewardson are the architects, and in the interests of stone shows several examples of the failure of concrete masonry in the church of St. John, Brooklyn, built ten years ago, thus offering a counterblast to the much-puffed Edison scheme of houses "poured while you wait."

The *Architectural Review* (Boston, U.S.A.) illustrates some small houses and two churches by Messrs. Cram, Goodhue & Ferguson, one in Texas and the other in Alabama. Views of Mr. Ernest Newton's house, Luckley, Wokingham, are also given.

The *Scientific American* (New York) gives a number of views of the rock-cut buildings and ruins of Petra from recently taken photographs.

*Engineering Record* (New York) publishes a number of letters from architects who have specialised in mill buildings, expressing their opinion of the value of the practice of boring longitudinal holes, with cross ones for ventilation, through timber posts as a preventive of dry rot. The general opinion seems to be that the practice has no effect on the development of dry rot. A description with illustrations is given of the constructional steelwork of the New York Municipal Building, of which Messrs. McKim, Mead & White are the architects.

MR. JOHN GARLICK, of Berkeley Lodge, Ashtead, and of Sloane Street, S.W., builder, who died on February 16, aged seventy-four, left estate of the gross value of 88,863*l*. 10*s*. 5*d*., of which the net personalty has been sworn at 39,240*l*. 9*s*. 2*d*.

SINCE the passing of the new American Tariff Act, providing for the free entry of works of art over twenty years of age, and antiques over 100 years old, the value of the exports from Britain to the United States has materially increased, the American Vice-Consul-General in London reports. During August, September, and October of 1908 the value of art and antique exports was 75,153*l*., but during the same period of 1909 the value of the exports rose to 1,339,516*l*.

# A CHURCH IN REINFORCED CONCRETE.

### MATERIALS_ EXTERIOR.

The concrete to be buff coloured and to have marble chippings of various colours in the aggregate.

Centering struck after 24 hours & the face wire brushed whilst green

Bronze copings to piers and beams

Windows in red marble glazed with silver white Norman slab in the bronze casements.

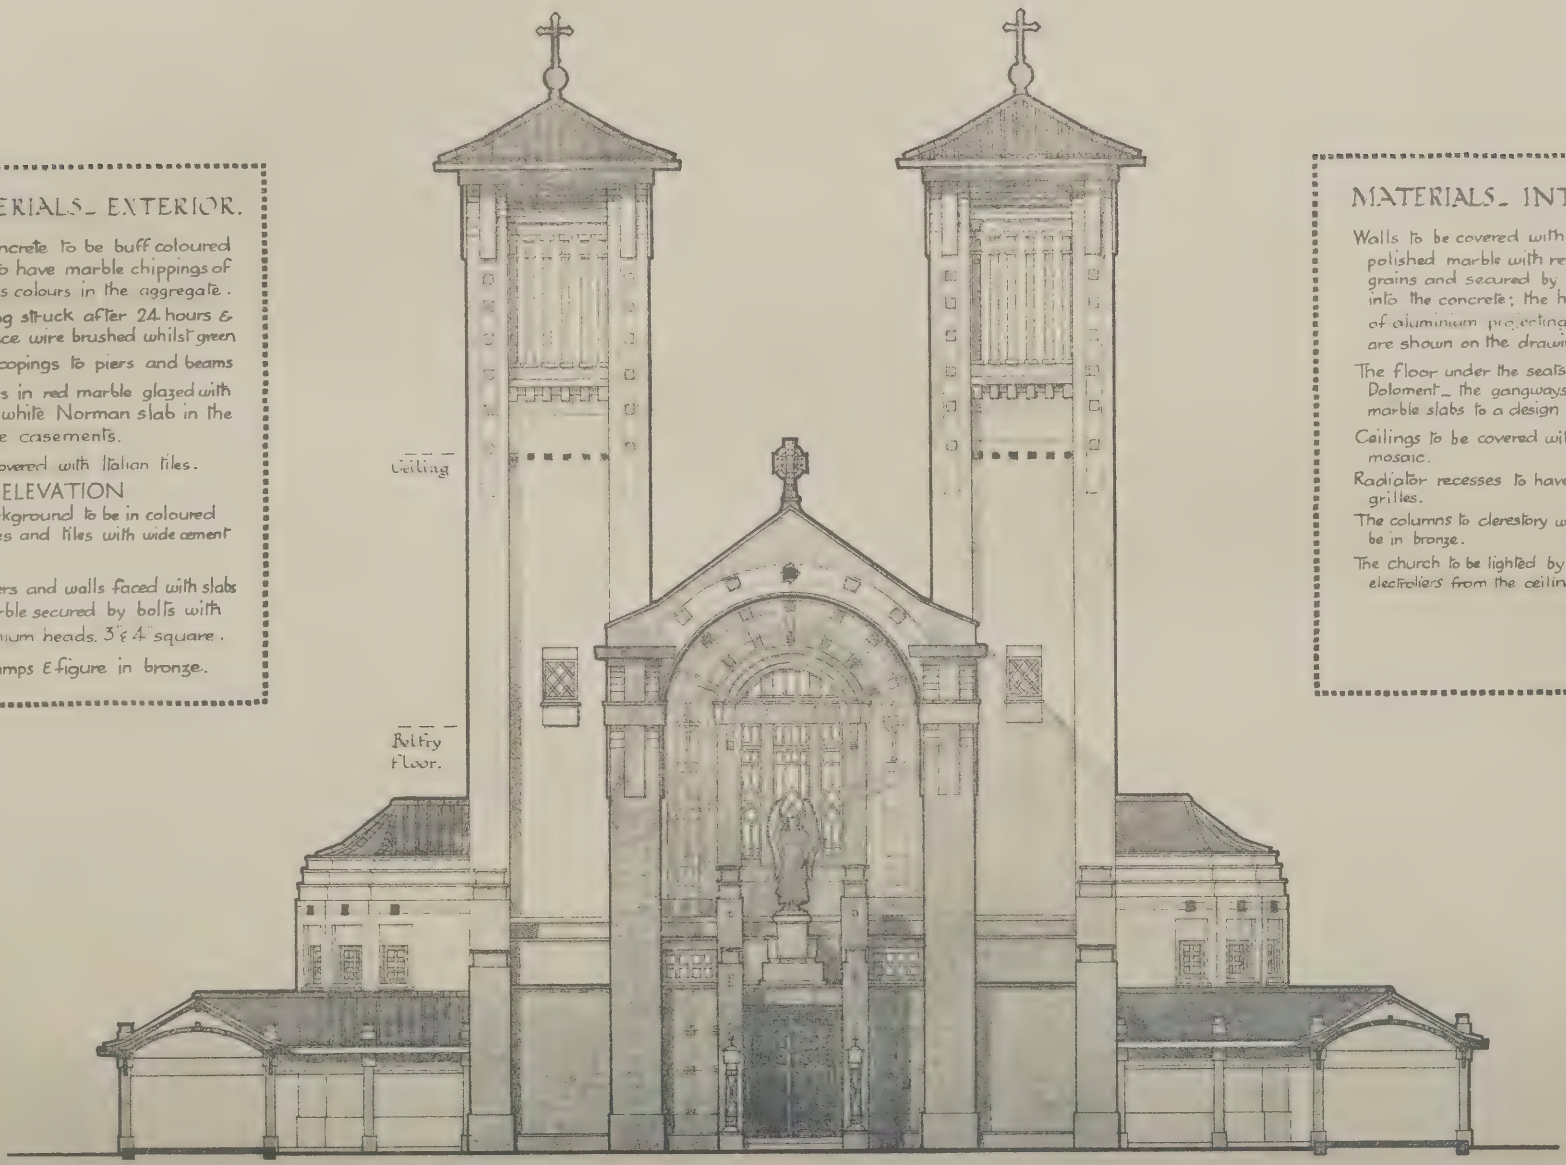
Roofs covered with Italian tiles.

WEST ELEVATION

The background to be in coloured marbles and tiles with wide cement joints

Inner piers and walls faced with slabs of marble secured by bolts with aluminium heads. 3" & 4" square.

Doors, lamps & figure in bronze.



### MATERIALS_ INTERIOR.

Walls to be covered with slabs of polished marble with reversed grains and secured by bolts let into the concrete; the heads to be of aluminium projecting where they are shown on the drawing.

The floor under the seats only to be Doloment_ the gangways in polished marble slabs to a design

Ceilings to be covered with glass mosaic.

Radiator recesses to have bronze grilles.

The columns to clerestory windows to be in bronze.

The church to be lighted by large bronze electroliers from the ceilings.

ELEVATION OF WEST END.

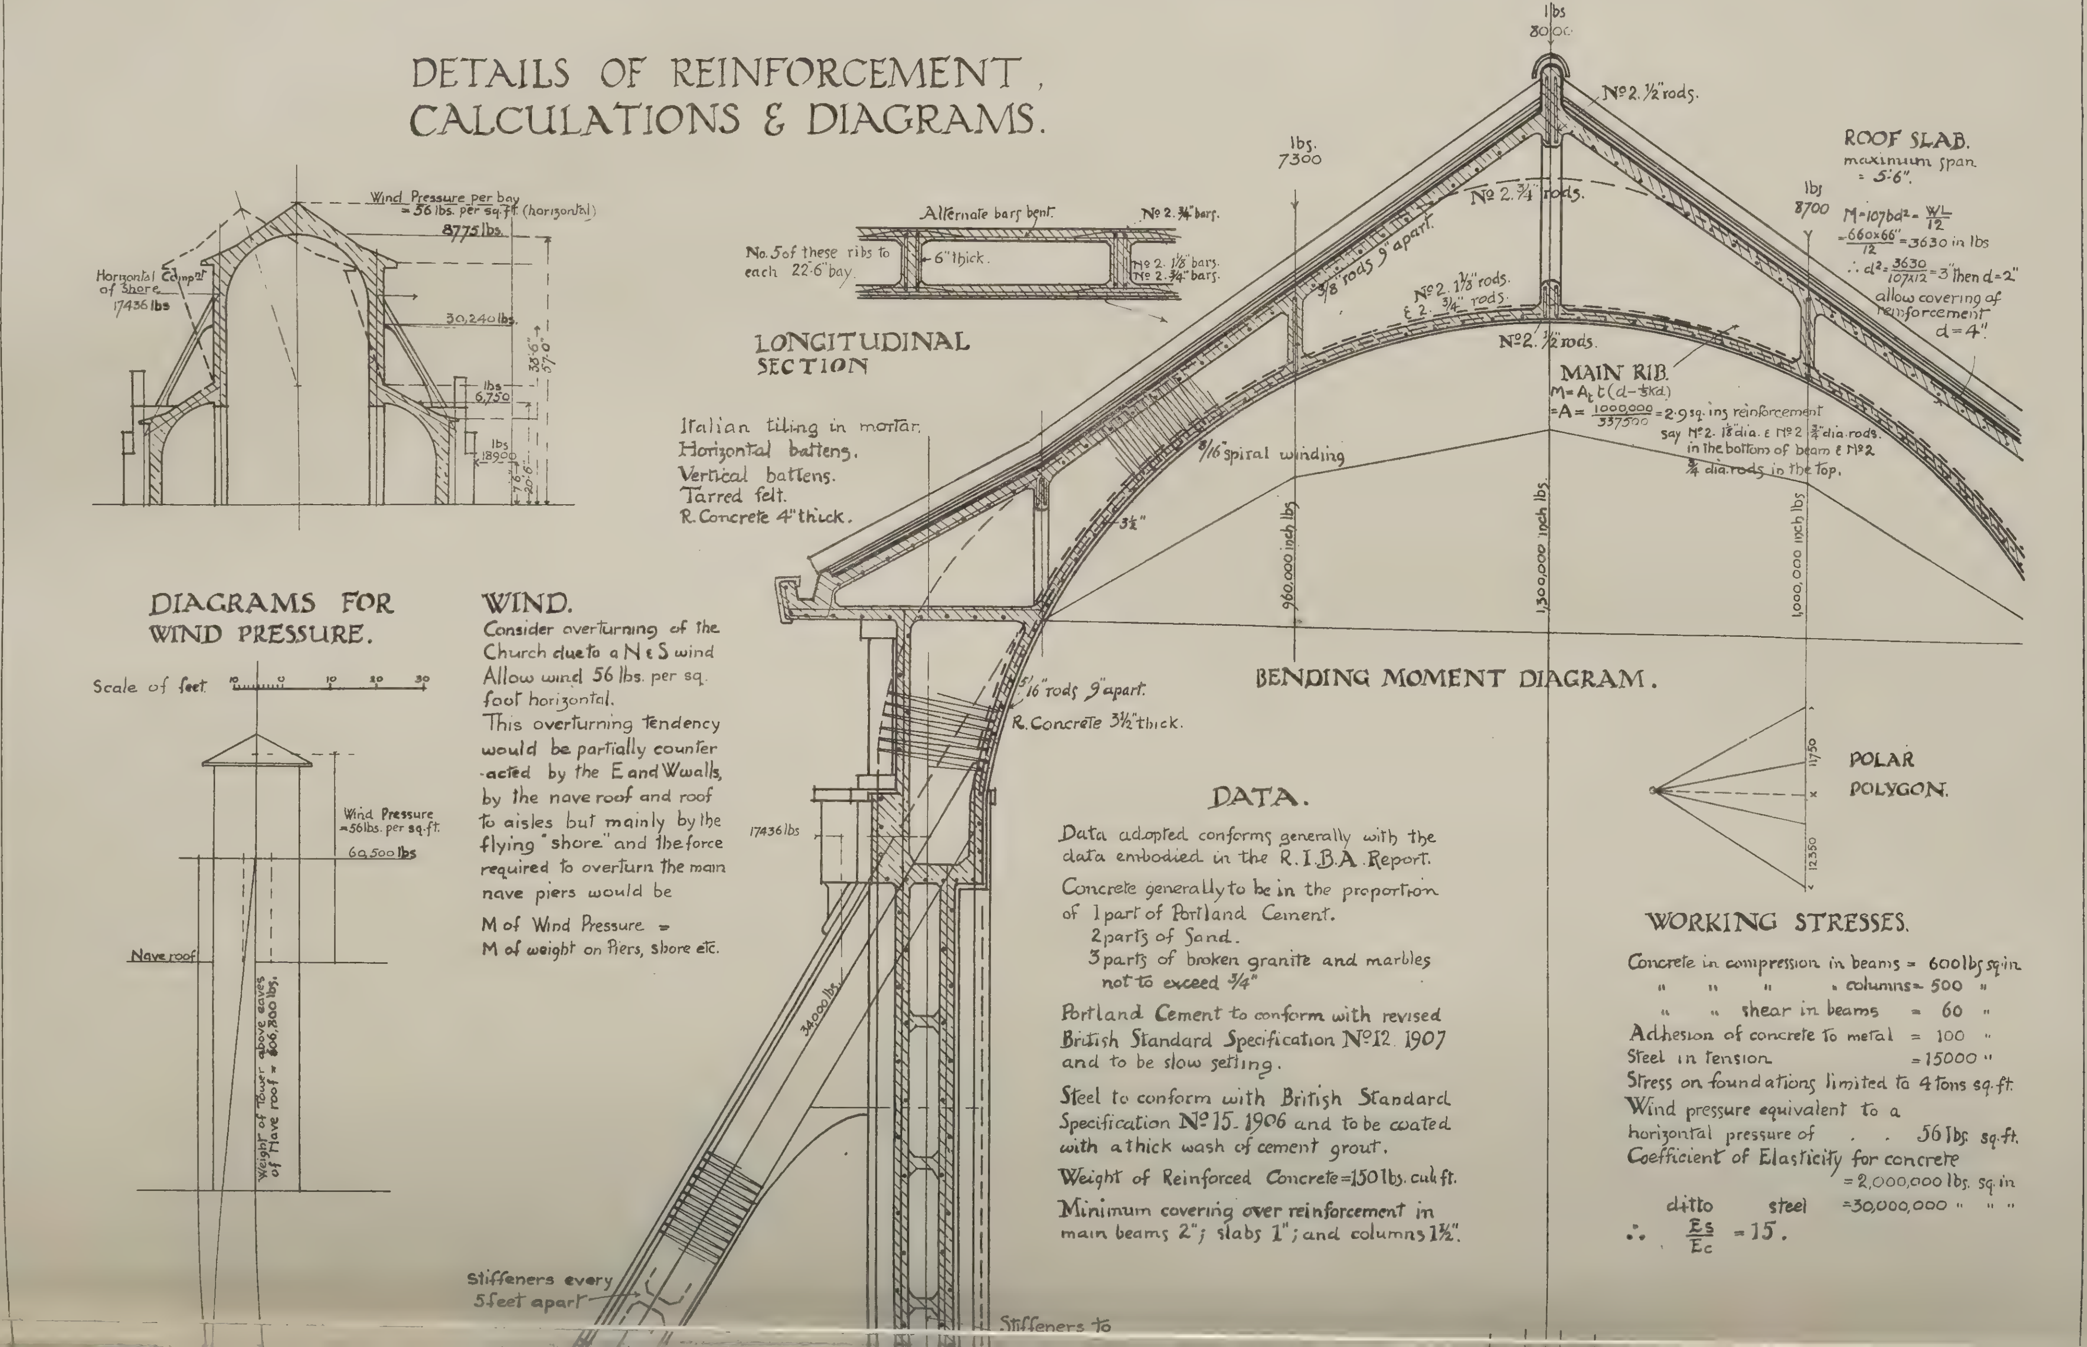
# A CHURCH IN REINFORCED CONCRETE

## DETAILS OF REINFORCEMENT, CALCULATIONS & DIAGRAMS.



**ROOF SLAB.**
maximum span = 5'6".

$M = 107bd^2 = \frac{WL}{12}$
$= \frac{660 \times 66''}{12} = 3630$ in lbs
$\therefore d^2 = \frac{3630}{107 \times 12} = 3''$ then $d = 2''$
allow covering of reinforcement
$d = 4''$.

**MAIN RIB.**
$M = A_t t(d - \frac{1}{3}kd)$
$= A = \frac{1000,000}{337500} = 2{\cdot}9$ sq. ins reinforcement
say No 2. 1⅛" dia. & No 2 ¾" dia. rods. in the bottom of beam & No 2 ¾ dia. rods in the top.

### WIND.

Consider overturning of the Church due to a N & S wind. Allow wind 56 lbs. per sq. foot horizontal.

This overturning tendency would be partially counteracted by the E and W walls, by the nave roof and roof to aisles but mainly by the flying "shore" and the force required to overturn the main nave piers would be

M of Wind Pressure =
M of weight on Piers, shore etc.

### DATA.

Data adopted conforms generally with the data embodied in the R.I.B.A. Report.

Concrete generally to be in the proportion of 1 part of Portland Cement.
2 parts of Sand.
3 parts of broken granite and marbles not to exceed ¾"

Portland Cement to conform with revised British Standard Specification No 12. 1907 and to be slow setting.

Steel to conform with British Standard Specification No 15. 1906 and to be coated with a thick wash of cement grout.

Weight of Reinforced Concrete = 150 lbs. cub ft.

Minimum covering over reinforcement in main beams 2"; slabs 1"; and columns 1½".

### WORKING STRESSES.

| | | |
|---|---|---|
| Concrete in compression in beams | = | 600 lbs sq in |
| " " " columns | = | 500 " |
| " " shear in beams | = | 60 " |
| Adhesion of concrete to metal | = | 100 " |
| Steel in tension | = | 15000 " |

Stress on foundations limited to 4 tons sq. ft.
Wind pressure equivalent to a horizontal pressure of . . 56 lbs. sq. ft.
Coefficient of Elasticity for concrete = 2,000,000 lbs. sq. in
ditto steel = 30,000,000 " " "
$\therefore \frac{E_s}{E_c} = 15.$

6" thick.
Marble secured by bolts with heads of aluminium.
Stiffener every 5 feet apart
6'0" Sq
Average pressure 4 tons per sq ft.
Nº 5. 1¼" rods.
Nº 5. 1¼" rods.
½" Stirrups
22'6" Span
22'6" Span
5/16" Spirals 3" centres.
Nº 12. ¾" rods.
Scale of feet for reinforcement
Ins 0 5 10 15 20 Feet

## ELEVATION OF BEAM.

## MAIN BEAM.

262,000 lbs. dead weight

$M = \frac{WL}{12} = \frac{262,000 \times 22'6" \times 12"}{12} = 58,950,000$ inch lbs

with 1% reinforcement

$d^2 = \frac{58950,000}{107 \times 18"\text{wide}} = 3063$

$d = 55$ inches.

Then $55" \times 18" = 990$ @ 1% = 10 sq. inches

Say Nº 8. 1¼" dia. rods.

## ROOF RIBS. (max. span)

11,500 lbs. dead weight

$M = \frac{WL}{12} = \frac{11500 \times 144}{12} = 138,000$ inch lbs.

$M = A_t t (d - \frac{1}{3} kd)$

$138,000 = A_t 15000 (16-3)$

$138,000 = 185,000 A_t$

$A_t = \frac{138.000}{185.000} = \cdot 75$ sq. inches

say Nº 2. ¾" bars.

## NAVE PIERS.

Dead weight on foundations = 296,703 lbs.

Average pressure per sq. inch on concrete $= C = \frac{P}{A} = \frac{296.703}{720 + (14 \times 5\cdot 76)} = 371$ lbs. sq. in

With a wind blowing at a pressure of 56 lbs. per sq. foot horizontally the maximum intensity would be 600 lbs. per sq. inch.

Average pressure per sq. inch on steel $= \frac{15 \times 296,703}{720 + (14 \times 5\cdot 76)} = 5511$ lbs. per sq. inch.

With a wind blowing at 56 lbs. per sq. foot. the maximum intensity would be about 12 000 lbs. per sq. inch

Pressure on earth $= \frac{296,703}{4 \times 2240} = 34$ sq. ft.

Say 6'×6' base.

## TOWERS.

Weight of tower = 1.408.400 lbs.

Area of concrete required at base $= \frac{1,408,400}{500\text{lbs} \times 4} = 704$ sq. inches

Actual compression on 4'×4' pier on concrete $= C = \frac{P}{A_c + (m-1)a} = \frac{P}{A}$

$= \frac{352116}{1404 + (14 \times 11\cdot 23)} = 225\cdot 5$ lbs. sq. in

Maximum intensity due to wind would be 451 lbs per sq. inch.

Comp. on steel $= t = \frac{mP}{A_c + (m-1)a} = \frac{mP}{A}$

$\frac{15 \times 352116}{1404 + (14 \times 11\cdot 23)} = 3383$ lbs sq. inch

Maximum intensity due to wind would be 7000 lbs per sq. inch.

Pressure on earth $= \frac{1408400}{262" \times 2240} =$ say 2 tons. sq. ft.

## FORTHCOMING EVENTS.

*Monday, April* 18.

Royal Institute of British Architects : Paper on "The Architecture of Adventure," by Professor W. R. Lethaby, F.R.I.B.A.

Liverpool Architectural Society : Annual General Meeting.

Architectural Association : Play "Arctia" at the Royal Court Theatre, London. Also on Tuesday.

Royal Society of Arts : Mr. A. B. Searle on "Modern Methods of Brickmaking." (Cantor Lecture 2.)

*Wednesday, April* 20.

Guild of Architects' Assistants : Paper on "Art, Architecture, and the Assistant," by Mr. E. J. Dixon, A.R.I.B.A., at Bedford Head Hotel, Tottenham Court Road, W.C.

*Thursday, April* 21.

Concrete Institute : Paper on "The Effect of Sewage and Sewage Gases on Portland Cement Concrete," by Mr. Sidney H. Chambers, at the Royal United Service Institution, Whitehall, S.W.

Royal Society of Arts : Paper on "The Arts and Crafts of Tibet and the Eastern Himalayas," by Mr. J. Claude White.

## "THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

IN setting our students a water-colour sketch as the subject for March we realised that we were imposing a hard task, for few architectural students at an early period of their career can be expected to have attained proficiency in the use of water colour. This medium is, however, valuable to the architectural student as a means of training both his feeling for colour and his appreciation of mass and surface rather than line, a corrective that is particularly necessary to an architect whose daily work in an office leads him to attach too much importance and to become too much habituated to the representation of buildings by hard lines and flat washes.

Water-colour sketching is moreover a most enjoyable pursuit and relaxation for holiday times, fascinating in itself at the same time that it is a means of improvement for the architectural student. Hence we by no means regret that we have asked the members of our club to try their hand at water colour, and though the present results are not all worthy of being hung in the water-colour room of the Royal Academy exhibition, they in most cases give hope for the future, and we would exhort those who have made their first attempts on this occasion to persevere and steadily practise the art of drawing in water colour, so that when next we set a similar study we may be gratified by obvious improvement.

Those who have already attained some proficiency will not need to be urged to further efforts, as they have already, we doubt not, felt some of the pleasure that comes from the use of colour and brush in the delineation of architecture.

The tyro in water colour must at the outset put on one side all endeavour to reproduce all the detail that he sees and still more all that he knows to exist in the subject before him, which, by virtue of his architectural training, he is apt to suppose that he sees and to attempt to include in his drawing. It is almost impossible in a water-colour drawing to draw, for example, all the tiles that are on a roof, and even were it possible it would be undesirable. Elimination, therefore, must be one of the first principles, and selection must follow it. In a water-colour drawing it is not the number of bricks in a chimney-stack but their contribution of colour to the whole that counts. The architectural water-colourist should try to clear his mind of the knowledge that the building before him is constructed of brick, of timber, or of stone, and roofed with tile or slate or lead, but regard it as a collection of a vast number of patches or dots of different colours or tints of varied shapes.

Some of our students have been unable to forget that in the office drawings they always tint the windows blue, and so have done the same in their sketch, following in this as in other matters the conventional colours of working drawings. Another great fault also derived from office work is the use of flat washes. These must be avoided like the plague in water-colour sketching. There are no flat washes in any actual building even when it is brand new and fresh painted, and still less anything approaching a flat wash in the objects before us that are the work of nature and not of man.

One of the first things, therefore, to be learnt in the technique of water-colour painting is the laying on of washes that are not flat, but that approach somewhat to the infinitude of variation that exists in what is actually before us as we draw. Although a nearer approach to this infinitude may be obtained by stippling with many small points of colour, we should advise the architectural student in his earlier stages to avoid stippling and the use of a quite or approximately dry brush, and to rely on broad washes of broken colour, endeavouring to obtain the variation in the single wash rather than by repeated overlays or glazing of tint upon tint. When he has attained proficiency in the spreading of a broad single wash of broken colour then he can glaze this with other similar washes and pick out brilliant and strong points of colour, but even so the practice of glazing and stippling should always be very charily employed in water-colour sketching. The untouched wash left to dry as it falls from the brush is always more beautiful in a sketch than the painfully-worked-up imposition of tint upon tint, in glazing and stipple.

The beginner in water colour must not suppose that because he is attempting to paint, he need not therefore trouble to draw. Painting is drawing in colour, and perspective and form must receive as much careful attention when the drawing is in colour as when it is in black and white.

Chiaroscuro, the treatment of light and shade, must also be considered, and as a water-colour sketch usually takes some time, the artist has to be careful that he is not led into the error of painting part of his picture with the lighting that obtains at the beginning of his work and part as it is at the end. The sun often travels a considerable distance between the commencement of a sketch and its finish, and shadows at different angles give an absurd falsity to a drawing.

Tone and atmosphere are closely allied in painting. There should be careful study of gradation of tone, and as a general rule, though, like all rules, not without exception, strong tones are suitable for foreground and lighter ones for background. In this way a sense of atmosphere and distance is conveyed. The term "atmosphere" is one frequently used in the criticism of painting and means

SHIPTON HALL, SHROPSHIRE. (From "The Manor-Houses of England.")

the effect of the atmosphere in the modification of what we see. It applies not only to the strengthening or weakening of tone, but affects also the actual tint of colour, as, for example, a hillside near at hand may be strongly and even brightly green, but, viewed at a distance, becomes blue or purple.

Of the elementary principles of painting we have left to the last the most important—colour. In colour the temperament of the artist is most strongly expressed. Some men will never be skilful colourists, for it is not in them to appreciate the harmony of colours; but most of us have some sense of colour, and this is capable of development. When an architectural student sees before him something that pleases by its colour he must put on one side the conventions of the drawing-office and endeavour to see what actually are the colours before him, and by persistently so doing he will be surprised to find how many tints there are in buildings, even as in natural objects. He must not say to himself, " There is a red brick wall; I will put on a wash of Venetian red for that." If he looks carefully and closely he will find that his red brick wall requires quite a number of pigments from his box, yellows and browns, even blues and greens, as well as reds. Elimination and selection may be necessary, but once again the importance of broken colour must be enforced.

Space does not permit us to say all that might be said on the subject of water-colour drawing, but, having explained some of its more important fundamental principles we recommend our students to bear these in mind, and, basing their work thereon, endeavour by constant and assiduous practice to improve their technique and facility. We can assure them that they will obtain much pleasure, as well as an increase of their artistic ability, by continuing the pursuit of water-colour sketching.

We will now proceed with the criticism of the drawings we have received.

Mr. Stanley E. Minns must learn to avoid hardness and refrain from drawing lines in a water-colour sketch; at the same time careful drawing is important. One must not falsify perspective because colour is used. Mr. Minns's colour is not satisfactory, being too hard, and the preponderance of blue in the louvres of the tower of " St. Mary the Virgin, Cottingham, near Hull," is neither true nor pleasant.

Mr. Charles T. Whiteley has chosen a subject in " Stanley Palace, Chester," that would have made a good picture with more wise selection of point of view. As it is the red brick chimney-stack is the most striking feature. There is not sufficient carefulness in the drawing, while the colour is too monotonous and flat, particularly of the timber work. The light and shade is false. The tree rendering in particular requires more study and practice, but with these there is hope for Mr. Whiteley in the future.

" Sans Peur " sends four sketches, of which the best is that of the " Palace Eye, Wells." As a picture it is spoilt by the overhanging tree in the top left-hand corner, which would be better omitted. The colour of the other foliage does not harmonise well with that of the stonework, and in this some of the architectural detail is expressed with too much harshness. The " S.W. Tower, Wells," suffers from the hardness of the shadows in the tower, which should have been treated softly to give atmosphere and a sense of distance. The trees in their compromise between impressionism and literalness are marred by the treatment of the timber, trunks and boughs. A tree does not present so much of its skeleton structure in front with all the foliage behind, but is a more or less round object. The " Old House, Wells," by " Sans Peur," has also too much harshness in the drawing of the woodwork of windows, though the treatment of the wall surfaces is good. The cobble stones are too much in evidence. One does not want in a water-colour sketch to be told exactly how many stones there are in the paving. In " All Saints Church, Newcastle-on-Tyne," a stronger treatment of the sky would have been an improvement, and a judicious grey tone would have softened down the harsh silhouette of the tower and of the chimney-stack on the right.

Mr. Reginald Pywell has contributed two sketches, one of " Lyminster Church " and one of " Rustington Church," both in Sussex. The chief fault of Mr. Pywell' work is the use of too dry a brush, so that his colour look woolly instead of being full and luscious. His foreground are not sufficiently-strong. There is also too much uni

RAM HALL, WARWICKSHIRE. (From "The Manor-Houses of England.")

formity of a rather unpleasant blue tint in his windows. This is particularly noticeable in the sketch of Lyminster.

Mr. B. J. Mendham's sketch of "Aston Hall" is commendably bright and sunny, but his treatment of the foliage of the hedge leaves much to be desired, and would be better if more broadly washed in. There is too much sameness of tint in the windows, and the roof of the further tower is too strong in colour.

"Esek" is a skilful water-colourist, and sends us a charming sketch of the "Entrance to Tower, Bolton Abbey, Yorkshire," which is an accurate and informative representation of the architectural detail of his subject and at the same time a delicious study of colour.

"Nelson" has fairly well treated the building he represents, known as "The Tower," near Mold, though his perspective drawing leaves somewhat to be desired; but he is sadly lacking in ability to represent foliage in colour, while a flat wash of blue sky with hard edges intended to represent cloud form hopelessly kills the picture. The artist should take as much, if not more, care and trouble over the constituents of his picture other than the building as he bestows on the latter. "Nelson's" washes are continued without break of colour over too much surface of paper.

Mr. Walter Benwell in his sketch of the "Tower of St. Mary's Church, Stoke-by-Nayland," has produced a bright and sparkling drawing, but only by means of harsh and impossible contrasts of black on white, or at least extremely dark colour on very light. He should leave his fine and small brushes at home and work for a time with a large one full of colour, getting variety into his surfaces and less white or almost white paper.

We have no hesitation in awarding the prize for March to "Esek," whose work is far superior to that of any other student.

## THE MANOR-HOUSES OF ENGLAND.

In the whole field of English architecture of the past there is scarcely a more interesting section than that of the manor-houses, which occupy a place intermediate between the mansion of the noble and the cottage of the peasant, and hence are of especial value to the architectural student of the present day, whose opportunity for the exercise of his art is more likely to occur in the homely house of moderate size than in the cathedral, the mansion, or the costly municipal building.

If there is one characteristic of our old manor-houses that is more outstanding than another, it is their homeliness. Each and all give us the feeling that they were built as a home for the family of the individual squire who brought about their erection, and often not only impressed upon his own house his own personality, but actually superintended the detail of its construction, as we are told of Squire John Jones in his eighteenth-century restoration of Chastleton.

Therefore we welcome such a charming presentation of the manor-houses of England as we have before us in the volume by the Rev. P. H. Ditchfield,* in which there are brought to our ken not only a number of characteristic and typical examples, but many little-known specimens of the indigenous art of our domestic architecture. And yet the full tale is not told, for to do this and to catalogue the whole wealth of England's country-side in manor-houses, let alone of similar homes not strictly manorial, would need a far larger volume than the book offered to all lovers of English art at the modest price of three half-crowns.

The scheme of the author's work is excellent. After some introductory chapters explanatory of the manorial system, which may be epitomised in its essence as a patriarchal scheme of communities, of which the lord of the manor was the head, recompensed by certain rights for his maintenance of the privileges of his tenants, Mr. Ditchfield, following an exposition of the development of plan, deals with manor-houses from the point of view of their materials of construction. This is peculiarly appropriate to the subject, for it connotes local distribution of type, which was always largely based upon and influenced by the local material, thus bringing about that sense of harmony with its environment that is so characteristic of the design of the English manor-house. The adherence to the use of local material and the development of local type of design were no doubt in part due to the comparative isolation of various districts by the lack of facilities for intercommunication. As the author says:—"Villages or districts were self-centred, owing to the difficulties of communication and transit, and different parts of the country preserved their own peculiarities little affected by what was being accomplished in other parts of the country outside their own little world. Some wrought in stone, others in brick, plaster, or timber, but the same underlying principle governed all—a wish to do their best with the materials nearest to hand."

Passing from the consideration of materials in general, with the description of many examples illustrative of their effect on design, we are treated to an account of the particular treatment of details: first, of the exterior, chimneys, porches and doors, windows, roofs and gables; second, of the interior, mantelpieces and fireplaces, staircases, panelling, ceilings, windows; third, of metalwork in lead and iron. In this section we are furnished with many sketches, to a large scale, of the details described, which make the book particularly valuable to the architectural student.

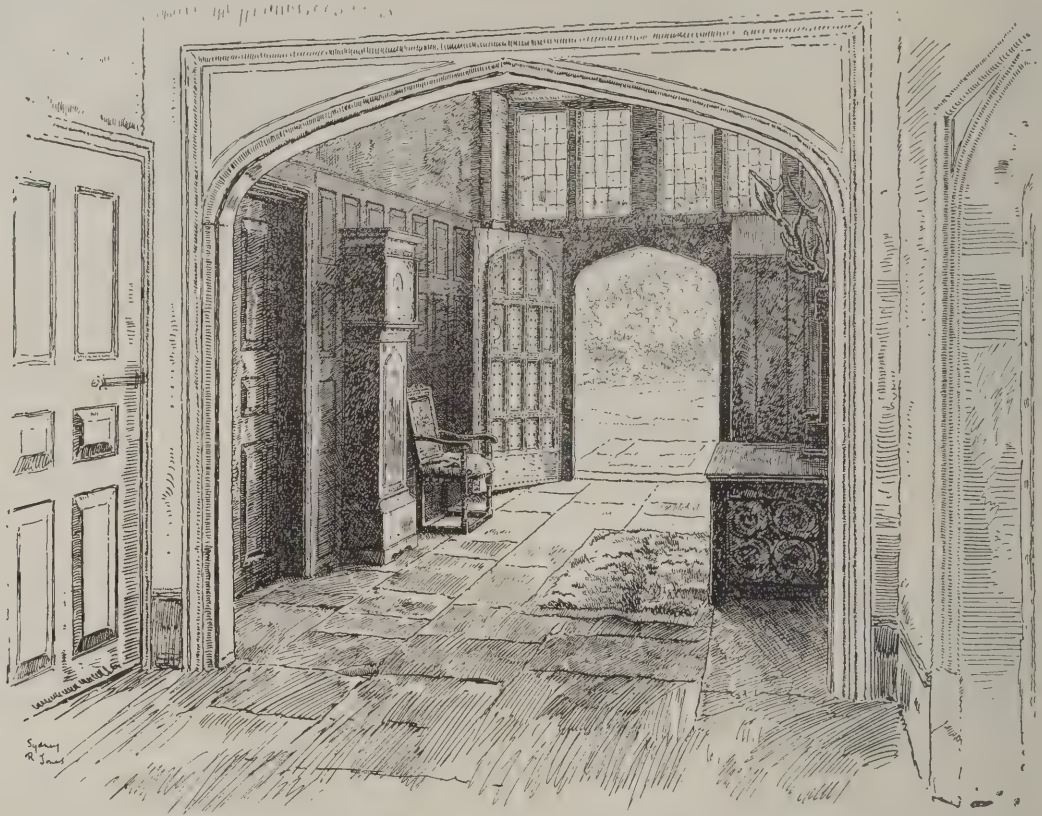
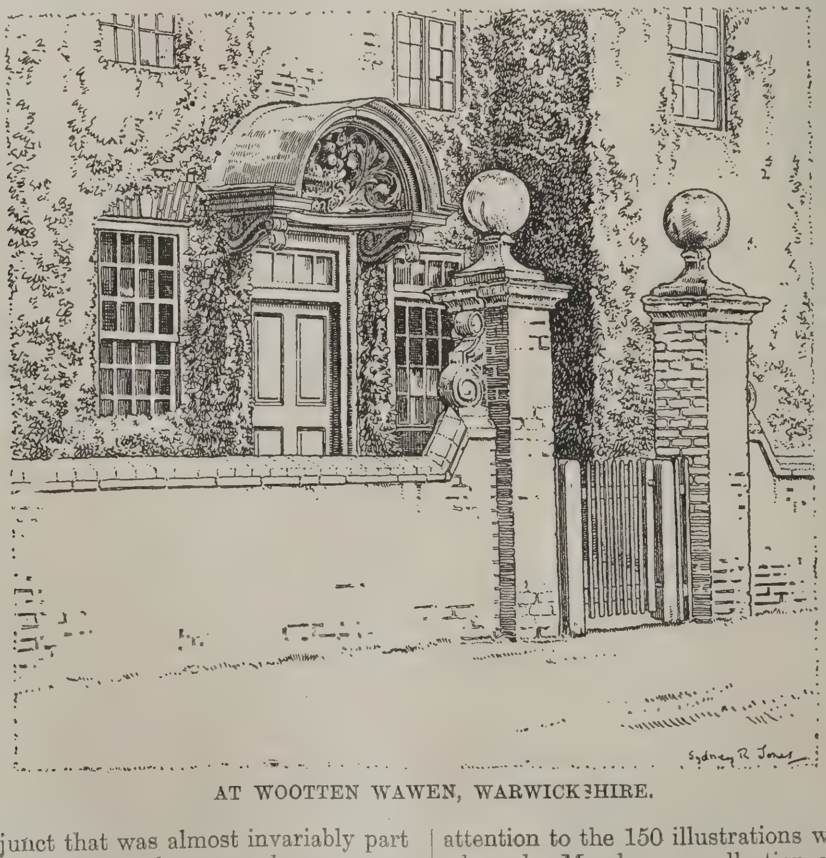
* *The Manor-Houses of England.* By P. H. Ditchfield, M.A., F.S.A. Illustrated by Sydney R. Jones. (London: B. T. Batsford, 1910. 7*s.* 6*d.* net.)



THE ENTRANCE HALL, WHITTINGTON COURT, GLOUCESTERSHIRE.

Finally, we have a chapter on gardens and their surroundings, an adjunct that was almost invariably part of the scheme for a home that the manor-house represented, and although with the degradation that has too often reduced a manor-house to a farmhouse, many of the old gardens have fallen into decay, it is, as our author tells us, "easier to discover a good manor-house garden than one attached to a more magnificent mansion."

The manor-house gardens, more often than those of lordly mansions, escaped the wild mania for landscape gardening which permitted the efforts of "Capability Brown" and other revolutionists to destroy the old pleasance.



AT WOOTTEN WAWEN, WARWICKSHIRE.

We cannot conclude our review without calling special attention to the 150 illustrations with which this book is adorned. Merely as a collection of admirable specimens of pen-drawing the volume is worth many times its price to the architectural draughtsman who desires to attain proficiency in this branch of his craft, for Mr. Sydney

JONES has proved himself one of our ablest present-day exponents of the use of pen and ink in the delineation of architecture, and has here given many delightful examples of his skill. By the courtesy of the publisher, Mr. BATSFORD, we are enabled to reproduce some specimens of the illustrations which assist to render the monograph on "The Manor-Houses of England" one of the pleasantest additions to the library of every lover of our native architecture that has appeared in recent times.

## NOTES AND COMMENTS.

THE incident of the alleged discovery of a signature on the famous Rokeby picture of *Venus*, discrediting the hitherto received ascription to VELASQUEZ, has once again demonstrated the absurdity of the fictitious and inflated values assigned to "old masters." It is beginning to dawn on the mind of the Philistine that the question, whether this particular picture is worth the 45,000*l*. for which it was purchased and presented to the nation depends on the accurate deciphering of certain cracks and scratches, is preposterous, and that the value of the painting as a work of art does not rest with the determination of its authorship.

IN the number of the *Art Journal* for April is an excellent appreciation by Mr. RUDOLF DIRCKS of the President of the Royal Institute of British Architects, Mr. ERNEST GEORGE, A.R.A., as a painter in water colours. Several capital reproductions from Mr. GEORGE'S sketches are given, and though these, of course, lose by translation into black and white their distinctive value of colour, it is remarkable what charming effect they convey in monotint, showing Mr. GEORGE'S mastery of values, his power of composition, and his fine sense of proportion in chiaroscuro.

THE Rev. R. T. S. TOLSON makes an appeal for funds for the preservation of the remains of the Oratory of St. Piran, in the parish of Perranzabuloe, on the north coast of Cornwall, which venerable sanctuary, he says, "must be one of the most ancient ecclesiastical buildings in the country, having been built by the Irish missionary St. PIRAN in the fifth century." Buried beneath an accumulation of sea sand some four hundred years later, it was discovered in the year 1835 and disinterred. Now by the exposure that has followed the removal of the protecting sand it has reached a serious condition of decay, to avert the further extension of which it is proposed to enclose what remains with walls and roof.

THE draft conditions of the forthcoming competition for the Usher Hall at Edinburgh provide for an expenditure of 65,000*l*., for which sum is to be built a hall to accommodate an audience of 3,000 persons with an additional 500 on the platform; crush-hall and lounge foyer, and other accessories. Designs are to be sent in by July 9, and copies of the particulars will be obtainable after April 18.

AT a meeting of the Southampton Cymmrodorian Society last week Mr. CHARLES COOKSEY advanced the theory that Southampton was the first Celtic capital in Britain, being known as Trisanton. The claim of Southampton to be the ancient Celtic city of that name was based upon historical, archæological, topographical, and philological evidence which existed in great abundance. He exhibited several excellent Celtic relics, and added that similar discoveries were constantly being made in and around Southampton. Amongst the exhibits were Celtic coins, a coin of ARBACES II., King of Parthia, about 225 B.C.; a shield brace, and the frontal of a skull found at a considerable depth quite recently during some excavations in the immediate vicinity of the buried Roman city of Clausentum, on the east bank of the river Itchen opposite Southampton. These, he explained, were only a small portion of the remarkable discovery of great deposits of human remains which had been unearthed during the digging of the foundations for a number of small houses which are now being built upon this extremely interesting, but much neglected site.

THERE were many references in the ancient chroniclers to events that took place in the large and important city of Trisanton. Here was buried the great King LUD, who first fortified the city and exercised much influence over the people, and whose name is preserved now in that of the old Celtic city of Ludgershall, in Wilts, on the borders of Salisbury Plain. This place was named after the great Celtic city of Lutetia, the original Paris, as Carisbrook in the Isle of Wight was from Cær Ebrauc, or Evereux, another ancient Celtic city upon the same river. Sir BEDEVRE, or BEVIS, according to the old British or Welsh story, sleeps on the wooded slopes of Trisan, now Portswood, and where his tomb remained till within the last fifty years, when the monument which marked the site on Bevois Hill, which overlooks the river Itchen and the Roman station of Clausentum, was destroyed, and his bones scattered.

ON his second invasion of Britain in B.C. 53, JULIUS CÆSAR sailed up Southampton Water, and after a sturdy resistance by the Britons took and destroyed Trisanton, but, beyond that, CÆSAR seemed to have done little by his second invasion, save to extract at the point of the sword a promise from the Britons to recognise the power of Rome by an annual payment, and upon this he withdrew. To avoid a repetition of this attack the Britons re-established their capital twelve miles further up the river Itchen, near the ancient oppidum known as Cær Gwent, now St. Catherine's Hill. Here, in the valley of the Itchen, they built their new capital, which they called Camelot, and erected a royal palace, where stand the ruins of Wallesey, or Wolvesley, Palace at Winchester. To protect the mouth of the Itchen they constructed a great defensive work at Woolston, considerable traces of which are still quite evident, and where within the last few years remarkable discoveries of bronze implements and Celtic coins have been made. This camp was referred to in the account of the invasion of AULUS PLAUTIUS in the year 43 A.D. as Cær Peris, or Byris, or Bere, which was corrupted to-day into Pear Tree Green. The Roman station of Clausentum later became the seat of the Roman power in this district, and it remained a city till the end of the Saxon period. Winchester continued to be the Celtic capital till the more thorough and effective invasion of VESPASIAN took place, which broke up the Celtic form of government and established that of Rome.

THE preservative works on Ayr Auld Brig, which have been going on more or less continuously for the last three years, have now been practically completed, and the bridge will again be thrown open to the public in the course of the summer. It was at one time thought that it would be necessary to rebuild the bridge, but it has been found practicable to preserve it as BURNS saw it, and so thoroughly and conservatively has the work been carried out that there is now practically nothing to show for the expenditure of over 11,000*l*. This is preservation of the right sort, much to be preferred to a conjectural restoration of what might have existed in the distant past.

THE Finance, Property, and Law Committee of the Heriot Trust have come to the decision not to adopt the proposals we gave some time back, as made by Treasurer LEISHMAN, for the adoption of some desirable, if a little Quixotic regulations for a considerable addition to the amenities in the future lay-out of their estates. The Committee appear to have been influenced to their decision by the feeling that the provisions of the Housing and Town-Planning Act, 1909, would do all that was desirable.

## THE CRAFT OF REPAIRING BUILDINGS.*

THERE is a striking difference between present-day views of architecture and the views taken by those living during any great period of building in the past. No people could have built so sumptuously as did our forefathers if they had not cared greatly for the work which was being done, and we know from the ruthless manner in which the Mediæval builders swept away or altered the work of their predecessors that they set no value upon it, but only on their own work. Architecture in those days was in somewhat the same position as electrical science is with us to-day. Everyone understood it more or less and everyone was in sympathy with it and everyone was watching its progress with keen interest. At the present time there *is* a little real architecture being done—a very little indeed when compared with the enormous amount of building which has been going on during the last fifty years—and even this little has not interested the public or the educated. No. It is only buildings of the past which now arouse interest and admiration. To know nothing about such buildings might almost be said to mark a man as uneducated. We can only hope that all this study will ultimately have a good effect on architecture whenever it does come to us, and it is clearly our duty to preserve the old buildings, at any rate until we can do something better ourselves. The mere fact of our caring so much about these old buildings is a proof that we are not producing a national architecture, because history shows that a people who are doing so do not care about anything except their own work. As matters stand it is, as I have said, clearly our duty to preserve the grand buildings left to us, and above all to preserve them in an authentic condition. This being so, I am justified in doing my best to lay before you such knowledge as I have on the way in which buildings can be made substantial without robbing them of the qualities which their makers gave them, and which we rightly value so highly.

Now let us consider why buildings need repair. Materials decay, but they do not decay without a cause. Snow and rain getting through roof coverings is one of the first causes. Timber decays by being wetted and dried, and mortar, bricks, and stone decay by wet, chiefly through frost expanding the wet by turning it into ice and thus forcing the particles asunder. Ivy destroys buildings by getting its roots into walls and forcing the stones apart and by covering the roofs and preventing the wet running off and the sun and wind from drying the roofs. This brings about the decay of the timbers and lathing. Another cause is the giving way of the ground on which walls rest. Such a result is generally due to the adjacent ground being disturbed, as for example by the digging of graves or sinking heating chambers. The ground giving way is of course a great danger to any building, and besides the causes I have named for this happening there is one most insidious one—viz. the water from the roofs being allowed to stagnate near the walls and soak into the foundations, thus making the ground soft and compressible.

A very common cause of failure in buildings is bad mortar. The old builders seem generally to have used local lime, and therefore you will find the *best walling* in the neighbourhood where the *best lime* is found. Where blue lias lime was procurable you will find instances, as for example the castles in Wales, where the mortar is as hard, if not harder, than the stone.

There is, however, one cause of decay which gives more trouble than any other. In years gone by it did not exist, and it has greatly increased in virulence since I have watched buildings. It is the surface decay of stone and mortar brought about by the enormous and wasteful consumption of coal at the present day. It is often thought that this only applies to town buildings, but it is not so, for the decomposing elements are carried by the winds and affect buildings miles away. Wood smoke does no harm.

We will now consider how these troubles can be overcome, and we will take a concrete example in Sutton-on-Trent church tower, which is in Nottinghamshire. It is a thirteenth century building with a later stage added. It had been in a critical state for a long time. Owing to bad mortar the core of the wall was like so much loose rubble and the walls were bulging and settling in spite of support being given by iron bands, and fissures were coming between the main walls and the angle buttresses. Both the architectural and engineering professions had reported that the only course was to pull down and rebuild. That is, to put modern workmanship in the place of ancient, so that the building, when finished, would not have been an old building. It is no disgrace that this advice should have been given, for those who gave it rightly said that it was dangerous even to pull it down. Mr. William Weir said he could repair the tower without rebuilding and he did so successfully. The walls were not only cracked on the face, but were splitting vertically in their thickness. What he argued was that the walls could not fall down if they could not fall outwards. He therefore began by planking the walls all over and connecting the opposite faces together by means of iron tie rods. Fortunately the original builders had worked with putlogs going right through the walls and this gave an opportunity of taking the rods through the walls without cutting holes, which might have been dangerous. When all this had been done the repairs were begun on the inside, starting at the ground level, for it was found that the foundations were quite sound. Loose stones were removed and the core of the wall taken out as far back as the outside facing stones. New work of brick and of concrete was put in to take the place of the old disintegrated work, and the backs of the outer facing stones were carefully bonded into the new work, care being taken to prop up the old work above the part being repaired. In one place the outer stone face had bulged so badly that it could not be bonded in as the work went up, so toothing was left and the bulged portion was rebuilt vertically and bonded into the toothing when the rest of the walls were finished.

This tower is sixty feet high and the walls four feet thick at the ground level, with a six-inch set-off at the first floor and another six-inch set-off at the belfry level, so that the fourteenth century top has three feet walls. The expense of doing the work was less than two-thirds the cost of rebuilding.

I have hardly said anything about how the tower was repaired, because if you can successfully renew or make good a portion of a wall measuring, say, two feet each way, and you slowly carry this process on, in time the whole will be new. Do not think that it is necessary to renew the whole; some is always good enough to strengthen and retain. At Sutton-on-Trent the whole of the original work outside was kept as the original builders left it, with the exception of the bulged face. The process of taking out old work and putting in new can only be properly learnt by seeing it done, and our present knowledge is the result of many years of effort and experience. You know that the Romans were very good builders, and that one of their methods of building was to have a band of tiles the full thickness of the wall alternating with a band of concrete. When repairing walls we bear this in mind. The bands of tiles or bricks bind and the concrete consolidates. Cost cannot be ignored, and it will be seen that a great saving can be effected if all the loose core which is taken out can be kept on the scaffold and put back as concrete, for hoisting is a serious item of expense.

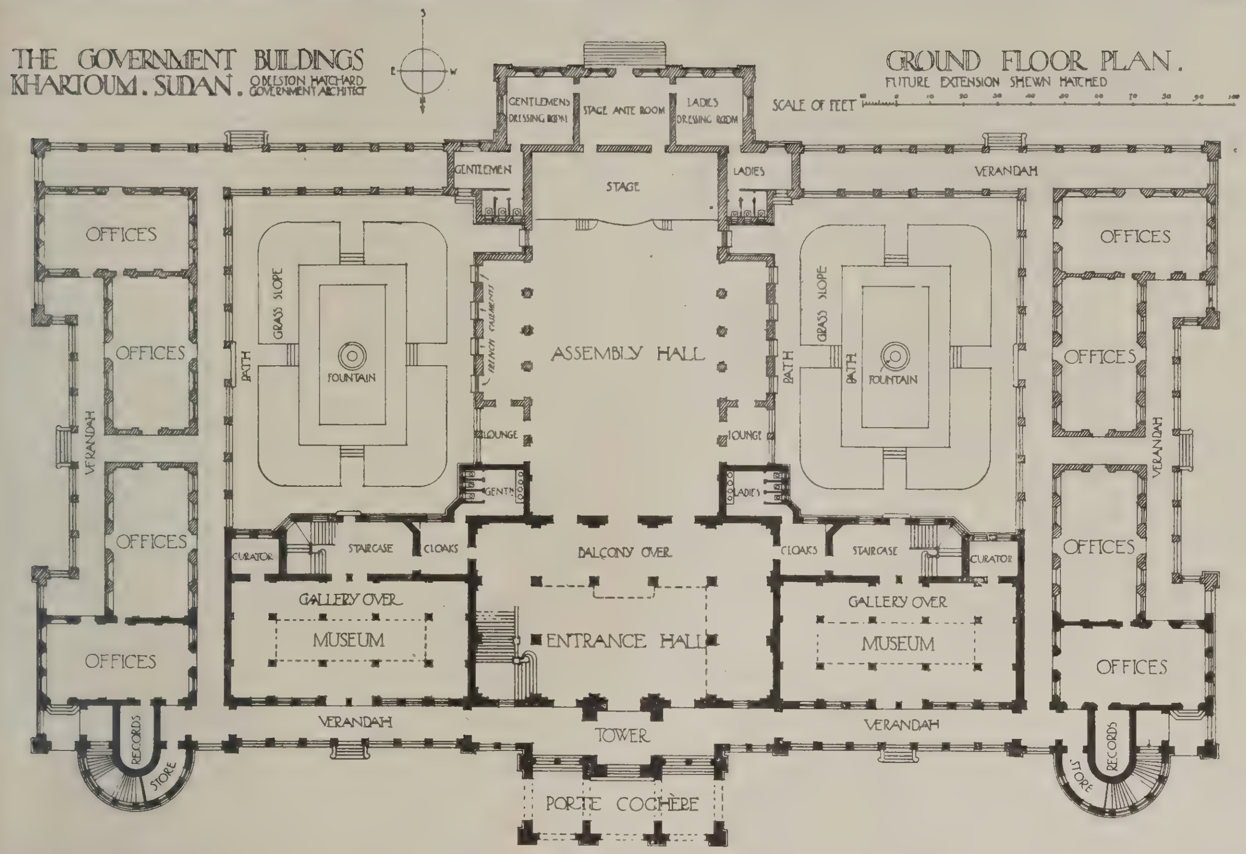
It must be remembered that workmen cannot be expected to understand the value which we attach to ancient work. Neither should they be trusted to cut into an old wall for the purpose of repair without supervision. It is essential for the proper carrying out of such work that a man should be in constant supervision over the workmen and that he himself should have had previous training. Besides being a good antiquary, so far as our English and Saxon buildings are concerned, he must have a clear head for construction, and know all about building materials and their use. From this it will be obvious that the repair of buildings cannot be properly directed from a London office, and a specification for the repair of an ancient building is an absurdity.

Sutton Courtenay Church, in Berkshire, may be taken as an example of a beautiful building requiring repairs, such as will ordinarily be found to be needed. The tower is Norman work, and it, like Sutton-on-Trent, has had a fourteenth century belfry stage added. It had been plastered externally, but the weather had got behind the plaster so that it was only keeping the walls damp instead of protecting them. It was decided to point the walls and not replaster them.

In the matter of building, few things are more important than the treatment of wall surfaces, and any man undertaking the daily supervision of building work ought to take a trowel and learn how to point different kinds of walling. To begin with, the old mortar ought to be cut out of the joints for at least as far back as the joints are wide. Before pressing in the new mortar the joints ought to be thoroughly washed out, and if the work is to be of any use the mortar must really be pressed in, and not wiped on the surface in the usual way. Any one who takes an interest in building will have noticed the wonderful variety in the different kinds of modern pointing, and I think I may safely say that every one of these are bad. For example, what could be more foolish

---

* A paper read at Carpenters' Hall on April 6 by Mr. Thackeray Turner, F.S.A., F.R.I.B.A.



than to put on a raised joint? The wet hangs on it, and the frost gets hold of it. It takes a long time to do, and like all unconstructural methods is very ugly when done. Could anything be much more silly than "tuck" pointing? and yet it is very difficult to do, and it may be taken as a good test of a modern bricklayer, as to how well he can do "tuck" pointing. The brick joints are raked out and filled with mortar flush with the walling, and then coloured over to match the brickwork. Then a line of white putty, or still worse it may be black putty about a quarter of an inch wide is run on all the joints, so as to make believe that the brickwork is very accurately built, with fine joints. Good pointing will always be flush with the wall face, and the best result is obtained when the joint is finished as the wall is built, but unfortunately this is not often possible, because a new wall stays wet for a long time, and if frost comes before it is dry, the mortar in the joints will crumble away, and then the joints must be pointed. The cost in this case is much greater, for there is no difficulty in raking out the joints when the mortar is fresh, whereas if you pay for the joint being finished as the work proceeds, and then have to pay for raking it out after the frost, and pointing it, especially if the scaffolding has been removed, obviously considerable expense will be incurred. The real difficulty comes in when a stone wall built of irregular stones with irregular surfaces has to be pointed. It seems to me that the old builders did the best thing. They threw the mortar on, and then scraped it off even with the projecting stones. I must not speak of mortars now, but I may just say that with bad mortar no good work can be done, and that you will never have bad mortar if you use four or five parts of washed river sand, and one part of blue lias lime. All good mortars are what is called "short," that is they are not sticky, and they fall off the trowel like wet sand when first mixed, but this can be rectified by mixing it beforehand and using it just as it begins to toughen. It is well known that blue lias lime is slow in setting, and therefore it should be kept moist by the use of a garden syringe for a couple of weeks after the work is completed, and if a cloth can be hung over the work so much the better, for it will keep the wet from drying out.

The chancel arch of Sutton Courtenay Church was badly twisted and cracked. It was found that the foundations had given way on the south side, which had caused a dislocation of the wall on each side of the arch. The first thing done was to secure the arch with a strong wood frame so that no movement could take place during the progress of the work. The loose earth was then removed to a depth of six feet below the wall, at which level a firm bottom was found. A new wall was built up under the old wall and wedged firmly under it; the crushed wall was then removed piecemeal, and replaced with new work. Over the chancel arch there is a fine coat of arms of King Charles painted direct on the wall. Of course this had to be preserved. As it was desirable to relieve the arch of the weight of the wall above it, a lintel or beam of brickwork was built into the wall from the chancel side. This was done by the same process of doing short lengths at a time and leaving toothing on the end of each length, so that the next length, when built, could be bonded on to it. This was successfully done without disturbing the plaster on which the Royal Arms is painted. As blue lias lime sets slowly, Portland cement was used for the new brickwork, as there would not be time to wait for the lime to set. On completion the brickwork was covered with smooth hand trowelled plaster, similar to the old and lime-whitened.

(*To be concluded.*)

## Correspondence

**Licentiates R.I.B.A.**

Sir,—May I venture to commend to the careful consideration of all architects (whether principals or assistants) who are not members of the R.I.B.A. the advisability of taking the present opportunity of becoming Licentiates of the central representative body? The title of Licentiate is conferred by Royal Charter; as a title it has its parallel in the L.R.C.P. of the medical profession, and the power for Licentiates to become Fellows, should they so desire, is secured by the Charter.

There are already several hundreds of applicants, and it is hoped that every *bona-fide* architect will be enrolled.

The next step will be the consideration by the general body of the Bill now being drafted to secure statutory recognition.—Your obedient servant, Edwin T. Hall.

54 Bedford Square, London, W.C.: April 10, 1910.

## ILLUSTRATIONS.

### LIVING ARCHITECTS.—NO. 32, MR. JOHN DOUGLAS.

Few architects have more notably upheld the position of provincial artists than John Douglas, of Chester, whose work, whether ecclesiastic or domestic, has been a source of delight to his *confrères* throughout Great Britain.

### NO. 33, MR. WILLIAM HENMAN, F.R.I.B.A.

Mr. William Henman ranks among the leading architects of Birmingham, and is especially known by his work at the Central Hospital and his advocacy of the Plenum system of ventilation.

### THE GOVERNMENT BUILDINGS AND ECONOMIC MUSEUMS, KHARTOUM.

THE Sûdan possesses practically no ancient architecture; true, a few remains exist of churches erected probably in the fourteenth century by Coptic Christians, but, unlike the neighbouring land of Egypt—the seat of the earliest civilisation—there are no wondrous temples or tombs such as bear witness for all time to the magic skill of the Egyptians of remote antiquity.

Thus, after the reconquest of the Sûdan, when it became necessary to erect buildings for administrative purposes, there was no indigenous architecture to reproduce or to work upon as the basis of a style for modern buildings suited to the exacting climatic conditions.

The Governor-General's palace, built on the site of Gordon's old residence, was the first important building of the new *régime*. It was commenced by Lord Kitchener almost immediately after the battle of Omdurman and is designed in the Florentine manner. Situated amid a wealth of tropical foliage, the effect of the white palace on the bank of the Blue Nile is certainly pleasing, though it is perhaps chiefly interesting for the rapidity of its construction and from the fact that it was built entirely by native soldiers quite untrained in the building crafts. The Gordon College, another of Lord Kitchener's achievements, is also Gothic in treatment. This building, as its name implies, was erected in memory of the heroic General who was killed in 1885 while defending Khartoum.

When the question of the new Government buildings was mooted the first consideration was as to style. After much thought a form of Saracenic architecture was adopted, this style being, of course, the product of the Mohammedan faith, and therefore eminently suitable for a country where the English have never sought to impose their religion or customs on the natives. Further, it has a certain likeness to the style of the buildings previously mentioned, and as it has ever been a style for Eastern lands it lends itself readily to a treatment designed to obviate the discomforts of a very trying climate.

The building is being erected on the peninsula formed by the junction of the White and Blue Niles. The part to be proceeded with at present contains the entrance hall (a room of noble proportions), the economic museums, and a masonic temple, the interior of the latter being modelled on one of the ancient temples of Egypt. The whole scheme, which it is hoped to carry out eventually, will comprise a large hall in the centre of the building adjoining the entrance hall, which will be used for official receptions, levées, &c.

The frontage of the building is 352 feet, the depth 230 feet, and the tower when completed will be 150 feet high.

The walls are of hard sandstone on a plinth of granite, and will be finished externally in white plaster, the ornate details being specially executed by skilled workers.

Internally a considerable amount of marble and mosaic will be used, and a feature is to be made of the great staircase in the entrance hall. The steelwork employed in the floors and domes will be supplied by Messrs. Francis Morton, Jun., & Co., of London.

The accompanying illustration is a reproduction of the water-colour perspective hung in the Royal Academy Exhibition of 1907.

The work is being carried out by the Sûdan Public Works Department, Captain M. Ralston Kennedy, R.E., D.S.O., Director of Public Works, the designs having been prepared by the Government architect, Mr. O. Beeston Hatchard.

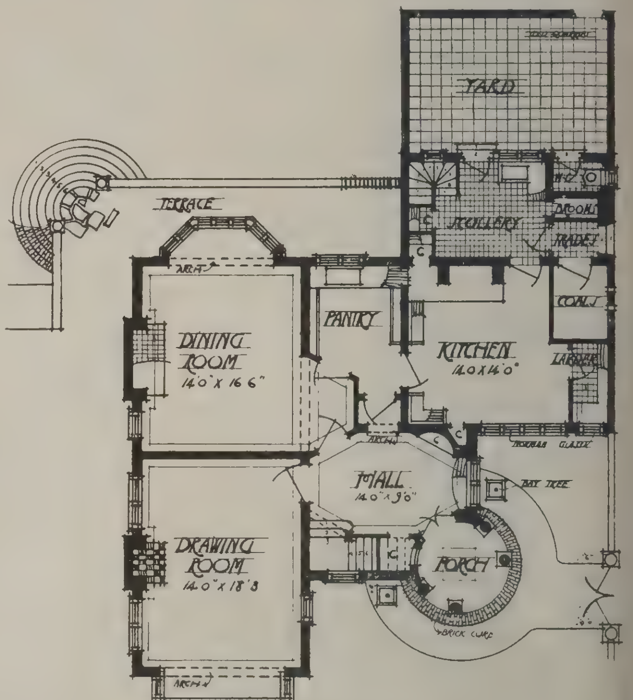
---

### THE WOOD HUT, FYLINGDALES.

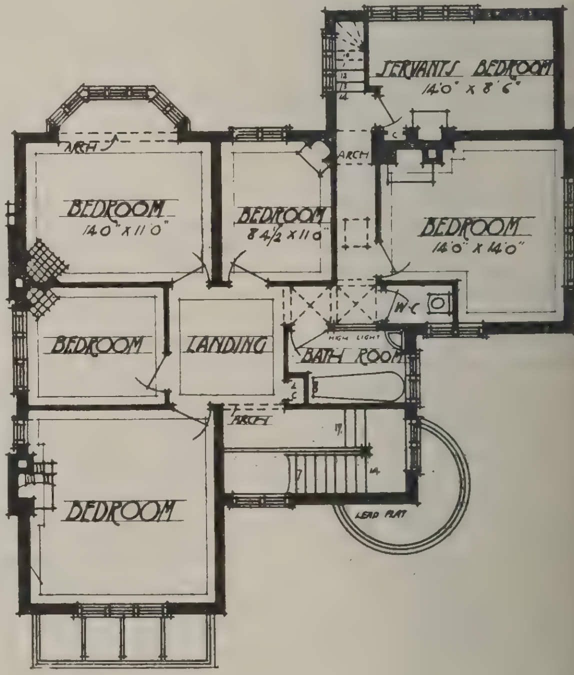
THIS house commands fine views of Robin Hood's Bay and Ravenscar. It is built externally of local common brick, covered with rough-cast. The plinth and caps to chimneys are of Staffordshire blue brick. The roof is covered with green Westmoreland slates. It is lighted by acetylene gas. The architect is Mr. H. Ascough Chapman, F.R.I.B.A., Leeds.

### HOUSE IN WALPOLE ROAD, SURBITON.

THIS house, which has lately been completed, occupies a corner site at the junction of four roads. The external wall of the servants' portion is brought out to the boundary to secure extra garden space, by doing away with the usual tradesmen's path. The walls are of Crowborough bricks, relieved by red brick and tile dressings to the windows and sills, and tile work in subdued panels introduced to relieve the brickwork. The window-frames have wooden projecting pins and are painted white; iron casements are used throughout where lights are made to open, the glass being divided up with broad leads in large divisions. The eaves, brackets, and iron casements are painted dull black, and the down pipes green. The hall is panelled and painted white, with an oak entrance door. The house is planned with a view to simplicity of arrangement. Mr. A. Jessop Hardwick, F.R.I.B.A., of Kingston-on-Thames, is the architect for this and several other houses on the estate. The contractors are Messrs. Limpus & Sons, of Norbiton. Messrs. George Wragge, Ltd., supplied the iron casements and fittings.



Ground Floor Plan



First Floor Plan.

## THE SOCIETY OF ARCHITECTS.

At the meeting of the Society of Architects held April 14 the following paper on "Constructional Steelwork," by Mr. S. Bylander, was read:—

The preparation of the plans for a building where the skeleton consists of steelwork as compared with a building where the loads are carried on walls or piers differs considerably.

I intend in this lecture to deal with the general principle of steel construction as far as it may interest the architect, and will not extensively go into the question of strictly theoretical methods for the calculations of the various members in a structure.

Steel is becoming a more and more important material in building construction. As the sizes of the buildings are increased and fireproof construction adopted, steel construction can be used with advantage. Heavy brick walls are substituted with steel stanchions, and rolled-steel beams are used instead of wooden joists, thereby saving rentable space, and by the use of fireproof floors the danger of ruinous fire materially reduced.

When steelwork constitutes the skeleton of the structure, it is obvious that the application of this material should be given careful attention. The architect must therefore make himself well acquainted with the principles of steel construction, or be in frequent consultation with an engineer competent in steelwork design. It is entirely wrong to prepare the final architectural design independent of the steel construction, and ask a contractor or engineer to design steelwork to suit the lay-out of the different floors.

Steel should be employed to its greatest advantage, and not merely as a substitute for brick and stone, as is often the case; for instance, where large rooms are required in the lower storeys while in the upper storeys are placed heavy division walls and brick stacks, and where positions of the columns vary in the different storeys. Economy is after all the essential thing to aim at, consistent, of course, with suitable planning and good architecture. The object of the design should be to obtain the best result for the minimum amount of money, and this can only be obtained when the different building materials are employed to their greatest advantages. It is obvious that the steelwork, brickwork and stonework must be designed simultaneously in order that no material should be wasted. The amended London Building Act of 1909 will give guidance to the architect and engineer, and insure uniformity in specifications and designs and undoubtedly prove of great advantage to the quality of construction generally.

Building regulations will not, in my opinion, retard the use of any satisfactory material provided restrictions are made for all materials and all treated on a fair basis, and I hope before long the necessary additions to the present Act will be made covering other classes of materials as well as steelwork. The advantages promised in the Act of 1909 will, however, not be complete until all buildings are treated on the same basis. At present there are no regulations for buildings constructed in accordance with the old Act, while stresses and loads are definitely specified for steel-framed buildings. The first consideration the designer has to take into account is the factor of safety and the loads which should be used in the calculations for the different members. One sometimes hears very strange opinions about the expression "factor of safety." If a specification requires that the steelwork shall be designed for a factor of safety of four, this does not necessarily mean that every member is four times as strong as that required to carry the specified load. Often a structure cannot carry more than twice the specified load on account of imperfect loading, material and workmanship, although it is designed for a factor of safety of four. The factor of safety is intended to cover unknown quantities which are not considered in the calculations. Good practice is to use a safe stress for steel equal to one-quarter of the ultimate strength of the material, or seven and a half tons per square inch if the ultimate strength of the material is thirty tons per square inch. As the elastic limit of medium steel is about fifteen tons per square inch, the actual factor of safety will be two. The construction of the steelwork must be adapted to suit the particular class of building for which it is required.

Buildings may be classified as follows:—Apartment houses, hotel, office buildings, public buildings, warehouses, factories. The general lay-out of steelwork for a building is primarily dependent upon the size of rooms and type of floor construction; secondly, upon loads to be carried and requirements as to decorations. The spacing of columns should be uniform if possible in order to permit repetition of sections and details.

The actual live load is not used in the calculations, but the corresponding dead load, which would cause the same stress in the steel as the actual live load.

This dead load is usually referred to as "superimposed load," and varies from 70 lb. to 120 lb. per square foot for apartment houses, hotels, and office buildings, and from 150 lb. to 400 lb. per square foot for warehouses and factories. To the above loads should be added the weight of the floor itself (including steel girders and beams), which is about 100 lb. per square foot for an average concrete floor. The dead load of floor must be carefully calculated in each particular case.

Steel may be used in a building for the following reasons:—(1) By necessity; (2) for economy; (3) for fireproofing.

Steel may have to be used in buildings where the design will not permit of the use of only brick and stone work on account of large rooms, great loads, architectural features, or planning requirements. It is used by reason of economy where steel is found to be cheaper than other material, or where the floor space saved by using steel columns instead of brick wall or piers will more than compensate for the extra cost of steel compared with the cost of brick. Steel beams and concrete is substituted for wooden joist floors and roofs in order to obtain a more fireproof construction, often to a considerable increase in the first cost of the building. However, the fireproof building may be more profitable to the owner than the old wooden construction when the reduced insurance premiums and the increased rigidity and stability are taken into consideration. No doubt fireproof construction will soon be adopted generally for large towns, and I will, therefore, in this paper only deal with that kind of construction.

In addition to the before-mentioned reasons for using steel in buildings there are others more or less important, according to conditions or circumstances:—

1. Rapidity of construction.
2. Possibility of changing the arrangement of rooms after the carcase of the building is completed.
3. Increased stability and rigidity; uniform distribution of loads on foundations to prevent unequal settlement.

Rapidity of construction is generally a question of economy. By speedy completion of the building, interest on the capital is saved. Possibility of changing the arrangement of rooms saves cutting away brick walls and putting in steel girders to suit the client's requirements. Such alterations of rooms may in many cases increase the rateable value of the building. A steel-framed building where steel is properly covered with protective material is, I believe, the most durable fireproof building that can be produced at reasonable cost.

Let us compare the setting out and construction of a brick building and a steel-frame building.

The setting out of a brick building need not be very accurate as to dimensions. The builders can set out the walls and foundations to the architect's plans and elevation drawn correct to scale, but not necessarily dimensioned. The accurate dimensions of the site are often not ascertained before the old building is taken down and the builder is ready to start work building the walls. A little variation between the dimensions sealed from the drawings and the actual dimensions of the site will not present any great difficulties or cause delay or additional cost. The dimensions can simply be agreed upon between the builder's foreman and the architect's representative on the site. It is neither necessary to have particulars of details when starting the work, as cutting away of little brickwork is not accompanied by any great difficulty should it be found at a later date that some alterations were necessary on account of some of the detail drawings not being ready when the work was commenced. In the case of a steel structure, however, it is most essential that the drawings are completely worked out beforehand and all details made. Ventilation, heating, drainage, lighting arrangements, &c., should be set out beforehand, and the general lay-out and steel plans made to suit the different requirements.

Economy is the essential thing to aim at, and generally speaking steel is being used in buildings because it admits of cheaper construction than other materials and at the same time ensures a reliable structure. By the use of steel the rental floor space is increased considerably; it also permits the use of large spans and less pillars, thereby enabling the future tenants to arrange the rooms according to their requirements. Buildings can be quickly erected and completed, thus saving interest on capital. In order to obtain true economy, however, it is necessary that the planning and designing, and also the method of carrying out the work, should be systematical and in accord with the general principles which I will deal with hereunder.

The steelwork plans should be ready several months before work can be started on site to allow for the time required for the manufacture of the steelwork at the mills; also it should be borne in mind that the steel can be obtained at a smaller cost if ample time is allowed for the steel contractor. It is advisable to order the full quantity of each section in one lot, and get the pieces cut to exact lengths at the mills. Considerable waste occurs if the shop has to draw material from stock. To take material from stock should only be permitted when very quick deliveries are absolutely essential. Generally speaking, complete dimensioned shop drawings should be made in the office in preference to setting out the rivets, connections and details by workmen in the shop. It is, of course, necessary for the engineer in charge of making the detail drawings that he must have a well-trained staff of draughtsmen who are thoroughly familiar with shop work, as the draughtsmen are called upon to do such work as the template worker would otherwise do according to the old practice. Positions of every rivet should be shown on the detail drawings, and nothing should be left to the judgment of the workmen in the shops. More reliance can be placed upon drawings which have been checked than upon setting out in the shop, which setting out is not usually checked.

Another advantage of having complete shop drawings is that every piece can be inspected and compared with the detail drawing, and errors in shop work can more easily be detected than if the work is set out in the shop without shop drawings. Every piece can be made complete to the detail drawing without fitting the different pieces together, and still they must fit perfectly when erected. The essential thing to remember in steel construction is that there should not be any alterations of the steelwork on the site.

It is a very serious proposition to make alterations to the steel design during progress of manufacture, and still more during erection. Not only will it incur delay and additional cost, but also less satisfactory work. Alteration work cannot as a rule be so well made as is possible if the original design was carried out. Records are difficult to keep, and inspection is unreliable. If all drawings are properly worked out and completed before work is started, the possibility of alterations is materially reduced. We will now follow the progress of manufacture of the steel from the date the steelwork drawings are ready and handed to the steel contractor.

The first thing the contractor has to do is to issue orders for rolling of the material. An inspector will be appointed by the architect or engineer to inspect the quality of material at the place of manufacture. The inspector will be at the mills when the material is rolled. He will be present when the chemical and physical tests are made, and make records of the results of the tests, and order additional tests to be made if the material does not run evenly. The inspector will reject and order such material to be removed which will not meet the requirements of the specification, and stamp and approve such which is satisfactory.

The approved rolled material is stamped with the inspector's mark of approval of quality of material. Any piece coming from the rolls is stamped with the blow or melt number, and this number is referred to on the test-sheet reports. The material in one and the same blow is usually the same, as great care should always be taken to have the melted metal well mixed before it is put into the ingots. Every piece is also marked with an identification number given on the detail drawings. This number is used for reference when consulting the drawings in the shop or when locating in which place the piece is to be erected on site. After being rolled and straightened the material is placed in the stockyard until required in the shop. As a rule the material cannot be rolled in the order it is required in the shop, but in such order as the rolls go in according to the rolling programme for the rolling mill. Weeks and often months may elapse before same section is rolled again. It is often, therefore, advisable to roll the beams for the roof at the same time as for the lower floors when same section is used. In the shop, however, the material is usually fabricated in the order as it is required on the site. The inspector is kept well informed as to the dates of rolling and manufacture, so that he can be present and inspect as required and as the work proceeds.

From the stockyard the material is brought to the working shop, and skilled workmen mark on the position of the holes, lines of cutting, &c., on the steel pieces direct with or without template. The number of the shop drawing and number of job is often painted on the piece before it leaves the working shop in order to assist the checker and inspector. Therefrom the marked material is brought to the drilling shop. In the case of built-up sections, as, for instance, a column composed of angles and plates, all the angles and plates are not marked and drilled separately, but only a few holes are first drilled; the different plates and angles are then bolted temporarily together and the whole thickness of metal is drilled through at the same time, thus saving time and assuring greater accuracy and all holes being true. Several drilling machines can be used for one member at the same time. Burrs are removed after the drilling, and the ready-drilled piece is sent to the assembly shop. Some pieces are milled or ground to fit; the different pieces forming one member are temporarily bolted together and sent to the rivetting shop. During assembly the detail drawings are consulted and dimensions checked. When the pieces are rivetted they are sent to the milling machines if any part has to be machined, such as ends of columns or bearing plates on girders. Before assembling some surfaces must be painted, as after assembly they are inacessible. Open holes which are to be filled with rivets in the field are marked by the assembler so that such holes shall not be filled in by rivets in the shop. Holes in small pieces and brackets are generally punched and rimered after assembling, but main members are drilled. Before the finished steelwork is painted it is examined by the inspector and all dimensions are checked. Ends of compression members which are machined must be examined, and it is ascertained if the ends are square to the axis of the member. If all measurements are correct and the workmanship is satisfactory, the inspector stamps the piece with his shop inspection mark.

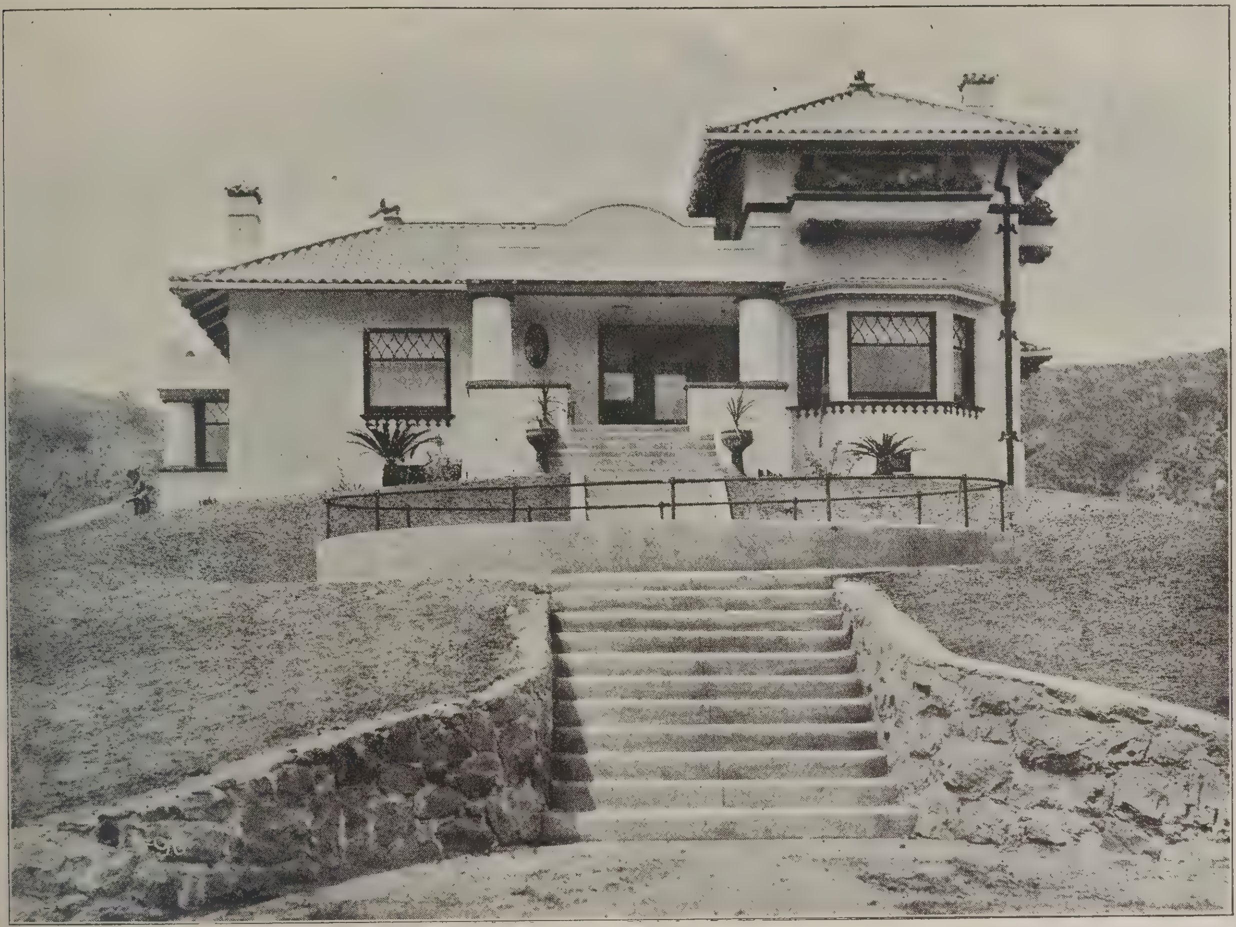
The material will now receive its shop coat of paint or oil before shipment.

Any piece or bundle of pieces must not be shipped unless having the following marks applied:—(1) Blow or melt number; (2) identification number; (3) mark of mill inspection; (4) mark of shop inspection; (5) shipping mark.

When painting the material before shipment all marks made in the shop are extinguished (except those above stated). A small circle or triangle with white paint is made around the marks previously indented by stamps. The shipping mark and the identification mark is applied by paint in large and distinct letters or figures. Sometimes pieces for different parts of the building are painted in different colours, or a spot or ring of a distinguishing colour is applied to facilitate selection of the material at erection. If the above described methods are used little or no difficulties will arise at erection, and no risk is taken of material arriving at the site incorrect. The inspector makes remarks on his copy of the shop drawing when approving any piece at the time when his stamp of approval is applied. He has also to see that the material is shipped in the right order as required on the site. After completing inspection for each lot he makes up a proper list of material. The works do likewise, and the two lists are compared and checked. Several days before a shipment is made the shipping statement is written out in detail, and instructions are issued for shipment or transport of the material to the site. As the material passes out of the works it is weighed, and the inspector records the weight and counts the pieces weighed and sees if they are in agreement with the advice of shipment. The weighing machine should be checked at regular intervals by an independent party to assure that it registers the correct weight. The shipping statement, advice and invoice is now sent to the contractor as the material is shipped if the contractor only buys the material but executes his own erection.

According to requirements the steel is transported on van, railway car or barge, or by ship. Considerable damage to the material may occur during transport if proper precautions are not taken against careless handling when loading or unloading, so that small pieces are not bent or crushed by large or heavy pieces placed on top. Delay, mixing up of the different consignments, is a source of great inconvenience and prevents speedy and methodical erection.

The material is usually brought alongside the building on vans, and is hoisted by the erection cranes to a place on the building near to where it is to be erected, or sometimes directly placed in its final place. The different pieces are first temporarily bolted together and afterwards set to correct level and made plumb, after which all holes are filled with rivets. The steelwork is painted immediately after erection, and if more than one field coat is applied different colours of paint should be used. Floors and walls are built and fireproofing applied. The erection of the steelwork should be two storeys ahead of the floors. The floors should be put in one storey ahead of the walls as may be convenient. In cases where walls partly support the floors or girders the



HOUSE NO 1.

walls must, of course, be built the same time as the steel is erected. In order to prevent accidents to workmen below, the floors should be put in close to the steel erection, or the floor framing should be boarded over to prevent any tools or material falling on the men below. At the same time the different trades should be kept separate so as not to interfere with the rapid progress of the work. When the carcase is complete and the roof is on, heating, ventilation, &c., are installed, partitions built and joinery and finishing completed. In the carrying out of a large job it is not always satisfactory to put the responsibility on to different parties for designing, detailing, manufacture, inspection and erection, as no one particular system is followed.

In my opinion one man should be responsible for the systematic carrying out of the work.

The engineer responsible should bear in mind that no work is satisfactory unless the following requirements are fulfilled:—(1) Economic and safe design; (2) good material and workmanship; (3) correct work as to dimensions; (4) prompt deliveries; (5) proper erection.

Satisfactory design can only be obtained by making a special study of the conditions and prepare accurate drawings and calculations. Good material can be assured by tests and inspection. Correct work can be obtained by systematic working and supervision. Prompt delivery is dependent on each portion of the work being ready in schedule time. Careful watching of each department is necessary, particularly at the early stages of the work. It is wrong to suppose that after a good design and specification are made the responsible engineer's work is done. A good specification is of equal little use without inspection as a clever design without proper shop drawings. The practice of taking a few test pieces from a job and sending them to a testing firm is not reliable, and is more deceiving than convincing. It may be that the test piece selected will show good results, while material in other parts of the structure is bad. The material should be tested at the mills during the progress of manufacture.

As I have previously said, satisfactory results can be obtained by the use of steel for buildings if the architect and engineer work hand in hand and the work is carried out systematically in all details.

When preparing plans and calculations for a building the work should proceed in the following order:—

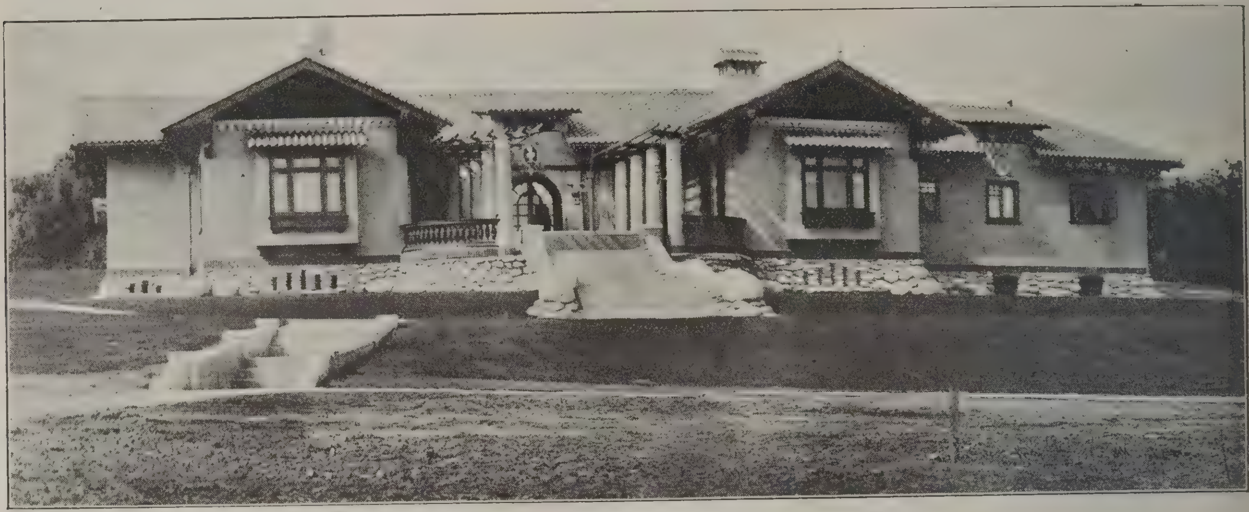
1. The specification drawn up for stresses and loads.
2. The principal members for the structure to be calculated, and it should be ascertained whether the setting out of the columns and girders is economical and reasonable, and, if necessary, such modifications made as will improve the construction.
3. When the architectural plans are completed the engineer will calculate all the loads of floors, walls, &c., make stress sheets for each member, after which a set of plans is made and the required sizes given. The sizes of the steelwork thus obtained are drawn to scale on the architectural plans, and, where necessary, the engineer will modify the sections to suit architectural requirements; after which the architectural plans are practically completed, the shop drawings made, and the contract placed with the steelwork contractor.

## REINFORCED CONCRETE FOR HOMES.

By A CALIFORNIAN.

HAVING long passed the experimental stage, the employment of reinforced concrete as the important building material of the near future is assured, and it will supersede all others not only for substantiality and durability, but also from a sanitary point of view; and the fact that it has proved its worth on many occasions as an admirable fire-resistant gives it a claim to the fullest consideration, and places it in a class that is entirely its own. Architects and builders have not been slow to recognise its merits, and that it permits of more rapid construction than almost any other material.

Concrete construction is undoubtedly to be the substitute in house construction when the scarcity of lumber (so much heard of) demands an adequate building material to replace that commodity, and thus an improvement will come into vogue that will be of permanent value, inasmuch as the cost of the building is very little more, and the additional investment will total out less than the insurance premium on the lumber building, the work is made permanent, and insurance can very well be eliminated, the inflammable material being reduced to a minimum and the risk easily handled. When these facts are grasped and recognised by the home builder concrete construction will have the pre-

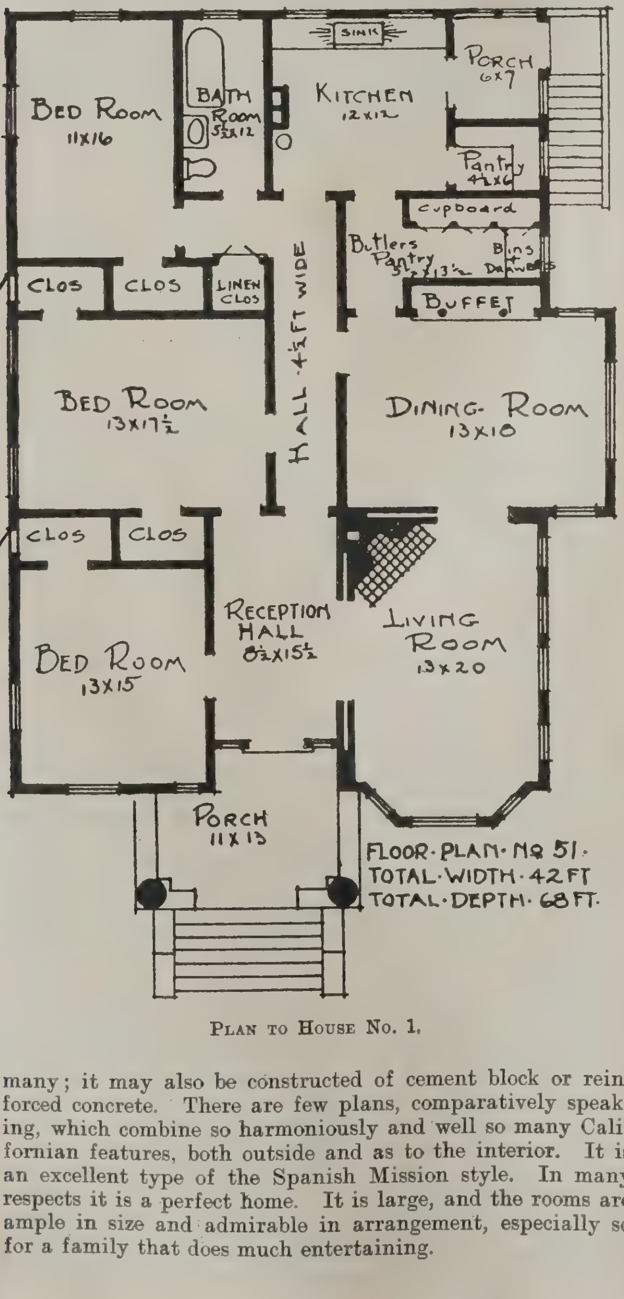


HOUSE NO. 2.

ference, as the material will readily lend itself to the artistic conception, as well as being durable.

The illustrations herewith will furnish some idea of the artistic capabilities of the material, and the floor plans some good ideas to work on.

No. 1.—This cement-finished bungalow of seven rooms, exclusive of tower and bath, is a home that will appeal to many; it may also be constructed of cement block or reinforced concrete. There are few plans, comparatively speaking, which combine so harmoniously and well so many Californian features, both outside and as to the interior. It is an excellent type of the Spanish Mission style. In many respects it is a perfect home. It is large, and the rooms are ample in size and admirable in arrangement, especially so for a family that does much entertaining.

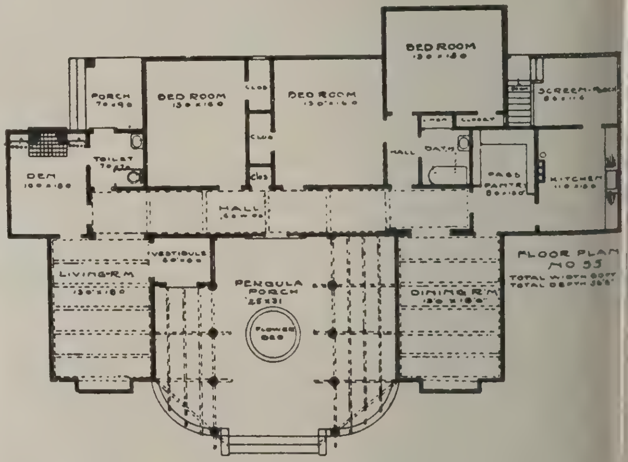


Plan to House No. 1.

The reception hall, living room and dining room are arranged *en suite*, with a floor space of nearly 700 square feet. To this a corner bedroom may be added by throwing open the connecting door. The roof may be red tile, or if it is desired to lessen the cost use metal tile, which is 50 per cent. cheaper. The flower-boxes are of cement. Hardwood floors and beam ceilings are used in the principal ground-floor rooms.

The sun room at the left, opening off the dining room, with its comfortable seats, will be appreciated by many. The tower room can be used as an open-air sleeping room, or it may be fitted with windows and used as a sleeping room or den. And here is another pleasing innovation. The rear part of the roof can easily be made into an attractive roof garden. The dimensions of this house are 43½ feet front and 44½ feet deep, exclusive of porch, nook, &c. As indicated by the illustration, this house should have a site that will set it off to advantage and lend itself to scenic effect.

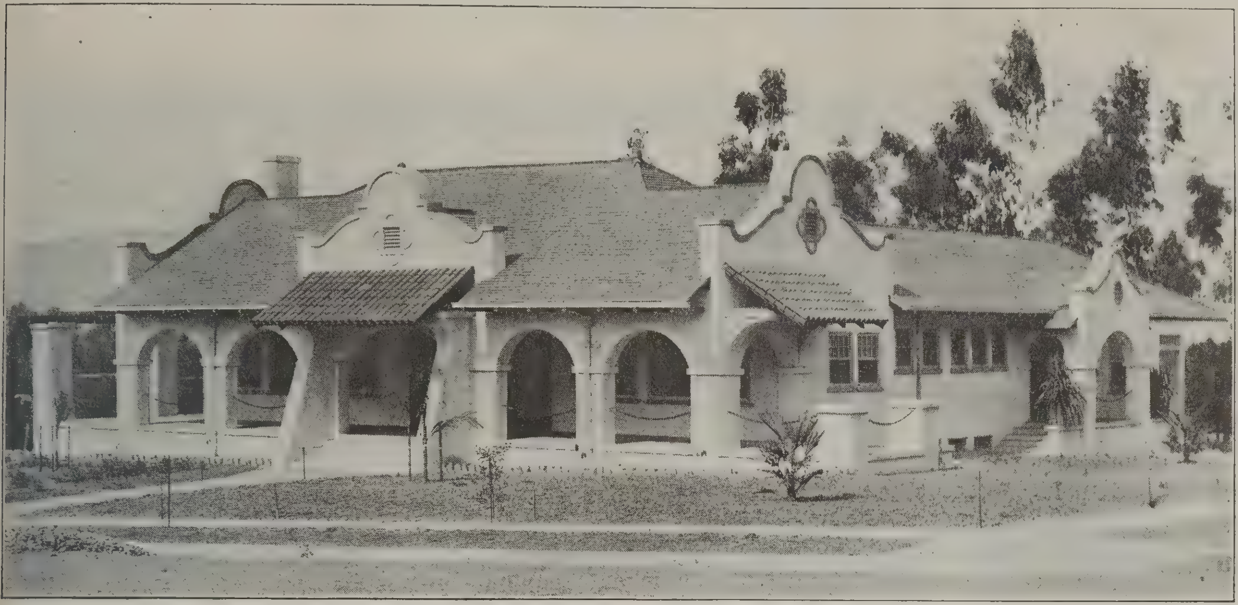
No. 2.—This design should be surrounded by spacious and well-planned grounds in order to fully develop its artistic merit, and if to this might be added the advantage of an elevated location the condition would be perfect. We have seen it, however, on a level city lot, surrounded by well-kept lawns and semi-tropical plants, and have been ready t believe it the most beautiful place in the world.



Plan to House No. 2.

The entrance is quite unique, being into an open pergol court, at the end of which is the main entrance. Directl in front is the charming feature of the house, a circula flower-bed, and a many-paned window opens into a com modious hall. The dining room and living room occupy th front entirely, and all rooms have an outside view. In th way every room in the house has almost immediate access t the outside.

The mantel is in the reception room, and is faced wit brick in two shades of brown. The living room has panelled wainscot and beamed ceiling, while the dining roo has only a deep cornice beam. Large closet space is provide and an excellent bathroom.



HOUSE NO 3.

No. 3.—This is a concrete bungalow that is well adapted o a cold climate as well as a very warm one, as the walls are well protected, affording shade and keeping the rooms dry. This house may be built on a corner lot, or would show well with plenty of space, and the floor plan can be easily arranged.

## FIRE ALARMS.

By T. E. Lander.

THE subject of my paper is the scientific detection of fire with special reference to the Leslie Walker system of automatic alarms. As a director of the Leslie Walker Company, I wish to point out the perfection of this system, but I can only hope to do so by clearly explaining the principles on which it is based. It is also my earnest wish to make no claim for our system that the company cannot substantiate. While we are naturally doing all we can to make our company a financial success, my interest in the subject of automatic fire detection goes a long way beyond my concern about getting a good return for my investment. I want to see reliable automatic fire alarms far more generally understood and used than at present, because I know what a great number of lives they will annually be the means of saving. They will also save an immense amount of property, but that, of course, is of secondary importance. If I ever come across a system that I believe to be a better one than our own, I for one will ungrudgingly wish it success.

There are three essential features of a perfect fire alarm, namely :—

1. Great sensitiveness, so that very early warning is given on the outbreak of a fire.

2. Freedom from liability to give false alarms ; and

3. Freedom from danger of being tampered with, and put out of action, either by merely inquisitive persons or by ncendiaries.

While I consider the above absolutely essential, I would add, as a fourth very desirable feature, that the system hould be such as to permit of easy and rapid testing of all ssential parts that could by any possibility be put out of order without an automatic warning being given.

As in the case of all the systems of which I have any knowledge, our alarm consists of a detector, or instrument ensitive to fluctuations of temperature, which on an outbreak of fire completes an electric circuit, and this, in turn, ings a gong or gives other warning of the outbreak. The de- ectors of the various systems are, like the brain in the human eing, what make the greatest difference between success and ailure. In fact, a good detector may very aptly be described s the brain of its particular system. I would liken our own etector to the brain of a man who stands with a thermometer in one hand and a watch in the other, and who ever for one moment thinks of anything but the relative movements of the mercury in the thermometer and the second hand of the watch, knowing that, if a fire takes place anywhere near him, the mercury will expand at a greater rate than it ever does under normal conditions.

It would not be sufficient for such a man to study the thermometer without the watch, and the production of an instrument which would properly combine the two observations was what had puzzled all inventors of automatic fire alarms until Mr. Leslie Walker produced his. It will at once be evident to you that the mere observation of degree of temperature would not be enough if you think what would happen on the contents of a waste-paper basket catching fire in the study of a private house and also a similar one in a large public hall, such, for instance, as the Library of Glasgow University. The cubic feet of air in the main hall of the University Library will, I think, be somewhere about 500,000, whereas it is a good large private room which contains one-hundredth of this quantity of air, or 5,000 cubic feet. While each waste-paper basket is burning the heat generated will be very much the same, so it is quite apparent that if anything approaching the same speedy warning is wished for in two such cases, it will be necessary to use instruments of entirely different degrees of sensitiveness. To be of any real use, an automatic alarm must be such as can be depended on to give warning in the very earliest stages of a fire ; the sensitiveness of the instrument must be such as to suit the particular room in which it is installed, and, as I will endeavour to prove to you later on, the necessary degrees of sensitiveness vary to a far greater extent than would at first be imagined and cannot be estimated by guess-work. I think it is now admitted by every disinterested person who has studied the subject, that fixed temperature alarms are of no practical use, and that no system can be reliable unless it compensates for, or takes no apparent notice of, ordinary fluctuations of temperature, but which gives almost instant warning when an abnormally fast rise of temperature takes place. Even such an instrument as this must give warning if a dangerously high degree of temperature is reached slowly, as in the case of a smouldering fire which has not yet broken into flame. The Leslie Walker instrument fulfils both these conditions.

The earliest automatic alarm of which I have learned had for its detector an ordinary mercury thermometer with two wires passed through and fused into the glass, the end of one permanently in the mercury, and the end of the other at some part of the tube which the mercury would never reach under normal conditions, but which it would reach after an outbreak of fire, and this, of course, was a purely fixed temperature alarm. The wires were connected with an electric battery and a gong in such a way that the gong would be sounded the moment the mercury completed the electric circuit by coming in contact with the upper wire. The battery, wires and gong are still used in most fire alarm systems, the detector being the part that had to be greatly changed.

I purposely use the word detector throughout my paper instead of thermostat, which is generally employed, because I consider the latter only suitable for use in the case of a fixed temperature alarm.

While the fixed temperature alarm which I have just described might have proved to a certain extent serviceable in buildings which contained small rooms all of one size, in each of which the artificial heating was the same, and each

## MODERN EUROPEAN ARCHITECTURE.

SHOP FRONT IN BUDA-PEST. M. Bela Lajta, Architect.

of which was equally exposed to the sun, it would be of practically no use elsewhere, and there are hardly any such buildings as that described.

I have not been able to discover any disinterested literature on the subject, and I am unable to say what was the first step in advance of the purely fixed temperature alarm, of which there have been several, but quite a number of very ingenious contrivances have been invented with the object of overcoming the objection to it, and of providing an instrument which would compensate for ordinary fluctuations of temperature, and only give warning when the rise of temperature takes place at too great a rate. While some of them compensate to a certain extent, up to the present Mr. Leslie Walker's detector is, so far as I have been able to learn, the only one which perfectly fulfils this requirement. As some of these inventions are still in use and capable of providing more or less efficient protection if their limitations are recognised, and they are only used in situations for which they are suited, I cannot compare the systems by name, or as fully as a disinterested person would be justified in doing, nor have I any wish to disparage them. I feel that there is plenty of room for us all, and that the more fires of which there is timely warning given by any of the various systems, the more will the insurance companies and the general public realise their value, study their relative merits and protect their lives and property by installing one or other of them. My desire is that this recognition of their value, and anxiety to make use of the best system, should spread rapidly; I am not afraid of the result so far as our own company is concerned, if we can only get the principles of the system intelligently considered by persons who are really desirous of securing such great protection as it provides.

This brings me to the point at which I must explain the principles of our system and prove to you that I have claimed nothing for it but what we are able to substantiate.

I mentioned, as the first qualification of a good fire alarm, great sensitiveness, so that early warning is given on the outbreak of fire. This, as I have stated, can only be perfectly brought about by a detector which absolutely compensates for all ordinary fluctuations of temperature. In our system the warning is just as rapidly given if a fire breaks out when the temperature of the air is below zero as it would on a hot summer day. In the detector which does not fully compensate for all normal fluctuations, on a cold day there will be a greater gap between the points that have to be connected to complete the electric circuit than there will be on a hot day, and, therefore, a longer period between the outbreak of a fire and the sounding of the warning gong. When one considers how easily a single person can usually extinguish a fire if it is caught in its early stages, and what difficulty there is in putting it out when it has got a good hold, the importance of early warning is very apparent. On a hot day the gap in a non-compensating detector will be less than on a cold day and the danger of false alarm increased.

To work without trouble with this great degree of sensitiveness, the detector must be such that it will not be affected by any vibration to which it is likely to be subjected. It is very evident that in a detector which is liable to be affected by vibration, the contact points must be set a certain distance apart irrespective of the size of the room and of the normal fluctuations of temperature. I will endeavour to explain how serious a defect this is, as it is not quite apparent at first sight. Take, for example, an instrument which cannot be depended on to give no false alarm unless set in such a way that it will not give warning of fire until the temperature rises at the rate of 25° Fahr. per minute or more. This may be all right in a small room, but what would be the result in a hall such as that which I have already referred to, the Library of the Glasgow University? In this hall, which is protected by our system, as are the Museum, the rest of the Library, and certain other parts of the University, the instruments which we have installed at some of the highest points, about sixty feet from the floor, will give warning of fire if the temperature rises more quickly than $\frac{1}{4}$° Fahr. per minute. Before deciding to use instruments of this degree of sensitiveness we made tests in a way that I will describe, and found that, with the doors and windows closed, the heating apparatus in the room could never raise the temperature of the air at a greater rate than 1-40° Fahr. per minute. This does not mean that the heating apparatus is not powerful enough to heat the room properly, but merely that, owing to the enormous volume o air to be warmed, the process is necessarily slow. In such room it would be useless to instal detectors which would no act at a lower rate of rise than 25° Fahr. per minute. I believe such detectors would, under the conditions described only act as fixed temperature alarms, and only give warnin after the fire had either become a very fierce one, or had bee burning for a considerable time. At a demonstratio which we gave after the University installation was completed, we lighted two copies of the *Glasgow Herald* unde the highest portion of this room and the warning gon sounded in less than half a minute. I firmly believe tha there is no other existing detector which would give anythin approaching this result when set for ordinary working conditions, and not adjusted immediately before the demonstration. In spite of their extreme sensitiveness, these instruments, which have now been installed fully a year, hav never given a false alarm.

Realising the importance of it, Mr. Walker has ver carefully studied how to ensure that detectors of proper degrees of sensitiveness are used in each situation. He wante each detector to be as sensitive as possible, to ensure speed warning in case of an outbreak of fire, but at the sam time it had also to compensate for all the normal fluctuatio of temperature to which it was likely to be subjected. T take two extreme examples, a detector for use in the dryi room of a laundry would require to compensate much mo rapidly than one to be used in a building which is nev heated artificially. Mr. Walker found that the fluctuatio of temperature varied so greatly in rooms of different size and used for different purposes, and it was so impossible arrive at a correct estimate of the rapidity of the fluctu tions by guess-work, that he invented an instrument for th

[From *A Haz.*

SHOP FRONT IN BUDA-PEST. M. Bela Lajta, Architect.

special purpose. If we are in any doubt as to the fluctuations of temperature in a particular room, we leave one of these instruments in it for two days, or longer if we think it necessary. At the end of this time the instrument shows, not the maximum temperature reached, but the maximum rate at which the temperature rose at any one time, which, of course, is what we are concerned to know. Mr. Walker calls this instrument a ratiometer. Where there is any doubt as to the maximum normal temperature it is ascertained by means of the ordinary "maximum thermometer."

Having satisfied ourselves as to the maximum rate of rise of temperature in any particular room under normal conditions, we are in a position to say how sensitive an instrument we may instal without fear of its giving false alarm, and the great importance of this does not, I think, require any further demonstration than I have already given. But this knowledge would be of little use if our detectors could not be made to exactly suit the requirements of each situation. Fortunately, after an immense amount of experimenting we are able to make them of any degree of sensitiveness from 1·5° Fahr. per minute up to, if necessary, 50° Fahr. or higher.

The degree of sensitiveness has to be arranged for while the instrument is being made, and this is a most important point, as it ensures that the sensitiveness of the detector can never be altered after it is once installed; to do this one would require to replace the detector by an entirely new one. Before any detector is put into use, its degree of sensitiveness, as represented by the rate of compensation, is marked on it after being ascertained by means of another instrument which was invented by Mr. Walker, and which he calls an incrementometer. I am particularly anxious you should bear in mind that, when once installed, no one can alter the sensitiveness of our instruments, as this is a very great element of safety.

(*To be concluded.*)

## ST. GILES'S CHURCH, SHELDON, WARWS.

ST. GILES'S CHURCH is situated in the little rural village of Sheldon, in the county of Warwickshire. The greater portion of the church is of the Decorated period, but the tower s of later date, and the old timber roof in the nave still emains.

The church, an edifice of red sandstone, was built in 291 A.D., and was founded by Roger de Northburgh, then Bishop of the Diocese of Coventry, and the Canons of Kenilworth, and it is very probable was built by the monks and aymen of Maxstoke Abbey, which is close in the vicinity. The plan of the church consists of a nave 67 feet by 20 feet 6 inches wide, at the west end of which is a tower 16 feet square. At the east end is the chancel 29 feet by 17 feet 6 inches wide, with a low side window and Early English piscina. On the north side of the nave there stands another chapel of fourteenth century date, 44 feet 6 inches long and 13 feet wide, on the site of an earlier one which was the "chantrie chapel dedicated to our Ladie," and built by John de Peto in the twelfth century. Inserted in the internal wall of the tower is a stone slab bearing the following inscription:—

"In Dei noie . . . lord MCCCCLXI ys stepel was begon ye masson had tho and forti pond iiijs and viijd for makying of the sepel."

The window illustrated last week is one of several good examples of the Decorated period in the church, and is a fine specimen of geometrical tracery. The panels are however of later date, probably the carving being added when the church was being restored in 1867.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* (New York) has a not very interesting number this week, the illustrations being of the Union Boat Club House, Boston, Mass.; the Wholesale Fish Market, New York; two wooden houses at Montclair, N.J., by Mr. Frank E. Wallis, and some students' work from the Society of Beaux-Arts Architects.

*La Construction Moderne* (Paris). The Farnese Palace at Rome, having just now a specially topical interest in France, our contemporary gives some detail illustrations of parts of this notable building from photographs recently and specially taken.

*Arquitectura y Construccion* (Barcelona) devotes special attention to the work of the lately deceased architect, D. Juan Torres y Guardiola, with illustrations of some of his more strictly engineering work. The principal other example of modern Spanish architecture illustrated is the new Spanish Theatre at Barcelona, of which D. Melchor Vinals Munoz is the architect.

*Construction* (Toronto) has some good photographic illustrations of the Ca d'Oro and Contarini-Fasan Palaces at Venice, and an interesting article on Architectural Education in Toronto. A full account and many illustrations and diagrams are given of the construction of the movable dam at St. Andrew's Rapids, Manitoba. The New Theatre at New York, by Messrs. Carrere & Hastings, is fully illustrated and described.

The *Architectural Record* (New York) deals with some examples of utilitarian or business architecture in Chicago, with the work of Rudolph Zahn, a German architect, and with other examples of modern work in Germany.

*Engineering Record* (New York) has an account of the foundations and steel-frame structure of the Bryant Building, New York, an erection of thirty storeys, rising to a height of 338 feet above the street.

## Correspondence

*[The Editor will not be responsible for the opinions expressed by Correspondents.]*

### Modern Indo-European Architecture.

Sir,—I should like to make a few remarks respecting Mr. Havell's criticism of Modern Indo-European architecture in your issue of February 25 (Supplement, p. 14), and the adoption of his so-called Hindu architecture, which he so strongly advocates.

As an architect practising in Madras since 1883, this subject has from my advent here engaged my earnest attention, and it seems to me that in the earnest desire to advance Indian art, the advocates of this school have entirely lost sight of a few points which require deep and wide consideration. These are as follows:—

1. Is archæology to be entirely ignored and rendered a dead science or art?

2. Are we to ignore our nationality as the ruling race, and to leave no trace whatever of our sojourn here?

3. Is architecture a history or not, in brick or stone, of a nation?

4. Is not the so-called Indo-Saracenic or Moghul architecture as foreign in this Dravidian country as the much despised Classic or Gothic of the West?

5. If we are to adopt Indian architecture for the sole advancement of Indian art, what architecture are we to adopt in this Presidency, wherein Moghul art is as foreign to the natives as the much despised European styles?

I will take the above questions in order.

1. Archæology, I think, demands our regard, coupled as it has always been with architecture from the earliest ages in all countries of the world. I will first ask, Is it in accordance with the first principles of art and architecture to commemorate the reign of our late illustrious Queen-Empress Victoria by erecting buildings to her memory in a style which is false to archæology and false to future history?

Can you truthfully commemorate and hand down to future archæologists a building built as a memorial of the Victorian rule in India, when it falsely represents the Akbarian age of Moghul rule. Is this truth? No. Is it archæology? No. Then I say it is not architecture. It is imitation, falsity, deception, and against the first principles of true art.

Either we must go on building these falsehoods, and rendering archæology a dead letter, or at once be truthful to ourselves, and like the Romans and Grecians of old, adopt our national styles, and continue to let archæology live, and architecture be as it always has been, a history of a nation in brick or stone.

2. Are we to ignore our nationality as the ruling race, and to leave no trace of our sojourn here? To answer this I refer all to history. Did the Romans leave no trace of their sojourn in the countries they governed? Are there not decided Grecian traces in Northern India? Did Alexander try to hide his face or change his vesture, so as to practise a studied deception on the long-after coming Anglo-Saxons? Certainly not.

3. Is architecture, or is it not, a history in brick or stone of a nation, and has it not always been so? If it is not a history of a nation in brick or stone, then assuredly it is never architecture, but merely decorative engineering or building.

4. The so-called Modern Indo-Saracenic or Moghul architecture of the Madras Government buildings is far more foreign to the Dravidian than the despised Classic or Gothic. It is foreign, the foreign architecture of the Mahommedan conquerors, and anything but indigenous to the Madras Presidency.

5. This is answered by the adoption of Dravidian architecture. Let us then at least be truthful, and erect and crown our Government buildings with many-storeyed Gopurams, covered all over with repetitions of miniature pediments of Classic character as in Hindu architecture, and depicting not Hindu mythology, but the chief events in the Victorian age. What a noble and inspiring architecture we might attain to, something more novel and extraordinary than beautiful.

I have no leaning towards any particular style; architecture, if good, is architecture, no matter what be the style. If a suitable and adaptable style is sought after for this country of bright sunshine, deluges of rain, and flat roofed cooling areas, after a residency of twenty-seven years I would advocate an oriental treatment of Perpendicular Gothic. This may astonish many, but it would be national and true to the ruling race, and leave some trace behind of an English rule, for at present we leave naught behind, lest it be empty and broken soda water bottles and kerosine oil tins. Its almost flat roofing, its four-centred expanding-span arches, its fan vaulting (so easily executed here), its deep buttresses affording shade and support to balconied verandahs, its small deep recessed windows, make it, if orientally treated, the most elastic style suitable to a tropical climate. It could not deceive the future archæologist, if orientalised, any more than does the present House of Parliament buildings. Its nationality is unique. It lends its plan to any form, and with its buttresses pierced for verandahs it does away with that terrible "bird-cage" appearance which the present Government buildings all possess. Any amount of ornament can be lavished on it, it lends itself to breadth and repose, and above all to a picturesque skyline and artistic massing. The great fault in the modern Indo-Saracenic is its structural untruthfulness and its excessive small detail and profuseness of useless ornamentation. The modern Indo-Saracenic buildings of Madras are only characteristic externally, but internally they are a mixture of modern Minton tile work and copied Moghul art, jumbled up of parts of East and West, and "never the twain shall meet." We have our duty to archæology to attend to as well as to architecture, and we must not sacrifice the architecture of our buildings to the advancement of native art. Let us at least be truthful, and not ashamed of our nationality, even in modest architecture which is to be a legacy to our descendants. Otherwise, abolish archæology entirely, abandon architecture and history, and let us go in for decorative engineering and plain building. To adapt any style to the requirements of any particular climate only requires architectural brains and a little talent, combined with a long residence in the country to understand the wants of the climate.

Sad to say, not a dozen natives in the whole of this Presidency care a fig about architecture, neither are they taught the first principles of the art, and care less about it, and until the Government teach architecture, the mother of all art, in the colleges, little or no improvement can be made in advancing indigenous art. We don't want artistic vases, paintings, mural decorations and oriental carpets and metal craftsmanship to adorn buildings that are but four plain walls with holes in them for doors and windows. The history and prosperity of a nation lies in its buildings; they are the language which speaks of its greatness, and they are the foundations of all art, for without them art is not required.

W. N. Pogson, F.R.I.B.A.

Madras: March 23, 1910.

### The Remuneration of Architects.

Sir,—Your leading article in the current issue of *The Architect* makes very interesting reading, and once again brings into prominence a matter of some concern.

But in regard to payment of members of our profession, though the percentage system has its defects, yet I do not see how it can be satisfactorily amended by substituting a scale of fees.

A painter or a sculptor may be able to forecast fairl accurately the work involved in any case, and may thus nam a definite fee, with some expectation of its proving just; no do the uncertain factors exist respecting his work such as a architect experiences by reason of (*a*) the necessary labour being effected by other hands than his own; (*b*) the unknow troubles lurking respecting soils, easements, and tiresom neighbours; and (*c*) the whims of the client not necessaril involving "extras." Consequently, the percentage system however unsatisfactory, seems better to meet the requirement of the case, dealing as it does automatically with rise or fall i expenditure.

Consider this. If, say, a church costing less than 2,000*l* commands one fixed fee, and a church of value from 2,000*l* to 3,000*l*. commands another, will not the average client objec to pay the higher fee on a 2,005*l*. church? And if the contract be for, say, 1,999*l*. 19*s*., subsequent extras to the value o 2*s*. will give rise to the unworthy suspicions to which you refer and in a more pronounced form than under the percentag system, as the "quantum meruit" in such a case would be to trifling to admit of suspicion even on the part of a clerica client.

Does the remedy consist in the client swearing that he wi not permit of any extras? One of mine tried that once, an necessary extra expenditure arising, it was borne by the complaisant contractor.—Faithfully yours,

Percy L. Marks.

## WATERPROOF BUILDING.

THAT ordinary building materials are porous we all know, and although by careful selection of brick and ne and using them in sufficient thickness we generally ceed in erecting structures that do not visibly or iceably permit the transmission of damp under normal ditions of weather, yet there are occasions on which ething more efficient is required to prevent the actual etration of water into a building.

Basements and sub-basements have to be constructed these days of high ground rents and limitation in laws of height of buildings. Riverside structures have resist the percolation of water not only through their ls but through their floors. Swimming-baths and er tanks, including lily-ponds in gardens, have to be structed.

Waterproof building in Great Britain has received less eful attention than in the United States, and much be learnt from the experience and experiments of our eagues across the Atlantic. In particular, the value oncrete as a resistant of water pressure on its surface f exceedingly dubious character, owing to an incom- le study and comprehension of its idiosyncrasy. As MARSH says, "There is no doubt that reinforced con- e standpipes have been constructed which have with- d considerable heads of water, and it is equally certain very many reinforced concrete reservoirs and tanks more or less."

What Mr. MARSH predicates of reinforced concrete ies also to concrete without reinforcement. It can be, has been, made water-tight without apparently special al, and in other cases has proved pervious. Generally king the elements that go to the making of water- f concrete are a correct proportioning of coarser and particles of the aggregate and of the matrix to ensure nce of voids, and the mixing and placing of the con- in dry and cold weather.

When really waterproof qualities in walls and floors been required, architects in this country have been to rely on asphalte or other bituminous material. may be applied either upon the surfaces or within tructure as a shield or membrane. When applied to ces these may either be external or internal surface, is, the bituminous membrane may either be between all or floor and the water, or may have the permeable between it and the water. In either event it is to injury on its exposed surface, and in the latter has also to be made capable of resisting detachment its support by water pressure.

ence has arisen the practice of forming a bituminous rane within the substance of walls by pouring the d composition in a fluid state into a hollow. In this way a thoroughly satisfactory result can be obtained, but is dependent on the homogeneous and uninterrupted continuity of the membrane. On the other hand, this method has repeatedly failed. Failure has resulted usually from one of two causes—incomplete filling of the hollow space, low melting point of the compound. The incomplete filling may be caused by mortar droppings or other obstruction in the hollow, or by the lack of sufficient fluidity in the material to ensure the run being completed before congelation. The fluidity of a bituminous composition thus used is produced by heat, and if the heat is not sufficient, or the hollow too small, the fluidity may speedily be reduced by cooling to a point of insufficiency. The hollow should never be less than three-quarters of an inch wide, and in many cases an inch is necessary. Workmen are sometimes tempted to increase the fluidity of a bituminous composition at a reduced temperature by adding tallow, oil, or other foreign material, and the compound may thus be brought to so low a melting point that the heat of the sun may so far soften it as to allow it to weep through the joints of the outer skin of the wall. Thus the continuity and efficiency of a bituminous membrane poured into a hollow space cannot be regarded as absolutely certain.

Therefore asphalte or other bituminous compound is preferably to be used as an applied coat, protected by an additional thickness of wall or floor. Care must be taken that the compound is neither hard and brittle with a high melting point, nor brought to so low a melting point for the sake of elasticity that it readily softens from the heat of the sun. Caution must also be exercised that in the adding of the protective coat injury is not caused to the waterproof membrane.

Bituminous coatings applied cold are in use for the interior surfaces of exposed walls or for the exterior of foundations not subject to water pressure. These are made up of specially selected asphaltes dissolved in carbon bi-sulphide or some kindred hydro-carbon, the proportions varying according to the use to which the same is to be put. This class of damp-proof paints is more in use in America than here.

A method of waterproofing by the use of surface washes that is of old standing in this country is SYLVESTER'S soap and alum process. In this a hot solution of soap, prepared by dissolving ¾ lb. of Castile soap in one gallon of water is first brushed over and into the surface of the brick, stone, or concrete and allowed to dry for twenty-four hours. At the end of that time a second wash, consisting of 2 oz. of alum dissolved in one gallon of water, is applied at a temperature of from 60° to 70° Fahr. The double operation is to be repeated as often as necessary, but four such coats are said to be impervious to a head of 45 feet of water. The aluminium oleates formed by the process fill the pores of the material with a water-repellent.

Several variations of this process have been employed, in some of which the alum and soap are mixed before application; whilst in others they are applied separately, sometimes the alum first, sometimes the soap. Other variants are chopped suet and lime, caustic potash and alum. All of these are intended to induce the formation of aluminium or calcium oleates or of aluminium hydrated oxide. In some instances stearates are sought in lieu of oleates by the employment of stearine or other fatty acid.

Paraffine wax is another material that has formed the base of several waterproofing methods. It may either be applied under heat or dissolved in a volatile vehicle with the addition of resin as a hardening agent.

Bituminous felts can also be used, preferably on floors and roofs or other horizontal, or approximately horizontal, surfaces. These should be laid in several thicknesses, three or four-ply, and may with advantage be finished with coatings of asphalte and protected from the sun's heat by gravel or concrete.

We now come to the class of waterproofing materials added to concrete or cement rendering to render this impermeable to water even under pressure. Sometimes these are added to the water with which the cement or concrete is mixed, and then are usually some form of calcium chloride, aluminium sulphate, oil emulsions, or soap and alum. Other materials are added as dry powders to the cement. These are generally sold under trade names, of which there are many in America, represented principally in this country by Medusa, Ceresit and Solita. Their precise composition is kept secret by their makers, but they are usually composed of hydrated lime and metallic stearates, or formed by the mixture of chloride of lime and stearic acid; in some of these compounds alum and clay are added in varying proportions.

The effect of this class of compounds upon the cement used for concrete or rendering is to somewhat retard the time of setting, to decrease the strength of neat cement, to increase the strength of cement mortar, to increase the adhesive power of old to new concrete, to fill the pores of the concrete or cement with a water-repellent.

The permeability of the best-known of these compounds, as used in the United States, exists at first to a slight extent, but varies with different brands. After twenty-eight days they are all practically impermeable. In the application of these materials to walls leaking under pressure it is advisable to relieve this pressure by drainage until the applied rendering has set and hardened, when its adhesion to the wall is sufficient to prevent subsequent blowing.

Useful information on American methods may be obtained from a reprinted paper on "Waterproofing," by Myron H. Lewis, C.E., published in this country by Constable & Co.

## "THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.

We reproduce in monotint the prize drawing for March, but as this does not convey all the charm of the author's colour, the original can be seen, framed and hung up in the Editor's room, by any member of the Club who likes to call at our offices.

The sketch represents the entrance of the tower at Bolton Abbey, Yorkshire.

The Priory was founded about 1120 A.D. at Embsay, near Skipton, by the regular canons of St. Augustine, but thirty years later was removed to its present position.

In plan it takes the form of a Latin cross; the portion west of the crossing is used for services, the remainder is in ruins, probably on account of the rule that the nave was reserved for public use, while the choir was kept exclusive for the canons.

A good deal of Norman work remains in choir and transepts and some fine wall arcading.

The upper portion of the choir and transepts appears to have been rebuilt and Decorated windows inserted.

The nave retains much of its Early English character;
the aisle is divided from it by four arches, and in t
clerestory over are four lancet lights.

The thirteenth-century west front is perhaps the mo
beautiful of all the work, and is in a good state of preserv
tion owing to the protection afforded by the tower erect
at the beginning of the sixteenth century, but not complet
before the Reformation.

This tower is a very fine example of Late Perpendicul
work, especially in proportion and fine detail, the moul
ings and carvings being exquisitely worked.

The date 1520 is carved in the inscription over the doo
way. Had the tower been completed, we should probab
have had no thirteenth-century west front, as the tow
would no doubt have been connected to the nave.

## NOTES AND COMMENTS.

The announcement has been made that the Spec
Parliamentary Bill Committee of the Council of the Ro
Institute of British Architects has reached the final sta
of its work, and the Institute solicitors are now drafti
the Bill. The objects of the Bill, as defined by the Reso
tion of the Royal Institute at the meeting held on March
1907, are:—(1) To declare that it is in the public inter
to enable the public to distinguish architects recogni
as qualified by a competent authority from those not
recognised; (2) To extend the present chartered privile
of the R.I.B.A., making it the statutory authority for
education and examination of architects for admission
the Institute; (3) To legalise a scale of charges.

Applications for admission to the class of Licentia
of the Royal Institute of British Architects are be
received in considerable numbers, showing that archite
throughout the country who have previously held a
from membership of societies are realising that the po
now adopted by the Institute is a sound one, and that
to their advantage as well as their duty to associate th
selves with the corporate representative body of the
fession. As the opportunity for joining the Class
Licentiates ceases on March 23 next, it is essential tha
architects who wish to be recognised as qualified sh
at once proceed to enrolment in the ranks of the Insti
or one of its Allied Societies.

Mr. Walter Runciman, President of the Boar
Education, has appointed a departmental committe
consider and report upon the functions and constituti
the Royal College of Art and its relations to the Schoo
Art in London and throughout the country. We t
there is occasion for such a committee. Good wo
being done by the Royal College of Art, but its pos
and influence are not what they should be. In parti
the relations between the Schools of Art and the
College require co-ordination. There is a grand o
tunity for the committee to show its ability in organisa

We regret to have to announce the death of
Campbell Douglas, F.R.I.B.A., one of Glasgow's

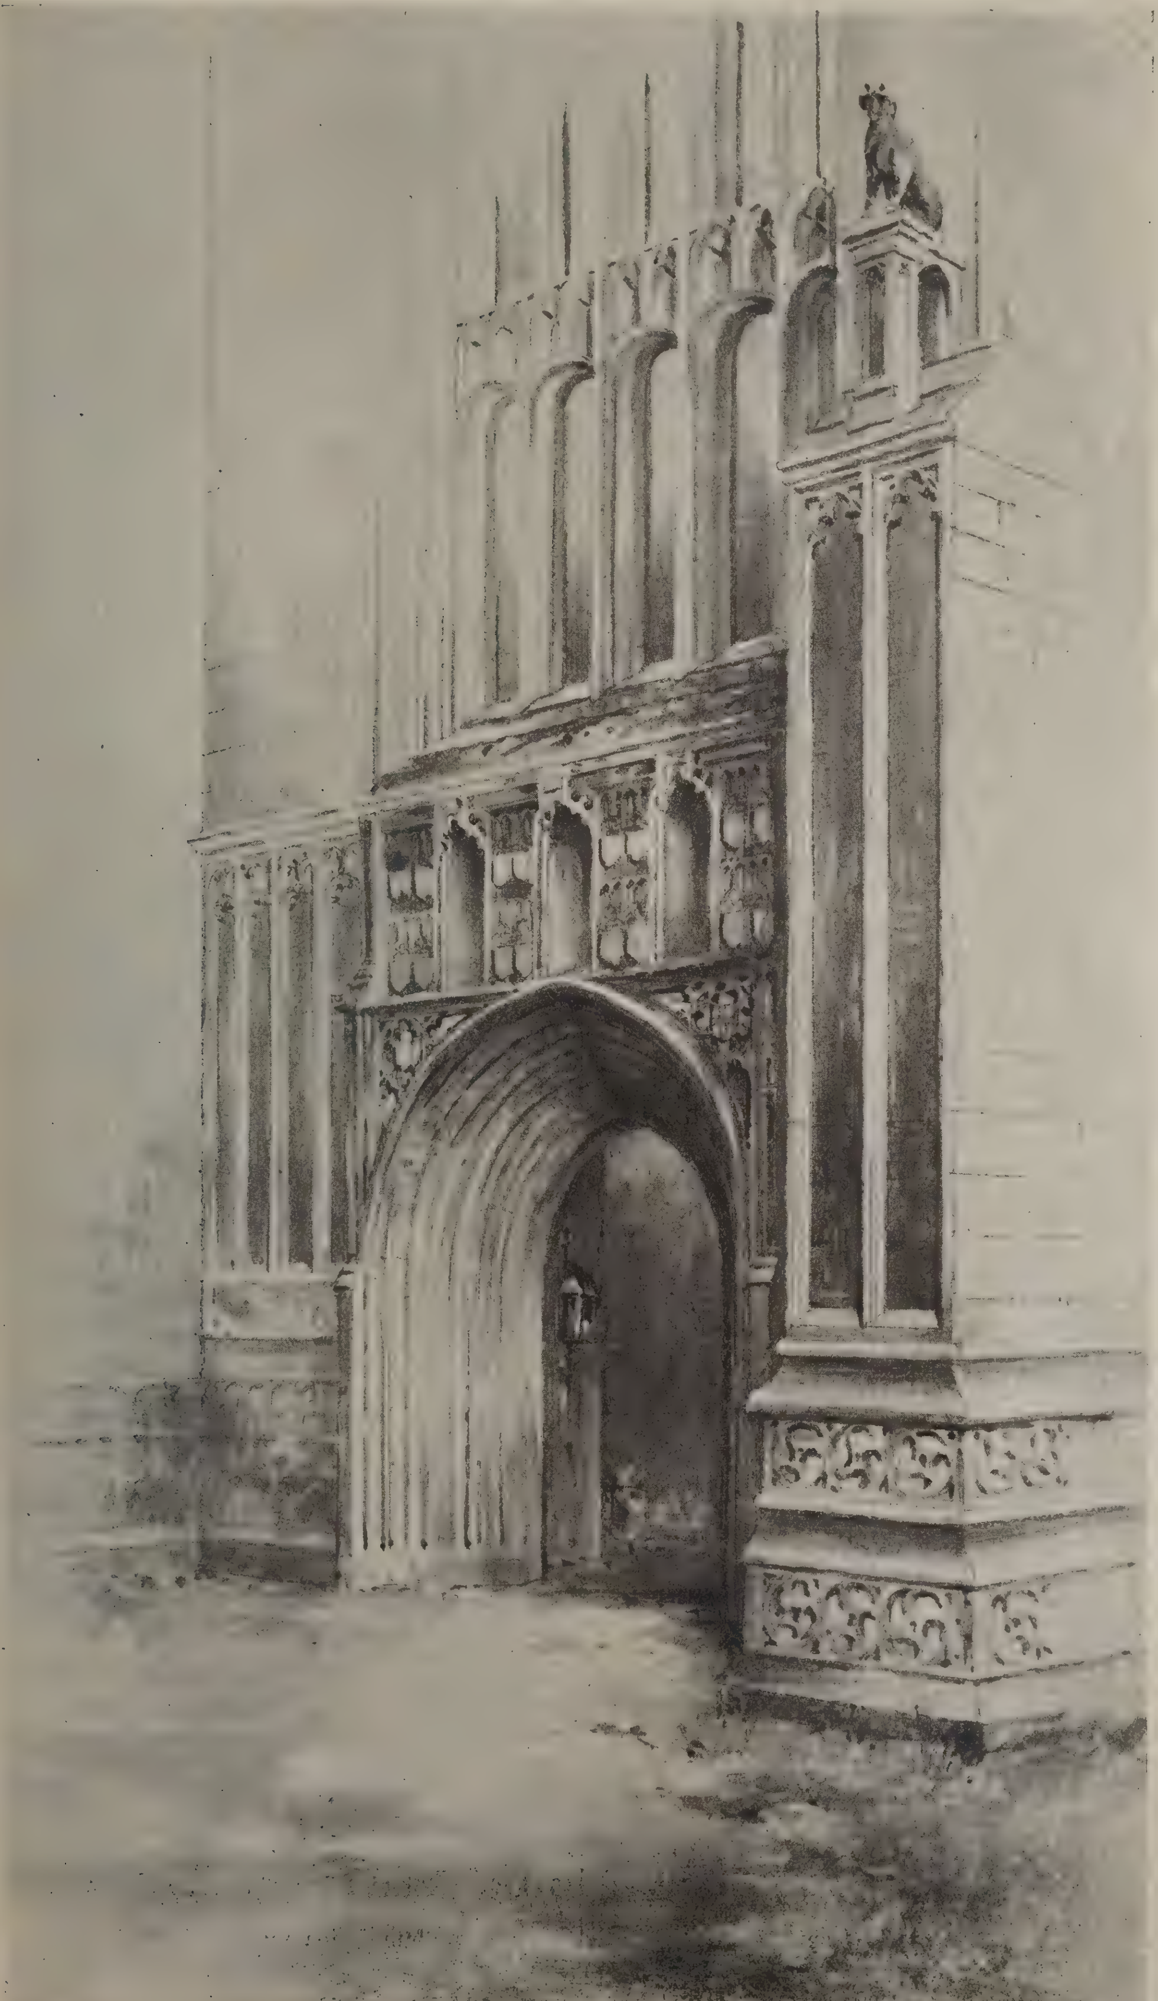
Douglas was born in 1828. He was educated part
home and partly at the University of Glasgow, and
business on his own account in Glasgow in 1856.
with his partner, Mr. John J. Stevenson, he did
good architectural work, and among other buil
erected from his designs were Kelvinside United
Church and Townhead Parish Church. On Mr. St
son leaving for London, Mr. Douglas assumed
James Sellars as a partner, and during the foll
years until the death of Mr. Sellars in 1888 the
carried through a large amount of important work, s
of the buildings erected from their designs being a
the chief architectural features of the city. Examp
their work in which Mr. Douglas was chiefly conc
are the St. Andrew's Halls, which were orig
planned by Mr. Cunningham, the designer of the
pool Philharmonic Hall, but which were ulti
altered in detail by Messrs. Campbell Dougl
Sellars; Kelvinside Academy, the Victoria Infir

"THE ARCHITECT" STUDENTS' SKETCHING AND MEASURING CLUB.



BOLTON ABBEY, YORKSHIRE.—Prize Drawing for March by "ESEK" the Sick Children's Hospital, the New Club, Netherhall, the residence of the late Lord Kelvin, at Largs; Mugdock Castle, and a large number of churches in Glasgow, Edinburgh, and other parts of the country. Mr. Sellars was succeeded in the firm by Mr. James Morrison, and while he remained a partner with Mr. Douglas the second section of the Victoria Infirmary, for which in Mr. Sellars's time designs had been provided, was completed, and the Sandeman Library, Perth, and the Ayr Free Library were also designed.

The special site committee of the City Council of Manchester has come to the decision that the only satisfactory method of dealing with the old infirmary site is to build upon it a new Art Gallery and Central Library. The site was sold by the infirmary trustees with the tacit understanding, from which nobody dissented, that, as stated at the time of the sale by the late Mr. John Thomson, the chairman of the Board of Governors, it would be used to secure for the city an unrivalled site for public buildings and an extent of open space which it would be beyond the reach of a private individual or business syndicate to obtain. The proposals of the special site committee will, if they are carried out, secure both the public building and the open space. The streets around the site have already been widened considerably, more open space has thereby been secured, and the value of the site itself increased largely. The committee propose to occupy only 5,500 square yards with the new art gallery and library building. The old infirmary buildings covered 6,600 yards, so that the city will under the scheme secure 1,100 square yards more open space than was the case when the infirmary stood upon the site. They suggest, too, that the buildings should be set well back from Piccadilly to ensure a noble stretch of open land in the front of the Municipal Art House.

On Saturday last Mr. T. R. Ferens, M.P., opened the new art gallery at Hull, which has been designed by Mr. Hirst, the city architect, who has embodied in his scheme some of the best features of the Continental galleries. Enclosed within three windowless walls, whose surface is broken only by decorative panels, each bearing the name of a great painter, are a series of four galleries, named after the four points of the compass, with a lofty domed circular gallery in the centre, which may probably be reserved for the immortals, as in the "Tribuna" of the Uffizi in Florence. The east and west galleries are each 90 feet by 30 feet, the north and south galleries being 30 feet square. Perfect silence is secured by the solidity of the outer walls, the absence of external windows, and the double roof, which also serves to diffuse the light. Daylight is filtered through two crystal roofs, and at night a number of powerful electric arc lamps are switched on outside the skylights. The four galleries are paved with parquetry in oak, mahogany and ebony, and have dados of walnut, while the central gallery, with its marble columns, is arcaded for the reception of sculpture, and is paved with Italian terrazzo in black and white. From the principal entrance in Carr Lane, on the south side of the building, the galleries are approached by a marble staircase, and through a vestibule with a finely modelled plaster ceiling. The scheme of decoration is rich though simple, and the air of Classic repose and dignity is successfully preserved. Mr. Ferens, in the course of his opening speech, promised an annual donation of 1,000*l.* a year for the purchase of pictures for the new gallery.

The vital importance to the beauty of London of the adoption of a worthy design for the new St. Paul's Bridge over the Thames has impressed itself upon the minds of the members of the Royal Academy, and is expressed in a letter to the *Times* signed by L. Alma-Tadema, Thos. Brock, John Belcher, Reginald Blomfield, George Frampton, Ernest George, John S. Sargent, Hamo Thornycroft, and Aston Webb. They say of the proposed work:—"This scheme when carried out will leave an indelible mark on the scenery of the river, and, according as it is handled, may be a magnificent approach t St. Paul's Cathedral, or a monumental fiasco." Wit this every lover of art and of London must agree. W have not a single bridge across the Thames that can b placed in the same class with what may be seen at Pari Berlin, Vienna, or Ostend, and the Corporation of th City of London should endeavour to obtain an adequa return for the expenditure of the Corporation funds n only from a practical but from an artistic point of vie and to this end should afford the fullest opportunity "f the expression of competent opinion and criticism of t design proposed."

The Royal Archæological Institute is about to i augurate a new departure which, we think, should decidedly valuable and popular, in the form of meetin in and around London for the study of ancient buildin on the spot. The first of these is to be to Westminst Abbey, and will occupy two days, Tuesday, May 10, a Wednesday, May 11, from 10 A.M. to 4.30 P.M.

We regret to have to announce the death of Mr. Lew Foreman Day, F.S.A., which occurred on Monday la Belonging to an old Quaker family and with Welsh blo in his veins, Lewis F. Day was educated at Mercha Taylors' School, followed by two years in France a one in Germany. On leaving school he became apprentice at the works of Lavers & Barraud, t glass painters and designers in Greek Street, Soho. He he laid the foundation of his practical knowledge of artis crafts. Later he went to the workshops of Mess Clayton & Bell, the well-known stained-glass work of the mid-Victorian period, and spent one or two ye in executing special glasswork for Eaton Hall, for t late Duke of Westminster. He was one of the p moters of the Arts and Crafts Society, a Past Master the Art Workers' Guild, and a Vice-President of Society of Arts. He delivered several courses of Can Lectures, two courses at the Royal Institution, and seven years or more an annual course to the Natio scholars at South Kensington—all on practical des and ornament. Both by his oral teaching and by text-books, "Every-day Art," "Nature in Ornamen "Pattern Design," "Art in Needlework," "Ornam and its Application," and others, he exercised a very g influence on modern design as applied to industry, there is hardly a branch of manufacture into which or ment enters that has not felt his influence.

## COMPETITION FOR PROPOSED USHER HA EDINBURGH.

THE conditions of this important competition provide the expenditure of 65,000*l.*, with Sir Aston W C.B., R.A., as assessor, Mr. James A. Williamson, City Architect being associated with him. Sir As Webb has not seen his way to accede to the reques suggestion made in an open letter that appeared in columns and those of our contemporaries, but requ the designs submitted in this competition to be illustr by plans of each floor, two main elevations, two sect —longitudinal and transverse—as required to fully il trate the design. These to a scale of 16 feet to an i and in addition one external bay, one internal bay half-cross section of the hall to 2 feet to an inch, exterior and one interior perspective view of the hall

To take part in this competition will therefore ne heavy expenditure on the part of each individual archi and the profession as a whole would be well advised t it alone. The net profit to the successful architect hardly be more than 1,500*l.*, the competition draw will probably cost each participant from 150*l.* to Is the chance of winning worth the gamble at 10 to 6 to 1? We think a flutter in rubber or oil would be b business.

The accommodation required includes a hall to 3,500 people at musical performances, a crush hall lounge foyer, cloak and retiring rooms, kitchen and ive offices, public office for hall-keeper, ticket-boxes, main, ubsidiary, service and escape or emergency staircases, pace for grand organ, retiring rooms for male and female rtists, retiring rooms for male and female chorus, room or instrumentalists, chamber for boiler, heating and ventilating plant, and coal stores, storage for platform seats, ousemaids' and cleaners' stores and such other subsidiary ccommodation as in usual in buildings of this class.

The site is of an irregular shape at the junction of Camridge Street, Lothian Road and Grindlay Street, and has maximum difference of level of between 9 and 10 feet, so here is ample scope for a considerable variety of treatment nd a fine opportunity for the waste of time and labour y an error of judgment in the initial conception of a cheme.

Designs have to be sent in by July 9, and questions as o the conditions and requirements have to be sent not ater than April 30, so when the replies to these are reeived there will probably be about six weeks clear for the reparation of the drawings. The competition is attractive rom its importance and the opportunity it affords of naking a fine design, but from a business point of view lecidedly undesirable, in our opinion.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Royal Institute was held on Monday, April 18, when Mr. Ernest George, A.R.A., the resident, occupied the chair. The Secretary announced the ecease of Sir W. Quiller Orchardson, R.A., honorary member, notable example of whose work as a portrait painter was the nstitute's portrait of the late Mr. A. Waterhouse, R.A.; also he decease of Mr. W. Owen, retired member, and of Mr. ionel Gordon Detmar.

Professor W. R. Lethaby, F.R.I.B.A., then read a paper n

### The Architecture of Adventure.

By the architecture of adventure Professor Lethaby said e meant that spirit of experiment in building which has been he living force and active principle of all architecture. If it desired to give two separate though consistent meanings to he words architecture and building, by the first we must ean building enhanced by sculpture and painting—that is, uilding completely furnished as Morris says. In any case ere needful and experimental building is the main subtance, force, and origin of the art. So far as it has to meet anging conditions and ideals it must be experimental. herein lies the present difficulty. From a review of the ttempts made it would seem impossible to continue in old ays or revert to past types. We have passed into a scientific ge, and the old practical arts, produced instinctively, belong a different era. History shows that any basis on which ere can be general agreement over a long space of time will roduce architecture of a sort. The one thing essential is this greement, so that a process of development may be set up continuous experiment. The only possible basis of agreeent at the present time is the scientific method.

The Greeks probably took over the notion that architecture as to be reached through a system of ratios from the gyptians; in any case it belongs to many ancient peoples. reek thought on the matter was very clear-cut, and with em proportion meant a definite pre-arranged relation of easured quantities. Polycletus, the sculptor, wrote, Success in art is attained by exactness in a multitude of ithmetical proportions." Greek artists all agreed to such theory. Notwithstanding this their architects, as a matter fact, seem nearly always to have been engineers. The gineering element in Roman architecture is most marked; d it was this indeed which entirely burst the old bottles tradition and transformed the art into one of daring ructural adventure. Most of the great Roman architects em to have been engineers in the strict sense. The identity tween engineers and architects continued into the Byzantine riod, and into the Middle Ages. The great Mediæval ildings are solutions of problems of how to throw stones gh into the air and balance them there. A great French stle or cathedral was not designed as beauty, it was developed ng a line of experiment as surely as the great ocean liners being so developed.

With the Italian Renaissance men there was a set-back. e mighty architecture of ancient Rome was studied cernly, but for the mere fashion of outward adorning and t for its science of construction. The notebooks of nardo da Vinci, however, are full of practical exercises and experiments. Indeed he was the first to enter on a systematic inquiry as to the mechanics of architecture. Amongst his schemes was one for a town, for he was a pioneer in town planning as well as in aviation. The only other artist of the Renaissance who caught the idea of investigating principles was Dürer, and he possibly had access to Da Vinci's notes. In his manuscripts in the British Museum are some studies of domes of a parabolic section and some exercises in plan schemes.

Although Wren was not a world-genius like Leonardo da Vinci he was in many respects an English Leonardo, and the one architect we have had whose formal thought (as opposed to the flashes of insight of a dozen men like Pugin) matters. More even than a great artist, Wren was a great man. Robert Hook, another scientific architect and his friend, says of him, "Since the time of Archimedes there scarce ever met in one man in so great a perfection such a mechanical hand and so philosophical a mind." Wren was almost certainly the first in England to apply the methods of scientific investigation to the laws of structure, and Hook is said to have been the first who stated the mechanical properties of the arch.

It seems clear that Wren contemplated writing a history of architecture and also a general philosophy of its first principles. The notes were probably written when, over eighty, he had retired from active work to pass his time in contemplation and studies. His intention appears to have been to give "a larger idea of the whole art" of architecture, beginning with the reasons and progress of it from the most remote antiquity, and thereby to reform the generality to a better taste.

Architecture aims at eternity, and therefore is the only thing incapable of modes and fashions in its principles. "The orders are not only Roman and Greek, but Phœnician, Hebrew, and Assyrian, being founded upon the experience of all ages, promoted by the vast treasures of the great monarchs and skill of the greatest artists and geometricians, everyone emulating each other." The orders, that is, were admirable so far as they embodied much experiment and long experience. He complains that while architects dwell too much on the ornamental side of architecture they slightly pass over the geometrical side, "which is the most essential part of architecture. For instance, can an arch stand without butment sufficient? If the butment be more than enough it is an idle expense of materials; if too little it will fall; and so for any vaulting; and yet no author hath given a true and universal rule for this nor hath considered all the various forms of arches." Wren then investigates the laws of stability by consideration of the centres of gravity of the several parts, and concludes:—"The design where there are arches must be regulated by the art of statics and the duly poising of all parts to equiponderate. Hence I conclude that all designs must in the first place be brought to this test or be rejected." He says that he adopted the form of vaults used at St. Paul's from Sta. Sophia "because it was the lightest manner and requires less butment; I have therefore preferred it to any other way used by architects." Some sketches for the great dome show that its section was conceived as conforming to a general parabolic curve rising from the plinths of the great piers and passing through the abutments and over the crown of the so-called cone. Wren saw, and probably was the first of architects to do so, that necessity, which he equates with nature, must be one with beauty.

There is a view as to the meaning and content of architecture which holds that it is primarily building according to the natural laws of structure and stability, according to need and order, and always with care and finish. That it must ever vary with ever-changing conditions, and that this ordinary building may have associated with it painted and sculptured stories, or inlays or fretted works and gildings, while the essential architecture is still structure, and the method of architectural growth is by continuous experiment in the possibilities of structure. Nevertheless it should be clearly understood that any quest for originality just blocks the way, with our preconceptions and limitations, to any possibility of realising a true originality, which properly is of the root, not of the appearance. True originality is to be found by those who, standing on the limits of the sphere of the known, reach out naturally to some apprehension and understanding of what is beyond; it is the next step in an orderly development.

What should be urged is concentration on practical, experimental, and scientific education. What we most need at the present time is the accumulation of power; we want high mechanical training, wide practical experience, and great geometry. And then we want to cover the field by a systematic research into possibilities. The possibilities of walls and vaults, and of the relation between the walls and the cell, and between one cell and another, want investigating. It is true such a training would not include the whole of architecture, but it would open the way to the best we can attain. We might hope thus to give up hugging the coasts of the known, to sail boldly forth under the stars. Thus, and thus only, may we enter again upon the architecture of adventure.

Building has been, and may be, an art, imaginative, poetic, even mystic and magic. When poetry and magic are in the people and in the age they will appear in their arts, but there is not the least good in saying, "Let us build magic buildings. Let us be poetic." Yet it is because these things are wanted that this problem must be faced.

Something desperate must be done. We should devote the next session to papers on constructive science, get Professor Karl Pearson to give his researches on the arch, Professor Perry to draw up a report on the application of mathematical inquiry to structures, and our Fellow, Mr. Dunn, should lecture on modern constructure problems. As talking of reason in design is to be tabooed as a self-evident truism, someone who is prepared to commit suicide should examine the prevalence of *irrationality* in modern buildings. The scientific side of our examinations should be rapidly screwed up, and the archæological side as rapidly unscrewed. All our travelling studentships should be made to bear on the same quarter. Pugin students should be made to analyse varieties of mediæval vaults, and Soane students varieties of staircase arrangement. Tites should be sent to study French railway stations, Grissells to work at German hotels, and Godwins to American hospitals.

To emulate the highest in our art we need first the natural, the obvious, and, if it will not offend, the reasonable, so that to these, which might seem to be under our own control, may be added we know not how or what of gifts and graces. Thus may we hope to combine the two realities, the reality of natural necessity and common experience, and the reality of the philosophers, which is the ideal, and to reconcile again art with service.

Professor Beresford Pite, in proposing a vote of thanks, said that it was very difficult to listen to Professor Lethaby and to forget his past. He himself could not hear him without being wicked enough to recollect the exceedingly stimulating designs which Professor Lethaby had produced. But their business was not of course to consider what each had done in the past, but rather to set their houses in order with regard to education. It did not carry them very far if they protested against the habit of loading the architectural student with forms of bygone styles and then set him an examination in what he had learnt. The paper just read should, however, at any rate help them further along the road in disassociating antiquarianism with modern architectural education. A practical knowledge of archæology as a living science rather than as a thing of the museums, as rather that which teaches us of their life and methods and gives a vivid realisation of the bygone nations, than being coached in the forms and examined in their reproduction, was vital and essential. It was difficult to be altogether convinced by the theory that Professor Lethaby had advanced. The men he had quoted were all geniuses, and it was dangerous to argue from them. Leonardo da Vinci had been mentioned as a pioneer in town planning as well as in aviation; the same thing could have been said of Dædalus. Great emphasis had been laid on the constructive aspect of Wren's genius, but there was also an extraordinary fluidity in his treatment of the Classic orders, and he breathed a wonderful originality into the style. All this was a pure play of abounding fancy, though behind it was Wren the mathematician and the man of science, as was also to be seen in the work of Leonardo and of Brunelleschi. In such minds there was the perfectly continuous and perfectly proper line of scientific progression, while parallel to it and coupled and united with it ran a stream of artistic sympathy. In some cases the two were not always equal in strength or assertiveness. However the point must not be pushed too far, for if there is nothing else to guide us but our perception of constructive achievement all our delight in past architecture vanishes apart from that single quality. Engineering works had for years impressed him (the speaker) more than any other class of building; they are most impressive to the eye and vastly suggestive to the mind. In the future the Forth Bridge and other achievements in engineering will be gazed at with wonder. But the world will not stop at the point now reached. So far as we are concerned all the effects of everyday architecture are arrived at and obtained. For instance, the necessary knowledge about brickwork is easily acquired. Our buildings will be singularly devoid of interest if we stop there. The only thing that can be done is to hope for that distant view of things which are just visible to us to-day, and which will be crystallised for future generations. In the meantime architects must tak up those forms which are admired by the existing generatio and make them humanised.

Mr. H. H. Statham seconded the vote of thanks for paper which, he said, was not only very interesting, but als one which will be rather a landmark. In regard to the Gree idea of proportion he quite agreed with Professor Lethaby tha it was a definite prearranged relation of measurements; bu if the idea is pushed too far it brings one to the point reache by Pennethorne, that to get the true effects of a Greek buildin you must see it from one point of view and one point of vie only. This was obviously a *reductio ad absurdum.* M Statham said he would like to know why Wren put a secon storey to St. Paul's. He was much struck by the statemen that any strong and general interest felt by a people wi produce a school of art. It was quite true, the one thin necessary being that interest in architecture. He woul venture to ask if there was no other form of adventure besid the adventure of construction. Would we not all be sorry lose those Renaissance palaces? Yet they failed to com under the latter description. Besides, Leonardo da Vin sometimes regarded his work primarily from the architectur point of view. Was not architecture the poetry of plan ar section? Even without its colouring and mosaic Sta. Soph would still be very great art. Mr. Statham said that a go many years ago when staying with the Dean of Salisbury was on one fine afternoon in the cloisters with a lady wh admired sculpture and painting, but who knew nothing abo architecture. She, after watching the wonderful effects the tower and spire, turned round and said, "Well, I belie architecture is the greatest of all the arts." He was willi to accept the spirit of the paper provided that the adventu of construction was recognised as the groundwork for t adventure of design; with that reservation there was much it that was most remarkable and helpful.

Mr. Paul Waterhouse said that one felt with Profess Lethaby that he was one of the men who knew his subje that he really appreciated what architecture was. Not ma did that; most men tended to look at it as a matter of dai business, forgetting its higher aspects. Professor Letha would not, he knew, mind him saying that with many thin contained in the paper he was in disagreement. He was the first place inclined to take a pessimistic view. He cou not help thinking that there was a danger of ignoring t study of the past, and he could not bear to think that you men would come to think that one jot or tittle of their study ancient work was wasted. There was one thing in the pap that struck him as a beautiful definition; it was as follows: "True originality is to be found by those who, standing on t limits of the sphere of the known, reach out naturally to so apprehension and understanding of what is beyond." H he might remark that a man standing on the limits of wh he believes to be the unknown must be very sure that it really unknown. It was difficult to understand what Mor meant when in speaking of the art of the Renaissance he sa that the past slew the present:—"Strange to say to this liv body of social and scientific new birth was bound the cor of a past art. On every other side it bade men look forwa on the side of art it bade them look back." As he hims understood it there was nothing more stimulating than feel in sympathy with some great period of the past. But questions of this kind one does not cease to sympathise w what is being said on the other side.

Mr. Weir Schultz said he entirely sympathised w everything that had been said in the paper. He would rat take exception with what had been said by subsequent speak who seemed to think that if architecture was studied scientific grounds all sense of beauty would be lost. T forgot that Gothic art was the romance of construction. builders tried to see how far they could go, and someti they overshot the mark. If in the future architects go b to the study of construction they will be going to the roo the art, and there will be some hope of a really living ar- tecture again. A great deal was said about the great bea of English domestic architecture; it was scattered all the country, where it was done by the local builders in local way. They were real cottages and real houses. Whe the modern domestic architecture only approximates to th in spite of all the labour put into them by trained archite

A vote of thanks having been passed, Professor Leth replied briefly to some of the points raised. In referrin contemporary work he said that the modern architect see to be dealing with a multitude of flavours that seem like things but are not the things themselves. They reminded of a story he had heard many years ago when a friend of in passing down a back street saw a card in a window say "Fine Jam; Good Strawberry Flavour."

## THE CRAFT OF REPAIRING BUILDINGS.*

*(Continued from last week.)*

A VERY interesting little Gloucestershire church is Coln St. Denys. It has a central Norman tower on which a ifteenth-century belfry has been built. The arches which pierced the east and west walls of the tower were inadequate, and the slope where the Norman work leaves off curves downwards in the middle owing to the arch below having given way. Although very extensive repairs were carried out, he character of the building has hardly been changed. It was thought wise to put the clock to the west of the window, for it had been placed in the middle of the window. The origin of all the trouble was the semi-circular tower arches built in Norman times. The eastern or chancel arch was replaced by a pointed arch in the thirteenth century, but the arch leading from the tower into the nave was retained, and ts shape shows the dangerous condition it was in before it was repaired. By the process, already explained, of replacng little by little old walling by new, a solid band of brickwork the full thickness of the walls behind the stone facings has been inserted in all four walls, thus bonding them together and helping to distribute the weight of the tower over the whole length of walling and thus relieve the tower arches.

Onibury Church, Shropshire, is a good example of a church which has been repaired and made structurally sound and fit for Divine worship without loss of interest. The only exterior change noticeable is the belfry windows having ouvres in them. A stone-paved and slightly sunk wide channel against the walls runs all round the building. This does not look so well as seeing turf coming right up to the walls, but it is very necessary in some cases to keep the buildng dry. When such channels must be used they should be formed of concrete. They should be laid to slight falls leadng to gullies, beneath which there should be glazed earthenware drain pipes taking the water well away from the buildng, and the surface drain should not be less than 2 feet wide, with a long slope from the wall and a quick slope up to the turf, and they should be paved with stone, otherwise the cement always cracks and goes to pieces. It has been very usual when repairing lead roofs to take the lead away and put new milled lead in its place. The late Mr. Crickmay told ne of a case where a church had its north and south aisle roofs covered with cast lead in bad repair. One aisle was renewed with milled lead, and the other was left. This was when he was a young man. He saw the church in after-life, and he new milled-lead roof was in a worse state than the cast-ead one which had been left alone. Milled lead is made into heets by crushing it between rollers until the desired thickness is obtained. This hardens it and makes it brittle and iable to crack. Moreover, age turns it black, whereas lead which is cast into sheets becomes silvery, for it oxidises, so hat the surface gets covered with white lead. I have seen old cast lead looking almost as if it had had a coat of white paint on it. This oxidisation, I believe, acts as a preservative. When repairing timber roofs it is a great gain to repair them *in situ*. Each timber is examined, and the portions which are decayed are cut away and new oak fitted on to take the place of what has gone. There are many ways f splicing wood, and the splice should be so arranged as to ut away as little sound wood as possible from the old work. The worm in old oak can always be killed by saturating the ak with paraffin. Some years ago a parson wrote me an nteresting letter to say that he considered bats were a great reservative of timber; that his church was full of them, nd he would not have them destroyed. As you know, the reature which makes the pin-holes in wood is a beetle, and e found out that it only flies at night. He also found by xamining the bat droppings under a microscope that it was argely composed of the wings of this particular beetle.

West Walton Church, near Wisbech, is a noble thirteenth-entury building with fourteenth-century windows inserted. The nave roof is what is called a hammer-beam roof; that is, nstead of beams going right across at the level of the wall ops, and props standing on them, a bracket runs out from he wall-plate and a prop stands on the end of it. Each racket, or hammer beam as it is called, is carved into the orm of an angel, and each angel holds a shield, and each hield has a different emblem of the Passion on it. It ertainly seems as if the roof was not originally made for his building, as the pieces of timber running down the wall rom the hammer beam, and which are called jack-legs, cut right across the arches of the windows, which on the north side of the church have been blocked up because a high-pitched roof was put on that aisle. Many of these hammer beams were quite hollowed out on the upper side by decay, and had their ends, where out of sight, decayed away. New ends were, of course, spliced on, and the hollow places were cut out square and a new piece of oak fitted in from the back. Battens—that is, long thin slips of oak—were laid along the backs of the rafters on which wide oak boards were laid. This was put back when the repairs were done, and battens laid on the back of the oak boarding, and deal boards on the top of them to carry the lead, which must never rest on oak because the tannin in the oak eats away the lead. Each bay of the roof has a tie-beam, and there are two hammer-beam trusses between them.

There is one important thing to remember when repairing roofs, which is that you can hardly find yourself in a difficulty, because if the carpenter cannot see his way to make a sound and strong job of the work the blacksmith will be able to do so. In one case, for example, where timbers were not sufficiently strong, we cut a groove all down the back of them and then laid a T iron joist on the back out of sight, and with the flange of the T iron let down into the groove. Coach screws were then put in on each side of the flange to hold the steel joist firmly on to the timber. Apart from this, however, timbers can be strengthened by fish plates; that is, a flat iron placed on each side of the timber with bolts running through the timber and holding the iron plates together.

*(To be concluded.)*

## EXETER COLLEGE, OXFORD.

By the Rev. W. K. STRIDE, M.A.

EXETER COLLEGE derives its name from a great bishop of Exeter, WALTER DE STAPELDON, who in 1314 founded "Stapeldone Halle" for the benefit of twelve scholars in the University of Oxford, the statutes containing the proviso that eight of the twelve should come from Devon and the other four from Cornwall. As, to borrow from FULLER, New College is the most favoured by Southern men, Queen's by Northern, and Brasenose by North-western, so has Exeter ever been full of men from the West-country, and to this day, in spite of alterations, nearly half the College scholarships and exhibitions are restricted to natives of STAPELDON's old diocese. Exeter has always been connected with the West, and many well-known West-country names, such as ACLAND, BORLASE, CARY, EDGCOMBE, FORTESCUE, JAGO, LEIGH, ORCHARD, STUKELEY, GRENVILLE, TRELAWNEY, WADE, and YARDE are to be found on the books.

A few of the provisions of the original statutes are curious and are worth recalling. The Fellows were to have their rooms rent free, and each was to receive the magnificent emolument of ten shillings annually. They might have four weeks' "vac." without deduction of this allowance, but if they were away longer they suffered proportionately. They were cautioned against gossiping about the private affairs of the College to the detriment of its members; in all respects they were to "comport themselves with due regard to their dignity as clerics"; black shoes were to be worn, "or shoes as nearly black as possible," and only French or Latin should be spoken at dinner and supper.

Nothing of any special importance happened to the College till the beginning of the sixteenth century. There is the usual ebb and flow and gradual growth, but nothing more. In 1536, however, the College was in a very poverty-stricken state. The annual revenue was only 83*l*., from which 13*l*. had to be deducted for masses and exequies; the Rector's annual allowance was 4*l*., and a Fellow's 70*s*. But a new impulse was given by the benefactions of Sir WILLIAM PETRE, "the second founder." His first step was to increase the endowments, for which purpose he handed over various livings. These benefactions, together with subsequent legacies, more than doubled the revenues, and his services were rewarded by permission to draw up new statutes in conjunction with the Bishop of EXETER. A sub-rector was appointed, and a dean; gaming, shooting, and hunting were forbidden;

dress and manners were carefully regulated; and an attempt was made to stop pluralism. But the most important alteration of all was that eight new Fellowships were instituted, the holders to be elected from any of the counties in which PETRE or his heirs held land. As these included Somerset, Dorset, Oxon, and Essex, and gradually nearly the whole of the south and east of England, it will be seen that the old West-country element was almost swamped. Doubtless this was a good thing, for the conservative influence of the West had been affecting in no small degree the views of the College as regards both politics and religion. Possibly PETRE was more far-seeing than is generally realised.

During the Stuart period Exeter was further enriched with scholarships and grants. In 1636 CHARLES I. gave one of his three Channel Island Fellowships, and about the same time Sir J. ACLAND and Sir J. MAYNARD made grants. A short time before this the Hall had been rebuilt at a cost of 1,000*l.*, of which ACLAND found 800*l.*, and in 1624 a new chapel was erected on the present site, Dr. HAKEWILL, then Rector, giving 1,200*l.* During the Civil War, Exeter, like Oxford at large, remained faithful to the King's cause, and suffered accordingly: 300*l.* and nearly all the plate was given to the King. Under Parliamentary rule, even greater hardships were suffered: the Visitors of 1648 expelled ten Fellows and eighteen others; it was difficult, too, to collect arrears of rent, and some of the Fellowships had to be given up. JOHN CONANT, however, Rector 1649-62, did much towards restoring the College to its former prosperity and discipline.

We may now turn to the buildings themselves. One of the first was, of course, a chapel, situated a little to the north of the present College library; it was used as a chapel till HAKEWILL's building was completed in 1624. It was then turned into a library, which was burnt out in 1709, but continued to be used till 1779, when a valuable legacy of books and MSS. necessitated a larger building, the original library, built in 1383, having been converted into rooms in 1624. The first hall, running north and south, stood in what is now the front quadrangle. The main gate was on the north side of the College; in 1432 a tower and rooms were built over it. This is the oldest part of the College now extant; it is known as Palmer's Tower, and may be found at the east end of the chapel. The present gateway tower in Turl Street was erected in 1605 by one EVERARD CHAMBERS, Fellow of the College.

In the earlier part of the seventeenth century many important additions were made. In 1618, as we have already said, Sir JOHN ACLAND built the present hall and the cellars beneath it. This hall, which is fortunately almost intact, is a good specimen of Jacobean architecture. Not the least interesting detail is to be found on the fine screen—a carving of a man pulling contentedly at a long pipe. The pattern of the roof is peculiar and has been assigned to a later date, but by comparing it with that of Lincoln College Hall, which is known to have been built at almost exactly the same time and is practically identical, we may conclude, as the present Rector suggests, that it was a passing fashion of the day. There was originally a louvre in the centre, but unfortunately this was removed when chimneys and fireplaces were introduced. The present porch and clock were not added until 1820.

The second chapel was erected in 1624 by GEORGE HAKEWILL. It was built on the western part of the present site and consisted of a main chapel and an aisle on the south side. On the west wall there were flat pilasters, on which were musical instruments carved in high relief; these, however, seem to belong to a later date. There was never an east window. A noticeable feature was the ceiling, which was arched and plastered, and painted to resemble fretted stone, and there is still extant an oil-painting of the ante-chapel with chapel beyond which preserves this feature.

Great changes were effected between 1854 and 1860, when the old chapel, the Rector's lodgings, and the library built by CROWE, together with other buildings, were pulled down, and the new chapel and Rector's lodgings, the interior of the small quadrangle, the Broad Street tower and rooms, and a new Gothic library on the site of the old were all erected under the supervision of Sir GILBERT SCOTT. There was no pressing need for the rebuilding of the old chapel, but the authorities were apparently smitten with a desire to destroy, and declared the fabric unsafe. The present chapel is one of the best productions of the Gothic revival and contains many beautiful decorations. We may mention the stained-glass windows put in as memorials, the columns of Devon and Cornish marble, the rose window at the west end, and the mosaics by SALVIATI at the east end. But the great glory of the chapel, and indeed one of the great glories of Oxford, is the exquisite tapestry representing the Adoration of the Magi, designed by BURNE-JONES and executed and elaborated by his friend WILLIAM MORRIS, both of whom were Exeter men. The tapestry, treating the subject in an original way, is almost world famous, and is indeed a wonderful example of the artists' work.

There is much more to be said about Exeter College, but we have room only to attempt a short description o the Fellows' Garden—little known, perhaps, but one o the most beautiful nooks in all Oxford. As if to accentuate its charm, it is first necessary to trek across waste of gravel in the quadrangle and then to plunge mole-like into a dark tunnel hidden away in the fa corner. Having escaped the embracing arms of the common-room staircase the visitor stumbles suddenl into a fairyland—tiny as a fairyland should be. In front on the lawn, is a great acacia, behind which one may se the grey walls of the Old Divinity Schools; to the left i the library; on the wall through which one has tunnelle is a famous figtree named after Dr. KENNICOTT. (Non may escape from Exeter without hearing the story a least once.) Go down the winding path to the terrac at the end and look over the wall. Above are the branche of HEBER's chestnut—which the future bishop, while ye an undergraduate at B.N.C., is said to have found usefu after hours; in front is the Radcliffe Camera, on the righ the walls of Brasenose, and over your shoulder th Selden wing of the Bodleian. We may stand here as it were, in the centre of Oxford's learning, until chancing to glance upward, the eye is caught by th delicate spire of St. Mary's rising at first in intricat grandeur of carving and finally in one straight, pure boun into the heavens, as if to remind us that life holds greate pleasures even than those of earthly wisdom.

## ILLUSTRATIONS.

### EXETER COLLEGE, OXFORD.

WE this week resume our series of views of the Oxfo colleges, and a description of Exeter will be fou on p. 255.

### DESIGN FOR CITY OF LEEDS TRAINING COLLEGE.

THIS design was submitted by Mr. WILLIAM WHIT HEAD, A.R.I.B.A., in the recent competition for t new training college of the city of Leeds, and was one the best of those that were not fortunate enough to recei reward at the hands of the assessor.

DURING last week important excavations were carri out on the site of Malmesbury Abbey by Mr. Harold Bra spear, of Corsham. The result has proved highly satisfa tory so far as the cloister is concerned. A large piece of t flooring of the east and west alleys has been uncovere together with small patches of the north alley floor. A ve quantity of fragments of the vaulted ceiling has been fou showing that the cloister alleys were very similar to those Gloucester, but a little later in date. Fragments of the low parts of the inner walls have been discovered at the nor west and north-east angles, and a fine piece near the sou east corner.

## THE SOCIETY OF ARCHITECTS.

THE twenty-sixth annual dinner of the Society of Architects was held on April 15, at the Holborn Restaurant, hen nearly two hundred were present. The chair was occuied by the President, Mr. George E. Bond, J.P., and amongst hose present were the Right Hon. Lord Saye and Sele, Mr. yril Cobb (vice-chairman of the London County Council), Ir. L. A. Atherley-Jones, K.C., M.P., His Honour Judge entoul, Mr. Brook T. Kitchin, F.R.I.B.A. (architect, Local overnment Board), Mr. Herbert Neild, M.P., Alderman Iax Clarke, F.R.I.B.A. (Mayor of Holborn), Mr. H. D. earles-Wood, F.R.I.B.A. (chairman of the Royal Sanitary nstitute), Mr. Henry Tanner, jun., F.R.I.B.A. (president of he Architectural Association), Mr. Fredk. Higgs (President f the Institute of Builders), Ven. William Sinclair, D.D. Archdeacon of London), Mr. O. F. Peall (Master of the ainters' Company), Mr. Leonard Horner (President of the ondon Master Builders' Association), Mr. Alfred Stoner Master of the Tylers' and Bricklayers' Company), Mr. E. J. ilcock, M.Inst.C.E. (President of the Society of Engineers), Ir. Ellis Marsland (Past Hon. Secretary), Professor Henry dams, M.Inst.C.E. (Hon. Treasurer), Mr. William Woodard, F.R.I.B.A., Col. F. S. Leslie, R.E. (Hon. Secretary), Ir. Percy B. Tubbs, F.R.I.B.A. (Vice-President), Mr. . W. S. Cross, M.A. (Vice-President R.I.B.A.), Mr. Valter W. Thomas, J.P. (Past President), Mr. G. A. T. Iiddleton, A.R.I.B.A. (Past Vice-President).

After the Royal toasts had been musically honoured,

His Honour Judge Rentoul, in proposing "The Houses f Parliament," said he was particularly anxious not to miss heir entertainment, as he wished to give the Society of rchitects the opportunity of solving the problem of heating nd ventilating the new Old Bailey. At present he conidered it in those respects the worst he had ever been in. udge Rentoul made a humorous defence of the House of ords. Man for man, it would, he declared, compare with ny assembly of the same size on the face of the earth, whether r its distinguished statesmen, warriors, or ex-lawyers. If he House of Lords was to be changed for the better, then it ould be a remarkably good one.

The Right Hon. Lord Saye and Sele, in responding for the ouse of Lords, said he could only conclude that the reason r his being invited was that he had a son who was studying t the Architectural Association's school. Presumably, therere, the organisers had applied the principle of heredity ackwards. With regard to the toast, it seemed to him that was an example of bad building, inasmuch as the two who ere to reply for the Houses of Parliament were a Tory M.P. nd a Radical peer.

Mr. Herbert Neild, M.P., said the political events of the ast twenty-four hours had rendered his task a most difficult ne. The profession of architecture demanded that its practioners should be engaged on constructive work, whereas the oposals of the Government were solely of a destructive ature. It would be well to remember that until a comparavely recent period the House of Lords and House of Commons sed to sit together, and offer joint advice to their Sovereign. was to be sincerely hoped that they would come through this ying period in such a way as to still uphold the mother of rliaments as a model to the world.

Mr. L. A. Atherley-Jones, K.C., M.P., proposed "The ociety of Architects." He said it was to him a matter of tisfaction that the toast which it was his duty to propose d not trench upon the dangerous ground of party politics. e toast of the well-being of the Society was justly regarded the toast of the evening. He himself was present in a mewhat hybrid capacity, for in addition to being their guest was also an honorary member. He felt at the least a tain amount of regret that he had not been able to serve Society in obtaining the passing of a Bill in which they took a profound interest, and which was a reason for the gin of the Society, viz., the Bill for the Registration of chitects. He could assure them that the failure was not e to his own shortcomings, but entirely to the methods der which the Parliament of this country was conducted. r it was impossible for an unofficial member to advance a ll beyond the stage of a first reading. The Government of time, whether Liberal or Conservative, monopolises all session and prevents the advance of humble though useful asures in which such societies as their own were interested. was absolutely futile for any individual unofficial member try to make progress with a Bill which is at all of a controsial character. The Society of Architects had therefore en a wise course in suggesting that Lord Saye and Sele uld introduce that Bill into that serene assembly, which in e form or other is likely to continue to exist. It was to be hoped that if the Bill should meet the approval of that upper chamber it would enjoy a fair chance of being taken up by the Government of the day and passed into law. The Society had been founded twenty-six years ago, and never was it in a more prosperous condition than at the present time. That satisfactory state of things was in a large measure due to the fact that the Society was looked upon by architects as the machinery by which the Registration Bill will be passed into law. The proposal had been characterised as a narrow and yet not unbeneficent form of trade unionism. Well, that may play some part with the object in view; it was a desire on the part of the great body of architects to serve the interests of the general public by securing that the operations of the architect shall be carried on under conditions which shall safeguard the best interests of the public. The true architect combined technical skill with the poetry of art. Of such a character was the inspiring genius which transformed the humble cabins and hovels of a primitive age into the magnificent temples of Athens. Mr. Atherley-Jones said that it was because he cherished that ideal that he placed his services at the disposal of their great and distinguished Society. The difficulties that beset the passing of this measure appeared to have been largely due to a certain feeling of apprehension on the part of a sister body. But it was cheering to observe signs and tokens that the Royal Institute of British Architects is disposed to encourage legislation upon the lines advocated by the Society. Mr. Atherley-Jones stated his conviction that if the Society could secure the co-operation of the Institute that small but powerful influence opposing the Bill would disappear. He hoped that when they next met together they would be able to congratulate themselves upon the attainment of a work which is as much for the benefit of the general public as for the profession.

Mr. Geo. E. Bond, J.P., president, in responding, said a year ago when he last had the privilege of responding to that toast, he endeavoured to justify the position the Society had taken up with regard to the Architects' Registration Bill, and further, he was able to announce the result of a plébiscite on the question, taken by the *Builder*, which showed that out of some 2,500 replies received from practising architects in the United Kingdom there was a clear majority of eight to one in favour of registration; and that that result corresponded almost exactly with one of a similar plébiscite instituted by the Council of the Society some years previously. He did not intend going over the old ground, but Mr. Lamb, who responded for the House of Commons on that occasion, then expressed the opinion, as Mr. Atherley Jones had just done, that it was absolutely essential that architects should agree among themselves before attempting to present a Bill to Parliament, as owing to the congested state of public business it was almost impossible to carry a private Member's Bill through the House of Commons, unless all parties affected were unanimous in its favour. He (the speaker) subsequently emphasised this point, for he felt then as now, that although they were assured that a vast majority of British architects were in agreement with them on the question of registration, they could not hope to carry their Bill through if opposed by the Royal Institute, nor could that body succeed if opposed by the Society. It was therefore extremely desirable that all parties should at once agree upon the general principle of such a Bill, and he once more affirmed that the Society was not only willing, but anxious to work in harmony with the senior body in this matter. He did not suggest that the Institute should accept the Bill as it stands, but simply that it should carry its own policy to a logical conclusion; that instead of concentrating its efforts upon endeavouring to surround itself with a halo, it should attempt legislation in a broad-minded and practical spirit, in the interests not of a section only, but of the whole body of practising architects in the kingdom. Should the registration committee of the Institute, in preparing its new scheme, take advantage of its great opportunities, by including a definite proposition to apply the same qualifying tests to all future candidates for admission to the general ranks of the profession as are now applied to all candidates for admission to the Institute, it would receive the loyal support of a united profession and incidentally add greatly to its own power for good and its own prestige. The latest proposals of the Institute as to the licentiate class were humiliating.

Mr. Lamb further suggested that the time had arrived when they should decide among themselves whether architecture was an art or a profession, for if the former it should be left to its own free development, but if it was a profession it was entitled to the same protection in the form of registration as other professions. He (the speaker) ventured to suggest that at least 90 per cent. of the practising architects in this country were satisfied that it was a profession, but whether it was an art where some of the chief essentials to succeed were scientific and technical knowledge and common sense aptitude or whether it was a profession in the practice of which a knowledge of art was essential, mattered not at all to the building public, nor was the general practice of architecture affected by the question whether an individual practitioner styled himself an artist or a professional man; and he ventured to say that a definite solution of the problem would have no practical value. He was convinced that the great success of those leaders who styled themselves artists had been founded upon the fact that they were also practical men, with great business ability.

Many present, either in their private or public capacities, were interested in the employment of architects, and he asked them as practical men, whether in making a selection they were entirely influenced by a man's artistic qualifications? He felt sure they were not, for in addition to an art qualification, they required an architect upon whose strict integrity they could rely, one whose practical common sense would enable him to fully grasp their requirements, and who would carefully study the nature and routine of the business, or other work to be carried on in the building with a view to making it perfectly convenient for its purpose; one whose knowledge of construction, and of materials, would enable him to design the structure soundly and economically; and whose business knowledge would enable him to obtain reasonable tenders for the work, arrange terms of contract and carry all through to completion, protecting his client's interest with regard to ancient lights and other easements, while at the same time avoiding disputes leading to litigation with regard to the rights of adjoining owners and others. Thus, they expected their architect to be not only an artist, but a scientist, and a good man of business.

The small but select band of active "Anti-Registrationists," the members of which were their chief opponents, held that candidates cannot be satisfactorily examined in art, and that compulsory examinations would inevitably lead to stereotyped forms and a dead level of mediocrity. But the great inconsistency of this view was evidenced by the fact that most of them were staunch supporters of the Royal Institute, a body which now applied these art tests to all candidates for admission to its ranks; therefore, if their view was a correct one it would necessarily follow that the Associate members of the Institute were in danger of achieving that stereotyped mediocrity; while all those outside, being left to their own free development would have the better chance of becoming great artists, and consequently better architects, but the recognised facts stamped this assumption as perfect nonsense, for since the institution of those examinations in 1882, the standard of ability among the Associate members of the Institute had been continually rising, and at the present moment many of them were among the leading members of the profession. The Society simply desired the same principle to be applied to every candidate who wished to practice as an architect, and he thought they had reasonable grounds for inquiring why examinations which were necessary to the maintenance of the Institute's status could have other than a good effect when applied to the whole profession?

All sections were in absolute agreement with regard to the nature of the technical and practical qualifications required in the practice of architecture, differences of opinion being confined to the art side of the question, and with all due respect to their art leaders, he ventured to suggest that the rudimentary principles upon which the art was founded, its grammar and its history, must be taught, and that up to this point most architects in embryo would be the better for having received such teaching, and none will be harmed thereby. Its result might safely be put to the test of a compulsory examination; beyond this he agreed that it ought to be left to its own free development.

He suggested that without loss of dignity they might break through the veil of false sentiment which now obscures the general body of practitioners, step down among them, and look at the question from the point of view of the average provincial architect. From that side they would be able to see the tangled strands of inconsistencies with which that veil had been so closely woven, and to recognise the strength and earnestness of the registration movement, and that a large majority of their brethren had decided after mature consideration to persevere in their endeavours to carry through a broad-minded scheme of universal registration, involving a more thorough system of education and compulsory examination for all. He contended that modern conditions of practice demanded legislation on modern lines. Why should the modern false quantity of art sentiment be allowed to block practical progress? There was no absolute agreement among art leaders upon the principles which had determined the evolution of architectural art.

All thoughtful observers must acknowledge that the architecture of to-day, with its affectations, individual eccentricities and random impulses, reflected very fairly the mental conditions in which they lived. But some of the great teachers and lecturers, men recognised for learning and ability throughout the profession, condemned this view; one told them to "leave all such notions to the industry of German speculation." They agreed in tracing the evolution of styles to either the influence of the materials at command, or to structural requirements and necessities, and in sweeping away all theories which connected human emotions with architecture. Their immediate predecessors, the teachers of a past generation, emmeshed the art in a perfect network of definite rules and regulations which had their influence still; here were conflicting views taugh to-day, neither were correct as it stood, but by combining th two they might arrive at the truth with regard to architectura art, an art which was the outcome of centuries.

Were an art qualification the only requirement in th practice of architecture, he would say leave it to its own fre development; for in the past all art teaching had been to dogmatic. As previously suggested one might with advantag teach its principles, history and grammar, but its highe forms could only be inculcated as a spirit, and not taught a a creed. There was in every art a gradual evolution from crude simplicity to more complex forms, and without doubt educated sensibility would derive pleasures more elevated an refined from the more elaborated forms. There was, however a limit beyond which such elaboration must not pass, or would have a reverse effect; this was particularly true wit regard to the art of architecture, all examples of which we judged by some definite standard of taste.

During the last fifty or sixty years, standards of taste i architecture had been almost as numerous and as ephemer as those in the art of millinery. In his Romanes lecture Oxford on "Questionings in Criticism and Beauty," M Balfour said, "The history of taste yields no positive result as all our great critics have been engaged in sweeping aw the rubbish of their critical predecessors." This being t case, he thought it unwise to dogmatise, for every age wou fit its own standard; in the past, the master genius had s some particular fashion, and his disciples had followed i dictates with more or less fidelity; and as modern conditio did not conduce to the individual practice of clear and origin thinking, this state would obtain in the future. Therefo as the modern practice of architecture involved scientific a technical knowledge and business ability as well as artist taste, it was obvious that no artist without practical kno ledge could be an architect, and they desired to establish definite minimum of these combined qualifications below whi in the future no man should be entitled to style himself as architect. Such a minimum would not check advance in a of the branches; the master mind would still rise ab dogmatic limitations, for true architectural genius could be confined within a ring fence of rules and regulations, would be continually inspired to break forth and evolve n combinations of those beautiful lines, beautiful forms a beautiful colours which were the basis of the art and wh were constant in the effect which they produced upon cultured intellect.

At the conclusion a presentation of the Society's g medal, and a silver tea and coffee service, was made to Mr. E Marsland, past honorary secretary, by Mr. Bond, who s that Mr. Marsland had rendered such long and faithful serv that the Council decided to present him with some tangi token of their regard. It was at once determined that individual subscriptions should be limited to an extrem low amount, so that they should be thoroughly representat As a consequence subscriptions had come in from every p of the Empire. Mr. Marsland had always remained tru the interests of the Society, and had been one of the champions of registration. At his own expense he attended conferences held in large centres in order to expl the aims and objects of the movement; and in some cases succeeded in turning organised opposition into active supp Thanks to such efforts the success of this object of the Soc was now in view. All that is wanted is one strong persona with courage to step into the breach and apply balm to sore spots caused by twenty-five years of struggling. recent plébiscite showed the general body of the profes were waiting for some such lead. It was to be hoped that a person would step forward.

Mr. **Ellis Marsland** said in the first place he wante thank everyone for the honour done in presenting him the gold medal—the highest honour which the Societ rchitects could confer. He also wished to express thanks or the splendid testimonial. Mr. Marsland said that he ould flatter himself that some years ago he had been of ervice in promoting the registration of architects. The priniples of the movement were in the first place received with ndifference, and even with ridicule and contempt. The stage f indifference became one of reflection, and ultimately one f recognition, until at the present time a large majority were n favour of those principles. The only point was how to arry them out. It would be unwise to even suggest what ould be the best method ; but there certainly would be found ome way out of the difficulty, and in the meantime they must ait and see. The post of honorary secretary to the Society as a responsible one, and should not be occupied too long by ny one individual. When an opportunity to quit it had risen some time ago, he made up his mind to leave to a ounger and more able man to continue the good work of the ociety. His work as honorary secretary had enabled him o visit towns in England and on the Continent, to see things nd to make friends, all of which he probably would not have one under ordinary circumstances. The medal and the andsome testimonial would ever remind him of the pleasant ime he had had and the large number of friends he had made, any of whom were present that evening.

Mr. Henry Tanner, jun., F.R.I.B.A., proposed "The ocal Authorities," and paid a tribute to their unfailing ourtesy under trying circumstances. The regulations they ad to administer were framed for the good of the greatest umber, and in consequence the few might have to suffer ccasionally. Their duties ranged from the London Building ct to the examination of milk, and the removal of banana kins from the pavement. Mr. Tanner commented on the naccuracy conveyed by Mr. Bond when he suggested that he members of the Royal Institute were not practical men. his was not the case.

Mr. Cyril Cobb, vice-chairman of the London County ouncil, in responding, expressed his thanks for the kind emarks made about the London County Council, especially as any things in the regulations must be galling to architects. e sometimes wondered whether there might not be some body xercising jurisdiction over the buildings about to be erected. he Council itself had already enough to do without being hat body. He suggested that at least one of the London ounty Council buildings which stood very near them, viz., e Day Training College in Southampton Row, fulfilled the equirements of what a public building should be. With egard to their educational work he would like to say that the ouncil took a very great deal of care in the instruction of the oung people, and endeavoured to render it of a practical aracter. They hoped by laying a foundation of sound views turn out the boys as really good craftsmen.

Alderman Max Clarke, F.R.I.B.A., Mayor of Holborn, ho also responded, made a brief defence of the new Old ailey, a building which had been designed by a really great an who had done his best. It was part of the unfortunate osition of architects that they incur faults which they have power to stop as the work is going on, or even to express an inion whether it would be a success or not. It was the eaker's unlucky privilege to attend the Kennington Sessions, d he was convinced that that old building was fifty times rse than the new Old Bailey. There were admittedly two bjects about which most architects in this country or any her knew nothing, viz., acoustics and ventilation. The ole was a series of experiments. If the results are unsucssful, then the architect is blamed ; if the experiment is oderately successful the architect is never congratulated. the Council of the Royal Institute they were doing exactly e same with regard to registration as was being done with gard to acoustics and ventilation ; that is to say, they were ing their best. The Bill that was being promoted would obably be treated in the same way as the public treat archits. But so long as a beginning was made, that was the thin ge of the wedge. It would be a great advantage if the archits in the Kingdom would state their views in black and ite, for it seemed as if several people say they are registranists, and then when the time comes they do not act upon it. ch people try to run with the hare and hunt with the unds. Mr. Max Clarke said he begged to differ slightly from President's remarks as to the antagonism existing between two societies.

The toast of "Our Visitors" was proposed by Colonel S. Leslie, R.E., hon. secretary, and responded to by Mr. nest H. Lamb, C.M.G., Mr. H. D. Searles-Wood, R.I.B.A., chairman of the Royal Sanitary Institute, and . Frederick Higgs, president of the Institute of Builders.

## THE ARCHITECTURAL ASSOCIATION.

"Arctia."

"Arctia," a musical play in two acts, written by Mr. Gervase Bailey, and composed by Mr. Leonard Butler, was rendered by the Association on Monday and Tuesday evenings last at the Royal Court Theatre. The scene is laid on the terrace of the Royal Palace of Arctia, and though within view of snow-capped hills, "where the wild winds rage and the tempests blow," the assembled court, judged by their costumes, appear indifferent to the chilly air.

Into this legend of the Far North an architect intrudes. He has built temples by the score and of town halls even more, but not content with so much success this effete old monopolist plans castles in the air ; but we anticipate the story. King Rudolph of Arctia has some ambitions and an only daughter, the last of the royal race of Icebergs, whom he is ready to sacrifice as a hostage to fame. He would have us believe that his purpose is to test the love of suitors for the Princess's hand, and he stipulates they must undertake the small task of discovering the Pole. The Princess is agreeable to abide by these conditions for her Queen Mother favours the suit of Vinolia, architect-in-chief (Mr. G. B. Carvill). Had Vinolia wooed with such sentiments as "if I built a world for thee," the maiden perhaps would have listened even to such an old man, but instead he reveals a despotic nature.

You may talk of architects,
And their merits and defects,
Of their powers of construction and design ;
But such trifles do not matter,
You ignore them and grow fatter
In a little State monopoly like mine.
If a tower should collapse
Then you hang the builder chaps,
While exhibiting a little decent grief ;
If a town hall look unsightly
You behead your staff politely—
It's your duty as the Architect-in-Chief.

If this jackdaw mates with the linnet we shall be grieved, but No ! a wondrous happy surprise excites us. The keeper of the seals hurriedly approaches the king and reports a strange phenomenon in the sky. Is it a comet, a shooting star, a flying pig, a blue moon ? No ! a thing never imagined. Out of the dim distance, across the walls of snow, an airship approaches. It sails past the terrace and discloses to view the daring occupants, strangers of an unknown clime. In aviation we are evidently only regaining a lost science, 'tis perhaps as old as life in Mars ; the play would have us believe so, for instead of the hairy goggled bogies we associate with flying machines, these adventurers are Vikings, and prove to be Count Ripolin, flashing like a meteor, of the Viking Exploring Expedition ; Sigurd, a Viking chieftain ; and a small band of chosen men. Time and petrol may be precious for these warriors speedily acquaint the court with their mission.

The Princess and Sigurd happily meet, he divines her fate, and resolves to gain her. She gives him a magic wand, on which is inscribed the legend that it will stand upright on the spot where the pole is. Vikings we always believed were fierce men, but this Sigurd is a modest youth. Perhaps a trip in an airship cools one's ardour, and we could see from the first that Princess Hilda was ready to meet the tender youth half way, and she beguiled us all with her plaintive notes.

The King and his Prime Minister, Sapolio (Mr. H. M. Whitehead), discuss affairs of State, which very properly give the versatile and excellent Sapolio an excuse for song and dance.

On the summit of a spire sat a little weather-cock,
Cock-cock-cock-a-doodle-do.
He was specially designed, not a specimen from stock,
Hey, but my tale is true.
He'd a golden comb and wattle and a little golden mane,
And his tail blew out behind him in a shower of golden rain ;
He was quite the little weather-cock, and not a little "vane,"
With a cock, cock-a-doodle-doo.

So he turned to the East,
Though he liked it least,
And he turned to the West,
For he liked it best ;
When it roared from the North
He would turn in his wrath ;
When it sighed from the South
He would open wide his mouth
In a long cock-a-doodle-doo.

*Chorus.* With a cock, cock, cock-a-doodle-doo, etc.

And all the people said, "What a trusty little bird
Is our cock-cock-cock-a-doodle-doo.
The way he shows the wind that blows is really too absurd,
Hey, but his tail is true."
But the winds they didn't like it and were mightily put out,
For he showed them all in turn how each one was put to rout,
So one day they all came whirling in a mighty water-spout
On that poor little cock-a-doodle-doo.

Then the wind from the East
Behaved like a beast,
And the wind from the West
Hit him hard in the chest;
And the wind from the North
Belaboured him in wrath,
While the wind from the South
Smote him full in the mouth,
And stopped his cock-a-doodle-doo.

*Chorus.* Oh, cock, cock, cock-a-doodle-doo, etc.

Then the wretched little fellow didn't know which way to go,
Cock-cock-cock-a-doodle-doo.
And he spun upon his axis till he reeled with vertigo,
Hey, it is sad but true.
And soon his bearings got so hot they jammed and he stuck fast,
Till a mighty wind came buffeting and snapped him off the mast,
And he fell among the pinnacles expiring with a last
Long cock-cock-cock-a-doodle-doo.

It may blow from the East,
But he heeds not the least;
It may blow from the West,
But it breaks not his rest;
It may blow from the North,
It will never raise his wrath;
It may blow from the South,
But he'll never ope' his mouth
In another cock-a-doodle-doo.

*Chorus.* In a cock, cock, cock-a-doodle-doo, etc.

The Queen and her *protégé* resolve to spoil Sigurd's chance, and the scheming pair draw attention to an old law which enacts that all strangers setting foot upon the soil of Arctia shall pay for their audacity with death. The King and his minister Sapolio are not to be baulked in their endeavour to claim the Pole within the realm. His Majesty announces an amendment which rescinds this extreme sentence if the stranger can discover the Pole within the year. Sigurd, with all the confidence of youth, departs to find the Polar axis with the icebergs spinning round.

ACT II.—A year has elapsed. 'Tis the merry month of May, and Princess Hilda is disconsolate. Sigurd has not been heard of and preparations are made for the wedding of the Princess to Vinolia. The latter would claim our goodwill and attempts to exhibit youthful elation.

A was an Architect, old in his prime.
Pity the architect.
B was a Builder who took his own time.
Pity the architect.
C was a Client who had his own views,
D was the Details that no one would use,
E the Erection he tried to excuse.
Oh, pity the architect.

*Chorus.* Oh, pity the architect,
Why on earth did he ever select
Such a silly profession?
Then hear his confession,
And pity the architect.

F was the Frontage exceedingly tight.
Pity the architect.
G was the Ground Plan exceeding the site.
Pity the architect.
H the Half-timber he had to reveal,
I was the Ironwork he had to conceal,
J was the joinery, mostly of deal.
Oh, pity the architect.
Oh, pity the architect, etc.

K was the King-post that ought to have stood.
Pity the architect.
L the stone Lintel that proved to be wood.
Pity the architect.
M was the Mullion that blocked out the light,
N was the newel too thin for its height,
O the oak sill that was not water-tight.
Oh, pity the architect.
Oh, pity the architect, etc.
P was the Price on the contract agreed.
Pity the architect.
Q was the Quantities down to a bead.
Pity the architect.
R was the Rage that the client displayed,
And S the Sarcastic remarks that he made,
When T was the total that had to be paid.
Oh, pity the architect.
Oh, pity the architect, etc.

U was the Umpire called in to decide.
Pity the architect.
V was the Value the client denied.
Pity the architect.
W stands for Words that he said,
X was the Xtras for which he was bled,
Y Z the Young Zealot who wished he was dead.
Oh, pity the architect.
Oh, pity the architect, etc.

Count Ripolin (Mr. A. W. Bentham), desperate and loyal to his absent adventurous chieftain, plays to gain time, and in song and dance terrorises King, Queen and Count by narrating the fiendish diversions of Vikings. King Rudolph and Ripolin must be acting in collusion for his Majesty has a song up his sleeve. Perhaps he had received a wireles from Sigurd, for he tells of a good time coming.

Then no silly little worries will distract the Architect,
He'll be master of his soul and fancy-free;
He will simply be the Artist (with a most emphatic A)
And Designer (with a more emphatic D).
He will sit before his canvas with his baccy, pipe and pot,
And await the inspiration that will either come or not;
Then he'll seize a chunk of charcoal and will dash it in red-hot
In the Golden Age to be.

In the Golden Age, in the Golden Age,
There will be no angry clients to assuage;
There'll be no specification,
No Plans or Elevation,
No girder calculation,
And no Extras arbitration,
In that great and Golden Age.

At this point Sigurd appears, having failed to discover th Pole. Finding the city and palace decorated, he realises tha preparations are being made for the wedding of Prince Hilda. He conveniently faints on the terrace, thus allowin Hilda to hurriedly approach him. She proposes to elop with him in the airship. Vinolia overhears the plot, cu the cover of the airship, and has Sigurd made prisone Before the King, Queen, and Court, Sigurd admits h failure. He demonstrates how he sought to discover the po by means of the magic rod, and hazarding a throw, to th astonishment of all it stands alone and upright upon th very polar axis the King has built his palace. His anxiety at an end. Sigurd weds Princess Hilda, and realises th dream of his life. Vinolia, sharing the common fate of arch tects, does not, and the lesson we learn is that though may soon be able to fly, we must never dwell long in castl in the air.

Mr. Butler and Mr. Bailey are to be congratulated on th revival of their clever and tuneful production, and to th company of players we offer our compliments and thanks f an evening's entertainment.

---

MR. R. W. SMITH, of South Dene, Filey, is going undertake next autumn the erection of a ferro-concrete s wall from Primrose Valley towards the Flat Cliffs, to strain the constant slipping away of the cliffs on his L Whinns Estate. This important work will represent most extensive private effort yet made to combat sea eros on the Yorkshire coast. It forms part of a larger sche having for its object the building of a garden township villa residences on the Primrose Valley cliff-tops. C siderable strides have already been made in this work an artificial lake, having an area of some three acres, been formed.

## WATER SUPPLY ARRANGEMENTS FOR FIRE PROTECTION.

By F. J. Warden-Stevens, M.I.M.E., A.M.I.E.E.

THESE brief notes are intended to apply more particularly to large buildings such as factories, institutions, warehouses, estates, &c., in which cases it is very necessary that arrangements are available for protection against fire and to avoid being solely dependent on outside assistance of the public fire brigade.

It is proposed to refer specially to modern arrangements to ensure a proper water supply at various positions about the buildings, with facilities to enable such supply to be used at the outset in the event of fire occurring, as no doubt the question of the water supply is the most important one in connection with an outbreak of fire.

The conditions frequently existing with regard to the water supply in a large building are that a tank or tanks are fixed in the roof, these tanks being supplied by rising mains connected to the supply main. In the event of there being a staff fire organisation, hose cupboards may be available, with standpipes, or there may probably be a pail system, or emergency hand-pump appliances. Speaking generally, however, the proper arrangements of the water supply for use in case of fire are not sufficiently looked after in view of quantity, pressure, and facilities, and the following may be stated as modern conditions:--

There should preferably be a special main to which hydrants should be connected both outside as well as inside the building in important positions and on every staircase and every floor, and hoses should be left connected to these hydrants. This fire main should be in the form of a circuit with double ways for the water and with sectional valves, to enable any section to be disconnected in the event of a burst. The branch circuits from this main to the various sections of the building should also be controlled by valves to avoid obstacles to the main flow or reduction of pressure in the event of any branch circuit being rendered useless. This fire main should be connected to the high-pressure supply, and this connection should be near to the entrance, where the public fire brigade can connect their engine without difficulty. In addition, a fire pump should be provided and connected to the main at the same position.

Care should be taken in the selection of the pump to provide for air vessels of large size, as well as suction and delivery pipes of ample capacity, and to ensure free flow of water with a minimum of friction. It should preferably be of the duplex direct-acting type, and should be capable of "boosting" the supply pressure to secure a good pressure of water well above the highest parts of the buildings. This pump should be worked by power, and should be available for use at a minute's notice. In the event of a steam supply not being available in the buildings for other purposes, an electrically driven or oil- or gas-engine driven pump may be adopted. Failing either of these, a manual fire pump must e resorted to, although for large buildings power can generally be arranged.

A storage tank of large capacity and elevated is advisable, which should be kept full and solely for use in the event of ire, to be brought into use at the outset. If there is difficulty n obtaining a sufficient elevation, a pressure storage tank at round level can be adopted, the pressure being maintained by an air compressor. The general water supply system may be so arranged that the storage from the ordinary supply anks may also be used.

It is most necessary that particular attention be given to he pipe fittings, valves, joints, and connections, to ensure gainst bursts or leaks due to the increased pressure necessary in the case of fire.

A hose of useful size, 2½ or 3 inches, requires a pressure of bout 40 lbs. at the nozzle for a one-inch jet to reach a height f 75 feet, but it must be remembered that the loss of pressure in the hose is considerable and that the pressure in the main alls when several hydrants are in use, so that a high water ressure must be maintained, say about 60 lbs. A first-class type and quality of hoses are necessary to withstand the pres-ure, as upon this depends the satisfactory use of the water upply available. A good rubber-lined seamless canvas hose a suitable type and will withstand a high pressure.

As to the quantity of water necessary to maintain the fire upply, it may be allowed that each jet of water requires bout 100 to 200 gallons of water per minute, depending upon he size of jet and height to be delivered, so that a very con-derable quantity may be required.

Prevention of freezing of the water in circuits only used in case of fire can be secured by allowing a slight flow of water to cause circulation in cold weather.

As a first aid, reference to the use of water-buckets kept in convenient positions, and also emergency hand-pumps with tanks self-contained, must not be omitted. It must, however, be ascertained by periodical inspection that these are not allowed to be left without water or to be used for other purposes, thus rendering them useless in time of need. It is to be noted that a thin film of glycerine on the surface of the water in these buckets and tanks will reduce evaporation. Periodical inspection is also very necessary to ascertain that the pump is in proper working order, and the main, hoses, connections, and fittings watertight.

Having now referred to arrangements to ensure a satisfactory water supply being available and facilities for using it at various positions throughout the buildings, mention should be made of arrangements for automatic distribution of the water in isolated portions of the buildings or in parts not coming under frequent observation. In such cases, automatic water sprinklers may be frequently adopted with advantage. These consist of sprays or jets attached to water-pipes distributed and fixed on the surface of the ceiling. These jets are kept closed by fusible metal caps and only released by collapse of the covers when the temperature becomes abnormal.

In concluding these notes it may not be out of place to refer to the notification of fire to bring the available water supply into use. The alarm system frequently adopted is that of electric contacts enclosed in glass-fronted cases. These contacts operate a central indicator and gong, and the alarm may be augmented from the central indicator by the operation of a steam whistle and gongs in various important positions about the buildings. For night watching an automatic check or telltale system is usually adopted.

These arrangements, in conjunction with a complete telephone system, can ensure prompt action without panic, as, on an alarm being given from a certain position on the premises to the central position, the telephone system enables the circumstances to be ascertained and immediate notification given in some or all quarters, as may be necessary, either by telephone or alarm, or both, as occasion may require; after an alarm, the operation being to make use of the fire buckets and hand-pump in the particular location of the fire, and, if the conflagration justifies, to run out the hose from the nearest hydrant; then for the fire pump to be started, and, if circumstances should necessitate, a telephone message to the public brigade.

It is to be hoped that these brief notes will act as a reminder of the importance of this question, which, it is to be feared, is apt to receive insufficient consideration, notwithstanding the disastrous fires which only too frequently occur. It must also be remembered that insurance against loss by fire does not minimise loss of life, or the great inconveniences that are caused by fire, or even that the full financial loss is recovered.

First aid in the case of fire is of the utmost importance, and proper appliances are useless without a water supply at a high pressure in sufficient quantity and at various positions.

## AN ARCHITECTURAL WALK FROM WESTMINSTER TO CHARING CROSS.

By Percy Fitzgerald, M.A.

WE could imagine a pair of thoughtful, enquiring architects wandering from Parliament Square, Westminster, to Charing Cross, criticising and discussing as they walked all that they saw on the road. Much might be learned and much seen that was unsuspected. For on this route are crowded works of architects of all sorts and conditions. Here is the great Inigo, Robert Adam, even greater in his line, Sir Charles Barry, Nash—the French school even, Pugin, Brydon, Young, and others. Here is Gothic, Palladian, Early English, French, Georgian, Late Victorian. And here are contrasted many styles, with many striking things and some mistakes. If the reader will follow me on this promenade I will show him things that he may never have thought of observing.

The architect of to-day must look with surprise or amazement on the attempt to fashion Westminster Hall and the new Houses of Parliament into one building. As they are of different styles, of different alignment, and are antagonistic in every way, the task seemed impossible. But it was rashly attempted, and the Hall was encrusted on to the outer shell of the new Palace. The old fabric now lies embedded as it were in the vast bulk of building that has grown up about it. Seen on the ground plan, it lies a distorted rhomboid in the middle of the fair regular lines of the newer Senate House. And what a difficult problem it was—the Palace was to follow

DESIGN FOR A MUSEUM AT INNSBRUCK.—Herr Heinrich Ried, Architect.

the line of the river on the one side, while on the other it had to join on to the old Hall which was all "askew." At the extremity a sort of gable or wing from Barry's Palace projected, and the two buildings mixed up together were made to join after a fashion. The contrast of the two roofs, each of a different angle and height, the vast expanse of the older one contrasted with the attenuated coverings of the new is strange indeed. The whole effect of the composition is bewildering. What was to be done? it may be asked; the attempt had to be made. The real question is *que diable fait-il?* &c. Why think at all of blending the old and the new together in this fashion? The thing was literally impossible. Yet for more than half a century no one could make up his mind as to what could be done. We may lament all this falling away when we think how noble would have been the effect had the square been completed and the Gothic buildings been carried right on to join the other portions. What a Palace! How broad and solid! Now it seems but a thin unsupported strip carried along the river side. What have we not lost by this inconstancy and hesitation of treatment? We ought to see now before us a noble block of substantial buildings starting from the bridge and tower—a long stretch of Gothic work—the corners taken off to form a great gateway of entrance, the building carried on and turned a right angle, another long stretch, with its Gothic pinnacles and rows of Perpendicular windows, completely enclosing Westminster Hall. It would then join the existing portion, where the equestrian king stands—or rides. Entering by a great archway, we should have found ourselves in a great courtyard—Gothic all round—the front of the Hall removed, for it was a comparatively modern restoration, and something more harmonious substituted.

Within Westminster Hall there is palpable evidence of the attempt to join these incompatible things together. First the upper end was knocked out altogether, a flight of steps being introduced which led up to quite another level leading away on the left to the Parliament lobbies. What was the effect of this vandalism? The noble old Hall was on the instant transformed into a passage. And a passage or corridor to the Parliament House it has remained ever since. A further beautiful window is seen beyond, "Perpendicular" in style; but here the levels did not allow of its crest falling below the oaken roof of the Hall, which cuts across it. To cure this blemish Barry intended raising the whole roof by hydraulic screws, thus adding to the height of the walls, which would have destroyed the proportions.

Sir C. Barry always has the credit of this great work, and a real architectural success it is. But those who have studied Pugin's style and principles can recognise his elegant touch in every direction. All the ornamentation is admittedly his, and one might certainly credit him with the beautiful *flèche*, worthy of St. Ouen. *Apropos*, how amazing that the Canons of Westminster, who look so carefully after repairs and renewals, should never have thought of restoring their old spire, for which the base is ready waiting. It would be both cheap and easy, were it made of timber covered with lead or copper; and what an improvement to the old fane. I recall when the Houses of Parliament were in a perpetual state of decay and renewal. There was always a long row of scaffoldings up at some portion or other while this work went on. Now the destruction seems to have been arrested.

Nowadays we can hardly realise the barbarity of sending recalcitrant M.P.s to the Clock Tower for imprisonment. This was done within our own memory. Imagine the horrors of having "Big Ben" all but at your ear! Sleep must hav been out of the question, but madness very much in question. Another barbarity was that of making the poor clock-winde ascend some hundred of steps every day for his duty. Now, we believe, there is a lift. It is curious how a simple thing wil destroy all æsthetical association. For this clock-face see from afar had suggestive, even poetical, associations. But i has been converted into a sort of giant lamp post or lighthouse and when Parliament sits a great flaring lamp blazes from it summit to tell far away members that the House is sitting o "up."

It may have been noticed that the great Victoria Towe seems too short and too thick for its bulk and lacks proportio in reference to the far-spreading building below it. Th truth is Barry for years was projecting it skywards, until a last Parliament interposed with a peremptory order to sto and to put the cap or crown on. This he had to do. I reca this autocratic interference perfectly. It is quite clear tha some later "hand"—was it Edward Barry?—added th arcade below the Clock Tower in Palace Yard, which is dis cordant with the fabric, not only in style but in the materia for it seems made of a white Portland stone, whereas th fabric is of a yellow tint. The "grille" and its supportin piers are equally uncongenial, and seem to belong to anothe era. Pugin would have revelled in the task.

The Clock Tower is an elegant and original structure, bu we see it now as it was never intended to be seen—that is as detached tower. I remember when the whole side down to th ground that turns towards the Abbey was all exposed, with i inner bricks, &c., waiting for the building that was to attached to it. The Clock Tower would thus have risen out the building of which its lower half would have formed corner. I remember how the workmen were set to work cover it with carvings, &c., setting up an arcade in front, an an enclosure round Palace Yard.

The head or dial was long a great difficulty, and sever experiments were made, the Prince Consort making sugge tions. It must be said the arrangement is cleverly and grac fully managed. At the time of the fatal addition that w added on to it, an alternate scheme was to build on a continu tion of the main building so as to completely shut it in.

The great Gothic entrance to the Victoria Tower was on a subject of keen discussion, the point being whether t opening should be carried up for two storeys as it is now,

## MODERN EUROPEAN ARCHITECTURE.

[From *Der Architekt*

DESIGN FOR A MUSEUM AT INNSBRUCK.—Herr HEINRICH RIED, Architect.

for one. It is said that the former course is out of proportion and has dwarfed the structure by creating a false scale.

It is difficult to exhaust all the artistic mistakes that have been made in this quarter—notably that of putting the great Oliver in a sort of bear pit. Were he placed on a common pedestal we should have had to look down on him; so double pedestals, one on top of the other, were contrived to raise him to the level of the street. This wanton treatment of one of our greatest men, as though we wished to hide him away as much as possible—which actually was the case at the time—was unworthy.

The imposing Place de la Concorde in Paris occurs to us as we gaze on the somewhat rude disposition of Parliament Square for which art and nature have done nothing save "uglifying." The grass plot, with its meagre flower beds, has been divided into two by a walk, and each plot has been enclosed by a railing of true ironmonger pattern. The disposition of the four statues is terribly symmetrical. What a gain were it if the whole ground was laid out in asphalte as a public *Place*, the grass plot where Canning's fine statue stands being included. The equestrian statue of Edward I., now so awkwardly placed on its very low pedestal beneath the shadow of the House of Lords, might be set up in the centre, and the four statesmen in frock coats dotted about here and there. There might be rich ornamental lamps of large proportion. All this would be very imposing, and there would be an air of space and animation from the quantity of vehicles crossing and recrossing. But who would have the courage to make this vast change? Yet the great and important mass of buildings surrounding it clamour for space unencumbered, and would be seen to far greater advantage. If the Abbey enclosure could be thrown in, how fine would be the effect! But that is hopeless. Sir Gilbert Scott's building at the entrance of Dean's Yard is successful enough and harmonises well with the Abbey.

Here is the good old robust type of church, St. Margaret's, not at all disagreeable to look at, though rude enough in treatment. But what could have prompted them to stick on, as with paste, that extra Gothic portico, with its pinnacles, crockets, &c., and all, as Elia said of the "Anatomy of Melancholy," in a modern dress—so "heartless"? There, however, it has stood, I suppose, for twenty years. I fancy they intended treating the whole church in the same way. But the incongruity seems unpleasant.

Have we lost the art of expressing the finer abstract qualities in stone, such as stateliness, nobility, dignity? We may note a falling off in these things during the past years. Witness the case of doorways and gateways. In all these new public offices the entrances are poorish and undignified—at least not worthy of a vast building such as the Colonial Office, where a modest door leads to hundreds of passages and rooms. Now Sir G. Scott's Foreign Office has a singularly stately entrance, quite worthy of the huge palace that stretches back to the Park.

We look with some astonishment at the rich adornments of this palace, covered as it is with columns and statues and carvings, and wonder how the officials could have reconciled themselves to such extravagance. Hardly a foot of it is uncovered by decoration. Lofty are the windows, with plenty of space on either side. In those days nothing was spared. At the close, however, an unmeaning economy prevailed, and for some fifty years the corners have been left bare, and without their completing towers. How much these would add to the attraction of Parliament Street may be conceived. The jagged edges look very rude and unkempt. How spacious and stately are the great courts within. No stint of room. In the modern buildings, where room has become precious, the courts are attenuated and starved.

As we go up Parliament Street we may note two specimens of the *modern* arch—one on each side. One connects the two blocks of Mr. Norman Shaw's well-known and much admired work, the Police Offices; the other, on the opposite side, links two public offices together, is rather monumental in character and richly sculptured. But it offers the disturbing reflection that it is not intended as a place of entrance to an enclosure, but is entirely devoted to being a passage of communication *over* the archway, as we can trace by the outer surface and a too significant skylight. Thus is destroyed the whole nobility of an arch proper, or introducing the utilitarian element that always mean association of the "double debt to pay" contrived to get double work out of the same thing. The most notable specimen of which is to be seen within St. Paul's Cathedral, where Wren's broad, imposing cornices resting on pilasters are converted into a convenient walk and furnished with a richly gilt railing to emphasise it. Amazing! These communicating passages are really not arches at all, but bridges, a specimen of which is that elegant work of Robert Adam in the Adelphi, where two blocks are joined. The effect of the sculptured arch is, however, enfeebled by a petty cause. The footpath is so laid out as to enclose the base of each of the piers, following a very ugly curve. This weakens the solid aspect of the work. The two piers should spring straight out of the roadway, while the footpath should be limited to the two smaller arches.

The Treasury is a pleasing building, floridly treated, and decorative in character. But who thinks that it was originally an old red brick mansion, with rows of long windows, taken in hand by Barry and stone-faced in architectural style? It is cleverly done, and no one would suspect the change. The Treasury represents a florid style which was in high vogue say sixty years since, that is, is of rich cornices and fluted columns. Barry used it for his country houses, &c. There is a reflection of it in Lord Ellesmere's house close by St. James's Palace. In those days, circa 1840-50, everyone "swore by" Sir Charles Barry.

The Foreign and India Offices are a very successful work, and almost always impress the ordinary "passenger." There is something almost palatial about them. They suffer, however, that torturing process of "broken back" alignment now getting so common. Its success was owing to—or perhaps in spite of—a sort of "happy go lucky" arrangement between Scott, the architect, and Lord Palmerston. The original design was pure Gothic, all pinnacles and lancet windows. When the foundation had been got in, so the story runs, it was shown to Lord Palmerston, who summarily rejected it on the ground that it was too dark for the clerks to write in. He demanded an Italian design, which the complacent Scott supplied and fitted to the foundations. The architect, it was said, had never attempted an Italian design before, but no one could consider it a failure. The rejected design is said to be that of the great Midland Hotel at King's Cross, a fine, imposing structure. Few even of the architects may have noticed that the walls and towers are sloped inwards as they ascend, and that each storey recedes beyond the one below it. The same thing will be found in the new Ritz Hotel, the work of a Frenchman, and may account for its tone of refinement.

There is an old Georgian house next to the United Service Institution which offers a certain charm for anyone of true taste. It is the work of the Adam Brothers, now fast disappearing from London. In the centre is a truly pleasing, even elegant little composition, a group of arched windows on the first floor resting on the doorway below, both united. But violent hands have been laid on the latter, some of the columns carried away, the top unmeaningly altered, and the flat pediment resting on double columns shaped into a curve.

The detached building just completed beside the War Office was originally adorned with the old-fashioned decoration of four vases, which lent a certain piquancy. It occurred to the authorities that these either suggested something bizarre or were too ponderous for the façade, so they were removed. They forgot, however, that at the time there was a wooden hoarding round the base, which cut off the basement storey. As soon as this was taken away the building gathered weight and importance, and it is clear that now the vases would be appropriate enough.

(*To be concluded.*)

## THE "OLD" WATER-COLOUR SOCIETY.

THE Summer Exhibition of the Royal Society of Painters in Water Colours at Pall Mall comes as a welcome harbinger of spring. The majority of the pictures tell of sunny hours and sunny scenes; though by this we do not mean that the artists have all gone out of England for their subjects. Indeed, the reverse is really the case, as was to be expected so long as the President of the Society—Sir Ernest A. Waterlow, R.A.—is content with rural England. To the present exhibition he has sent twelve works, nearly half of which are taken from the neighbourhood of Pulborough, Sussex. This is a district which is becoming more and more favoured by artists, who find there a wide variety of scenery still unspoilt by modernism, though this latter characteristic appears to be slowly vanishing. The President's style and orthodox manner make an arresting contrast with that favoured by many of the other bright particular stars of the Society. For example, his "A Bridge on the Marsh near Pulborough" (3) should be compared with "Iona, Sunlit Sea" (6), by Mr. James Paterson, or "Under the Rialto" (7), by Mr. John S. Sargent, R.A., or even with No. 14, "By the Dancing Rills," by Mr. J. W. North, A.R.A. The work of Sir E. A. Waterlow is marked by painstaking thoroughness and attention to the minute details; it is like a beautifully printed page out of nature's book. Mr. Sargent and Mr. James Paterson are attracted towards a sketchy memorandum style which only gives the essentials, and from which the onlooker must create his own mental pictures. Mr. Sargent's two contributions are "Under the Rialto" and "Base of a Venetian Palace"; they are authoritative and decisive, but appear to err in giving too little assistance to the spectator. Mr. Paterson is more detailed, and really concentrates his attention on some particular part of the picture, the remainder being made to emphasise that part.

Most of the familiar exhibitors at this the "Old" Water-Colour Society appear once more, and help towards an exhibition that is full of interest. Mr. Reginald Barratt sends further drawings from India which are full of brilliant light. Two of the four contributions by Mr. Herbert Marshall treat more or less of architecture: the "Lincolnshire Marshland" looks towards the Boston Stump, and "Ludgate Hill from the Steps of St. Paul's" shows prominently the unusual spire of St. Martin's Church. Mr. R. Thorne-Waite is another artist who still finds a sufficient number of beauty spots in England to monopolise his twelve sketches. On the other hand, Mr. R. W. Allan has drawn upon three continents for sketches, only leaving the New World untouched. Mr. Albert Goodwin, as usual, has gone out of the country. In "The Pyramids" he has given a new reading of a well-worn subject, and he arouses a feeling of awe as distinct from the feeling of wonder or delight which seems the more usual object of painters. The spot chosen is at the very foot of, and within the shadow of, one of these towering structures. A novelist recently asked, "Isn't a rose more wonderful, more mysterious than all the pyramids Egypt ever built to hold the corpses of a few conceited men?" To most minds a rose must arouse different sentiments to what are prompted by the Pyramids. Mr. W. Mathew Hales finds most attraction in Venice. Among other artists who as usual have sent are Mr. H. Clarence Whaite, Mr. T. M. Rooke, Mr. Arthur Rackham, Miss Clara Montalba, Mr. Huges-Stanton, Mr. J. H. Lorimer, Mr. Tom Lloyd, and Mr. J. Jessop Hardwick.

It will thus be seen that the "Old" Water-Colour Society offers many attractions of the expected kind, and in addition there are unfamiliar contributions which add to the interest.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* (New York) makes its latest issue to hand, as far as illustrations are concerned, a monograph of the work of Mr. Guy Lowell, including "a building for music," at Bar Harbour, Me., in Greek Ionic, and a house at Bar Harbour, a severe and refined study in Italian Renaissance.

*La Construction Moderne* (Paris) illustrates the Villa Medici, the home of the French school at Rome, and a house for an artist at Levallois-Perret, of which M. Cuinat is the architect. Continuing its account of old Paris our contemporary now deals with the Quartier de Grève.

*Berliner Architekturvelt* (Berlin). It is refreshing for a change after the preponderance of "new-art" principles to find in German architecture that it is still possible to design a modern building with originality at the same time that traditional detail is employed. Such we have in the Imperial Bank building at Nuremberg, designed by Herr Julius Habicht. The remaining buildings illustrated are all "new art," including the premiated designs for the extension of the big shop of A. Wertheim in Berlin.

*Stone* (New York) exults over the collapse of a reinforced concrete bridge in Indiana, which is illustrated. The bridge was finished last October, and has been in use ever since. The principal illustrations are of the high altar of the cathedral of Toulouse, a carved tympanum panel over the entrance of St. Mary's Church, New York, and the new building of the Daughters of the American Revolution at Washington, of which Mr. Edward Pierce Casey is the architect. Of course, all these are examples of work in stone.

*Zodtchy* (St. Petersburg) in addition to a chapel at St. Petersburg, illustrates a series of examples of typical motifs of Chinese architecture.

*Engineering Record* (New York) sends us a colossal "Annual Contractors' Number," in which an account is given of the bodily raising of a four-storey brick factory building to a height of 8 feet, and insertion of new concrete walls below. Another interesting job described is the extension upwards of the Seventh Regiment Armoury, New York. The construction of the foundations of the new municipal building for the City of New York is described and illustrated.

Leith Dock Commission have had under consideration th question whether they should erect a plant for providin their own electricity supply or continue their present arrangement with the Town Council. A deputation recentl appointed to obtain information as to the best plant t use in the production of electricity have visited various town in England, and it is understood that their recommendatio will be in favour of the use of gas producer plant. Th Commission has not yet decided whether they will generat their own electricity for power and lighting in the docks o not.

A new variety theatre is to be erected in Glasgow Recently two plots of ground, extending together to abou 1,024 square yards, with the tenements of shops and dwelling houses forming Nos. 149 to 155 Castle Street, were pu chased by Mr. A. E. Pickard. It is his intention to erect o the site a theatre to be called the Glasgow Casino. Th theatre will have a frontage to Castle Street of 70 feet.

## FORTHCOMING EVENTS.

*Friday, April 29.*

Architectural Association : Paper on "The Architecture of Bath," by Mr. Mowbray A. Green, A.R.I.B.A.

Royal Sanitary Institute : Meeting at Worcester. Discussions on "Teaching of Sanitary and Domestic Science in Schools" and "Building By-laws Reform."

*Monday, May 2.*

Royal Institute of British Architects : Annual General Meeting.

Royal Society of Arts : Mr. A. B. Searle on "Modern Methods of Brickmaking." (Cantor Lecture 4.)

Royal Academy : Summer Exhibition opens.

*Wednesday, May 4.*

Royal Archæological Institute : "Notes on the Holy Blood of Hayles," by Mr. W. H. St. John Hope.

Iron and Steel Institute : Annual General Meeting (two days).

*Thursday, May 5.*

Architectural Association : Annual Dinner at the Trocadéro.

## ELEMENTS OF REINFORCED CONCRETE CONSTRUCTION.

NOWADAYS we all believe, more or less, in reinforced concrete, and realise that it is a method of construction with peculiar advantages on occasion. Hence we all desire to know something of the elementary principles that underlie the application of reinforced concrete to building. Numerous authors have striven to satisfy our desire for information. The standard work on reinforced concrete in this country is that by Mr. CHARLES F. MARSH and Mr. WILLIAM DUNN, and for those who require a thorough and complete knowledge of the subject it is indispensable; but there are many who cannot afford the time and attention to attain such complete mastery, and for their benefit smaller and simpler works have been recently produced, some of which we have now before us.*

We all understand that the fundamental principle of reinforced concrete construction is that the power of concrete to resist compression being considerable, the fullest advantage shall be taken of that power, but that the material being comparatively very weak in resisting tension, this stress shall be met by the assistance as reinforcement of a material strong in the capacity to sustain tensile stress.

From this simple proposition it is, however, necessary to proceed very much further in order that a proper relation between the two components of reinforced concrete may be established in respect of their position and mass may be preserved, so that their individual functions may be most economically fulfilled.

To do this with accuracy has required a large amount of scientific experiment and investigation, so that a reliable basis may be obtained for calculation of the requirements of the material in specific cases. Mr. MARSH in his book treats, with no more than sufficient fulness to ensure a proper understanding of the essentials, the scientific data on which calculations must be based, explaining what has been determined as to the properties of reinforced concrete and its behaviour under loading, as shown by the experiments of many investigators, leading to the assumption of certain hypotheses on which to base calculations. With a branch of construction at present, as far as absolute scientific knowledge of its many complexities has reached, still in its infancy, it is unfortunately by no means certain that these hypotheses are absolutely true.

Mr. MARSH formulates them thus: that the applied forces are perpendicular to the neutral surfaces of pieces subjected to bending; that each fibre of the concrete acts by itself, not being affected by the contiguous fibres; that there is always a solid contact between the reinforcement and the surrounding concrete; that plane sections remain true planes during loading; that there are no initial stresses on the structure before loading; that the resistance of the concrete in compression in pieces subjected to flexure varies uniformly from nil at the neutral axis to a maximum at the outer fibre; that the ratio of the moduli of elasticity of the steel and concrete is 15.

Some of these hypotheses are obviously incorrect, but their assumption is on the side of safety and necessary to enable formulæ for calculation to be propounded which may be relied upon for practical work, although the results of experiments may show that they do not reach finality in the reduction of material employed to the utmost minimum in every particular case.

Mr. MARSH gives a list of the symbols used in the methods of calculation, but these are necessarily not in accord with the standard notation recently suggested by the Science Standing Committee of the Concrete Institute. It is certainly desirable that a standard notation should be adopted by all writers on comparatively new methods of calculation such as apply to reinforced concrete. Mr. MARSH shows the method by which formulæ are obtained for the calculation of a large number of problems in reinforced concrete construction, and gives especially careful attention to arches of various forms and conditions. The application of the formulæ is to be found in the author's "Manual of Reinforced Concrete," to which the present volume is intended to be a companion. Some of the methods at present in use for introducing reinforcement are given in the concluding chapter.

Mr. RINGS in his book treats the subject of reinforced concrete from a practical rather than scientific standpoint, and after a short review of the history of the subject deals with practical details relating to materials and execution of work, including machines for concrete mixing and for shaping of rods, centring or "falsework" for the reception of concrete, and various arrangements for the placing of reinforcement. Some particularly useful details of the construction of roofs in concrete may be specially noticed.

In dealing with formulæ and methods of calculation, Mr. RINGS adopts the system of notation suggested by the Science Standing Committee of the Concrete Institute, but does not go beyond simple forms of slabs, beams, ribbed ceilings or T beams, columns and arches. Following the practical rather than the scientific line, the author gives a description of several of the various systems of reinforced concrete construction, patent bars, &c., now used in this country, and of them he says "all of these bars and systems have certain advantages under certain conditions and circumstances, and if used in their right places may tend to improve the soundness of the construction and reduce cost." A series of tables is included in the book to facilitate the calculation and design of reinforced concrete and render easy the path of the novice. To such an extent is this simplification carried that a ready reckoner is supplied, by which mechanically the thickness of a floor-slab and the sectional area of the steel reinforcement required for specific loads and spars can be read off. Mr. Rings's book is therefore admirable as a primer for the student who wants a practical introduction to construction in reinforced concrete.

*Reinforced Concrete: Theory and Practice.* By Frederick Rings, M.S.A. (London : B. T. Batsford. 7*s.* 6*d.* net.)

*The Elements of Reinforced Concrete Building.* By G. A. T. Middleton, A.R.I.B.A. (London : Francis Griffiths. 4*s.* net.)

*Inspector's Handbook of Reinforced Concrete.* By Walter F. Ballinger, Assoc. Am. Inst. of Architects, M.Am.Soc.C.E., and Emile G. Perrot, Assoc. Am. Inst. of Architects, Assoc.M.Am.Soc.C.E. (New York : The Engineering News Publishing Company. London : Archibald Constable & Co., Ltd. 4*s.* net.)

Mr. Middleton directs the attention of his readers chiefly to calculations, and aims at making the comprehension of those calculations and their methods easy to the rudimentary student. We do not know why Mr. Middleton starts from the basis that "the modulus of elasticity of steel is approximately ten times that of concrete," when the majority of governments, societies, and committees who have issued rules, recommendations, or regulations on the subject have taken 15 as the value, and it would appear from experiment that 17½ is nearer the truth. Mr. Middleton's calculations do not extend beyond simple problems of beams, slabs, columns, and walls, and his endeavour to produce a small book leads to a restriction of the description of material and workmanship to very elementary facts and practice.

The little handbook by Messrs. Ballinger and Perrot is intended primarily for the use of "inspectors," or, as we call them in this country, clerks of works, and hence deals with practical operations of workmanship more than with calculations. At the same time, some very simple tables and rules are given for determining the safe loads on slabs, beams and columns in accordance with the usual practice in Philadelphia.

The literature of the present day on the subject of reinforced concrete is not confined to nor even so thorough in English as in other languages, and the difficulty of reading in a foreign tongue on a subject so comparatively modern renders necessary a dictionary of technical terms. In the Deinhardt-Schlomann series there now appears* such a dictionary, giving the terms in German, English, French, Russian, Italian, and Spanish. Some of the English equivalents are rather too literal translations of the German, but numerous illustrations assist to correct verbal inadequacies, and the work is eminently useful.

## NOTES AND COMMENTS.

The Society of Architects has had an unpleasant experience in the result of its action to restrain "a builder and architect," as the report goes, from using the letters M.S.A. after his name, although he is not a member of the Society. The Society, as plaintiff, asked for an injunction, but although the defendant did not enter any appearance to the action, Mr. Justice Joyce declined to grant any injunction and dismissed the action, and in his judgment said that "this was the case of a private joint stock company, which for payment purported to give people the right to use a certain combination of mystic letters the meaning of which, his lordship ventured to say, nobody in the Court, except counsel for the plaintiffs, knew." Thus anyone, whether a member of the Society of Architects or not, can use the letters M.S.A. after his name, and consequently these are of no value. Mr. Justice Joyce appears to have been influenced in his decision by the consideration that the Society of Architects is not a chartered body. The only thing, it seems to us, that members of the Society can do is to drop the use of the letters M.S.A., and, unless already Fellows or Associates, join the Royal Institute of British Architects as Licentiates.

The parishioners of Puddletown Church have disregarded the opposition to the proposed reinstatement of the chancel of their church which some vandals, two or three centuries ago, reduced to half its original size, and we think they are quite right in so doing.

St. Asaph Cathedral has been discovered to be in need of urgent repair. Some slight cracks of long duration in the walls of the south transept have recently been observed to be expanding and supplemented by a fresh one; and Mr. Stuart Thompson, of Peterborough, has been consulted, and has advised that an expenditure of 700*l*. to 800*l*. is necessary. Mr. Thompson in his report states that cracks have appeared in the eastern wall of the transept, the stonework being torn above and below the two windows, and that one of the windows is still moving. He ascribes the primary cause of the trouble as being due to defective foundations, the actual footings of the walls being nothing more than rough stones laid in mud and with no projection. He opines that the defective footings of the whole of the transept will have to be carefully removed and new solid cement concrete inserted under the walls, with a good spread outwards to distribute the weight of the superstructure over as large an area as possible, the masonry being pinned up with hard brickwork in cement. Mr. Thompson further states that recent investigations show that the whole of the land between the two rivers is gradually sinking, and therefore it is essential that the foundations when completed should be continuous throughout, and not likely to be broken through by any unequal subsidence of the clay or shrinkage of the subsoil. To guard against this he proposes the use of armoured concrete and taking it below the range of atmospheric influence.

From the report of the Council of the Surrey Archæological Society, presented to the annual meeting held last Saturday, we learn that the future preservation of Whitgift's Hospital, Croydon, may now be regarded as assured.

During the next ten years immense changes will be made in the planning of Paris, to the alterations and extensions of whose main arteries and other improvements some sixty millions sterling is to be devoted. The schemes of Baron Haussmann are to be resumed, the Boulevard Haussmann to be joined up with the main system of boulevards. Better access is to be provided to the Central Markets and many other widenings of existing thoroughfares are to be made. Needless to say, much of the old Paris of the period of Henry IV. and Louis XIII. will be swept away.

An interesting paper on stained glass, from the earliest period to the Renaissance, read before the Oxford Architectural and Historical Society by Mr. Herbert W. Bryans, has been "printed by request," and is now published by James Parker & Co., at the price of one shilling. This is an interesting epitome of the history of the mosaic method of glass-painting, described by an expert, with due explanation of so much of technique as is necessary for the comprehension of what is good in the craft with which the author deals.

The Home Secretary has appointed Mr. H. J. Wilson, inspector of factories, Glasgow; Mr. W. W. Squire, M.I.C.E., engineer to the Bristol Docks Committee; and Mr. C. A. Harrison, D.Sc., engineer's office, North-Eastern Railway Company, Newcastle-on-Tyne, to be a committee to inquire into the dangers attending deep excavation in connection with the construction of docks and other similar works, and to consider and report what steps should be taken to minimise such dangers. Correspondence may be addressed to Mr. H. J. Wilson, 74 York Street, Glasgow.

## MODERN COLD STORAGE AND REFRIGERATION.

By W. S. Douglas, B.Sc.

### VIII.—INSULATION.

HAVING considered the refrigerating machine itself, and its behaviour under varying conditions, we come now to its practical applications. The extent of these has already been sketched out and it will have been noticed that, in the majority of cases, some form of cold store, similar to those cooled by ice, but of larger dimensions, is required. Such a store must necessarily be well insulated, and this, in the case of mechanical cooling, is more especially true, since not only are the storage temperatures lower, but the machine is frequently run only for a portion of the day. This means that during the remainder of the twenty-four hours the "cold" (if the inaccuracy will be excused), which is accumulated by the running of the machine, is gradually used up, owing to the leakage of heat into the chamber. The consequence is that unless precautions are taken to minimise any such leakage, the temperature, when the time comes to restart the machine, is again quite high. Now a uniform temperature is always a desideratum, and is sometimes an absolute essential. Hence our object must be to eliminate all defects which tend to cause a variation. The chief of these is leakage through the insulation, and it is proposed, therefore, to devote some attention to modern practice in this branch of refrigeration.

A

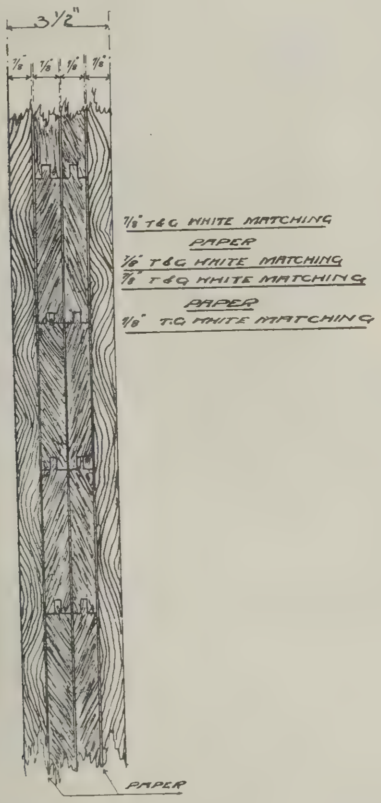

Fig. 22.—Heat leakage in B.T.U.'s per square foot per 24 hours per degree Fahr. temperature difference —4·75.

*Sections of Insulation.*—Since the success of a cold store depends to such an extent on the insulation, it is natural that a considerable amount of research work should have been carried out in this connection. As a result of these researches an endless variety of constructions has been put forward, each with its own strong advocates. Every maker almost has his own ideas on this subject. In fact were we to attempt a literal description of even those sections alone which have proved commercially successful, quite a respectable volume could easily be filled. In this place, however, only the more salient types will be selected, and these will be examined minutely with a view to ascertaining (as nearly as the data available will permit) which gives, in actual practice, the greatest return for the money spent in construction. It would of course be possible, were the stopping of the heat leakage our only object, to attain to an almost ideal efficiency, but it must be recognised that in the search after perfection there are certain practical limitations which must not be exceeded. What these actually are it will be our aim to discover.

Insulation may be formed either of air spaces created by timber distance pieces or of suitable filling material packed between timber battens, or of a combination of both. Broadly speaking, the first is more characteristic of American and the second of British design. But, as this branch of engineering has been so much more highly developed across the Atlantic than it has been here, some attention must be paid to both the prominent styles. In figs. 22 three different sections are shown and the coefficient of heat leakage allowed by each marked at the bottom. The first (A) shows a very simple section consisting of four ⅞-inch T and G boards and

B

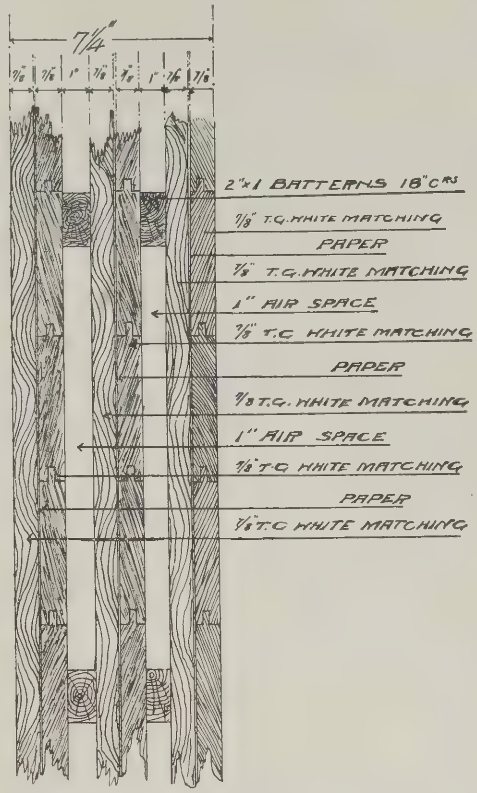

Fig. 22.—Heat leakage in B.T.U.'s per square foot per 24 hours per degree Fahr. temperature difference, 3·45.

C

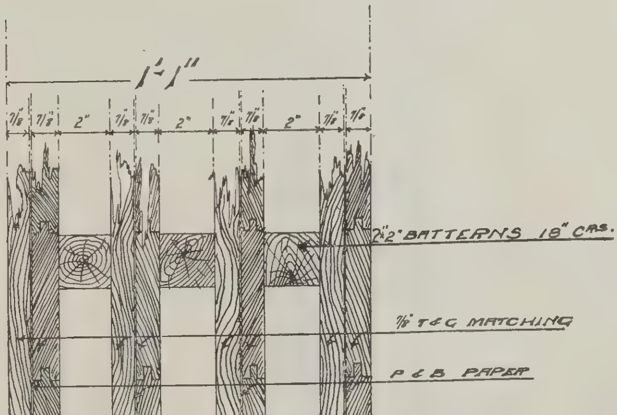

Fig. 22.—Heat leakage in B.T.U.'s per square foot per 24 hours per degree Fahr. temperature difference —2·70.

two courses of black insulating paper. Joints are broken where the paper is inserted, and the matching at the inside and the outside is arranged to be vertical for the sake of appearances. It could also, with advantage, be made beaded or vee-ed as either of these forms will add considerably to the look of the work. Such a section as this is, of course, very seldom found, unless in the cheapest ice boxes, and it is introduced merely to show the high heat leakage it permits when compared with really scientific insulation.

Section B is rather more elaborate, and comparing it with A we find we have added two more layers of $\frac{7}{8}$-inch T and G boarding, an extra ply of paper and two one-inch air spaces. Joints are broken as before and the matching (which should in this case also be beaded or vee-ed where seen) is vertical at the inside and outside of the section. The result, as will be seen, is a saving of 1.3 B.T.U.'s in the heat leakage.

In the third section (C) we have a yet more complicated construction, which involves an extra air space, two additional layers of $\frac{7}{8}$-inch T and G, and one more ply of insulating paper. The benefit accruing therefrom is a reduction of the heat leakage by another 0.75 B.T.U.'s.

These three sections give some idea of air space construction and what effect an increase in its complication has on the efficiency of the section. In figs. 23 two more sections are given. D represents insulation by filling material without air spaces, and E shows a combination of the two systems. Four inches only of filling material is used in D, and is packed between 2-inch by 4-inch battens spaced 16 inches to 24 inches apart, sheeted on either side with two layers of $\frac{7}{8}$-inch T and G boarding. Each pair of boards is separated by a ply of paper and joints are broken in the usual way. In E there are altogether four double layers of $\frac{7}{8}$-inch T. and G. boarding, each separated by insulating paper. Between are three spaces, created by suitable battens spaced at 18-inch centres. The first of these, 2 inches deep, is air, the second, 4 inches deep, is filled with insulating material, and the third, 1 inch deep, is air again. In both sections the heat leakage has been given, on the assumption that the filling material is granulated cork.

D

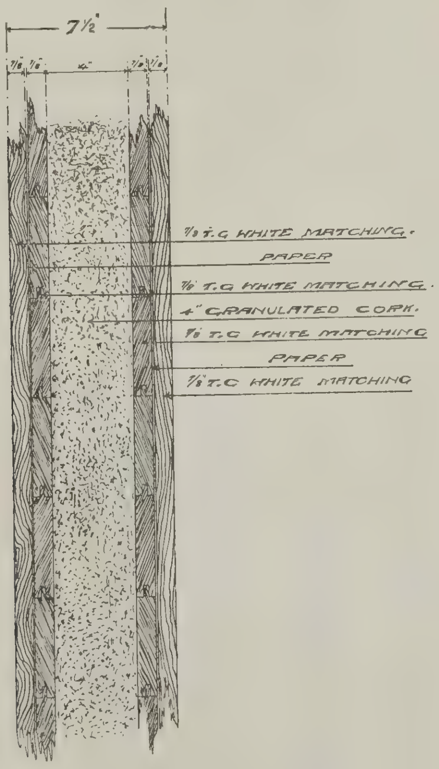

FIG. 23.—Leakage in B.T.U.'s per square foot per 24 hours per degree Fahr. temperature difference —1·70.

The question now is, Which of these various ways of insulating is the best commercially? We must know, in other words, which will effect the largest saving for the least expenditure. Hence there are two factors to be considered in any calculations which we may make. The one is to be as large and the other as small as possible. We must, in fact, show clearly how far the two conditions are fulfilled simultaneously, and, to this end, it is proposed to make out a miniature profit and loss account for each section. On the credit side will be the coal saved per annum in running the plant (due to the diminution in heat leakage through the insulated walls), and on the debit side, the interest and depreciation on the capital sunk in building.

The former item will be valued by assuming a steam-driven refrigerating compressor of rather low efficiency, in order to favour the insulation as much as possible. It will be taken as eliminating 3,500 B.T.U.'s for every pound of coal burnt in the boilers. The second item cannot be estimated exactly, but, by allowing for both interest and depreciation 10 per cent. per annum on the initial cost of the insulation, we shall be fairly near the mark. The balance or deficit, as the case may be, will then show what the insulation is really worth.

E

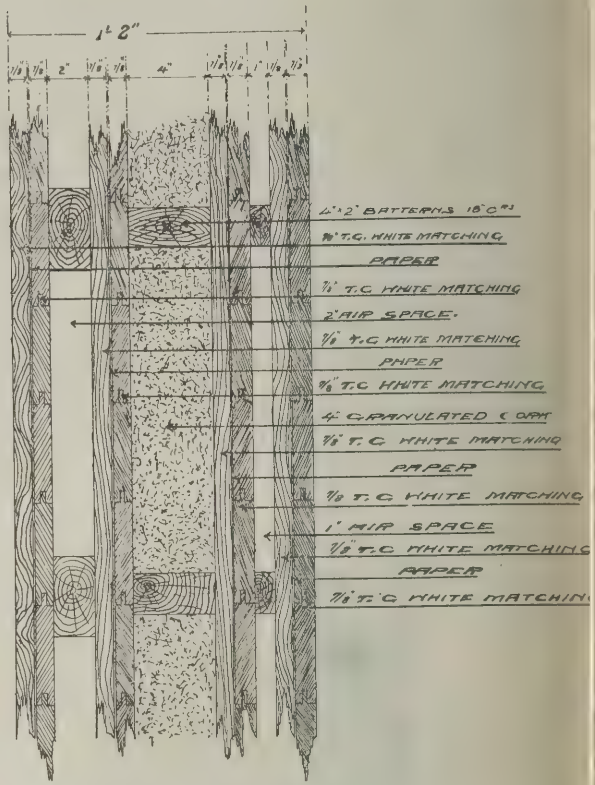

FIG. 23.—Leakage in B.T.U.'s per square foot per 24 hours pe degree Fahr. temperature difference —1·15.

For this purpose all the other sections (B, C, D and E) will be compared with section A as a standard, and to simplify matters we shall take a definite numerical example. It will be assumed that we have a cold room, in shape a perfect square, with no partitions and with a uniform section of insulation on floor, ceiling and walls, across all of which the average temperature difference is to be 50° Fahr. The dimensions of this room are 69 feet by 69 feet by 9 feet high, yielding a radiating surface of 12,000 feet super and a cubic capacity of nearly 43,000 feet. Such a store, if maintained constantly at 24° Fahr., when well loaded with produce, would require all the attention of a 50-ton compressor (*i.e.*, fifty tons ice melted or twenty-five tons ice made) for twenty-four hours per day. It is further assumed, in estimating the constructional costs, that the work is carried out in London, and no account has been taken for simplicity's sake of extras, such as doors, air-circulating devices, partitions, special floor construction, &c. A case such as this is, it is true, purely theoretical, but for the end we have in view the figures it shows will be sufficiently accurate.

Taking section B we find that compared with section A the B.T.U.'s saved per foot super in twenty-four hours per degree difference in temperature equal 1.30. This is equivalent to a saving for 50° Fahr. temperature difference of $1.30 \times 12{,}000 \times 50 = 780{,}000$ B.T.U.'s per day on the chamber to the particulars given, which means (assuming 3,500 B.T.U.'s per pound of coal) an economy of 36.5 tons coal per annum. The financial saving, with coal at 20*s*. per ton, will then be 36*l*. 10*s*.

The additional elements brought into the construction to effect this economy consist of two 1-inch air spaces, formed by means of 2-inch by 1-inch battens at 18-inch centres, two extra layers of $\frac{7}{8}$-inch matching, and one extra course of insulating paper. Carried out in London, the extra cost for building would probably, allowing for labour and the builders' running expenses and profit, amount to about 6½*d.* per foot super. This, for our ideal store, gives a total of 325*l.*, and 10 per cent. on this figure for interest and depreciation means 32*l.* 10*s.* per annum, showing a net saving of 36*l.* 10*s.*, less 32*l.* 10*s.*, or 4*l.* in the course of the year.

These calculations can be carried out in the same way for sections B, C, D and E, and we may then tabulate, as follows, our assumptions and results:—

*Assumptions.*—Work carried out in London; ideal store with 12,000 square feet of surface; all walls are outside walls; insulation of floor and ceiling same as for walls; nothing allowed for doors, &c., in costs; temperature difference =50° Fahr.; cost of coal = 20*s.* per ton; efficiency of compressor =3,500 B.T.U.'s per pound of coal.

*Results*, compared with section A:—

| Section. | B. | C. | D. | E. |
|---|---|---|---|---|
| Saving in heat leakage, B.T.U.'s per sq. foot per 24 hours per 1 deg. temperature difference | 1.30 | 2.05 | 3.05 | 3.60 |
| Total B. T. U.'s saved per day | 780,000 | 1,230,000 | 1,830,000 | 2,160,000 |
| Tons of coal saved per annum | 36.5 | 57.3 | 85.2 | 100.6 |
| Extra cost of insulation per sq. ft. | -/6½ | 1/0½ | -/4½ | 1/3 |
| Total cost | £325 0 0 | £625 0 0 | £225 0 0 | £750 0 0 |
| Total saving per annum | 36 10 0 | 62 10 0 | 85 4 0 | 100 12 0 |
| Interest and depreciation | 32 10 0 | 57 6 0 | 22 10 0 | 75 0 0 |
| Net saving per annum | 4 0 0 | 5 4 0 | 62 14 0 | 25 12 0 |

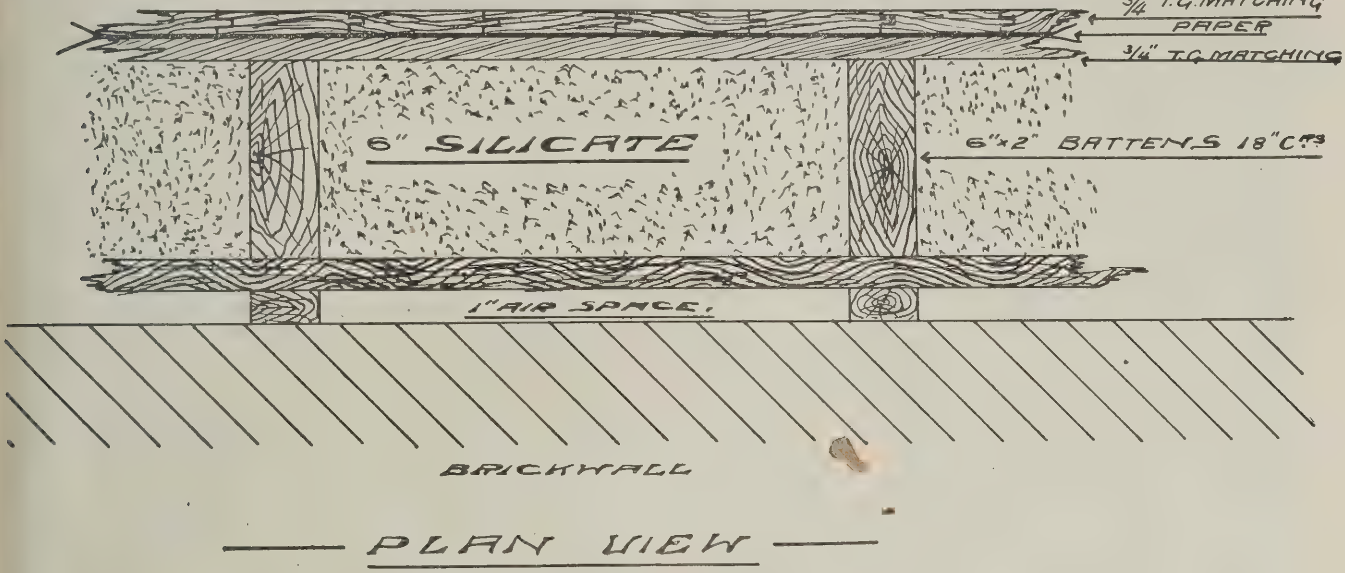

Fig. 24.

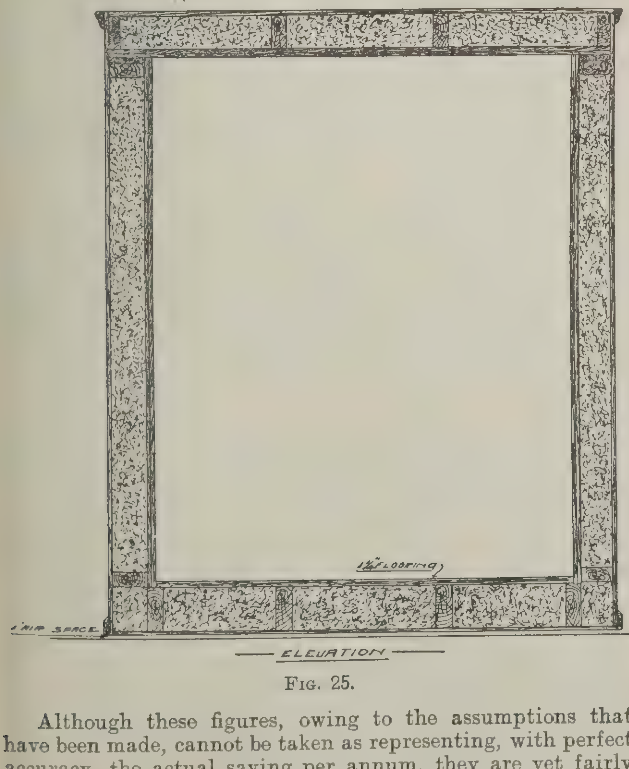

Fig. 25.

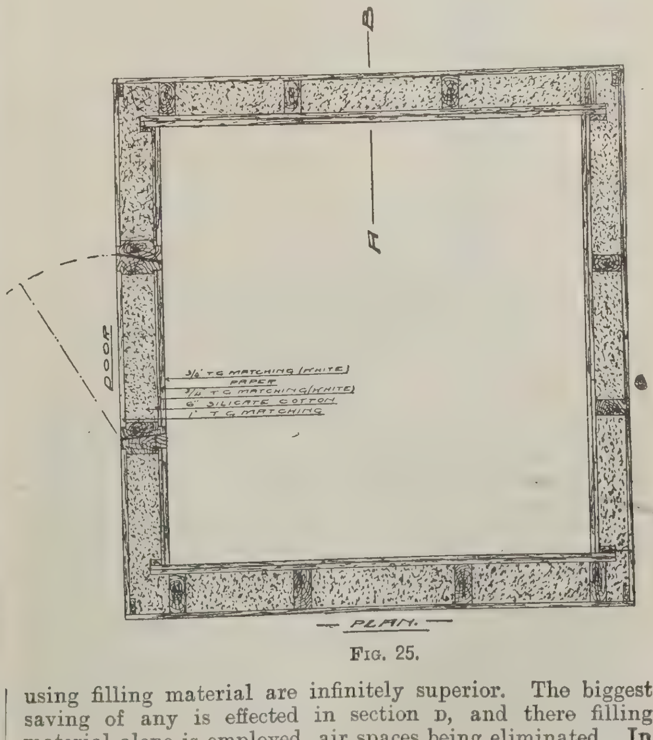

Fig. 25.

Although these figures, owing to the assumptions that have been made, cannot be taken as representing, with perfect accuracy, the actual saving per annum, they are yet fairly near to the mark. The costs have been worked out on actual quotations for timber, filling materials, &c., and an average percentage added in each case for labour and the manufacturer's profit. Moreover, as the same conditions have been assumed for all the different sections, the comparison must be perfectly fair, whether the figures themselves are absolutely accurate or otherwise. That is to say, the proportion existing between the various results holds good, even when the assumptions are changed. In the writer's opinion this way of comparing insulations is the only just one. It is of no use to the practical man to know only the heat leakage which he avoids by making a certain improvement. He must also have a knowledge of what it will cost him, and take account of this expense in appraising its merits.

As to the data in regard to the saving in B.T.U.'s lost, these are taken from tests made by Mr. John E. Starr for the Nonpareil Cork Manufacturing Company, U.S.A. A special room was fitted up for the purpose of carrying out the experiments, and elaborate precautions were taken to ensure accuracy. The results harmonise well with those due to other authorities, and, considering the nature of the apparatus employed, may be taken as being fairly correct.

Coming now to the comparison of the sections, the conclusion which we have to draw is obvious. It is quite clear that, compared with the air space insulation, the sections using filling material are infinitely superior. The biggest saving of any is effected in section D, and there filling material alone is employed, air spaces being eliminated. In section E we have also a considerable saving, although less than one-half of that obtained with D, while two air spaces have been used in addition to the filling. But in sections B and C, composed entirely of air spaces, the economy is either negligible or is actually converted to a loss. It is noteworthy, too, that section C, which gives us the loss, has three air spaces, while section B, showing a bare profit, has only two. It would seem, in fact, that directly we begin to put in air spaces we have a reduction in economy, and, further, that an increase in the number of spaces gradually leads to a loss. The moral of this reasoning is too plain to require emphasis.

In both sections D and E granulated cork has been shown as filling, but with any other good insulation, such as charcoal or silicate cotton, the same economy will be observed. With the last two materials, in fact, the economy would, if anything, be slightly superior, as will be seen by considering the leakage coefficients and costs tabulated in article II. The difference, however, is small, and hence it is not a question, in deciding between these insulators, of expense, but rather one of their individual qualities, such as inflammability, resistance to decay, liability to dampness, &c. These have already been fully dealt with, but mention might also be made of another material, which differs from the others inasmuch as instead of being packed it is applied in layers. This is "Cabot" quilt, made from the intertwined blades of a species of reed which is known as "Eelgrass." It will be familiar to architects in this country more as an efficient sound deadener than as an insulator, but in the States it is used in the latter capacity to a considerable extent. It was also tested by Mr. Starr, the section adopted being composed of four courses of double ply quilt between four layers of $\frac{7}{8}$-inch T. and G. boarding, and the result was a heat leakage of 2.5, showing a very fair efficiency. The cost of the double ply material is 0.87 pence per foot super, and the weight per square foot (the thickness being about $\frac{1}{4}$ inch) .24 lb.

Section D would do very well for partitions, but for the main walls at least 6 inches of filling should be used. In some cases even as much as 9 inches is necessary, the exact thickness depending on the temperature to be maintained in the rooms. For ordinary work, a very good section which has given complete satisfaction in practice is that illustrated in fig. 24. Here it is assumed that the insulation is used as a lining to existing walls, in which case it should be separated from them by a narrow air space, as shown, in order to avoid any risk of the penetration of dampness. Such a section is suitable for storage temperatures from say 28° Fahr. upwards. Below that figure the filling should be increased in thickness. Floors in small rooms need not be different from the walls, with the exception that $1\frac{1}{4}$-inch T. and G. flooring would be used instead of the two layers of $\frac{3}{4}$-inch T., G. and V. matching. The construction of a small chamber on this principle is shown in figs. 25, which give details of the arrangement employed for the rails, studs and plates. It is sometimes advisable, however, to thicken up the insulation on the floor, as it is there that the lowest temperature and consequently the greatest tendency to leakage will be found. In that case 8-inch or 9-inch instead of 6-inch rails would be used.

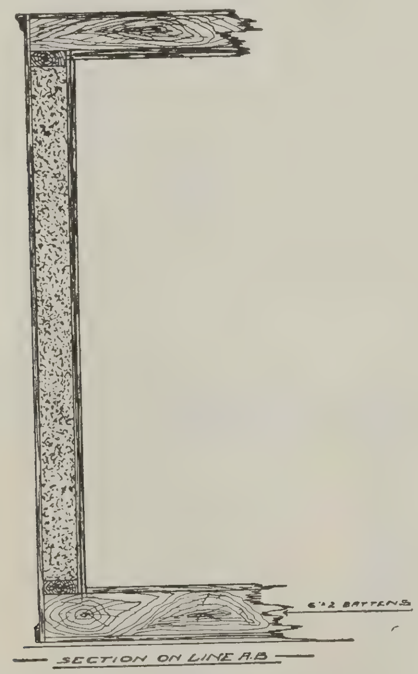

Fig. 25.

## BUILDING BY-LAWS.[*]

One of the most curious results of the continued craze for legislation is to be found in the by-laws which regulate building in so many parts of England at the present day. In attempting to discuss them collectively one is faced at the outset by a difficulty hardly to be anticipated in their diversity, which is so extreme that neighbours living near district boundaries might sometimes as well be living in different countries in respect of any equality of building rights they would be supposed to possess. It is quite a common and yet surely a very unjust state of affairs that a man owning property on one side of a road may only build by permission, under stringent regulations not easy to comprehend, and subject to delays, fees, fines and penalties, while his opposite neighbour may build just as he pleases and, not having the preliminary expenses, the contingent fines and, some would add, the blackmail to pay, is able to build better at less cost. Consequently, those who have the misfortune to dwell or to practice in by-law-beridden districts find it hard to arouse the sympathy of their more fortunate friends who have not been subjected to the annoyance and loss that ignorant petty officialism armed with clumsy but dangerous weapons can inflict. Experience in one district, where the surveyor is an honourable man who has had a proper training and knows how to administer his Council's by-laws with fairness and the minimum of hardship, gives absolutely no guidance as to what is to be expected in another.

The lack of uniformity in the building codes sanctioned by the Local Government Board is the more curious in that they all purport to be cast in the same mould. An examination of sixty odd copies obtained at random discloses the fact that no two are alike throughout, and the examination leaves one in doubt as to which should be taken as the criterion. So far as my present judgment goes, however, for completeness, if somewhat tainted with irrelevancy, no set of by-laws equals that issued by a rural district council whose clerk in response to my application for a copy of their building by-laws, obligingly sent me three pamphlets, one of which dealt with the construction and arrangement of bathing machines and the dress and deportment of bathers. A pamphlet I wrote in 1905 foretold the approach of a time when cricketers would have to get their garments approved by a Flannel sub-committee, and here we have a rural district council already issuing two if not more by-laws dealing with bathing costumes. What this sub-committee is called I dare not venture to suggest, but its rules are not as practical as they might be, for they do not specify fast colours.

Ordinary urban or rural councillors however do not attempt such ambitious flights, but find their desire for variety and originality sufficiently gratified by indefensible departures from the model.

The parent type of all the modern building by-laws is, I believe, to be found in a brief set of "Rules and Directions for Re-edifying the City," embodied in an Act of Parliament passed immediately after the Great Fire of 1666. They are both interesting and instructive. Not only does one find that they give the form to English by-laws of to-day, but they are a product of the same desire that inspired many of the decrees that have regulated building in Paris since the seventeenth century. These decrees are by no means democratic, and it seems strange that even now Paris architects have to comply with several enactments set forth in their code beginning "Louis, king of France, by the grace of God." The fact is that the by-laws of the seventeenth century in England and France were as much by-laws of street design as of building construction, intended to obtain uniformity to certain types of buildings, and considering the street and the terrace rather than the individual needs of the building owners and occupiers, in which respect they anticipate a recent Town-planning Bill.

The present English by-laws aim directly at permanency in building and indirectly at uniformity, for the fact that in pursuing the former without conspicuous success they have to a limited extent achieved the latter by reducing building in some districts to one dull level is accidental though natural. As a means of obtaining durability they endeavour to enforce good construction, but in this they effect but little, owing partly to the non-stimulative influence of restrictions upon experiment, but chiefly because one cannot originate what already exists. Good construction has always been generally aimed at and achieved as far as the knowledge of the period permitted, and it has never ceased and is never likely to cease to be in vogue for the simple reason that it depends not upon legislation but upon an intelligent public demand. In a similar way, stated in different terms, those who framed the by-laws tried to stop bad building, and in that attempt they have to some extent succeeded in the districts—very few, I believe when all is told—where it was prevalent. Jerry-building is an evil which cures itself whether in castles or cottages, motor-cars or perambulators—even in bathing machines—and it is not synonymous with speculative building. The successful speculative builder is the one who builds so that he can sell or mortgage his houses to people who have seen them built; the other sort of speculative builder eventually arrives unaccompanied by much sympathy in the bankruptcy court.

---

[*] A paper read before the British Constitution Association on April 25 by Mr. R. M. Lucas, F.R.I.B.A.

Naturally the progress of building is like all other human progress—not always in a straight line. If we could see the whole course of any science in its development and could review it at one glance back to its starting-point, should we not invariably see an irregular, zigzag line, even looped in a return upon itself sometimes, like the track of a sailing ship charted on the ocean?

Probably the most perfect construction the world has ever seen is to be found in the trabeated buildings of ancient Greece, notably the Parthenon, considered in this connection without regard to its exquisite refinements of design. Yet the Romans, though retrograding in respect of minute accuracy and skill of workmanship, made an unquestioned advance in another direction with the arched construction which so enlarged the scope of architectural energy. Experiment, variation, advance—so it has always been and will be as long as men retain a trace of individuality and freedom to exercise it.

Ever since human beings lived in caves—and in these days of electric light, forced ventilation, tube railways and flying machines we may again see them described as eligible residences—there has been a steady increase in the amenities and comforts of the home, and it is obvious that the appreciation of them would beget a desire to preserve them. Thus began the necessarily slow, because empirical, search for durability. The three great forces to be contended with were, and still are, fire, tempest, and decay, and the resistance offered to them found itself in good material and sound workmanship. These three forces, broadly speaking, explain to us the whole history of construction.

But with the demand for improvements in building there must have grown up, long before men were conscious of it, a desire for conditions that conduce to health—in one word, sanitation. These conditions were for centuries only dimly observed by the survivors under Nature's stern administration of the law of extermination of the least fit. Men who lived in caves gave place to men who lived in the light and air. The association between dirt and disease became apparent, and comparatively recently people have become aware of the relationship of darkness to both. Instincts of time-lost origin, making for cleanliness, are now endorsed by science, and homes that can be kept clean, fresh and bright are more and more sought after. Herein we have the development of sanitation.

These two great aims of home-builders, good construction and sanitation, are of remote antiquity, and even when unrecognised have never been absent, and they still beckon us onward, demanding an advance we can only make if we have freedom to experiment and vary, to test, to reject, and to accept.

Good construction and sanitation, however, though they go hand in hand, differ radically in one respect, even if good construction be expressed otherwise as the avoidance of bad construction. Construction is the almost exclusive concern of the building owner; but sanitation is never that, it must always be partly at least the concern of the community.

It is important to bear this general distinction in mind, for it helps us to see through the confusion that exists between the constructive and the sanitary by-laws, a confusion unhappily engendered by the way in which the various Acts have been drafted. It would have been well if the two subjects had been separated, but as they were combined in the City of London Re-edifying Act of 1666, the custom of treating them as of the same nature is sanctioned by long use. That Act, being germane to my subject and of considerable interest, I venture to quote briefly in outline.

It begins by enacting "That there be only four sorts of buildings, of the dimensions that appear in the annexed table. The first, or smallest sort, to be erected in by-lanes, to be of two storeys high, besides cellars and garrets; the second sort, to be built in noted streets and lanes, to be of three storeys; the third sort, to be erected in the high and principal streets, to be of four storeys, with balconies before the same; and the height of the fourth or largest sort, for mansion-houses for the principal citizens and persons of quality (not fronting the street) to be at the discretion of the builder, provided it does not exceed four storeys."

The Act continues:—"That all new buildings are to be built with stone or brick, not only for beauty and duration, but also as a fence against fire."

Its third paragraph is "For the more effectual preventing of the citizens being imposed upon . . . in case of any combination, or exaction, by brick or tile-makers, lime-burners, carpenters," &c., and generally provides for the prevention of what are now known as "rings" and "strikes."

The fourth paragraph deals with privileges of workmen; the fifth with the widening of streets; the sixth with compensation to freeholders; the seventh, which I fear we are all guilty of disregarding, ordains an anniversary fast, or day of humiliation to be annually kept on the second of September as a perpetual memorial of the conflagration—our ungrateful by-laws do not even mention this; the eighth enacts that "a column of brass or stone should be erected on or near the place where the said dreadful fire unhappily began"; the ninth deals with the formation of a riverside wharf; and the tenth and last with an import tax of a shilling a ton on coal. Then follows the table mentioned in the first paragraph.

This table, the foundation as I believe upon which all our modern building by-laws, both constructive and sanitary, are based, groups its clear and fairly comprehensive regulations under six headings.

The first heading is "A plan of dimensions," &c., and it gives heights of rooms, and thickness of external walls and party walls. The second and third headings are "Scantlings of timber for the first sort of houses"; and "Scantlings of timber for the second and third sort of houses"; the fourth, fifth and sixth headings, applying to all sorts, give scantlings for timber and laths, for stone piers, &c., and for sewers.

As a specimen of these regulations, I quote the following, applying to houses of the first, the smallest, class, to be erected in by-lanes:—

Height of storeys:—Cellars, 6 feet 6 inches; first storey, 9 feet; second, 9 feet; garrets, no height given. All through the table garrets are put down with two noughts in the feet and inches column, but this implies only that roofs sloped at various angles, not that occupants of garrets had but the two dimensions of length and breadth without height. It is to be observed that the dimensions are not minimum but absolute, obviously intended to produce uniformity in terrace elevations, and thus distinctly "town-planning" in character.

Thickness of front and back walls:—To the first floor, two bricks, that is, an 18-inch wall; to the second and third a 14-inch wall; to the garrets a 9-inch wall.

Thickness of party walls:—To the first, second and third floors, 14-inch walls; to the garrets 9-inch.

These dimensions are more substantial than those required under modern by-laws, and the party walls for two storeys had to be as thick as the external walls, whereas now they need only be two-thirds the thickness.

Under the next heading we have the following scantlings (the breadth and depth of timbers) up to a length of 15 feet:—Summers or girders, 12 inches by 8; wall plates, 7 inches by 5; joists, 3 inches by 7; joists for garrets, 3 inches by 6; principal rafters at the foot, 8 inches by 6; at the top, 5 inches by 6; single rafters, 4 inches by 3.

For the second and third sort of houses, other timbers are specified in addition to these: rising pieces, beams, lintels and purlins, with their appropriate scantlings.

The next heading gives scantlings for sawn timber and laths:—Single quarters, 8 feet long, 3½ inches by 1¾; double quarters, the same length, 4 inches by 3½; joists, 8 feet long, 6 inches by 4; laths, 5 or 4 feet long, 1¼ inch by ⅜ of an inch.

Except those of the joists, which show that the relative supporting strength of depth and thickness had only been partially grasped, the dimensions given are practically those of to-day.

Stonework dimensions are then laid down:—Corner piers, 18 inches square; single piers, 14 inches by 12; double piers, 14 inches by 18; door jambs and heads, 8 inches.

Then last of all comes the solitary reference to sanitation. Sewers being 3 feet wide and 5 feet high, were to have walls a brick and a-half thick, to be arched over with bricks set on end, and to be paved with "one brick sideways, laid circular."

A few months later, in April, 1667, this re-edifying Act was supplemented by an Order made by the Lord Mayor, Aldermen and Council, beginning—"It is ordered that the surveyors take special care that the breast-summers of all houses do range of an equal height house with house, so far as shall be convenient and there to make breaks by their directions.

"And that they do encourage and give directions to all builders for ornament sake, that the ornaments and projections of the front buildings be of rubbed bricks neatly wrought, or all rubbed at the discretion of the builder, or that the builders may otherwise enrich their fronts as they please."

In the King's Declaration upon the Great Fire, notice is taken of "the pernicious consequences which have attended the use of building with timber or even with stone itself, and the notable benefit of brick," and to build with timber in the City was henceforth forbidden absolutely.

The table which I have quoted and the brief recommendations could be printed on an ordinary sheet of notepaper, and these regulations sufficed to control the rebuilding of the heart of the greatest city in the world.

It is instructive to compare these short and effective by-laws issued to cope with an emergency, the like of which has never since occurred, with the 139 by-laws that regulate building in the rural district of Farnham, or with the illustrated volumes of 150 pages or more issued in some boroughs and urban districts, and to compare further the state of those districts with that of others which thrive and prosper without ever having had any building by-laws at all.

The by-laws under which the City of London was rebuilt have taken but a few minutes to quote, but time would by no means permit of the quotation of the present-day by-laws even of a remote village—not to mention the London Building Act. I have, however, collected for comparison some few facts by a wearisome examination of over sixty codes framed on the same model but without the least uniformity of arrangement, the majority being without indexes, marginal references, or paragraph headings. It really seems as though those who are responsible for the by-laws were determined to make them as obscure and difficult of reference as possible. Indeed, I once heard a town clerk tell his committee, "There are objections to an index." To a bad index, perhaps; but surely not to a good one. The remark can only have meant that if an index were supplied it would probably resemble others in being so inaccurate and incomplete as to be a snare and a hindrance.

I mentioned a lack of uniformity, but in one respect the codes are terribly uniform. Nearly every clause, instead of beginning with some noun or verb that would indicate the subject, begins with the words, "Every person who shall erect a new building." For those whose duty it is to hunt for hidden prohibitions through the regulations of various districts, this concealment of the subjects means a surprising amount of extra labour.

Nor is reference facilitated by the fact that the sequence of subjects in one code is seldom, if ever, the same in another. For instance, by-law No. 11 in Okehampton is No. 59 in New Winchester, 12 in Hitchin, 49 in Godstone, 17 in Amersham, 29 in Gloucester, 66 in South Stoneham, 58 in Farnham, 57 in Dursley, 64 in Hendon, and 69 in Blackburn rural districts. It is certainly No. 11 also in Alresford, Penrith, Pembroke, and other places; but then the 38th Okehampton by-law is No. 40, 41, and 39 respectively with them.

This Okehampton by-law No. 11 requires certain ventilation flues. In Gloucester the minimum size for them is 50 square inches; in Dursley, in the same county, 100 square inches. One size is wrong, but which? And is either right?

Among urban and rural districts that index their by-laws are the following:—Portsmouth, Aylesbury, Winchester, Southampton, West Ham, Farnham, and Eton; and among those that do not are Blackburn Rural District, Bournemouth, Penrith, Yeovil, Bodmin, East Westmorland, and Lymington. Blackburn borough by-laws have the sort of index the town clerk whom I quoted must have had in his mind—a non-alphabetical table of contents.

Bournemouth, Portsmouth, and Blackburn embellish their codes with explanatory diagrams, but their example is seldom followed.

The Windsor Rural District Council charge 2*s.* 6*d.* for their by-laws; Guildford, 1*s.*; Aylesbury, 7*d.*; Petersfield, 6*d.*; South Stoneham, sometimes 6*d.*, sometimes nothing. The majority make no charge.

Amersham, Bodmin, Hendon, and a few other councils provide fairly full marginal references; Blackburn Rural District and Godstone do so but stingily; while most of the codes are lacking in these obvious conveniences.

About half the rural districts have by-laws relating to the general construction, height, and thickness of walls, Godstone, for instance, rejoicing in seventeen pages of them—enough, one would think, to regulate the building of a new Tower of Babel. In Dursley, however, they only provide for heights up to 60 feet—no sky-scraping labourers' cottages there! The remaining districts have no such rules, and presumably do not need them.

(*To be concluded.*)

## ART EXHIBITION.

At the Leicester Galleries, Leicester Square, W., there are now on exhibition about forty paintings in oil and watercolour upon which Mr. Charles Sims, A.R.A., has been engaged during the last four years. The collection includes finished sketches for his "The Land of Nod," "An Island Festival," and "The Fountain," all of which aroused great admiration—it might almost be said that they made a sensation—at the time of their exhibition on the staid walls of the Royal Academy. This does not mean to suggest that this young Associate is at war with Burlington House traditions, but merely that his pictures have qualities rarely found there. In this connection it is useful to recollect that Mr. Sims commenced his art training in 1890 at South Kensington; he then joined the Académie Julian in Paris, where he worked under M. J. Lefebvre and M. Benjamin Constant, and finally was at the R.A. schools. It would appear as if the French influence made an indelible impression on his work. The pictures now exhibited, though of a variety of subjects, are all viewed through the same poetic glass. For example, we may take Nos. 10 to 14. The first is "Gipsies," though the interest of the picture is centred not in a small encampment in the lower foreground, but in the glorious stretch of open (Sussex) country towards which the gipsies are looking. No. 11, "Child Worship," is obviously, from its title, a flight into the poetic. The same instinct is in No. 12; yet "Washerwomen," busy in a garret, is prosaic enough to most eyes. "The Quarry" (No. 14) is a hunting scene, where a stag is brought to bay by incorporeal shapes armed with bows and arrows. The same fanciful spirit breathes through these and all the other works; happily it is reinforced by powers of execution fully equal to the conception. There is a variety of treatment also which holds out the greatest promise for the future. A steady output of even such works as "The Fountain" would perhaps become in time cloying. Fortunately the same hand has produced "The Heather Crown," "Sap," and "The Astrologer and the Witch." Mr. Sims has come to be looked upon as one of our leading men; the present exhibition will enhance his reputation.

## ILLUSTRATIONS.

### LIVING ARCHITECTS.—NO. 34, MR. J. J. BURNET, A.R.S.A., F.R.I.B.A.

Mr. Burnet is a representative Glasgow architect, and is known to Southerners as the selected architect for the extension of the British Museum and an active member of the Council of the Royal Institute of British Architects.

### NO. 35, MR. W. FLOCKHART, F.R.I.B.A.

Mr. Flockhart is a past member of the Council of the Royal Institute of British Architects, and has distinguished himself in some of the recent principal open competitions as well as by his domestic work.

### CLYDE NAVIGATION TRUST, GLASGOW.

As examples of the work of Mr. Burnet we illustrate some views of the interior of the office building of the Clyde Navigation Trust.

Messrs. Read & Waring, civil engineers, Westminster, have been instructed by the Berwick Town Council to prepare a scheme of water supply for Tweedmouth and Spittal.

The directors of the Stirling Royal Infirmary have resolved, owing to the 12,000*l.* asked for to make a large extension to the infirmary building not having come in, to proceed at present with a new wing to cost 4,300*l.* The smaller scheme will fit in with the larger proposal, for which it is hoped the money will yet be obtained.

The University of London has arranged an advanced course of lectures, to which admission is free, on "The general principles of waterworks engineering, with special reference to the mechanical filtration of water," by Mr. W. H. Maxwell, A.M.I.C.E., at the University of London, South Kensington, S.W., on Fridays, May 6, 20 and 27, at 6 p.m. No tickets required.

## THE CONCRETE INSTITUTE.

The ninth ordinary general meeting of the Concrete Institute was held at the Royal United Service Institution, Whitehall, London, on Thursday, April 21, when a paper on "The Effects of Sewage and Sewage Gases on Portland Cement Concrete" was read by Mr. Sidney H. Chambers, engineer and surveyor to the Hampton Urban District Council.

The subject of the communication, the author stated, was one in regard to which it might be assumed that the available evidence was either inconclusive or of a more or less negative character; for, notwithstanding that cases were on record of destructive changes in tanks and sewers, the opinion tended to prevail that when the concrete construction was sound no marked disintegration need be anticipated, neither from sewage nor from its emanations.

The author's experience, however, did not support this view, and it was to the elaboration of this, the positive side of the question, that he desired to direct attention. During the last five or six years he had had very special opportunities for studying the problem.

In order to be in a position to more fully appreciate the disintegrating changes occurring at Hampton, and the deductions drawn from them, the author described briefly the installation in question, and stated the character of the sewage as well as outlining the nature of the materials used in the construction of the tank and channels.

### *The Hampton Installation.*

The nature of the sewerage system was water carriage, primarily flowing by gravitation, and, secondarily, raised by plenum pneumatic power. The sewerage was entirely and completely on the separate system. The installation consisted of a screening chamber, two detritus tanks, a hydrolytic tank, and triple contact beds, and an air purifying filter.

The sewage on its arrival at the works was delivered from the rising main into the screening chamber, and after passing through the screen was conveyed by a channel to the detritus tanks. From these tanks the sewage entered the hydrolytic tank, which, together with the detritus tank, was installed in 1903. The disposition of the tank was such that the main bulk of the sewage—80 per cent.—passed through at a comparatively high rate of flow, issuing in four hours as a clarified liquid, whilst the small volume—20 per cent.—containing the deposited matters was sixteen hours in the tank. After flowing over the weirs of the first portion the liquid entered a channel which led to the second portion of the tank, consisting of four hydrolising chambers arranged in sequence and filled with large flint stones. The liquid having taken three hours in its passage through these four chambers, entered the lower channel, which conducted it to the contact beds.

The screening chamber, the tank, and the channels leading to and from the tank, as also the effluent channel of the primary contact beds, were covered in. The entire installation was ventilated by the hydro-mechanical system of sewer ventilation, and the withdrawn gases were purified by being passed through an air filter.

The sewage of Hampton was of a strong domestic character. It had undergone thorough disintegration by the lifting operations and by the putrefactive changes occurring in the rising main. It was malodorous on its arrival at the screening chamber, where, as it left the rising main, it evolved sulphuretted hydrogen and other bad smelling compounds. The liberation of these gases constituted a nuisance, necessitating the screening chamber, channels and tank being covered in and a means being provided for drawing a large volume of air through them before discharging the gases into the atmosphere.

The whole of the tank and channels were constructed of Portland cement concrete. The walls of the tank are 6 feet 6 inches in thickness at the base and 1 foot 6 inches at the top, and are strengthened by tie-rods; the roof was 6 inches in depth, and was reinforced by "expanded metal," and the channels were covered by 2-inch "Indurated" paving slabs. The work was executed by departmental labour, and the best materials were used.

The concrete was composed of one part of Portland cement properly mixed with clean water and six parts of ballast thoroughly free from loam, clay, mud, or dirt of any kind, and no material was allowed to be used larger than would pass through a 2-inch screen.

The makers of the "Indurated" paving flags state that they are composed of Mountsorrel granite chippings, washed and crushed to pass through a ¼-inch mesh sieve, and heavy Portland cement made by themselves, the raw material for which is obtained from the Barrow-on-Soar blue lias beds. The materials are mixed in the proportion of one part of cement to three parts of granite.

### *Efflorescence.*

Early in 1905, a few months after the hydrolytic tank had been put into use, it was noticed that the roof and walls of the hydrolysing chambers above the liquid level were white or yellowish in appearance. This efflorescence was not crystalline in structure, but was of a chalky subsistence, and resembled distempered work on a damp wall. On examination it was found to be due to a thin covering of sulphur, which could be easily removed by rubbing. Later the face of the walls and the roof in the second part of the tank showed signs of peeling, and the concrete appeared to be disintegrating. A thorough inspection of the installation was thereupon made.

### *Disintegration.*

At the screening chamber nothing appreciable was observed, neither at the highest water-level nor on the underside of the roof. The concrete was sound, and when struck had a good ring. Immediately adjoining this chamber was the main sewage inlet channel, along which the whole of the gases pass to the main air duct leading to the air filter. At this point slots were made in the concrete to receive a dam; the concrete at the back of the grooves was found to have disintegrated, although the sides were perfectly sound.

Further along this channel it was observed that the greatest disintegration had taken place on the walls at the liquid level. Owing to variations in the flow of the sewage, the level of the liquid in the tank and channels rose and fell; thus a certain area of the walls was constantly being immersed in the sewage and then exposed to the air. This area was consequently, even when not immersed, much wetter than the part of the walls which was always above the level of the liquid. The latter area at this point showed erosion, which, however, had not penetrated so deeply as that at the level of the liquid itself. At the liquid level there was a deep groove in the concrete, and above this the face of the work had bulged out and lost its nature.

The first portion of the tank—*i.e.* the hydrolytic tank proper—appeared to have suffered very little. The walls and roof had only the slight sulphur deposit. At the liquid level, which varied less than in the channel, there was a slight erosion. The second part of the tank—*i.e.* the hydrolysing chambers—was found to have suffered in places to a marked degree. It was observed on breaking through the erosion on the surface that the concrete at the back was moist, soft and gritty. Also it was noticed that increased dampness constituted an important factor in the destruction of the concrete, for the lower parts of the vertical faces of the beams supporting the roof were more affected than the upper parts. The lower portions of the vertical walls of the tank also were more eroded than the upper. At the liquid level the concrete had been severely attacked, and a deep groove existed in it.

### *Analyses of Concrete in Hydrolytic Tank.*

Two samples of surface concrete were taken above and below the liquid level, and the following was the result of the analyses:—

| | Below Liquid Level. Sound. | Above Liquid Level. Unsound. |
|---|---|---|
| Appearance ... ... ... | Grey | White |
| Texture ... ... ... ... | Hard | Soft |
| Ratio cement to sand ... ... | 1:2 | 3:2 |
| Sulphate of lime in cement ... | Trace | 66 per cent. |

### *Considerable Deterioration.*

The same pronounced effect was to be seen in connection with the concrete blocks, which were grooved to receive sliding boards and project above the liquid level; these blocks had in many instances crumbled away to such an extent as to be almost shapeless. Recently these chambers were emptied, and it was found that the concrete below the liquid level was perfectly sound and in a good state of preservation.

The lower channel conveying the liquid from the tank to the contact beds revealed the same characteristics as were observed in the upper channel, but the portion at the liquid level was very much more markedly affected.

### *Analyses of the Disintegrated Concrete in the Channels.*

Samples taken of the lining of the sides and covering gave the following analyses:—

| | Ratio. | | Sulphate of Lime in Cement. |
|---|---|---|---|
| | Cement. | Sand. | |
| 1. Concrete at varying liquid level | 1 | 1 | 70.26 per cent. |
| 2. Underside of slab forming covering . . . . | 5 | 1 | 74.61 per cent. |

The air duct taking the gases from the effluent channel of the primary beds and communicating with the tank outlet channel was found to have a coating similar in appearance to that observed on the underside of the covering to the channels.

*Analyses of Concrete in Air Duct.*

Analyses of this coating were made, with the following results:—

|  | Ratio. |  | Sulphate of Lime in Cement. |
|---|---|---|---|
|  | Cement. | Sand. |  |
| Underside of slab forming covering of air duct . . . . | 2 | 1 | 70.71 |

*Conversion to Sulphate of Lime.*

The point to observe in the above analyses was the conversion of the lime in the cement into sulphate of lime, the sulphur being obtained from the sewage flowing through the tank and channels, as well as from the gases expelled from the sewage, and contained in the air withdrawn from the several parts of the installation.

*Suggested Explanation.*

Much thought had been given to the explanation of the foregoing observations, and it had been concluded that the effects had arisen from the putridity of the sewage and the oxidation of the putrid products by the air supply. The main erosive effect was at the varying liquid level, and was there dependent upon the amount of sulphuretted hydrogen in solution in the liquid. The gas was comparatively small in amount in the incoming sewage and in the liquid in the hydrolytic tank, and increased as the liquid passed through the hydrolising chambers. The results of this were especially well shown in the two channels: the alternate wet and dry area of the upper channel conveying the sewage from the rising main was less markedly affected, whilst in the lower channel the corresponding area was severely attacked. So with the two parts of the tank; the first part into which the sewage was delivered, and wherein comparatively little putrefaction took place, had not been affected to anything like the extent that the second part or hydrolysing chambers had.

When the level of the liquid fell it left the concrete which it previously covered wetted with a liquid containing sulphuretted hydrogen in solution. This wet surface was then exposed to the action of the air supply, which oxidised the sulphuretted hydrogen with the production of sulphur and sulphuric acids; these decomposed the concrete, the lime being converted finally into sulphate of lime. What the exact nature of the intermediate compounds was could not be stated, as none of them had been isolated, but it was probable that the active agent was sulphurous acid, as it was known that cement was insoluble in sulphuric acid. When the liquid rose again, the decomposed concrete was washed away either wholly or in part, and a fresh surface was exposed to action when the liquid fell again. It was the continuation of this cycle which led to the formation of the grooves at the varying liquid level.

*Concrete above the Liquid Level.*

The erosive effects on the concrete above the liquid level were dependent upon the sulphuretted hydrogen evolved from the liquid and mixed with the air supply. Some of this gas was dissolved by the moisture which was present on the walls and roofs, from evaporation and condensation; it was then oxidised by the air, and decomposed the concrete as described above. In this case the decomposed concrete either remained as a coating on the surface, peeled off, or crumbled away.

*Effect on Concrete Tubes.*

In order to observe the phenomenon on concrete tubes, two 9-inch concrete tubes were selected, which were supplied by the makers of the paving slabs previously referred to, and were composed also of similar materials in the same proportion. One of the tubes was coated with Dr. Angus Smith's composition (coal-tar, pitch, linseed oil, and resin). They were placed side by side in the second part of the tank in such a position that they would be subjected to the rise and fall in the level of the liquid. At low level the tubes were not in contact with the liquid, and at high level the liquid rose to half the diameter.

After the tubes had remained in the tank for eight months they were taken out and examined. The coated tube did not appear to have been affected, other than at the highest liquid level, where a thin line could be observed, and when struck it was found hard and had a good sound. It was noticed that there were two areas on this tube without any coating, due no doubt to its having been placed upon two supports to allow it to dry; these areas were soft on the surface and similar to the uncoated tube. With these exceptions the tube appeared to be in as good a condition as when first placed in the tank. On the other hand, the uncoated tube had a distinct line at the highest liquid level, which was found to be soft, and when tapped with a chisel had a dull sound; the interior of the tube which had been immersed appeared soft and had a dull sound when struck; the portion of the tube above the liquid level was unaffected, and when struck had a clear ring.

The author then referred to other cases of disintegration of concrete by sulphur compounds.

*Conclusions.*

The deductions to be drawn from the investigations were that the gases in solution in sewage, and those expelled from it, arising from its decomposition, do act injuriously upon Portland cement concrete, notwithstanding the fact that the concrete is constituted of sound and good materials, when the following conditions prevail:—

1. A high degree of putrescence of the sewage.
2. A moistened surface, which held or absorbed the putrid gases.
3. The presence of a free air supply.

Further, that in the absence of one or other of the above enumerated factors little danger from erosion need be feared.

Letters were read from Mr. H. K. G. Bamber, of the Associated Portland Cement Co., Ltd., and Mr. A. E. Collins, M.Inst.C.E., Norwich. Mr. Bamber said that in the main he was in accord with the author as to the probable cause of the defects discovered in the concrete being the action of sulphur compounds, although there may be some doubt as to the precise action which takes place. In his opinion a fairly warm temperature and moist atmosphere is necessary to produce the results stated by Mr. Chambers—*i.e.* the conversion of sulphuretted hydrogen into the sulphuric acid. Mr. Bamber said that the author's statement in this connection that cement is insoluble in sulphuric acid was not quite in accord with the previous statement that the sulphurous acid decomposes the concrete. Cement in the form of calcium hydrate, in which it largely exists in concrete, is soluble in sulphuric acid, the suggestion that it is not being simply due to the fact that during the action of sulphuric acid on the lime calcium sulphate is formed which collects over the surface particles of calcium hydrate to be dissolved, and prevents the further contact with sulphuric acid. Calcium hydrate continually agitated with sulphuric acid is soluble in that reagent. It is possible, continued Mr. Bamber, that the reaction may be brought about also by the combination of the sulphuretted hydrogen with the lime of the concrete forming calcium sulphide which is oxidised to calcium sulphate by the air passing through the culverts, and in either case the result is a loose friable material which is washed away by the passing fluids, again exposing a further surface for such decomposition. The remedy for this seemed in Mr. Bamber's opinion to be in the formation of an absolutely impervious and smooth surface on the inside of the culverts. In this connection he mentioned that his company are at the present moment engaged in experimental work with a special preparation of Portland cement to be used for this purpose. He was hopeful that in this way defects such as have been described by the author, and which may have been brought about by some special circumstances, may be entirely avoided. Mr. Bamber said he recently had an opportunity of inspecting some of the main sewers of Paris lined with Portland cement, which show no such deterioration. He therefore thought that Mr. Chambers's experience in this connection for some reason was somewhat unique, and must have resulted from special circumstances, as such defects are not general in sewer work constructed with Portland cement concrete.

Mr. A. E. Collins, M.Inst.C.E., surveyor, Norwich, writing in reference to the destruction of cement concrete in the Travis tanks at Hampton, said there were some concrete sewers in Norwich which were laid in 1891, varying in interior diameter from 42 inches to 24 inches, and the total length of which amounts to several miles. They were brought into use for conveying sewage about twelve years ago, and yet they show no signs whatever of deterioration. The main outfall discharges into a sewer of concrete tanks forming screen chambers, and the concrete in these is not deteriorated. The sewage passing through these screens is pumped to the sewage farm, where for nearly forty years it has been conveyed in a concrete carrier, and in this there is no disintegration through chemical action. A few years ago Mr. Collins had his attention drawn to the brickwork of a reservoir built in East Anglia in which bricks from the Peterborough district were used. In this case the very high-class cement mortar was in parts quite disintegrated. He was informed that this was due to the presence of sulphur in the mortar. A few years ago Mr. Collins was consulted respecting the failure of a etaining wall of a circular percolating filter constructed by he local authority of a town in East Anglia. The specificaion required the brickwork to be laid in cement mortar. About twelve months after construction the wall collapsed. On examining it Mr. Collins found no appearance of it having been constructed with cement, it being similar in ppearance and look to that constructed from ordinary chalk ime; when kept wet over a prolonged period it was pasty and had no strength. An analytical chemist was thereupon onsulted, and he reported the presence of a large quantity of ulphur. It appeared this sulphur came from the bricks which were from the same district as those used on the reservoir referred to above. Various experiences in cement oncrete work point to any excess of sulphur as being very destructive to it.

Mr. Alfred Roechling said the paper was a very instructive one and contained a good deal of food for thought. The author had stated his case very fairly, his observations were carefully recorded and his conclusions were logical. Papers of the kind just read taught far more than papers about which here is a great preliminary flourish of trumpets. Concrete was, of course, very largely used in sewage work, in fact the engineer cannot do without it. He had been studying the question of the effects of sewage and sewage gases on Portland cement concrete, and more particularly on concrete tubes. First of all he would like to point out that no alarm need be felt by anyone who has been using concrete tubes. But wherever there was reason to anticipate that the conditions would lead to the formation of sulphuric acids it was to avoid the use of concrete. On the Continent tubes are, and have been, very largely employed. Some time ago the question was raised as to what extent they could replace stoneware pipes above 15 inches in diameter and brickwork sewers by tubes. It was stated that it all depended upon the cost of making the concrete. Investigations were carefully made, and it was clearly proved that under ordinary conditions sewage does not affect the concrete tubes. But there were certain conditions under which they should not be employed; for instance, where very hot liquids or discharged steam passes through the concrete heats unequally and cracks occur. In one case the ground through which the sewer was laid contained a great quantity of pyrites, with the result that the tubes eventually collapsed. In another case a reservoir of reinforced slag collapsed in ten years. But with the exception of these conditions there seems no need to have any fear that concrete tubes will be attacked by sewage or sewage gas. Mr. Roechling said that in Paris he examined lengths of rising main where the Bonna system was used, and he could observe no signs of deterioration.

The discussion was continued by Mr. D. B. Butler, Mr. A. C. James, Mr. W. G. Kirkaldy, Mr. E. P. Wells, Mr. Herbert E. Brooks, and Mr. W. Dunn, F.R.I.B.A., chairman.

A vote of thanks having been passed, Mr. Sidney H. Chambers replied briefly to the discussion and stated that he would deal at greater length in the Institute's proceedings with those or any other points raised.

## ART ARCHITECTURE AND THE ASSISTANT.*

THE first glimmer in the official mind of the existence of the architect's assistant, as we know him, was exhibited in the address of Mr. Walter Cave at the Architectural Association nearly two years ago, and the measures taken by that body in reference to the state of unemployment, as exhibited by their register, indicates the desire for protection so widespread in the profession at the present time, and of which the measures taken by the Royal Institute cannot be too generously praised. But, previous to Mr. Cave's address, and since, the official view of the assistant as a person of private resource apart from the salary he receives for his work, has been the predominant one. In listening to presidential addresses one after another, one wonders whether presidents live in another world, whether their productions in this direction are intended as an impertinence, a gross piece of sarcasm by tacit inference to their audiences, who principally consist of the struggling assistant who often finds it a matter of difficulty to pay his annual subscription, or, thirdly, whether the assistant is considered so unimportant as to deserve no recognition from the presidential point of view, except as a student.

From the position of the assistant as student there is much to be done, and the existence of a large class, much larger than one would suspect, wretchedly paid, quite unrepresented in any society, and having no means whereby their position may be bettered, the existence of this class, I say, is a standing menace to the profession as it concerns the assistant, for it means the lowering of salary and status of the better men and more casual employment. The existence of many offices where men of this class are employed at insignificant salaries, with a paid assistant brought in at intervals to perform any thoughtful work, tutor the pupils and backward assistants, and then politely dismissed when the term of his usefulness is past, is no uncommon experience, and one which has been politely waived aside by official opinion. As a student, the assistant has always been interested in matters of art, and especially in relationship to his profession. From the point of view of individual development, the study of art is essential; but art in relation to the assistant and to our profession as matters stand at present is besmirched with cant and hypocrisy. One cannot but regard the manner in which the cant of art has grown up in our profession as one of the most important signs of the times, whereby the selfish business man talks insincerely of art in order to dupe his sincerely artistic *confrères* to achieve his real aims; those aims, of course, being those of any other profession or business devoid of any factor appealing directly to the emotions, as art appeals to any architect who sincerely believes and practises the Mistress Art.

The assistant, of course, has only the full opportunity of showing his knowledge of the art of architecture when either the cunning, carelessness, laziness, or lack of ability of his principal will allow—a condition of things which often prevails, and very largely in public offices where an engineer often reaps a harvest of praise and prestige from the work of an unheard-of architectural assistant. Art itself appears to have reached a precarious stage in the profession of architecture. The disciples are busy imitating and collecting from the masters, and the masters are busy in an ostensible game of bluff—that of imitating themselves; so that the final result of the latter's work is little above the average of their disciples.

To describe the present position of the profession of architecture towards art as that of a mere superficial relationship will probably honestly astonish a few, disgust many, and be looked upon as the idle prattle of an imbecile by many more. To describe that relationship as suspiciously dishonest is probably much nearer the truth, and to frankly describe it as dishonest is more probably the expression of outspoken sincerity. The many points of view as to the relationship of architecture to art agree in those well-known aphorisms so dear to some of us, architecture "The Mistress Art," "The Mother of all the Arts," "Architecture not a Profession but an Art." Most of us have heard these well-worn words so many times that, had we no genuine basis for our belief in them, the mere repetition would have engendered it. The purely artistic phases of the profession, Grand Manner or No Grand Manner, Decorated Construction or Constructed Decoration, are gradually being narrowed to the position the question of religion popularly occupies. If we are Methodists we buy our bread from a Methodist baker, and if we are Calvinists we feel intense remorse on purchasing goods sold by a grocer who contemns the Five Points. Likewise the Grand Manner disciples gaze with silent disgust on the followers of Mr. Baillie Scott. All this is very pleasing and amusing, but its economic aspect as affecting the assistant is scarcely worth any further reference except in a very few exceptional cases. The most noticeable feature of many of the ardent and talkative adherents of any of the schools of architecture is, that if their principles differ, their work has much in common, and usually finds an ample shelter under the title "early Victorian."

As all true camp followers of the art of architecture, the members of this Guild of Assistants duly subscribe to the common declaration of faith which we continue to recite with all due solemnity as our professional fathers have taught us. We do not desire to drag the art of architecture from the high place it occupies, or to trail even the hem of the garments of the Mistress Art in the dust. One would have thought that the position of the art of architecture was sufficiently well-established to resist the breath of scandal from any quarter, but it has ever been a commonplace that the gods should be strictly respected and protected in their implied sufficience from blasphemous influence. We are not deeply concerned in this table talk of architecture, and as a Guild of Assistants we desire to study the profession of architecture as it really is, and to discover the sources of the evils we know and feel the effects of. Let us leave for a moment the attractive thesis of the art of architecture and examine the less attractive but more engrossing one of the

---

* A paper read by Mr. E. J. Dixon, A.R.I.B.A., at a meeting of the Guild of Architects' Assistants on April 18.

The air duct taking the gases from the effluent channel of the primary beds and communicating with the tank outlet channel was found to have a coating similar in appearance to that observed on the underside of the covering to the channels.

*Analyses of Concrete in Air Duct.*

Analyses of this coating were made, with the following results:—

| | Ratio. | | |
|---|---|---|---|
| | Cement. | Sand. | Sulphate of Lime in Cement. |
| Underside of slab forming covering of air duct . . . | 2 | 1 | 70.71 |

*Conversion to Sulphate of Lime.*

The point to observe in the above analyses was the conversion of the lime in the cement into sulphate of lime, the sulphur being obtained from the sewage flowing through the tank and channels, as well as from the gases expelled from the sewage, and contained in the air withdrawn from the several parts of the installation.

*Suggested Explanation.*

Much thought had been given to the explanation of the foregoing observations, and it had been concluded that the effects had arisen from the putridity of the sewage and the oxidation of the putrid products by the air supply. The main erosive effect was at the varying liquid level, and was there dependent upon the amount of sulphuretted hydrogen in solution in the liquid. The gas was comparatively small in amount in the incoming sewage and in the liquid in the hydrolytic tank, and increased as the liquid passed through the hydrolising chambers. The results of this were especially well shown in the two channels: the alternate wet and dry area of the upper channel conveying the sewage from the rising main was less markedly affected, whilst in the lower channel the corresponding area was severely attacked. So with the two parts of the tank; the first part into which the sewage was delivered, and wherein comparatively little putrefaction took place, had not been affected to anything like the extent that the second part or hydrolysing chambers had.

When the level of the liquid fell it left the concrete which it previously covered wetted with a liquid containing sulphuretted hydrogen in solution. This wet surface was then exposed to the action of the air supply, which oxidised the sulphuretted hydrogen with the production of sulphur and sulphuric acids; these decomposed the concrete, the lime being converted finally into sulphate of lime. What the exact nature of the intermediate compounds was could not be stated, as none of them had been isolated, but it was probable that the active agent was sulphurous acid, as it was known that cement was insoluble in sulphuric acid. When the liquid rose again, the decomposed concrete was washed away either wholly or in part, and a fresh surface was exposed to action when the liquid fell again. It was the continuation of this cycle which led to the formation of the grooves at the varying liquid level.

*Concrete above the Liquid Level.*

The erosive effects on the concrete above the liquid level were dependent upon the sulphuretted hydrogen evolved from the liquid and mixed with the air supply. Some of this gas was dissolved by the moisture which was present on the walls and roofs, from evaporation and condensation; it was then oxidised by the air, and decomposed the concrete as described above. In this case the decomposed concrete either remained as a coating on the surface, peeled off, or crumbled away.

*Effect on Concrete Tubes.*

In order to observe the phenomenon on concrete tubes, two 9-inch concrete tubes were selected, which were supplied by the makers of the paving slabs previously referred to, and were composed also of similar materials in the same proportion. One of the tubes was coated with Dr. Angus Smith's composition (coal-tar, pitch, linseed oil, and resin). They were placed side by side in the second part of the tank in such a position that they would be subjected to the rise and fall in the level of the liquid. At low level the tubes were not in contact with the liquid, and at high level the liquid rose to half the diameter.

After the tubes had remained in the tank for eight months they were taken out and examined. The coated tube did not appear to have been affected, other than at the highest liquid level, where a thin line could be observed, and when struck it was found hard and had a good sound. It was noticed that there were two areas on this tube without any coating, due no doubt to its having been placed upon two supports to allow it to dry; these areas were soft on the surface and similar to the uncoated tube. With these exceptions the tube appeared to be in as good a condition as when first placed in the tank. On the other hand, the uncoated tube had a distinct line at the highest liquid level, which was found to be soft, and when tapped with a chisel had a dull sound; the interior of the tube which had been immersed appeared soft and had a dull sound when struck; the portion of the tube above the liquid level was unaffected, and when struck had a clear ring.

The author then referred to other cases of disintegration of concrete by sulphur compounds.

*Conclusions.*

The deductions to be drawn from the investigations were that the gases in solution in sewage, and those expelled from it, arising from its decomposition, do act injuriously upon Portland cement concrete, notwithstanding the fact that the concrete is constituted of sound and good materials, when the following conditions prevail:—

1. A high degree of putrescence of the sewage.
2. A moistened surface, which held or absorbed the putrid gases.
3. The presence of a free air supply.

Further, that in the absence of one or other of the above enumerated factors little danger from erosion need be feared.

Letters were read from Mr. H. K. G. Bamber, of the Associated Portland Cement Co., Ltd., and Mr. A. E. Collins, M.Inst.C.E., Norwich. Mr. Bamber said that in the main he was in accord with the author as to the probable cause of the defects discovered in the concrete being the action of sulphur compounds, although there may be some doubt as to the precise action which takes place. In his opinion a fairly warm temperature and moist atmosphere is necessary to produce the results stated by Mr. Chambers—*i.e.* the conversion of sulphuretted hydrogen into the sulphuric acid. Mr. Bamber said that the author's statement in this connection that cement is insoluble in sulphuric acid was not quite in accord with the previous statement that the sulphurous acid decomposes the concrete. Cement in the form of calcium hydrate, in which it largely exists in concrete, is soluble in sulphuric acid, the suggestion that it is not being simply due to the fact that during the action of sulphuric acid on the lime calcium sulphate is formed which collects over the surface particles of calcium hydrate to be dissolved, and prevents the further contact with sulphuric acid. Calcium hydrate continually agitated with sulphuric acid is soluble in that reagent. It is possible, continued Mr. Bamber, that the reaction may be brought about also by the combination of the sulphuretted hydrogen with the lime of the concrete forming calcium sulphide which is oxidised to calcium sulphate by the air passing through the culverts, and in either case the result is a loose friable material which is washed away by the passing fluids, again exposing a further surface for such decomposition. The remedy for this seemed in Mr. Bamber's opinion to be in the formation of an absolutely impervious and smooth surface on the inside of the culverts. In this connection he mentioned that his company are at the present moment engaged in experimental work with a special preparation of Portland cement to be used for this purpose. He was hopeful that in this way defects such as have been described by the author, and which may have been brought about by some special circumstances, may be entirely avoided. Mr. Bamber said he recently had an opportunity of inspecting some of the main sewers of Paris lined with Portland cement, which show no such deterioration. He therefore thought that Mr. Chambers's experience in this connection for some reason was somewhat unique, and must have resulted from special circumstances, as such defects are not general in sewer work constructed with Portland cement concrete.

Mr. A. E. Collins, M.Inst.C.E., surveyor, Norwich, writing in reference to the destruction of cement concrete in the Travis tanks at Hampton, said there were some concrete sewers in Norwich which were laid in 1891, varying in interior diameter from 42 inches to 24 inches, and the total length of which amounts to several miles. They were brought into use for conveying sewage about twelve years ago, and yet they show no signs whatever of deterioration. The main outfall discharges into a sewer of concrete tanks forming screen chambers, and the concrete in these is not deteriorated. The sewage passing through these screens is pumped to the sewage farm, where for nearly forty years it has been conveyed in a concrete carrier, and in this there is no disintegration through chemical action. A few years ago Mr. Collins had his attention drawn to the brickwork of a reservoir built in East Anglia in which bricks from the Peterborough district were used. In this case the very high-class cement mortar was in parts quite disintegrated. He was informed that this was due to the presence of sulphur in the mortar. A few years ago Mr. Collins was consulted respecting the failure of a retaining wall of a circular percolating filter constructed by the local authority of a town in East Anglia. The specification required the brickwork to be laid in cement mortar. About twelve months after construction the wall collapsed. On examining it Mr. Collins found no appearance of it having been constructed with cement, it being similar in appearance and look to that constructed from ordinary chalk lime; when kept wet over a prolonged period it was pasty and had no strength. An analytical chemist was thereupon consulted, and he reported the presence of a large quantity of sulphur. It appeared this sulphur came from the bricks which were from the same district as those used on the reservoir referred to above. Various experiences in cement concrete work point to any excess of sulphur as being very destructive to it.

Mr. Alfred Roechling said the paper was a very instructive one and contained a good deal of food for thought. The author had stated his case very fairly, his observations were carefully recorded and his conclusions were logical. Papers of the kind just read taught far more than papers about which there is a great preliminary flourish of trumpets. Concrete was, of course, very largely used in sewage work, in fact the engineer cannot do without it. He had been studying the question of the effects of sewage and sewage gases on Portland cement concrete, and more particularly on concrete tubes. First of all he would like to point out that no alarm need be felt by anyone who has been using concrete tubes. But wherever there was reason to anticipate that the conditions would lead to the formation of sulphuric acids it was to avoid the use of concrete. On the Continent tubes are, and have been, very largely employed. Some time ago the question was raised as to what extent they could replace stoneware pipes above 15 inches in diameter and brickwork sewers by tubes. It was stated that it all depended upon the cost of making the concrete. Investigations were carefully made, and it was clearly proved that under ordinary conditions sewage does not affect the concrete tubes. But there were certain conditions under which they should not be employed; for instance, where very hot liquids or discharged steam passes through the concrete heats unequally and cracks occur. In one case the ground through which the sewer was laid contained a great quantity of pyrites, with the result that the tubes eventually collapsed. In another case a reservoir of reinforced slag collapsed in ten years. But with the exception of these conditions there seems no need to have any fear that concrete tubes will be attacked by sewage or sewage gas. Mr. Roechling said that in Paris he examined lengths of rising main where the Bonna system was used, and he could observe no signs of deterioration.

The discussion was continued by Mr. D. B. Butler, Mr. A. C. James, Mr. W. G. Kirkaldy, Mr. E. P. Wells, Mr. Herbert E. Brooks, and Mr. W. Dunn, F.R.I.B.A., chairman.

A vote of thanks having been passed, Mr. Sidney H. Chambers replied briefly to the discussion and stated that he would deal at greater length in the Institute's proceedings with those or any other points raised.

## ART ARCHITECTURE AND THE ASSISTANT.*

THE first glimmer in the official mind of the existence of the architect's assistant, as we know him, was exhibited in the address of Mr. Walter Cave at the Architectural Association nearly two years ago, and the measures taken by that body in reference to the state of unemployment, as exhibited by their register, indicates the desire for protection so widespread in the profession at the present time, and of which the measures taken by the Royal Institute cannot be too generously praised. But, previous to Mr. Cave's address, and since, the official view of the assistant as a person of private resource apart from the salary he receives for his work, has been the predominant one. In listening to presidential addresses one after another, one wonders whether presidents live in another world, whether their productions in this direction are intended as an impertinence, a gross piece of sarcasm by tacit inference to their audiences, who principally consist of the struggling assistant who often finds it a matter of difficulty to pay his annual subscription, or, thirdly, whether the assistant is considered so unimportant as to deserve no recognition from the presidential point of view, except as a student.

From the position of the assistant as student there is much to be done, and the existence of a large class, much larger than one would suspect, wretchedly paid, quite unrepresented in any society, and having no means whereby their position may be bettered, the existence of this class, I say, is a standing menace to the profession as it concerns the assistant, for it means the lowering of salary and status of the better men and more casual employment. The existence of many offices where men of this class are employed at insignificant salaries, with a paid assistant brought in at intervals to perform any thoughtful work, tutor the pupils and backward assistants, and then politely dismissed when the term of his usefulness is past, is no uncommon experience, and one which has been politely waived aside by official opinion. As a student, the assistant has always been interested in matters of art, and especially in relationship to his profession. From the point of view of individual development, the study of art is essential; but art in relation to the assistant and to our profession as matters stand at present is besmirched with cant and hypocrisy. One cannot but regard the manner in which the cant of art has grown up in our profession as one of the most important signs of the times, whereby the selfish business man talks insincerely of art in order to dupe his sincerely artistic *confrères* to achieve his real aims; those aims, of course, being those of any other profession or business devoid of any factor appealing directly to the emotions, as art appeals to any architect who sincerely believes and practises the Mistress Art.

The assistant, of course, has only the full opportunity of showing his knowledge of the art of architecture when either the cunning, carelessness, laziness, or lack of ability of his principal will allow—a condition of things which often prevails, and very largely in public offices where an engineer often reaps a harvest of praise and prestige from the work of an unheard-of architectural assistant. Art itself appears to have reached a precarious stage in the profession of architecture. The disciples are busy imitating and collecting from the masters, and the masters are busy in an ostensible game of bluff—that of imitating themselves; so that the final result of the latter's work is little above the average of their disciples.

To describe the present position of the profession of architecture towards art as that of a mere superficial relationship will probably honestly astonish a few, disgust many, and be looked upon as the idle prattle of an imbecile by many more. To describe that relationship as suspiciously dishonest is probably much nearer the truth, and to frankly describe it as dishonest is more probably the expression of outspoken sincerity. The many points of view as to the relationship of architecture to art agree in those well-known aphorisms so dear to some of us, architecture "The Mistress Art," "The Mother of all the Arts," "Architecture not a Profession but an Art." Most of us have heard these well-worn words so many times that, had we no genuine basis for our belief in them, the mere repetition would have engendered it. The purely artistic phases of the profession, Grand Manner or No Grand Manner, Decorated Construction or Constructed Decoration, are gradually being narrowed to the position the question of religion popularly occupies. If we are Methodists we buy our bread from a Methodist baker, and if we are Calvinists we feel intense remorse on purchasing goods sold by a grocer who contemns the Five Points. Likewise the Grand Manner disciples gaze with silent disgust on the followers of Mr. Baillie Scott. All this is very pleasing and amusing, but its economic aspect as affecting the assistant is scarcely worth any further reference except in a very few exceptional cases. The most noticeable feature of many of the ardent and talkative adherents of any of the schools of architecture is, that if their principles differ, their work has much in common, and usually finds an ample shelter under the title "early Victorian."

As all true camp followers of the art of architecture, the members of this Guild of Assistants duly subscribe to the common declaration of faith which we continue to recite with all due solemnity as our professional fathers have taught us. We do not desire to drag the art of architecture from the high place it occupies, or to trail even the hem of the garments of the Mistress Art in the dust. One would have thought that the position of the art of architecture was sufficiently well-established to resist the breath of scandal from any quarter, but it has ever been a commonplace that the gods should be strictly respected and protected in their implied sufficience from blasphemous influence. We are not deeply concerned in this table talk of architecture, and as a Guild of Assistants we desire to study the profession of architecture as it really is, and to discover the sources of the evils we know and feel the effects of. Let us leave for a moment the attractive thesis of the art of architecture and examine the less attractive but more engrossing one of the profession of architecture. The principal and the assistant of fifty years ago might be described as standing on the same plane as regards rank and social position, and in a relationship somewhat of tutor and pupil, the latter being practically certain, if he persevered, of reaching the same, or perhaps a higher, position in the profession than his tutor. It is not implied that the service of architecture was entirely the object, for many of the older practitioners have left some goodly sums of money, as we all know, penuriously amassed in the service of architecture. The advent of the modern assistant, a man with little or no financial backing and depending solely on his salary to live, was gradual; but eventually he numerically swamped the older class, and often proved himself more capable. He immediately endeavoured to imitate the older men—he adopted their superstitions, their habits, and their prejudices. This kind of thing is not, of course, unknown in other walks of life, it is a common social phenomenon. The difficulties of any new movement on behalf of any section have, as their initial difficulty, their first obstacle, the prejudices borrowed from the social strata immediately above, and the question of their removal. The architect's assistant of the present day quickly found himself in the same position as the wage-earners in any other business, and due to precisely the same causes. He has hitherto found his prejudices too strong to permit him to combine in his own interests, to recognise, in short, that his position as assistant is rapidly becoming a permanent one, that the possibilities of becoming a principal grow less as he grows older, that signs are not wanting that the principal means of outlet for the energies of the assistant, the opportunity that this profession possesses above all others, the open competition, is gradually becoming limited, either to districts and more often to architects in practice. I do not think that in thus rapidly sketching the latter history of the architect's assistant I have in any way overdrawn the real state of affairs in the profession as it concerns him. Once granting the truth of this account of the present position of the architect's assistant, it would appear that the only common-sense course to adopt, if no escape from the profession is available, would be to render it as congenial as possible; to recognise the probable limitations of one's genius without attempting to render null and void any ambition one may possess. The first point to be noticed in assuming this view of the architect's assistant's place in the profession is the fact that nothing definite can be achieved without organisation of some kind or other, and the painful fact that the existing societies are composed of principals or those who are in full possession of the illusion that they will be principals, and, secondly, that a deplorable reception awaits the man who would take up cudgels on behalf of the assistant in such a foreign atmosphere. The question then for all assistants to decide is the kind of organisation they will select, the work they propose to commit to its care, and the manner of its execution.

---

* A paper read by Mr. E. J. Dixon, A.R.I.B.A., at a meeting of the Guild of Architects' Assistants on April 18.

The Guild of Architects' Assistants proposes to unite all those who have any title whatever to its designation; it proposes to primarily unite them socially as a matter of course, and, secondly, it has proposed a programme whereby the many grievances under which the assistant struggles, and which before recognising his position as practically that of a mere casual labourer with practically the same wage, it regarded as the necessary struggle of the architectural pilgrim on his way to achieve the crown of glory of a future practice; this programme has now been before the public in the architectural Press for the past eighteen months. It proposes to endeavour to do something in the matter of (1) salaries, (2) office hours, (3) office conditions, (4) recognition of an assistant's work where possible, (5) legal assistance, (6) unemployment bureaux and insurance, (7) education. The Guild will endeavour to carry out the proposals by means of combination, necessitating strength of numbers, and conference with existing societies and principals, necessitating tact and toleration. There are many other advantages a keen, solid combination such as this will immediately suggest, such as parliamentary and municipal action, it being usually found an easier matter to effect changes in the domestic affairs of public bodies by means of correspondence and deputations than in the case of private employers.

The act of bringing forward matters which immediately affect the well-being of the assistant to the notice of existing bodies would have the effect of stimulating the interest of assistants who are members of those bodies.

The inclusion of principals who are interested in this, which the Guild trusts will become the important phase of architectural politics, will provide the necessary element of experience and breadth which such a movement as ours demands. The principal finds it necessary to take some measure of protection for his own interests against the guerilla warfare carried on against him by the unruly members of his class, by taking refuge within the folds of a Registration Bill; but the assistant feels doubtful as to whether he should combine in like manner, and for exactly similar reasons. You see "We don't intend to remain assistants—we shall one day be principals," and then "The idea of combination is so like trade unionism, which, of course, is a thing we must not dream of." There are some of us, however, an increasing number, who, after noticing the gradual removal of the elderly assistant who has failed to arrive, muttering continually, as he shakes his iron-grey head, the dear old excuses and shibboleths, and gradually sinking into that dismal limbo from which no architect's assistant returns, who, I say, desire to bring all assistants together within a bond of union of their own interests, for their own progress and betterment. Whatever is bad in combination let us exhibit enough sense to reject, and whatever is good let us hold fast to whatever borrowed prejudices may be wrecked in the struggle.

To begin with, this Guild of Architects' Assistants welcomes the advice, help, and assistance of all principals who are really interested in the welfare and fate of the assistant. They are able to see the assistant from the business point of view, to appreciate the value of a good assistant, and to condemn the incompetence of a poor one. All principals interested in the better organisation of the profession generally will welcome the advent of any well-considered scheme which redounds to their benefit, which will select, classify, and secure to them the best assistant available on the market, instead of continuing the present method, if it can be so called, of trial and error in the engagement of assistants. Principals will recognise that the assistants are even more interested in any sound scheme for the protection of the profession than they are themselves, that they form a potent numerical factor in all societies, and consequently represent an interest which, if well organised, would unquestionably prove of great value in any movement in the direction of the real reform of the business organisation of the profession or the improvement of the status of its units.

We make no attempt to strictly define the term "Architects' Assistant," regarding as such all who are engaged in the practice of the construction of building and who may be likely to compete with us in business life for any class of work, building, or architecture. We want to make the term "Architects' Assistant" as broad as possible, leaving it to the common sense of those who desire to join us as to their reasons for inclusion.

Apart from all these reasons for the development of the Guild of Architects' Assistants, which we may term "economic," another, and perhaps more powerful one, may be brought forward to justify our existence, and that is the "social" reason. We are the only "Society of Architects' Assistants," the only architectural society having for its primary object the maintenance of the status of assistants. As all other existing societies place the principals' interests first and the assistants' last, so we fill a place in the profession by providing for and maintaining the assistants' interests, and those not without deference to the principal, whom we ask to join and assist us. We have continually reiterated that we have no desire to compete in any way with other societies, but to collaborate and work with and within them. Unfortunately the fact that we must receive subscriptions if we want to live constitutes in some way a challenge to other societies; but we have endeavoured to minimise this possible source of irritation to as low a figure as possible (1) in order to allow our members to remain in existing societies and to work within them, (2) to avoid as much as possible any appearance of competition with other societies. Any similarity that may be apparent in the aims of the Guild in comparison with those of other societies demonstrates firstly, that no radical difference exists; secondly, that the proposals of other societies in relation primarily to the principal are exactly similar to ours in relation to the assistant; and thirdly, the social aspect, that of providing an assistants' society, is exactly similar to that of other societies.

In conclusion, therefore, it is our hope that the Guild of Architects' Assistants, by presenting the assistants' case in an organised fashion to existing bodies, besides carrying out that section of the work which is peculiarly its own, will form a useful cement to existing professional opinion, even if it may not eventually aspire to the position of an important feature in the professional structure itself.

A Cardiff and District Builders' Association has been formed to protect the interests of those who do not belong to the Cardiff Master Builders' Association.

## FIRE ALARMS.

By T. E. Lander.

*(Concluded from page 247.)*

I WILL now endeavour to explain the principles on which our detector is constructed. We have two forms. The main principles are the same in each, but, in describing these to you, I will use an enlarged illustration of the long form, as all the details of it can be shown in a sectional drawing made on one plane, which would be impossible with the small circular instrument.

This drawing shows our detector as it appears when first out of the glass-blower's hands and before it is mounted. When complete the platinum wires D, E and F are embedded in strong cement, the instrument is supported on springs, and the whole protected from injury by a substantial cover with perforations, which permit free circulation of air.

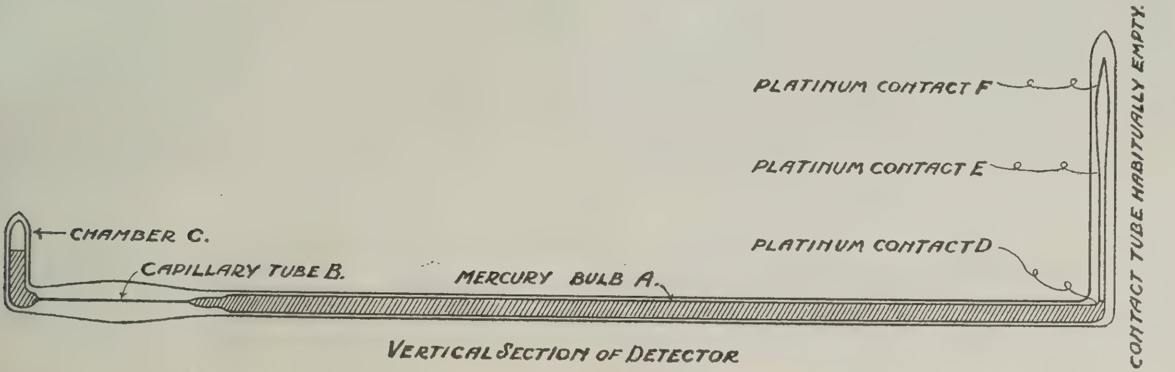

Fig. 1.

A corresponds to the bulb of an ordinary thermometer. This bulb, as I will call it, is always full of mercury, as are also the capillary tube B, and about one-half of the chamber C. The upper portion of chamber C has no mercury in it, and has had the air expelled from it. The upright chamber at the other end of the instrument has also neither mercury nor air in it. The end of the platinum wire D is always in the mercury, and on an outbreak of fire occurring the mercury rises to E., when an electric circuit is completed and a warning gong sounded. Except in the case of an explosion, this warning gong would be sounded so quickly after the outbreak that a single person could almost invariably put the fire out, and the gong will go on ringing until this is done, or until the electric batteries become exhausted; but, if no attention is paid to this warning gong, the mercury, on rising to contact F, completes another electric circuit, and either rings a large gong outside the building to attract the attention of passers-by, or, as would usually be the case in a town, gives a call to the brigade. It will be seen that the space to be filled between E and F is of considerably larger size than that between D and E. This is intentional, as it is desirable that the warning call should be given as quickly as possible, and that between the sounding of this call and the second, or danger call, there should be sufficient time to allow of someone in the building rushing to the spot to extinguish the fire before the brigade is called out. If the fire is a really fierce one from the first, the second, or danger call, would be given in a very few moments. It may be asked what would happen if the fire destroyed the wires of the electric circuit before the warning is given. This is impossible, as far greater heat would be required to destroy the wires than to make the instrument act, and when once either gong has begun to ring the electric current does not pass through the wires in the region of the fire.

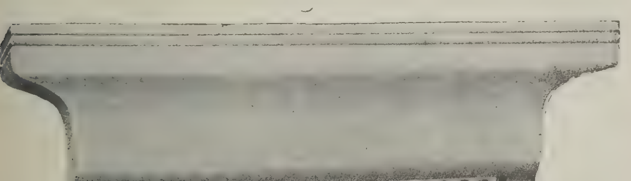

Fig. 2.

The compensation for ordinary fluctuations of temperature, to which I have referred so often, is brought about at the other end of the instrument by means of the capillary tube B and the vacuum chamber C. Under normal conditions the mercury is, when any fluctuations of temperature are taking place, always rising or falling in chamber C, and never moves from the point D. At first one wonders why, when the mercury at C is, as it usually is, higher than at D, it does not enter the contact tube. If we were to replace the mercury with water, capillary attraction would draw it up the narrow contact tube, and it would, as you see in these capillary tubes beside me, stand at a higher level in it than it would in the wide chamber C, but the exact opposite is the case with mercury, for the mercury does not enter the fine upright tube, although it stands at a considerably higher level in the wide portion at the other end. In the detector it passes freely backwards and forwards through the fine capillary tube B, because this is always full of mercury, and it is just as easy for the mercury to go one way as the other; but it has a distinct disinclination to enter a fine capillary tube. It is by regulating the fineness of the capillary tube B that we can bring about whatever degrees of compensation we wish for.

On a fire occurring, the mercury expands more rapidly than usual in the main bulb; it cannot get sufficient relief through the capillary B, and it is forced up the contact tube.

If, as in the case of a smouldering fire, the temperature of the room is not increased at a greater rate than the detector will compensate for, the mercury continues to expand until the chamber C is quite full, and then, again, it must enter the contact tube. By regulating the size of chamber C when the detector is being made, we determine the fixed temperature at which this shall take place.

I would like at this stage to point out a most important feature of this detector, namely, that the platinum contact points and the mercury, being hermetically sealed and in a vacuum, can never corrode, become coated with dust, or in any other way be prevented from making good electrical contact. From what I have said it will be seen that, however cold a room may be, the main bulb is always full of mercury, and that the mercury is always kept pressing against the mouth of the contact tube owing to the "head" of mercury in the chamber C. It is, therefore, always set to exactly the same degree of sensitiveness, and the distance between D and E, of course, cannot change. Although it sounds almost paradoxical, it is quite possible for this detector to give warning of fire while the temperature of the air round it is still below freezing point. The explanation is simple. Assume a room without a fire in it, the temperature of the air 10° Fahr. below freezing point, and the detector one which compensates for fluctuations up to, say, 5° Fahr. per minute. If a small fire breaks out and the temperature rises at the rate of, say, 6° Fahr. per minute, the first warning would be given in about one-fifth of a minute, by which time the temperature of the air would have risen only a little over 1° Fahr., and would be still more than 8° Fahr. below freezing point. I mention this as it is rather an interesting fact, and one which illustrates what really perfect compensation means.

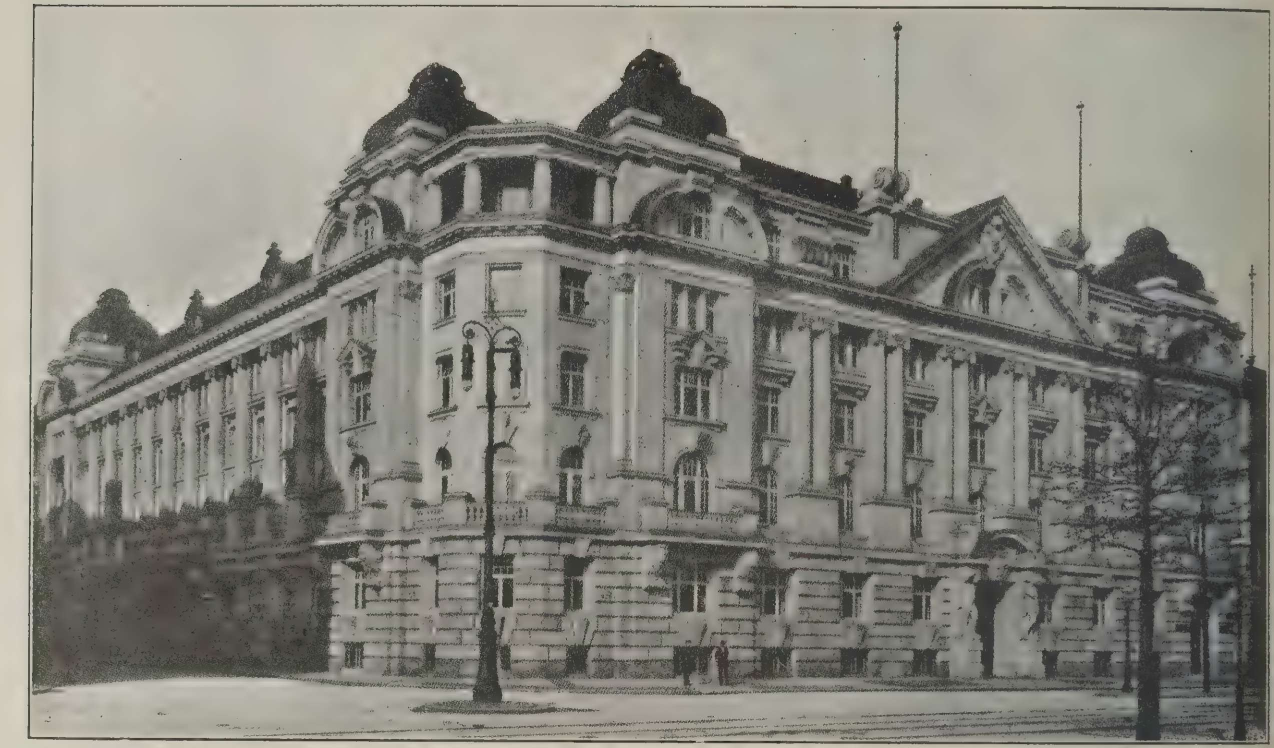
I have thus described the way in which our detector is designed to fulfil the first requirement, namely, great sensitiveness. The way in which it fulfils the remaining qualifications I can explain in fewer words.

With regard to qualification number two, freedom from false alarms, there were, in my opinion, three main causes of false alarms in the past, namely:—

1. Vibration.
2. Imperfect compensation for ordinary fluctuations of temperature.
3. Insufficient knowledge on the part of those installing the various systems of what the normal fluctuations of temperature were.

I think it will be admitted that the construction of our

## MODERN EUROPEAN ARCHITECTURE.
### GERMANY.



[From *Der Profanbau.*

OFFICES OF THE LEIPZIG LIFE ASSURANCE COMPANY, LEIPZIG.—Baurat A. Käppler, Architect.

detectors is such as to ensure that they will be very little affected by vibration. If placed under a floor of ordinary strength, the dropping of such weights as a bale of cotton, a sack of flour, or even considerably heavier things on the floor above, will not affect them at all.

The detectors compensate so perfectly, and it is so easy to make them of any desired degree of sensitiveness, that there is no temptation to us to instal any that are unsuited to the conditions under which they have to work; and the way in which we test these conditions is so accurate that there is no likelihood of our installing unsuitable ones by mistake.

With regard to the third qualification, given sufficient time, the requisite tools, and a knowledge of the principles, a man can prevent any piece of mechanism from performing its proper function, but I really think Mr. Walker has designed a fire alarm system which will puzzle even the deliberate incendiary. The detector, being made of glass, could, of course, be broken easily if unprotected; but it is protected against all ordinary rough usage by the substantial cover which is shown in my second illustration.

This cover cannot be removed without the warning gong being sounded, and if the detector is intentionally broken by forcing something through one of the openings of the cover, the warning is again instantly given. The gongs could be disconnected, but they are, of course, always placed in such a position as could not readily be got at. The wires might be cut, but to provide against this risk our system of wiring is protected in accordance with the Regulations of the Fire Offices' Committee, and, in addition, we use a double return arrangement of wiring which ensures that the system will not be rendered ineffective unless the wires of each group of units are cut at two separate places a considerable distance apart.

With regard to the fourth qualification, to make sure that the wires and batteries are in order, all that is necessary is to press a switch on the indicator board, when a current passes through the whole system and an ammeter shows at once if the entire circuit is not intact. To the right of this switch and ammeter you will notice a row of push buttons with a volt-meter above them. On pressing each of these buttons in turn the volt-meter shows whether the batteries are of full strength. We recommend that these tests be made daily, and, as they only take a few seconds and are all made from one central point, there is no temptation to the man in charge to omit to do this.

The use of automatic fire alarms has, I believe, been greatly hindered through the trouble they caused by false alarms. Naturally the fire brigade and the property owners who have paid for the installations are annoyed whenever a false alarm is given; but almost no new invention is perfect from the first, and time was bound to be required to find out from experience what the difficulties incident to automatic fire alarms were and the ways in which these difficulties could be overcome. Knowing the weak points of the earlier inventions, Mr. Walker set himself to produce one which could be depended on to give warning in the very earliest stages of a fire, while being free from liability to give false alarms, and I can see no room to doubt that he has succeeded.

The principles on which the detector works are simple and easily seen to be reliable; but my belief is also based on the experience of complete installations which have now been in operation for periods up to two years.

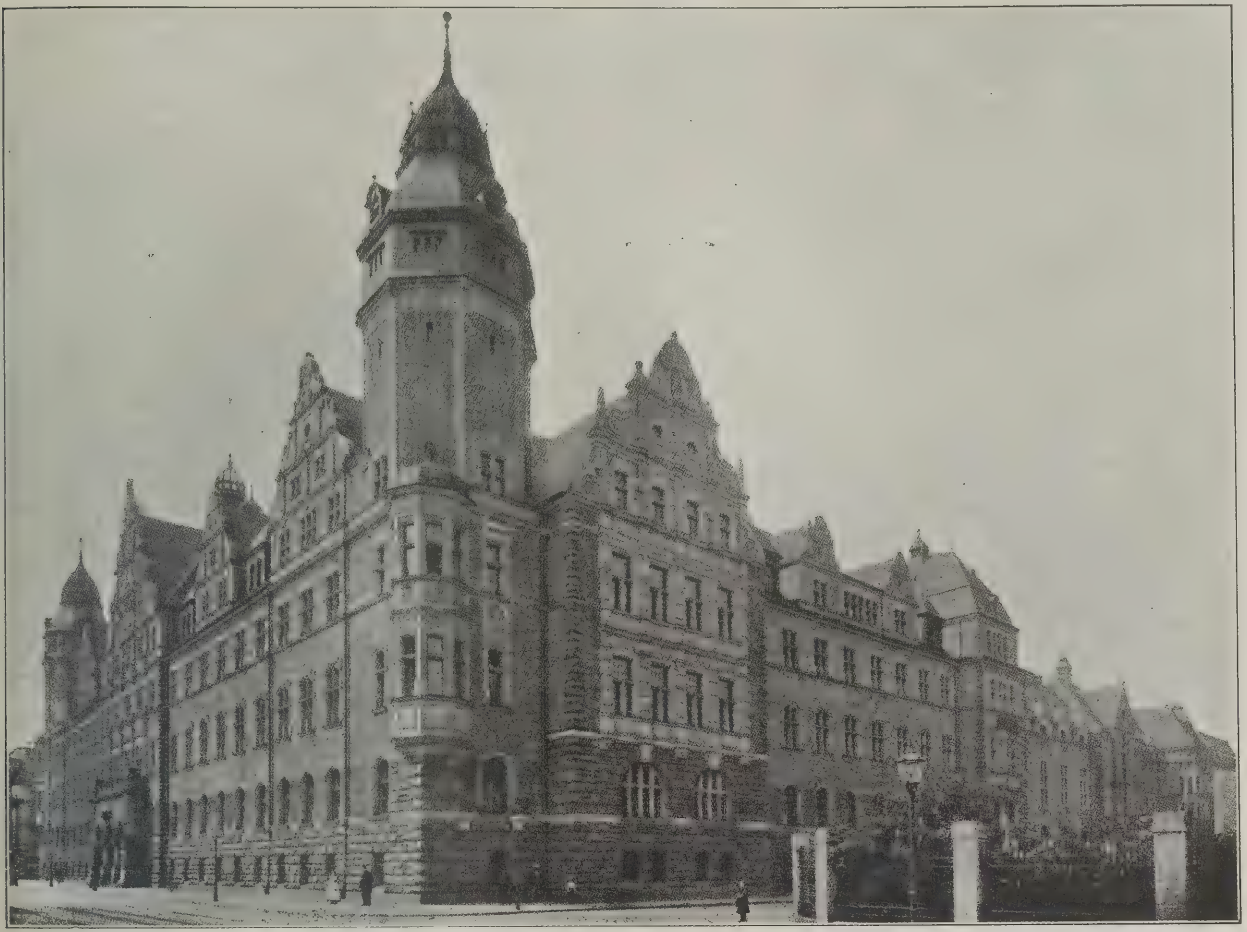
I hope that before long the protection which a reliable automatic fire alarm affords in almost every class of building will be more fully recognised than it is at present. As an instance of the way in which its value is recognised in at least one well-informed quarter, I may mention that some months ago a well-known firm who manufacture fire-extinguishing appliances advised us to approach a certain corporation with a view to getting our system put into one of their public buildings. The firm referred to had been asked to tender for a large number of chemical extinguishers for the protection of this building, but they told us that, unless a really good automatic alarm were installed, they would rather not have their extinguishers in the building in question. They had wisely come to this decision because, after carefully looking into the risk, they saw that there were many rooms in the building which, if not equipped with automatic alarms, might be burning so long unnoticed that hand extinguishers would be of no use. For a hand-extinguishing appliance to be of real use a fire must, of course, be caught in the early stages, and I consider it was very wise of the firm in question to prefer to lose a large order rather than run an undue risk of damaging the reputation of their extinguisher.

I would repeat that a reliable automatic alarm affords great protection in almost every class of building.

While we constantly hear certain classes of buildings described as fire-proof, I think that none of us have ever yet known of one which really was fire-proof. If I am right, then every building in which large numbers of more or less helpless people are housed, such as asylums, hospitals, model lodging-houses, &c., should be equipped with either automatic extinguishing appliances or automatic alarms. The automatic alarm does not pretend to extinguish a fire, but, if it is a reliable one, it will give warning in the very earliest stages of a fire, so early that, with any of the proper

## MODERN EUROPEAN ARCHITECTURE.

### GERMANY.



[From *Der Profanbau.*

NEW LAW COURTS, LEIPZIG.—Herr Theodor Kösser, Architect.

appliances available, a single man or woman should be able to extinguish it. It should give warning in time to permit of the fire being put out considerably sooner than an automatic sprinkler could come into action. I do not wish to minimise the value of the automatic sprinklers: they are undoubtedly of the very greatest value in many situations; but, on the other hand, there are many risks that will in future be protected by automatic alarms which would never be protected by sprinklers. For instance, in warehouses containing goods such as water would destroy to almost as great an extent as fire, or in private houses. I feel convinced that when they are better known automatic fire alarms will be looked upon as essential for every country-house of any considerable size. The destruction by fire of large country houses containing priceless works of art and other valuables is, as we all know, quite a frequent occurrence, and I am convinced that almost all these losses could be prevented by the adoption of a reliable automatic alarm. If discovered within a minute of a flame bursting out, as it should be with an automatic alarm, the fire could be put out with a chemical extinguisher or a few pails of water; but if it occurs in the night, or in an empty room during the day, and it is not noticed until it has obtained a good hold, it is seldom put out until the whole house is destroyed, unless a powerful fire-engine is on the spot and plenty of water available, which is hardly ever the case. Even when I read of stables or byres being burned with the horses or cows in them, I always think how easily, and at what comparatively small cost the loss to the owner and the suffering of the animals might have been prevented.

When anyone wishes to protect his property with automatic fire-alarms, and is in doubt as to which of the various systems is the one best suited to his conditions, our firm is always pleased to fit up a trial installation provided repayment of our out-of-pocket expenses is guaranteed in case an order is not placed with us; and we are always willing to do this whether other firms have been asked to demonstrate the working of their systems or not. The only stipulation we make is that the tests must be carried out under working conditions and that, for at least several days previous to the fire tests being made, no adjusting of the detectors by either our competitors or ourselves shall be allowed. This is the only way in which an intending purchaser can make sure that the rival systems are equally sensitive, and at the same time free from liability to give false alarms.

I will conclude by stating what we consider to be the features in which Mr. Leslie Walker's system is in advance of its competitors:—

1. Owing to the perfect way in which they compensate for normal fluctuations of temperature, we can safely use more sensitive instruments than any other existing firm.
2. We can make the detectors of any desired degree of sensitiveness.
3. The degree of sensitiveness cannot afterwards be altered.
4. We can test correctly the normal rate of fluctuations of temperature in any building.
5. We know the exact rate of compensation, and, therefore, the degree of sensitiveness of every instrument we instal.
6. The contact points cannot corrode, become covered with dust, or in any other way fail to make good electrical contact, as they are hermetically sealed and in a vacuum.
7. Our system provides both a warning and, a little later, a danger call.
8. Our detector cannot be tampered with by inquisitive persons because a warning is given immediately the protecting cover is removed.
9. A warning is given the moment the detector is broken.

## THE CRAFT OF REPAIRING BUILDINGS.*

*(Concluded from last week.)*

We will now turn to a domestic building. I think I may safely say you will not see a finer piece of brickwork anywhere in England than West Stow Hall, near Bury Et. Edmunds. Originally the hall had a moat round it, with a gatehouse and drawbridge. They then filled up the moat and extended the entrance right across it. The building was in a distinctly dilapidated condition. Windows blocked up, walls out of repair and patched with plaster. The front as now finished shows, I think, very well what we consider should be done and what left undone. Whatever was necessary for preservation was renewed, but whatever was pure ornament was left unrenewed. For example, light was wanted, and the blocked-up window was opened out and glazed and other windows were properly glazed. The archers' windows were opened out, but the missing mullions of tracery not renewed; all joints have been raked out and properly pointed.

---

* A paper read at Carpenters' Hall on April 6 by Mr. Thackeray Turner, F.S.A., F.R.I.B.A.

My experience is that everyone, when they see a building repaired on these lines, is satisfied, and when a thorough restoration is carried out they are dissatisfied. I was consulted about this building when about a quarter of the work was done. The building was so extraordinarily beautiful that I found it most difficult to give my attention to the prosaic question of what ought to be done. The chief question was whether or not to remove the rough-cast which had been put on over the half-timber work of the upper storey. The danger feared was the decay of oak which had been so long covered up, but it was thought that the great projection of the eaves would be sufficient to protect it and that the interest gained would be worth the risk. The original brick nogging, or filling in between the uprights, remained. There is one thing more about this building, and this is the wall painting over the fireplace in the guard-room over the gateway. It represents the four ages after childhood. A great deal has been written, said, and done on the preservation of wall paintings. In England they are never *frescoes*—i.e., paintings on wet plaster; or *tempera*—i.e., paintings with yolk of egg, but always true distemper paintings, the colours being used just in the same way as we use them now when distempering our walls. The one thing which you must not do is what has so often been done, and that is varnish them. When first done it seems most satisfactory, as it fixes the loose colour and brings the colour out. But it keeps all gases and moisture within the wall and plaster, with the result that eventually the whole painting, varnish and all, comes away and the picture is lost. In most cases the best thing to do is to spray on a little weak size or the fixative used for setting chalk drawings, but if the work is an important one you can read Professor Church's writings on the subject, and you will be safe in following his advice.

I have taken a large number of church towers as examples, because they are structurally the most difficult to repair, for the greater the weight the greater the risk of interference. But let me say here that the reason so many church towers are out of repair is that foolish people in their ignorance drive wedges between bell-cages or frames and tower walls when the cages need tightening, and so the bells batter the walls down, whereas their thrust should be taken by the spring of the wood cage.

In connection with West Ham church tower I will first call attention to the scaffolding, because considerable damage has been done to many a building by its being improperly erected. It was an independent or double scaffolding. Instead of having one single row of poles planted round the building and cutting holes in the walls, as must be done to carry the ends of the cross logs, which the poles do not carry, there was also a row of poles next the wall so that the poles carry both ends of the logs on which the planks are laid, and the wall is left untouched and free all over for the workmen to work on. This tower was found to be a substantial building, but it was faced with Kentish ragstone, which is particularly bad for standing the corroding influence of town atmosphere. The acids had eaten the face of the stone away and had attacked the joints the worst. The walling looked almost as if it was built of decaying boulders. Now the way buildings in such a condition have been treated in modern times has been for the architect to take much trouble to find out a good durable stone and to specify that all the old facing stones shall be cut away and substituted by new facing stones of the approved stone. Westminster Abbey, for instance, has been so faced many times over. The new stone facing, which was done under the direction of the late Mr. Pearson, is at the present time sadly decayed. This method is, we maintain, the wrong one, because cutting out the old stone jars the building badly and so does it harm; because you cannot get a new stone bedded in all round so as to become part of the wall like the old stone was; and because you lose all the interest which was left by the original builders; and after all the new stone will decay like the old unless protected, so why not keep the old stone and repair and protect it? We now know that stonework which is covered with lime cannot be eaten into until the lime is first eaten through; we also know, thanks to Professor Church, that many stones which are decayed can be again hardened by the use of baryta. What was done to these walls was to clear out the joints to a good depth, cut away the decayed stone each side of the joint, and wedge ordinary hand-made roofing tiles into the joint, leaving the edge of the tile nearly flush with the wall face. Then pieces of tile laid flat were built in in mortar above and below the joint, and finally the whole was flushed up with mortar level with the face. Where stones had over their whole surface decayed back behind the wall face, they were faced with tiles built like bricks and the tiles allowed to show.

There are technical points in this method of repair which I think I ought to speak about. First, let me say that the reasons we always use lime instead of cement are that if you cut into old work where cement has been used you will find it as hard as flint, but not homogeneous with the old work. You will also notice where it has been used for pointing that it frequently comes away. I do not say that it is impossible to use Portland cement properly, but the risks of failure are much greater than when using lime; and blue lias lime gives better results than ordinary lime, because it continues to harden for many years. It cannot, however, continue this process unless it can obtain plenty of moisture at first. For this reason hand-made tile is a particularly good material to use, because it holds water like a sponge. The bricklayer, when repairing joints in the manner I have described, should have his mortar on one side of him, which should be composed of washed river sand 5, blue lias lime 1, and a pail of water with broken pieces of tile soaking on the other side of him. Besides his trowel he should have a pair of pincers with which to break the tile to the right size, and a brush with which to throw water into the joint before beginning and in order to moisten the work which has begun to set. No mass of mortar should be more than an inch thick without having a piece of tile in it. All the buildings I have spoken about so far have been repaired by Mr. William Weir, and I consider that he is the greatest authority on this subject of any man living. There is no work which he directs which he cannot do with his own hands.

Mr. Redfern has recently been repairing the garden front of St. John's College, Oxford, one of the finest pieces of architecture I know. The work of repair has been done by filling in the joints and making up decayed stone with tile and mortar, as I have already described, but one new method was introduced. Where stonework, such as mullions, had decayed badly, holes were drilled into the stone and pegs of tile set in the holes so as to give the mortar a hold on to the face of the stone. Where stones have split they can often be jointed by drilling holes opposite one another into each stone, and setting a peg of slate or gunmetal between the two. On no consideration should iron bars, clamps, or dowels be used in stone or brickwork. I am at the present time repairing Cobham Hall in Kent. There are two brick pinnacles which I thought had certainly been shattered by lightning, and which now turn out to have iron rods up the middle of them. For all such purposes copper or gunmetal should be used. If you look at the Horse Guards and other buildings of the same date you will see how the stone facing has broken, and this is due to iron clamps, which were built in, having expanded by corrosion.

## OUR CONTEMPORARIES FROM OVER-SEAS.

THE *American Architect* (New York) issues a special number, the feature of which is "Detached Dwellings," and fifteen of the most modern examples of American domestic architecture are illustrated. The leading article is on "The Growth of the House in England and the United States," and is an interesting historical criticism and comparison.

*La Construction Moderne* (Paris) illustrates the first and second designs in the competition for the Achille Leclère prize at the Académie des Beaux-Arts, a floridly treated apartment house at Nice, by MM. Civalleri & Delserre, and the monument to Octave Greard at Paris, by M. Nénot, architect, and M. Chaplain, sculptor.

*Moderne Bauformen* (Stuttgart) devotes its illustrations chiefly to the work of Herr Albert Eitel, of Stuttgart, whose work, though "new art" in principle, is not devoid of historic reminiscence in motif, and is characterised by refined and original treatment of detail. Several designs of Herr Regierungsbaumeister Alfred Fischer, of Düsseldorf, are illustrated, and also a house at Pasing, near Munich, by the Brothers Rank. Coloured plates include work by Mr. Henry Wilson and Mr. Edgar Wood.

*Engineering Record* (New York) contains a paper on "Methods of computing flat reinforced concrete plates," read before the Convention of the National Association of Cement Users, by Angus B. Macmillan.

## FORTHCOMING EVENTS.

*Saturday, May 7.*

Municipal and Health Exhibition opens at the Agricultural Hall, Islington; closes May 14.

*Monday, May 9.*

British Constitution Association: Paper on "The Land Question," by Mr. C. F. Ryder.

*Tuesday, May 10.*

Royal Archæological Institute: Visit to Westminster Abbey (two days).

*Wednesday, May 11.*

Royal Society of Arts: Paper on "The Recent Discoveries and Restorations at the Guildhall, London," by Mr. Sydney Perks, F.R.I.B.A., F.S.A.

*Thursday, May 12.*

Society of Architects: Paper to be read.

## THE ROYAL ACADEMY EXHIBITION.

Though the present exhibition of the Royal Academy of Arts must be regarded as uneventful and devoid of striking incident, alike in painting, sculpture and architecture, the general impression produced by the Architectural Room is quietly pleasing, as much by the disposition of the drawings hung as by their individual merit. There is plenty of good work exhibited, and some things that are not satisfactory. In sculpture there is much in the smaller works that is excellent and superior to the general level of achievement of those that owe their importance to their size. This is by no means to be regretted, but is rather a subject of congratulation if, as we think it does, it augurs an appreciation of sculpture by the private owner rather than by the museum director.

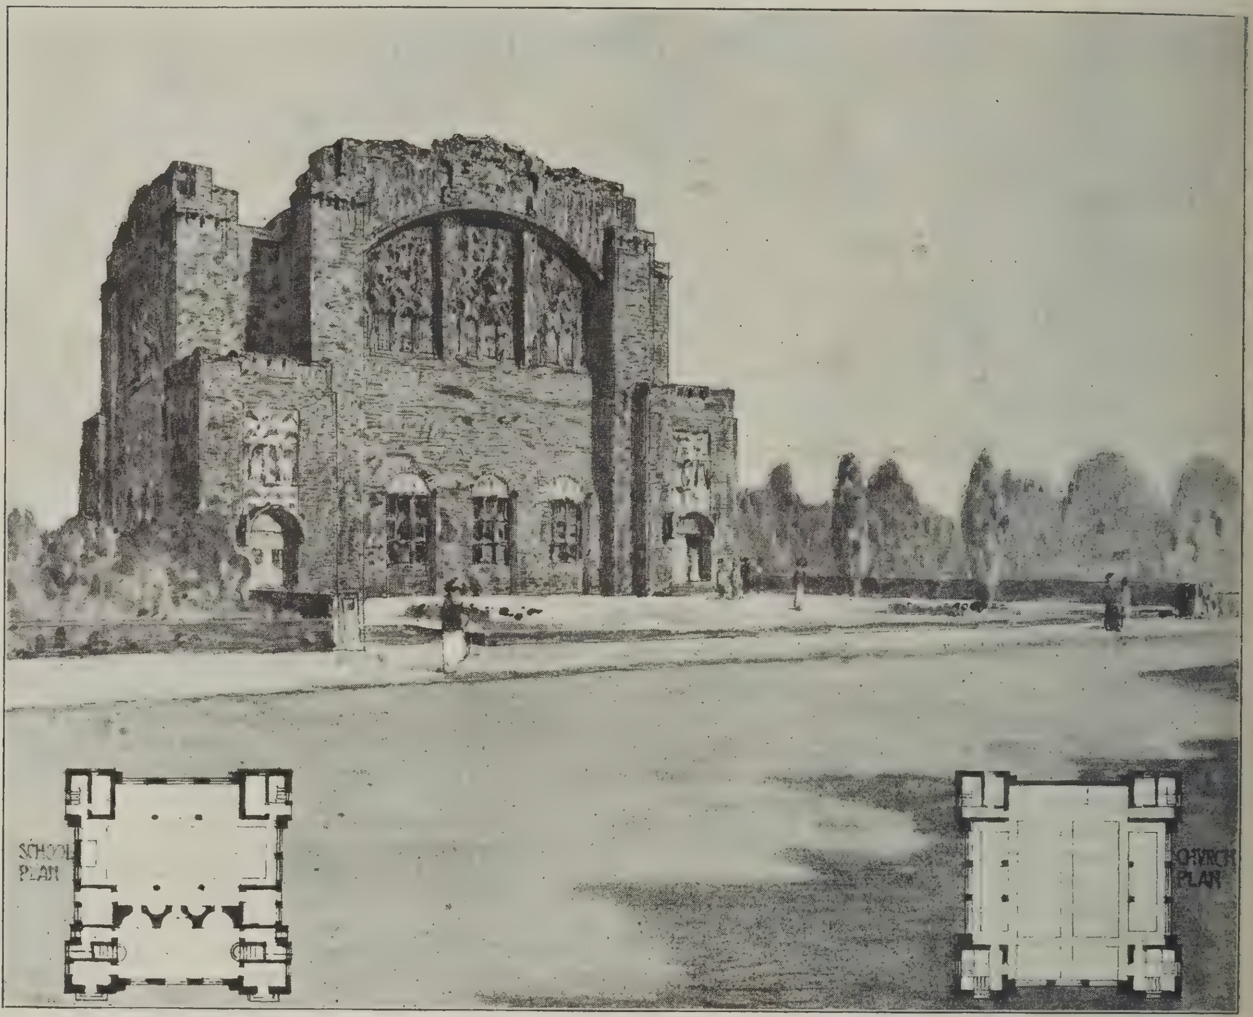
As we enter the Architectural Room we face the diploma work of the most recently elected architect Royal Academician, Mr. John Belcher, in the form of a tinted elevation of the design for the Ashton Memorial, in Williamson Park, Lancaster, now quite well-known, which, by reason of its author's selection as the justification of his election, we may believe to be his idea of pure architectural design untrammelled by considerations of commercial utility or compliance with necessity. Mr. Belcher also exhibits his design for the rebuilding of Holy Trinity Church, Kingsway, London, which, with its lofty tower set back in a circular sweep, maintains a sufficient importance for a building necessarily comparatively low in a roadway of tall buildings. We should like to see the lines of the tower brought down more pronouncedly to the ground to avoid the impression of its support by an obvious screen wall. The perspective is, perhaps, not quite correctly expressive of the architect's intention. This church will be a notable addition to the Renaissance ecclesiastical architecture of London. Mr. Belcher's third drawing is a design for the new building for the Zoological Society of London, Regent's Park, a study in simplicity, in which the breadth of treatment in Mansard roof and plain wall is relieved and accentuated by the use of loggias in the upper floors.

Sir Aston Webb, C.B., R.A., occupies the place of honour on the east wall with a water-colour drawing of "The entrance to the Mall from Charing Cross, showing the opening from Trafalgar Square widened." Despite the widening Sir Aston Webb's building is still shut in and obscured, and so attention is concentrated on the unhappy thinness of the dividing piers of the carriageways. In conjunction with Mr. E. Ingress Bell, Sir Aston Webb exhibits their joint design for "New Building, Magdalene College, Cambridge, from the River," which is eminently expressive of the atmosphere of college life in quiet but not dully decorous fashion. Sir Aston Webb's third contribution is also collegiate, in a sense, being the design for "The Students' Union in Prince Consort Road, in connection with the Imperial College of Science and Technology, South Kensington." The chief excellence of this is in the plan, though the restraint of the external treatment is quite admirable.

On the western wall of the Architectural Room the central position is occupied by a most interesting example of how little beyond brains is needed to transform a brutally ugly piece of engineering construction into a work of art. How many are there of the hundreds of water towers erected in this country that can give a moment's pleasure to the beholder, or even escape execration? Mr. Reginald Blomfield, A.R.A., in his design for "New Water Tower, Lincoln," has shown the difference between engineering and architecture in a four-square lofty tower, 58½ feet square, which, with the cathedral towers, will be a landmark of the city and also an attractive addition to its architecture. Simple in outline, strong in its proportions, with just sufficient introduction of detail to give interest, this design worthily occupies the position in which it is placed. Mr. Blomfield's other exhibits, "Manoir de la Trinité, Jersey," which we illustrate this week, and "New Buildings, Sherborne School," suffer by their proximity to his masterpiece.

Mr. T. G. Jackson's most interesting contribution to the exhibition is his "Suggestion for restoring the Cloister in connection with the necessary buttressing of the south side of the Nave" of Winchester Cathedral. In face of the enormous sums of money recently expended on the reconstruction of the foundations of Winchester Cathedral it is scarcely to be expected that funds will be forthcoming for the building of a cloister walk as an ornamental adjunct to the "necessary buttresses," although the south front of Winchester nave does look shorn and bare in its present condition. Therefore we imagine the "suggestion" will remain such. Mr. Jackson's "New Museum of Archæology and Ethnology for the University of Cambridge" is not one of his successes, being afflicted with all his faults in design and devoid of his excellences.

Mr. Ernest George, A.R.A., and Mr. A. B. Yeates exhibit their design for the "Royal Academy of Music, Marylebone Road," which, it is needless to say, is picturesque, this character being obtained by the composition of a tall central block with low wings and by varied treatment of detail. It will be a refreshing variant to the deadly monotony of the thoroughfare in which it will stand. "Crathorne Hall, Yorks," is one of Mr. George's Classic houses, but with the picturesqueness that one expects as an inevitable accompaniment of his designs on whatever period he elects to base his conception.



ROYAL ACADEMY EXHIBITION, 1910.—DESIGN FOR A CHURCH. By Mr. EDGAR WOOD, A.R.I.B.A.

Mr. RALPH KNOTT's "New London County Hall" is presented in what we may suppose to be its final form, still retaining what we think are its chief defects, the enormous chimney-stacks and inadequate flèche, although this latter has been slightly improved from its original insignificance.

Professor BERESFORD PITE has one of his characteristic dreams, a "Design for approach from St. Paul's Bridge," vaguely suggestive and idealistic.

An interesting study by Mr. W. D. CAROE is his drawing of the "Chapel of St. Mary, Glastonbury: reconstruction from existing evidences," which carries with it the presumption of possibility apart from the justification of the "evidences."

Two models are this year exhibited in the Architectural Room, one for a "Church at Rio de Janeiro," by Mr. EDWARD LARKINS, the other a "National Opera House for a Foreign Government," by Mr. E. O. SACHS "assisted by" Mr. A. H. LISTER. Both are excellent and costly models.

## PAINTING AT THE ROYAL ACADEMY.

IF every successive exhibition at the Royal Academy was the best ever held up to that date, the quality attained in the hundred and forty-second would be extraordinarily good. But this mathematical progression has not occurred, and we are still waiting for the time when the high-water mark of each year's Academy becomes the low-water mark of the next. At present it sometimes happens that an exhibition does not even attain, let alone start off from, the high-water mark of its predecessor. When this unfortunately occurs it is consoling to remember that the set-back is temporary, and that it will act as a foil to succeeding exhibitions. Moreover, it is pertinent to ask how far the walls of Burlington House act as a gauge-glass to the art production of the country, and indicate the position of contemporary painting. It must represent numerically a good proportion of those who seriously practise the art; but this does not necessarily mean that among them are to be found those with the greatest skill or who are really representative of the artistic impulses abroad in the land.

There will be few to maintain that the Exhibition opened on Monday is of outstanding merit so far as the paintings are concerned. Many may say that it is up to a fair average; while there are sure to be some who, speaking more in sorrow than in anger, will describe it as a poor one. Apart from technical reasons it is regrettable that there is not the usual number of pictures which can be described as pictures of the year, by which we mean pictures which for some more or less obvious reason arouse public enthusiasm or public curiosity. Such works act as a sort of condiment to the whole and render palatable much which, though nutritious in itself, is more wholesome than attractive. This year it is difficult to feel intensely interested in any one picture, and the after-impression is about many rather than the few. Obviously it very much depends on what the visitor expects to see whether he will have a disappointment or not, and perhaps for that reason it is wiser to wait until someone glowing with expectation and optimism has paid a visit and passed a verdict. It would be easy for an intending visitor to place his expectations at so low a level that an agreeable surprise would await him. For there is a very large amount of very excellent work, and each gallery has its sprinkling of interesting pictures.
